**A.11.3.4.2(2)** The incidental accessory uses are intended to apply to small office spaces or lounge areas and similar uses that are used by tower employees.

**11.3.4.3 Minimum Construction Requirements.** New air traffic control towers shall be of Type I or Type II construction. (See 8.2.1.)

**11.3.4.4 Means of Egress.**

**11.3.4.4.1 Number of Means of Egress.** Air traffic control towers shall be permitted to have a single exit, provided that the following conditions are met