Summary of pages

This document comprises a front cover, an inside front cover, pages i to iv, pages 1 to 26, an inside back cover and a back cover.

Foreword

Publishing information

This sub-part of BS 7121-2 is published by BSI Standards Limited, under license from the British Standards Institution and came into effect on 30 November 2012. It was prepared by Subcommittee MHE/3/11, *Crane safety and testing*, under the authority of Technical Committee MHE/3, *Cranes and derricks*. A list of organizations represented on these committees can be obtained on request to their secretary.

Supersession

Together with BS 7121-2-1, BS 7121-2-4, BS 7121-2-5 and BS 7121-2-7, this sub-part of BS 7121-2 supersedes BS 7121-2:2003, which will be withdrawn when all these sub-parts have been published.

Relationship with other publications

The BS 7121 series is being revised. The following new sub-parts of BS 7121-2 have been published or are in preparation.

- Part 2-1: *Inspection, maintenance and thorough examination – General;*
- Part 2-3: *Inspection, maintenance and thorough examination – Mobile cranes;*
- Part 2-4: *Inspection, maintenance and thorough examination – Loader cranes;*
- Part 2-5: *Inspection, maintenance and thorough examination – Tower cranes;*
- Part 2-7: *Inspection, maintenance and thorough examination – Overhead travelling cranes, including portal and semi-portal cranes, hoists, and their supporting structures;*
- Part 2-9: *Inspection, maintenance and thorough examination – Cargo handling and container cranes.*

When all sub-parts of BS 7121-2 have been published, it is intended that CP 3010 will be withdrawn and BS 5744 will be revised to cover manually operated and light cranes only.

This sub-part of BS 7121-2 is intended to be used in conjunction with BS 7121-2-1.

Information about this document

The Health and Safety Executive (HSE) commends the use of this British Standard to those who have duties under the Health and Safety at Work etc. Act 1974 [1]. This standard was drawn up with the participation of HSE representatives and it will be referred to in the relevant HSE publications.

The BS 7121-2 series has been accepted by the HSE as representing the consensus of opinion based on practical experience for safety of cranes.

Hazard warnings

WARNING. This British Standard calls for the use of procedures that can be injurious to health if adequate precautions are not taken. It refers only to technical suitability and does not absolve the user from legal obligations relating to health and safety at any stage.

Use of this document

As a code of practice, this sub-part of BS 7121-2 takes the form of guidance and recommendations. It should not be quoted as if it were a specification and particular care should be taken to ensure that claims of compliance are not misleading.

Any user claiming compliance with this sub-part of BS 7121-2 is expected to be able to justify any course of action that deviates from its recommendations.

It has been assumed in the preparation of this British Standard that the execution of its provisions will be entrusted to appropriately qualified and experienced people, for whose use it has been produced.

Presentational conventions

The provisions of this standard are presented in roman (i.e. upright) type. Its recommendations are expressed in sentences in which the principal auxiliary verb is "should".

Commentary, explanation and general informative material is presented in smaller italic type, and does not constitute a normative element.

Contractual and legal considerations

This publication does not purport to include all the necessary provisions of a contract. Users are responsible for its correct application.

Compliance with a British Standard cannot confer immunity from legal obligations.

Particular attention is drawn to the following specific regulations:

- Health and Safety at Work etc. Act 1974 [1];
- Lifting Operations and Lifting Equipment Regulations (LOLER) 1998 [2];
- Provision and Use of Work Equipment Regulations (PUWER) 1998 [3];
- Supply of Machinery (Safety) Regulations 2008 (as amended) [4];
- Merchant Shipping and Fishing Vessels (Health and Safety at Work) Regulations 1997 [5];
- Merchant Shipping and Fishing Vessels (Lifting Operations and Lifting Equipment) Regulations (MCA LOLER) 2006 [6];
- Merchant Shipping and Fishing Vessels (Provision and Use of Work Equipment) Regulations (MCA PUWER) 2006 [7];
- Road Vehicles (Construction and Use) Regulations 1986 (as amended) [8];
- Road Traffic Act 1991 [9].

NOTE 1 Details of the Lifting Operations and Lifting Equipment Regulations 1998 [2] and the Provision and Use of Work Equipment Regulations 1998 [3], together with an HSE Approved Code of Practice and HSE Guidance, are given in HSE publications Safe use of lifting equipment [10] and Safe use of work equipment [11].

NOTE 2 Details of the Merchant Shipping and Fishing Vessels Regulations [5], [6] and [7] are given in Maritime and Coastguard Agency Marine Guidance Notes MGN 20 (M+F) The Merchant Shipping and Fishing Vessels (Health and Safety at Work) Regulations 1997 [12], MGN 331 (M+F) The Merchant Shipping and Fishing Vessels (Provision and Use of Work Equipment) Regulations 2006 [13] and MGN 332 (M+F) The Merchant Shipping and Fishing Vessels (Lifting Operations and Lifting Equipment) Regulations 2006 [14].

1 Scope

This sub-part of BS 7121-2 gives recommendations for the pre-use checks, in-service inspection, maintenance, thorough examination (in service and following exceptional circumstances) and supplementary testing of mobile cranes, including truck cranes, wheeled rough terrain cranes, wheeled yard cranes, crawler mounted cranes, mini-cranes and vehicle mounted self erecting tower cranes.

2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

BS 7121-2-1:2012, *Code of practice for the safe use of cranes – Part 2-1: Inspection, maintenance and thorough examination – General*

BS ISO 4309:2010, *Cranes – Wire ropes – Care and maintenance, inspection and discard*

3 Terms and definitions

For the purposes of this sub-part of BS 7121-2, the terms and definitions given in BS 7121-2-1:2012 apply.

4 General

Regular pre-use checking, in-service inspection, maintenance and thorough examination of cranes are essential if cranes are to function safely and reliably. The nature of these activities can be summarized as follows.

- Pre-use checks are visual checks which are carried out to ensure that the crane has not suffered any damage or failure, and is safe to use.
- In-service inspections and maintenance are carried out to ensure that components are repaired or replaced before they deteriorate to a point at which they would become unsafe.
- Thorough examinations are carried out at specified intervals, after installation on a new site, after major alteration or repair or after the occurrence of exceptional circumstances which could jeopardize the safety of the crane.
- Supplementary testing is carried out in support of thorough examination and the extent and nature of any testing are specified by the competent person carrying out the thorough examination.

5 Personnel carrying out pre-use checks, in-service inspections, maintenance and thorough examinations

Attributes, competencies, competency assessment, training plans and training records of personnel should be in accordance with BS 7121-2-1:2012, Clause 5.

6 Pre-use checks and in service inspections

NOTE The inspection required by MCA LOLER 2006 [6] Regulation 12(1) is addressed in Clause 8.

6.1 General

Pre-use checks and in-service inspection of cranes, together with a system to rectify any defects disclosed, are required by the Health and Safety at Work etc. Act 1974 [1] Section 2(2)(a), LOLER 1998 [2] Regulation 9(3)(b) and MCA LOLER 2006 [6] Regulation 12(2)(b), to ensure that the crane is safe to use and that any deterioration is detected and rectified before the crane becomes unsafe.

Examples of checklists for pre-use checking and in-service inspections are given in Annex A.

Pre-use checks and in-service inspections should only be carried out by personnel who have been adequately trained and assessed as competent to carry out the required tasks (see Clause 5). LOLER 1998 [2] and MCA LOLER 2006 [6] require that results of all in-service inspections are recorded in writing. It is recommended that the results of all pre-use checks are also recorded in writing.

The crane user should ensure that sufficient time is allowed for pre-use checks to be carried before the crane starts work. The user should also ensure that a safe system of work is in place to prevent the person who is carrying out the checks/inspections from being exposed to danger.

6.2 Pre-use checks

Pre-use checks should be carried out at the start of each shift during which the crane is to be used. These are to test the functionality of the crane and visually check for any obvious defects. It is essential that these are carried out from a position of safety.

6.3 In-service inspection

A regular in-service inspection should be made to identify any defects which might not be detected by the pre-use checks. In-service inspections should be carried out at intervals which ensure that any deterioration is identified before there is a risk of failure of the crane or injury to persons. Further guidance is given in HSE document L113 [10] and MCA document MGN 332 [14]. It might be convenient to schedule the inspections concurrently with planned preventive maintenance (see BS 7121-2-1:2012, 7.2.2 and 7.2.3).

Steel structures suffer from fatigue, a process which can create cracks that propagate over time. If left unattended, cracks can cause serious failure of the crane structure, so the in-service inspection regime should include measures to detect cracks before the safety of the crane is affected.

The period between inspections should be decided on the basis of the duty of the crane and the environmental conditions and might need to vary between 1 week and 6 months. The period should be kept under review and adjusted according to the results of the inspections.

6.4 Reporting of defects

LOLER 1998 [2] and MCA LOLER [6] require that defects be reported immediately they are identified. There should be provision for the personnel carrying out pre-use checks or in service inspections to make written reports of defects or observations immediately they are identified.

This facility should augment the normal verbal reporting that should routinely take place between crane operator and crane owner/site manager. The written report should be to a pre-defined format, (a company pro-forma, a section on the daily time sheet, etc.), which requests details of the defect or observation and supporting information, such as date, time, crane identification, error codes and circumstances. The operator should also fill in a written report when there are no defects or observations to report (a "nil report") and these should be submitted at least weekly.

All the defect reports, including the "nil reports", should be forwarded to the crane owner (or the crane owner's delegated representative), who should arrange for any necessary action to be taken on the basis of the report. A copy of the original report should be retained by the crane user.

Once the defect/observation has been dealt with and cleared this should then be recorded, with supporting information, on the original defect report.

The "cleared" reports should be securely lodged in the crane owning company's maintenance management system and should be made available on demand to the users of the crane as well as other authorized bodies.

6.5 Records of pre-use checks and in-service inspections

6.5.1 General

Written records of all pre-use checks and in-service inspections should be kept.

6.5.2 Pre-use checks

The record of a pre-use check should include at least the following information:

- identity of the crane;
- date of inspection;
- result of the check, i.e. whether or not the crane passed;
- name and signature of person carrying out the check.

This may be recorded by, for example, completing a standard pro-forma record.

6.5.3 In-service inspections

The record of an in-service inspection should include at least the following information:

- date and location of the inspection;
- name of person carrying out the inspection;
- description and unique identification number of the equipment inspected;
- nature and extent of the inspection;
- results of the inspection, including details of the condition of critical components which need to be monitored, for example a wire rope showing signs of wear.

The record should be related to the mobile crane's historical records and made available to the competent person responsible for the thorough examination (see Clause 8).

6.6 Inspection of second-hand mobile cranes

When purchasing second-hand mobile cranes, their condition should be inspected and assessed; nothing should be taken for granted. Second-hand cranes might contain latent defects which might otherwise only become apparent when the machine is put into service. They might have suffered significant damage and have been inadequately repaired. Second-hand cranes might also have been imported into the European Community without being modified to meet EU requirements, so called "Grey imports".

The assessment of a second-hand crane should include a review of maintenance records and previous reports of thorough examination, together with consultation of the manufacturer to obtain details of any major repairs, etc. The contents of any data logger should be downloaded and reviewed. The assessment might require the removal of access covers or stripdown of major assemblies to reveal parts that could not ordinarily be seen. Once the crane's condition has been fully assessed, any necessary repairs should be carried out and appropriate inspection and maintenance intervals established.

7 Maintenance of mobile cranes

7.1 General

Under the Provision and Use of Work Equipment Regulations (PUWER) 1998 [3] and MCA PUWER 2006 [7] employers are required to ensure that cranes are maintained in an efficient state, in efficient working order and in good repair. To ensure adequate maintenance, an effective maintenance management system should be set up in accordance with BS 7121-2-1:2012, 7.1.

7.2 Maintenance of the mobile crane chassis

Mobile cranes are currently exempt from the Goods Vehicles (Licensing and Operators) Regulations 1995 (as amended) [15], and the Goods Vehicles (Plating and Testing) Regulations 1988 (as amended) [16].

The Road Vehicles (Construction and Use) Regulations 1986 (as amended) [8] Regulation 100 require that mobile cranes should "at all times be in such condition,...that no danger is caused or is likely to be caused to any person in or on the vehicle or on a road".

The safety of the crane driver and other road users is critically dependent on the condition of the crane chassis, including the brakes, suspension, steering, lights, wheels and tyres. Maintenance should be carried out in accordance with the manufacturer's service manual and at the intervals given in the manual. These intervals are usually recommended on the basis of engine hours run and distance travelled, where the first limit reached determines the need for maintenance.

Correct maintenance of the chassis of a mobile crane is essential to ensure the following and avoid putting the crane operator and other road users at risk:

- correct brake performance, to ensure that the crane can stop in time within the correct braking distances;
NOTE Braking parameters for new road going mobile cranes are specified in the Road Vehicles (Authorisation of Special Types) (General) Order 2003 [17].
- sufficient tyre tread grip to enable the crane to stop with the correct braking distances;
- avoidance of hydraulic fluid leaks from the suspension system, which could lead to contamination of the road surface and potential loss of control for other road users;

- avoidance of tyre blowouts, which could lead to loss of control of the crane;
- avoidance of steering system failures, which could lead to loss of control of the crane;
- correct functioning of the crane lighting, so that the crane operator is able to see clearly and other road users are able to see the crane;
- correct functioning of wipers, washers and demisters so that the crane operator can see clearly;
- avoidance of failure of the vehicle suspension system;
- avoidance of failure of the crane chassis;
- security of outrigger plates, covers, guards and other potentially loose items.

It is essential that the chassis of a mobile crane is effectively cleaned before maintenance and inspection is carried out to ensure that defects can be detected.

7.3 Manufacturer's technical product training

Before carrying out maintenance on a specific make and model of crane, all maintenance personnel should receive technical training from the crane or component manufacturer. If direct training by the manufacturer is not available, training may be carried out in-house. In this case training should be carried out by a competent trainer who has received model-specific technical training directly from the manufacturer, to ensure that the source of such training is only one step removed from the manufacturer.

In the situation where the manufacturer no longer exists, a careful selection of alternative competent training providers should be made.

7.4 Maintenance intervals

7.4.1 General

The Health and Safety at Work etc. Act 1974 [1] sets out a general duty requiring that work equipment is maintained so that it is safe.

For mobile cranes, planned preventive maintenance (see BS 7121-2-1:2012, 7.2.2 and 7.2.3) should be carried out at intervals which ensure that worn and damaged components are renewed before the mobile crane becomes unsafe, breaks down or fails.

NOTE Breakdown causes downtime and a consequent loss of production for the user, whilst a component failure could result in a partial or total collapse of the crane with potentially fatal consequences for persons in the vicinity.

7.4.2 Pre-delivery maintenance and inspection prior to long-term hires

Before a mobile crane, including a crawler, mobile tower or mini-crane, is delivered to site for a long-term hire, it should be inspected by maintenance personnel to identify any worn or faulty components, which should be renewed. The results of the inspection should be recorded. This record may be required by the competent person carrying out the thorough examination of the crane.

NOTE It is considerably easier and less costly to replace components and carry out lubrication and adjustments in a depot than when the crane has been set up on site. Work on a crane on site can involve work at height and can present difficulty in handling heavy components.

7.4.3 In-service maintenance interval

A mobile crane should be maintained at regular intervals to avoid breakdown, failure or collapse. The frequency at which inspection and maintenance is carried out should be based on the recommendations contained in the manufacturer's manual for the crane. This should, however, generally be taken as the maximum interval, as various factors, including the following, might require the interval to be reduced.

- *Usage* – Double shifting, frequent lifting at or near the rated capacity, high cycling, long hoist ropes and excessive slewing, which might accelerate wear of all components.
- *Road use* – Excessive travel on the highway or on site.
- *Environment* – Corrosive environments such as marine or industrial sites, which might accelerate corrosion of electrical connectors and components, drive train, structural components, fasteners and wire ropes.
- *Feedback* – Feedback from maintenance records, condition monitoring and thorough examination reports which might indicate accelerated rates of wear and deterioration.

Once established, the inspection and maintenance interval should be recorded in the machine history file. It is essential that any variation from the manufacturer's recommended intervals is recorded and justified each time a change is made.

NOTE The manufacturer's recommended service interval may be extended in certain circumstances where predictive maintenance techniques are used.

7.5 Information for maintenance

The wide variation of designs and the increasing complexity of mobile crane technology make it essential that all maintenance personnel are supplied with adequate information to enable them to carry out their duties effectively and safely. The recommendations given in BS 7121-2-1:2012, 7.8 should be followed.

7.6 Inspection during maintenance

This inspection is normally undertaken by maintenance personnel and is in addition to the in-service inspections undertaken in accordance with Clause 6.

When inspections are being carried out as part of maintenance it is important that maintenance personnel record all faults and do not omit to record faults that are then rectified as part of the maintenance process. Such masking of faults would invalidate the machine history and hinder the review process.

NOTE Where cranes are on long-term hire there is a need for site managers to allocate time for routine inspection and maintenance. It is unreasonable for a site manager to expect this work to be undertaken overnight, in darkness, or always at weekends. Time needs to be built into normal working hours for this work (see 7.8.2).

7.7 Management review of maintenance records and procedures

For the safe and efficient operation of a mobile crane fleet, a regular management review of the mobile crane maintenance records and procedures should be carried out by the managers responsible for the maintenance operation to enable them to be confident that a robust maintenance system is in place and will rapidly highlight any shortcomings and the need for corrective action.

The review should include:

- checks that faults are being corrected appropriately and the maintenance schedule is being completed to plan;
- checks to determine if the maintenance regime and frequencies are appropriate and to analyse trends.

The review should be carried out initially at least monthly. Once a suitable level of confidence in the systems has been established the review frequency may be reduced in the light of experience.

7.8 Site issues for maintenance

7.8.1 General

Maintaining a mobile crane (especially a crawler crane) on site presents a particular set of issues when compared with carrying out maintenance operations in a workshop or yard. These issues should be addressed at the planning stage before the crane is set up on site and taken into use. This should be done in close collaboration with the crane user as their cooperation is essential for the effective maintenance of mobile cranes on site.

7.8.2 Maintenance downtime

PUWER 1998 [3] Regulation 5 and MCA PUWER 2006 [7] Regulation 7 require employers to ensure that cranes are maintained in an efficient state, in efficient working order and in good repair.

As the main purpose for a mobile crane being on site is to carry out lifting operations, site managers can be, understandably, reluctant to stop the crane while maintenance is carried out.

WARNING. It is essential that maintenance downtime is scheduled into the work programme, so that maintenance is not pushed to the back of the queue and does not end up being carried out hurriedly in unsafe conditions such as poor light.

Mobile crane owners should make clear to those hiring their cranes that adequate maintenance downtime has to be built into the work programme. Hirers should be informed at the planning stage of the frequency and length of time required for maintenance operations. In certain circumstances it might be of benefit to substitute another crane to allow maintenance to be carried out in a workshop, rather than on site.

Projects in built-up areas often have environmental restrictions imposed on them which severely limit working time at weekends and in the evenings. Such restrictions should be taken into account in maintenance planning.

Mobile crane hirers should be informed that when maintenance of a mobile crane is taking place the maintenance team have full control of the mobile crane.

7.8.3 Communication

Those planning and carrying out maintenance on mobile cranes on site should ensure that they have effective lines of communication with the site staff for both routine maintenance and attending to breakdowns. Maintenance personnel should always report their arrival on site, agree the programme of work to be carried out and report back once the tasks have been completed. This can avoid much frustration and misunderstanding on both sides.

7.9 Spare parts

Maintenance operations on mobile cranes can only be fully effective if the correct spare parts are available at the correct location in a timely manner. A robust spare parts management system should be put in place to avoid any unnecessary additional direct and indirect costs and any adverse affects on the safety of the crane.

Where spare parts are not obtained from the crane manufacturer, parts should be obtained that meet the original manufacturer's specification. Where necessary, a full engineering assessment of the part(s) should be carried out to ensure that this is the case.

7.10 Use of special materials in crane construction

Modern mobile cranes make extensive use of high tensile steels. When repairs are carried out to any parts of the crane structure, the correct procedure laid down by the manufacturer should be strictly followed to avoid changing the properties of the material.

8 Thorough examination of mobile cranes

8.1 General

8.1.1 Thorough examination of a mobile crane is required by LOLER 1998 [2] Regulation 9 in the following circumstances (see BS 7121-2-1:2012, **8.3.1**):

- before being put into use for the first time, unless the crane is new and the owner has an EC Declaration of Conformity dated not more than 12 months prior to the crane being used for the first time, LOLER Regulation 9(1);
 - where safety depends on the installation conditions:
 - after installation and before being put into service for the first time, LOLER Regulation 9(2)(a);
 - after assembly and before being put into service at a new site or in a new location, LOLER Regulation 9(2)(b);
- NOTE This does not apply to a mobile crane which moves from one location to another to perform a lifting operation, is not fixed in position, and is operating within the scope of the current report of thorough examination.*
- periodically whilst in service, at maximum intervals of 6 months for cranes that lift people and 12 months for cranes that lift goods only, LOLER Regulation 9(3)(a)(i) and (ii);
 - after exceptional circumstances have occurred, LOLER Regulation 9(3)(a)(iv).

WARNING. A thorough examination does not include assessment of roadworthiness as required by the Road Traffic Act 1991 [9] and regulations made under it.

8.1.2 Inspection of a mobile crane is required by MCA LOLER 2006 [6], Regulation 12(1) in the circumstances listed below. The person carrying out this inspection should have the same competencies as a competent person carrying out a thorough examination (see Clause 5).

NOTE 1 This inspection is defined in MCA LOLER 2006 [6] Regulation 12(1).

- Where safety depends on the installation conditions:
 - after installation and before being put into service for the first time, MCA LOLER Regulation 12(1)(a);
 - after assembly at a new site or in a new location, MCA LOLER Regulation 12(1)(b);

NOTE 2 This does not apply to a crane which moves from one location to another to perform a lifting operation, is not fixed in position, and is operating within the scope of a current report of inspection or thorough examination.

8.1.3 Thorough examination of a mobile crane is required by MCA LOLER 2006 [6] Regulation 12(2) in the following circumstances:

- periodically whilst in service, at maximum intervals of 6 months for cranes that lift people and 12 months for cranes that lift goods only, MCA LOLER Regulation 12(2)(a)(i) and (ii);
- after exceptional circumstances have occurred, MCA LOLER Regulation 12(2)(a)(iv).

8.2 Selection of competent person

It is essential that the competent person undertaking the thorough examination of a crane has not been involved in the maintenance of the crane. This also applies to the inspection of cranes under MCA LOLER 2006 [6] Regulation 12(1) (see 8.1.2).

8.3 Scope of thorough examination before the crane is put into use for the first time

The competent person who undertakes the thorough examination should decide the scope of the examination. The extent of the thorough examination should reflect the likelihood of failure and the actual risk which could arise from any such failure. It should also take into account when the crane was made and the likely deterioration since manufacture, which could increase risks in use. Records of tests and inspections carried out by the manufacturer should also be taken into account.

These recommendations also apply to an inspection made under MCA LOLER 2006 [6] Regulation 12(1) (see 8.1.2).

8.4 Scope of thorough examination following installation

For mobile cranes for which thorough examination after installation is required (see 8.1), the competent person who undertakes the thorough examination should decide the scope of the examination. LOLER 1998 [2] Regulation 9(2)(a) and (b) requires that this establishes that the crane has been installed correctly and is safe to use.

As a minimum, the examination should ensure the crane has been installed, checked and tested in accordance with the manufacturer's instructions.

The scope of the thorough examination should be proportional to the complexity of the installation and the reports of previous thorough examinations, where applicable.

These requirements and recommendations also apply to an inspection made under MCA LOLER 2006 [6] Regulation 12(1) (see 8.1.2).

8.5 Scope of periodic thorough examination

8.5.1 General

The competent person carrying out a periodic thorough examination should work to a defined scope of thorough examination that has been drawn up specifically for the mobile crane they are required to examine (see BS 7121-2-1:2012, 8.6).

The defined scope of thorough examination should be drawn up in advance of the examination by a competent person and should identify those parts of the crane that should be thorough examined, together with required supplementary reports and tests and the extent to which they should be witnessed, and details of any required non-destructive testing of the crane structure and mechanisms.

The competent person carrying out the thorough examination may add to the defined scope but is not permitted to reduce it.

It is essential that the defined scope of thorough examination includes all components that may be used with the crane in different configurations, together with any dedicated ancillary equipment. Particular attention should be paid to wire ropes (see Clause 13). Components that are regularly used with the crane should be included in every thorough examination of the crane. Other components should be thoroughly examined prior to use. Precautions, for example quarantining, should be taken to ensure that such components are not used unless there is a current thorough examination report for the component.

The competent person who prepared the defined scope of thorough examination should periodically review it to take account of changes in usage of equipment, findings of previous thorough examinations, supporting supplementary reports and tests, together with any information from maintenance activities, manufacturers or other sources. A copy of the defined scope of thorough examination should be kept in the machine history file.

The defined scope of thorough examination should, as a minimum, include the components listed in 8.5.2. These components should be assessed against the relevant criteria listed in 8.5.3, taking into account the path of the load through the crane's structure and mechanisms. It is essential that the scope is risk based and takes into account the consequences of failure of the crane.

8.5.2 Components to be included

The following components should be included in the defined scope of thorough examination for a mobile crane (as applicable):

NOTE This list is not exhaustive.

- manufacturer's information plate/label, CE mark, and load and duty charts;
- tyres and wheels;
- axle locking system;
- crawler tracks;
- crane chassis;
- outrigger jacks and beams;
- chassis braking system;
- all bolts, pins and other fastenings (visual inspection);
- slew section structure, including fasteners and slew ring;

- slewing mechanism (examination throughout its full range of movement with jib at maximum radius);
- all pipe work and connections (including rigid and flexible hoses) (visual inspection);
- all hydraulic cylinders (visual inspection);
- hydraulic cylinder fittings (visual inspection);
- oil and other fluids;
- superstructure and jib (visual inspection);
- fly jib and mounting attachment (visual inspection);
- all pivoting joints on the jib and attachments of the crane (visual inspection);
- telescoping extensions on the crane (operation and visual inspection);
- wire running and static ropes, including terminations;
- pulleys/sheaves and drums, including guards;
- access, including ladders, walkways, guard rails and hand holds;
- cab, including controls, markings, indicators, seating, windows, heating, falling object protection structure (FOPS) bars, wipers and load charts;
- limiting and indicating devices including:
 - rated capacity system (measurement of load, moment and radius);
 - anemometer;
 - devices indicating:
 - over hoist and over lower limits;
 - luffing limits;
 - trolley limits;
 - slack rope limits;
 - rail travel limits;
- hook blocks, including sheaves, hook, safety catch and swivel bearing;
- counterweights, including pendants, fasteners, lifting and locking mechanisms;
- hoist and luffing winches and brakes, including hydraulic systems;
- power and control cables and slip rings (visual inspection);
- control cabinets and wiring;
- markings, instructions and safety notices.

8.5.3 Assessment criteria

The following assessment criteria should be included in the defined scope of thorough examination for a mobile crane:

NOTE This list is not exhaustive.

- accuracy of limiting and indicating devices – within manufacturer's tolerance;
- adjustment – as specified by manufacturer;
- alignment – within manufacturer's tolerance;
- backlash – within manufacturer's tolerance;

- bearing play – within manufacturer's tolerance;
- brake performance – within manufacturer's tolerance;
- corrosion – affecting strength or functionality;
- cracks – affecting strength or functionality;
- cylinder creep – within manufacturer's tolerance;
- damage – affecting strength or functionality;
- distortion – affecting strength or functionality;
- fluid levels – within manufacturer's limits;
- functionality – as intended by manufacturer;
- guards – presence and condition;
- leaks – affecting strength, functionality and slips;
- lubrication – adequacy;
- markings – presence, accuracy and condition;
- mode of operation – as intended by manufacturer;
- obstructions – impeding safe access;
- rope fit – as specified by manufacturer;
- rope reeving – as specified by manufacturer;
- rope specification – as specified by manufacturer;
- rope condition (see Clause 13);
- security – attachment of components and sub-structures, fasteners, welds, etc.;
- seizure – full or partial seizure of rotating components;
- tidiness – general housekeeping;
- wear – affecting strength or functionality.

8.6 Periodic thorough examination interval

The statutory maximum intervals of 6 months and 12 months may be reduced to take into account environmental factors or the general age and condition of the crane etc. The decision to reduce the interval between thorough examinations may be made by the competent person, the mobile crane owner or the mobile crane user.

Reasons for reduction of the interval between thorough examinations include the following:

- if the mobile crane frequently works above or near people, both personnel on site and members of the public outside the site;
- if the mobile crane might be used for lifting of persons in exceptional circumstances, including rescue, even if it is not initially planned;
- to take into account the intensity of use of the crane and the environment in which it is used;
- following a review by the competent person of the in-service lift plan (risk assessment, method statement and schedule of lifts) to ascertain the likely load spectrum and frequency of use of the crane.

8.7 Thorough examination after exceptional circumstances

LOLER 1998 [2] and MCA LOLER 2006 [6] require that if the crane is subjected to exceptional circumstances it has to be removed from service and subjected to a thorough examination to determine whether it is safe to be returned to service.

Exceptional circumstances include an overload, jib clash, collision, use for particularly arduous duties, failure of a structural component or being subjected to weather in excess of design parameters.

The scope of the thorough examination should be proportional to the nature of the exceptional circumstances and the extent of any repairs, and should take into account the reports of previous thorough examinations, where applicable.

8.8 Preparation for thorough examination

Prior to thorough examination the mobile crane should be cleaned by appropriate means, e.g. pressure washed, to remove all spoil/dirt that would otherwise conceal the structure or mechanisms and prevent an effective examination.

Where it is not possible to ascertain the condition of hidden mechanism parts, for example ropes, chains, sheaves, terminations or hydraulic cylinders, dismantling prior to thorough examination should be carried out as required by the competent person.

Additional means of safe access should also be provided as required by the competent person, e.g. scaffolding, working platforms or mobile elevating work platforms.

These recommendations also apply to an inspection made under MCA LOLER 2006 [6] Regulation 12(1) (see 8.1.2).

NOTE Attention is drawn to the Work at Height Regulations 2005 (as amended) [18].

8.9 Rated capacity indicator/rated capacity limiter (RCI/RCL) calibration check and functional test

The periodic thorough examination of a mobile crane (see 8.5) should include a calibration check and functional test of the rated capacity indicator/rated capacity limiter (RCI/RCL) in accordance with BS 7121-2-1:2012, 10.15.

9 Overload testing of mobile cranes

NOTE For testing of mobile cranes on water-borne craft see Clause 11.

9.1 Four year test

In the past, mobile cranes in the UK have frequently been subjected to overload testing at 4-yearly intervals, in addition to the periodic thorough examinations required by LOLER 1998 [2]. This is a legacy from the requirements of the old Construction (Lifting Operations) Regulations, which were replaced by the introduction of LOLER in 1998. HSE document L113, *Safe use of lifting equipment. Lifting Operations and Lifting Equipment Regulations 1998. Approved code of practice and guidance* [10] states that any testing is at the discretion of the competent person carrying out a thorough examination and that the competent person will decide on the nature of the test and the method of carrying it out.

The traditional routine overload testing of mobile cranes has a number of disadvantages and few benefits.

- Some manufacturers do not recommend overload tests, except in “exceptional” circumstances, and severely limit the magnitude of the test load that may be applied.
- Repeated overloads can cause deterioration of the crane structure over time.
- Most structural failures are the result of fatigue and such defects will not be revealed by an overload test; fatigue cracking can be identified during thorough examination.
- If a crane fails during testing it could be dangerous and will certainly be expensive.
- Inspection bodies, such as members of the Safety Assessment Federation, do not recommend it, as there is no defined structural or mechanical benefit.
- A significant number of insurance policies do not provide cover for a crane that has been overloaded in any circumstances, including overload testing.

In summary, where a defined scope of examination approach is used, 4-yearly overload testing is not required unless deemed necessary by the competent person.

9.2 Before testing

The competent person should seek advice from the manufacturer (or other suitable design authority) before deciding on the nature of the test and the method of carrying it out, including the magnitude of the overload to be applied.

A visual examination of the crane and the test area should be carried out prior to commencing the test.

Before the application of a load, a thorough examination of the crane should be carried out, including verification that the crane is rigged in accordance with the manufacturer’s instructions.

The competent person should check the rated capacity specified on the manufacturer’s certificate of test, the load radius indicator, the table of rated capacities displayed in the operator’s cab and those used by the RCI/RCL. The rated capacities should all be identical.

A functional test with no load applied should be carried out to determine whether the controls, switches, contactors and other devices operate correctly. The adjustments of the brakes and limit switches should be checked and tests carried out to determine whether they are operating correctly.

Mobile cranes have a large variety of support systems (for example crawler tracks, tyres and outriggers), jib configurations, counterweights and special attachments, all of which affect stability and strength of the crane. The competent person should take account of all the support systems when determining the conditions for overload testing. Further details are given in **9.3**.

9.3 Support systems to be taken into account in overload testing of mobile cranes

9.3.1 Outriggers

Certain manufacturers give duties for intermediate extension of outriggers. Before overload testing, the competent person should check that:

- a) the intermediate extension position is clearly and durably marked on the outrigger;
- b) the manufacturer's duty chart indicates the correct rated capacities applicable to the outrigger extension;
- c) the duty charts supplied by the manufacturer give the specified intermediate extensions;
- d) provision is made in the RCI/RCL to accommodate the specified intermediate extensions.

9.3.2 Counterweight

Variations in the counterweight affect the stability of the crane. The manufacturer's duty charts specify the ratings applicable for each counterweight. Sometimes mobile cranes have additional weights to increase the mass of the counterweight and special rigs to enhance the lifting capacities.

Before overload testing, the competent person should check that the correct counterweight and any additional weights and special rigs are on the crane.

9.3.3 Jibs

Before overload testing, the competent person should check that the jib is fitted to the crane in accordance with the manufacturer's instructions. Overload testing of cranes with jibs should be carried out in accordance with Clause 12.

9.3.4 Fly jibs

For overload testing, fly jibs should be erected in accordance with the manufacturer's instructions for the crane. Overload testing of cranes with fly jibs should be carried out in accordance with Clause 12.

9.3.5 Variable length jibs

Where jib lengths are increased by fitting intermediate sections, it is advised in HSE document L113, *Safe use of lifting equipment. Lifting Operations and Lifting Equipment Regulations 1998. Approved code of practice and guidance* [10] that all jib sections are marked to indicate to which crane they belong. When carrying out an overload test, the identification of the jib sections tested should be recorded on the test certificate. Overload testing of cranes with variable length jibs should be carried out in accordance with Clause 12.

9.4 Levelling

The importance of levelling the crane cannot be over-emphasized. The crane should be level to $\pm 0.5\%$ slope. One method of determining the level of the crane is to use a spirit level. Alternatively, the hook block should be in the centre of the jib when viewed from the front with the jib fully extended at or near minimum radius and with the unladen hook block lowered to just above ground level. The procedure should then be repeated when the jib has been slewed 90° . This method of levelling can only be used when it has first been checked that the jib is correctly aligned. Any built-in levelling device should be checked at this time and reset if necessary. The levelling of the crane should be monitored throughout the tests; this is particularly important when testing cranes with long telescopic and lattice jibs. If the slope is found to exceed the limit given above, testing should be stopped, any load should be removed and the crane re-levelled.

9.5 Lifting free on wheels

Tyre pressures are a critical factor in retaining the necessary stability margin of mobile cranes. The tyres of cranes under test should be as specified in the crane manufacturer's instructions. Some crane manufacturers stipulate higher tyre pressure for free on wheels (static condition fully mobile) duties than for road travel as a vehicle. Where the manufacturer permits lift and travel duties these can differ from the free on wheels duties and both types of duty should be subjected to testing.

9.6 Lifting capacities

The load ratings marked on mobile cranes and shown on the manufacturer's rated capacity charts indicate the gross loads, i.e. the loads quoted include the loads imposed by the hook blocks, slings and lifting gear and often also have deductions, for example deduction of the load due to a stowed fly jib. This fact should be taken into account when the crane is being tested and an allowance should be made for the load imposed by suspended hook blocks, slings and lifting gear. The exact load imposed by these items should be ascertained. Certain cranes can become unstable when working with long jibs and fly jibs if the jib angle to the horizontal is reduced below the minimum angle given in the crane manufacturer's instructions. The hook block should always be rested on the ground before any lowering of the jib beyond the maximum operating radius commences.

9.7 Overload testing

The crane should be functionally tested without a load applied to determine whether it is working properly.

After the functional tests without a load applied, the efficiency of the crane's hoist brake(s) should be tested with the load that gives the maximum line pull on the hoist rope(s). The load should be lifted clear of the ground and the brake applied by returning the control to neutral. There should be no fall back or creep. The load should be re-hoisted and the brake re-applied to check the ability to re-hoist. The load should then be lowered and the control returned to neutral with the load still clear of the ground. There should be no over-run or creep.

At every configuration in the test programme the crane should be set up with the test load at a radius/angle within the rated capacity of the crane. The test load should then be raised just clear of the ground and the crane derricked out to the radius/angle where the test load is at the overload specified by the manufacturer. The load should be raised until every tooth in the train of the hoist gears has been subjected to the overload and then lowered to between 100 mm and 200 mm above the ground and held there for 10 min. There should be no over-run or creep. The load should be slewed at the lowest possible speed in both directions through a small arc to determine the ability of the structure to withstand lateral loadings. The test load should then be slewed through the maximum slew angle permitted by the design of the crane.

NOTE During raising of any load it might be necessary to derrick the jib in so that the radius is not exceeded. Similarly, it might be necessary to jib out when lowering off a load at minimum radius (failure to do so can result in the jib falling backwards, particularly on a rope supported jib/fly jib).

9.8 Major repairs or modifications

Mobile cranes should be overload tested after major repairs or modifications.

9.9 Post-test thorough examination

On completion of the overload test a further thorough examination of the crane should be carried out, see BS 7121-2-1:2012, 8.12.

10 Non-destructive testing (NDT) of mobile cranes

NDT of mobile cranes may be requested by the competent person carrying out the thorough examination, particularly when there is a suspicion that cracks or other damage might be present in structural parts of the crane (see BS 7121-2-1:2012, 10.13).

11 Stability testing of mobile cranes mounted on water-borne craft

11.1 General

When a mobile crane is mounted on a water-borne craft (i.e. a barge or pontoon), LOLER 1998 [2] Regulation 9(2) and MCA LOLER 2006 [6] Regulation 12 class this as a major modification and require the assembly of the crane and the vessel to be assessed, tested and thoroughly examined as a floating crane.

Assessment, testing and thorough examination should be carried out for each location on the vessel in which the crane is to be used.

11.2 Information to be obtained

Information should be obtained regarding the amount of list and freeboard allowable under both rated capacity and stability test conditions (see 11.7) from a competent person or authority experienced in crane design and stability of water-borne craft.

NOTE This competent person may be a naval architect.

In addition, information should be obtained from the crane manufacturer on how far the crane is de-rated from land based ratings whilst on the barge or pontoon. This is necessary to enable precautions to be taken to minimize any excessive loads on the crane structure which would be applied when any part of the barge or pontoon is at maximum list.

11.3 Verification of test conditions

Before testing is carried out on the mobile crane, the following details should be verified:

- a) that the calculated angle of heel and trim of the vessel when the crane is in operation are in accordance with the allowable list and freeboard given in the information obtained in accordance with 11.2;
- b) that the load on the crane structure while the crane is on the barge or pontoon does not exceed the crane manufacturer's allowable rated capacity, taking into account the de-rating given in the information obtained in accordance with 11.2;
- c) that the amount and position of any ballast required is as given in the information obtained in accordance with 11.2;
- d) that the depth of water below the vessel's keel is as given in the information obtained in accordance with 11.2;

NOTE This is to ensure that the vessel does not ground during the test.

- e) that the weather and sea state conditions do not exceed the limiting weather and sea state conditions allowed by the crane designer, certifying authority or other competent person.

11.4 Mooring for testing

For vessels that are not dynamically positioned, if it is not possible to moor the vessel to the shore, the vessel should be moored to a craft alongside. The mooring should be sufficiently free to allow the vessel to take up a natural list in the water.

11.5 Rated capacity indicator/rated capacity limiter (RCI/RCL) and inclinometer

The crane RCI/RCL should be checked to ensure that the rated capacity reduction, and any increase in radius due to the list of the vessel, have been taken into account. The inclinometer should be checked to ensure that it is operating correctly and is visible to the crane operator when in the cab.

11.6 Thorough examination before testing

A thorough examination of the mobile crane should be made before the application of any loads. The examination should include verification that ties, supports, anchorages, ballast, counterweight and load radius configuration for the type of crane under test are in accordance with the crane manufacturer's instructions. Supplementary testing of ties, supports and anchorages, such as NDT or overload testing, should be carried out if required by the competent person. A functional test with no load applied should be carried out to check for correct operation of controls, switches, contactors and other devices. The operation and correct adjustment of the brakes and limit switches should be checked and tests carried out to determine whether they are operating correctly.

11.7 Stability margin

The required stability margin for a crane/vessel combination, in its least stable condition, should be calculated, using the information obtained in accordance with 11.2, by a competent person familiar with the use of mobile cranes on vessels. The margin should be such that the maximum angle of heel of the vessel does not exceed 7° with a minimum freeboard of 250 mm.

NOTE See MCA Small commercial vessel code (SCV) [19].

11.8 Stability testing

After the required stability margin has been calculated (see 11.7) the crane should be tested to the maximum rated capacity that is within that margin.

With the jib set at its maximum working radius (i.e. minimum working load) a load equivalent to the rated capacity should be applied and the crane operated through all motions. The load should then be raised 100 mm to 200 mm and held on the brake. An overload should then be applied by increasing the load above the rated capacity by the amount specified by the competent person on the basis of the information and calculations in 11.2 and 11.7. The crane should then be operated again through all motions, with the hoist and derrick brakes, where applicable, being proved to demonstrate whether they are capable of arresting the load without the acceptable freeboard limit being breached.

The overload should be handled through all motions at the lowest possible speeds.

The jib should be set at its maximum radius for the maximum load and the procedure repeated, first with the load equivalent to the maximum rated capacity and then the overload specified by the competent person.

The jib should be set at its minimum radius and the procedure repeated.

11.9 Post test thorough examination

On completion of the stability test a further thorough examination of the crane should be carried out, see BS 7121-2-1:2012, 8.12.

12 Overload test for jib arrangements

12.1 General

All of the jib and mast/tower configurations given in Table 1, Table 2 and Table 3 should be tested with the overload specified by the manufacturer. Where the crane has duties on outriggers, free on wheels, crawler tracks, and lift and travel then the test should be repeated for each condition.

Table 1 Test configurations for telescopic jib arrangements

Arrangement	Length of mechanized telescopic sections	Lengths of extended manual telescopic sections	Length of fly jib		
A) Mechanized telescopic jib	A.1 Shortest	—	—		
	A.2 Intermediate	—	—		
	A.3 Longest	—	—		
B) Mechanized telescopic jib with fly jib	B.1 Longest appropriate to maximum fly jib rating	—	B.1.1 At minimum offset	Shortest Longest	
			B.1.2 At maximum offset	Shortest Longest	
	B.2 Longest	—	B.2.1 At minimum offset	Shortest Longest	
			B.2.2 At maximum offset	Shortest Longest	
	C) Mechanized telescopic jib with manual telescopic sections	C.1 Longest	C.1.1 Shortest	—	
			C.1.2 Longest	—	
D) Mechanized telescopic jib with manual telescopic section and fly jib	D.1 Longest	D.1.1 Shortest	D.1.1.1 At minimum offset	Shortest Longest	
			D.1.1.2 At maximum offset	Shortest Longest	
	D.1.2 Longest	D.1.2.1 At minimum offset	D.1.2.1 At minimum offset	Shortest Longest	
			D.1.2.2 At maximum offset	Shortest Longest	

NOTE 1 If fly jib ratings for test configuration B.1 are similar to those for test configuration B.2, then B.1 is not applicable.

NOTE 2 If fly jib ratings at minimum offset are similar to those at maximum offset, then tests at minimum offset are not applicable.

Table 2 Test configurations for strut jib arrangements

Arrangement	Length of jib	Length of fly jib		
A) Jib	A.1 Shortest	—		
	A.2 Intermediate	—		
	A.3 Longest	—		
B) Jib with fly jib	B.1 Longest appropriate to maximum fly jib ratings	B.1.1 At minimum offset	Shortest	
			Longest	
	B.1.2 At maximum offset	Shortest		
		Longest		
	B.2 Longest	B.2.1 At minimum offset	Shortest	
			Longest	
B.2.2 At maximum offset		Shortest		
		Longest		

NOTE 1 If fly jib ratings for test configuration B.1 are similar to those for test configuration B.2, then B.1 is not applicable.

NOTE 2 If fly jib ratings at minimum offset are similar to those at maximum offset, then tests at minimum offset are not applicable.

Table 3 Test configurations for mast/tower and jib arrangements

Arrangement	Length of mast/tower
A) Mast/tower with jib	A.1 Shortest
	A.2 Longest
B) Mast/tower with jib and fly jib	B.1 Shortest
	B.2 Longest

12.2 Long jib lengths

The crane should be set up with the longest jib configuration (see designation A.3 of Table 1 and Table 2).

The manufacturer's specified overload for maximum radius should be assembled at a reduced radius where it is less than the rated capacity of the crane and at a slew position where the stability of the crane is minimal. The load should be raised just clear of the ground and derricked out very slowly keeping the load just clear of the ground until the maximum radius is achieved.

A load equivalent to the maximum rated capacity for the jib given on the manufacturer's crane-specific duty chart should then be assembled at the maximum radius of the jib and lifted just clear of the ground.

If the same rated capacity applies at a lesser radius, the load should be derricked in to the minimum permitted radius keeping the load just clear of the ground.

The load should then be lowered to the ground and increased to the overload specified by the manufacturer. The overload should be lifted clear of the ground and held for 10 min. Where possible, the derricking motion should be checked by first derricking in the smallest practicable distance and then derricking out to the same position.

If the same rated capacity applies at a greater radius, the test load should be derricked out to the maximum permitted radius keeping the load just clear of the ground.

The load should then be slewed at the lowest possible speed in both directions through a small arc to determine the ability of the structure to withstand lateral loadings.

These tests should be repeated for each configuration of the jib and mast/tower shown in Table 1, Table 2 and Table 3 except for the minimum length of jib in Table 1 and Table 2 and with the minimum tower length in Table 3 when this is appropriate.

12.3 Short jib lengths

For the minimum length of jib in Table 1 and Table 2 and the minimum tower length in Table 3 the crane should be set up either with the shortest jib or the shortest tower with the shortest jib.

The manufacturer's specified overload for the maximum radius should be assembled at a reduced radius, where it is less than the rated capacity of the crane, and at a slew position where the stability of the crane is minimal. The load should be raised just clear of the ground and derricked out very slowly, keeping the load just clear of the ground, until the maximum radius is achieved.

The load should be slewed at the lowest possible speed in both directions through a small arc to determine the ability of the structure to withstand lateral loadings and then slewed through 360° where the design permits.

A load equivalent to the maximum rated capacity for the jib should be assembled at the minimum radius and raised until each tooth of the train of gears has been subjected to the load. The crane should then be operated through its permitted motions at the lowest possible speeds including full circle slew.

The load should then be lowered off and increased to the overload specified by the manufacturer to form an overload test load which should be hoisted until each tooth of the train of gears has been subjected to the overload, then lowered to 100 mm to 200 mm above the ground. The crane should be operated through its permitted motions at the lowest possible speeds.

NOTE 1 It is recognized that for certain types of crane the structure does not permit full slewing with the load just clear of the ground. In these cases the test load should be rested and the crane repositioned to ensure that as much of the crane structure as possible is subjected to the test load.

NOTE 2 For lengths of jib (telescopic or strut) and fly jib, see Table 1 or Table 2, as appropriate.

The derrick brakes should be tested with the overload specified by the manufacturer suspended no more than 100 mm above the ground, by derricking in from the maximum load radius the smallest practicable distance and derricking out and applying the derrick brake immediately. Extreme care should be taken during this test.

13 Assessment of wire rope condition and discard criteria

When carrying out examination of wire ropes as part of the thorough examination of a mobile crane, the competent person should examine the rope in accordance with BS ISO 4309:2010, Clause 5 and Clause 6 (see BS 7121-2-1:2012, Clause 14).

Annex A (informative) Examples of checklists for pre-use checking and in-service inspections of mobile cranes

A.1 Pre-use checking

The following is an example of a checklist for pre-use checking:

NOTE These checks are in addition to any checks needed in accordance with the crane manufacturer's instructions. This list is not exhaustive.

- a) check availability of the current report of thorough examination and the operator's manual;
- b) check engine oil level;
- c) check fuel level;
- d) check coolant level;
- e) check torque converter level;
- f) check ropes for spooling and kinks;
- g) check jib pendant ropes and pins;
- h) check fly jib security;
- i) check operation of rated capacity limiter (if fitted);
- j) check operation of rated capacity indicator and check code is correct;
- k) check operation of motion indicating and limiting devices;
- l) check controls for correct operation;
- m) check cab gauges and warning lights;
- n) check operation of slew lock pin and slewing brakes;
- o) check operation of hoist/derrick brakes;
- p) check air tanks are drained;
- q) check tyre pressures and inspect tyres for damage;
- r) check wheel studs;
- s) check for debris between twin wheels;
- t) check cleanliness of crane and decking;
- u) check security of loose items, e.g. lifting tackle;
- v) check security of all retaining pins;
- w) check security and condition of hook block and safety catches;
- x) check condition of ladders, steps, guard rails, hand holds and working platforms;
- y) check for presence and legibility of markings, including marking of controls, and warning and safety notices.

A.2 In-service inspections

The following is an example of a checklist for in-service inspections:

NOTE These checks are in addition to any checks needed in accordance with the crane manufacturer's instructions. This list is not exhaustive.

- a) check battery and water level;
- b) check windscreen washer reservoirs;
- c) check lubricant levels in transmission system;
- d) lubricate sheaves and active linkages;
- e) lubricate ropes;
- f) check hydraulic oil levels;
- g) check brake and clutch reservoir levels;
- h) check steering and throttle reservoir levels;
- i) check hydraulic hose for leaks/damage;
- j) check operation of boom;
- k) check outrigger operation;
- l) check lights, indicators and wipers;
- m) check slew ring path;
- n) check load hooks;
- o) check all wire ropes, load chains and pulleys;
- p) check function of slew, hoist and luffing motions, including brakes, drives and winches;
- q) check crane structure, including counterweight;
- r) check lubrication of slew ring assembly and gear;
- s) check chassis structure, including outriggers, for damage and visible defects;
- t) check operator's/driver's cab.

British Standards Institution (BSI)

BSI is the independent national body responsible for preparing British Standards and other standards-related publications, information and services. It presents the UK view on standards in Europe and at the international level.

BSI is incorporated by Royal Charter. British Standards and other standardisation products are published by BSI Standards Limited.

Revisions

British Standards and PASs are periodically updated by amendment or revision. Users of British Standards and PASs should make sure that they possess the latest amendments or editions.

It is the constant aim of BSI to improve the quality of our products and services. We would be grateful if anyone finding an inaccuracy or ambiguity while using British Standards would inform the Secretary of the technical committee responsible, the identity of which can be found on the inside front cover. Similar for PASs, please notify BSI Customer Services.

Tel: +44 (0)20 8996 9001 Fax: +44 (0)20 8996 7001

BSI offers BSI Subscribing Members an individual updating service called PLUS which ensures that subscribers automatically receive the latest editions of British Standards and PASs.

Tel: +44 (0)20 8996 7669 Fax: +44 (0)20 8996 7001

Email: plus@bsigroup.com

Buying standards

You may buy PDF and hard copy versions of standards directly using a credit card from the BSI Shop on the website www.bsigroup.com/shop. In addition all orders for BSI, international and foreign standards publications can be addressed to BSI Customer Services.

Tel: +44 (0)20 8996 9001 Fax: +44 (0)20 8996 7001

Email: orders@bsigroup.com

In response to orders for international standards, BSI will supply the British Standard implementation of the relevant international standard, unless otherwise requested.

Information on standards

BSI provides a wide range of information on national, European and international standards through its Knowledge Centre.

Tel: +44 (0)20 8996 7004 Fax: +44 (0)20 8996 7005

Email: knowledgecentre@bsigroup.com

BSI Subscribing Members are kept up to date with standards developments and receive substantial discounts on the purchase price of standards. For details of these and other benefits contact Membership Administration.

Tel: +44 (0)20 8996 7002 Fax: +44 (0)20 8996 7001

Email: membership@bsigroup.com

Information regarding online access to British Standards and PASs via British Standards Online can be found at www.bsigroup.com/BSOL

Further information about British Standards is available on the BSI website at www.bsi-group.com/standards

Copyright

All the data, software and documentation set out in all British Standards and other BSI publications are the property of and copyrighted by BSI, or some person or entity that own copyright in the information used (such as the international standardisation bodies) has formally licensed such information to BSI for commercial publication and use. Except as permitted under the Copyright, Designs and Patents Act 1988 no extract may be reproduced, stored in a retrieval system or transmitted in any form or by any means – electronic, photocopying, recording or otherwise – without prior written permission from BSI. This does not preclude the free use, in the course of implementing the standard, of necessary details such as symbols, and size, type or grade designations. If these details are to be used for any other purpose than implementation then the prior written permission of BSI must be obtained. Details and advice can be obtained from the Copyright & Licensing Department.
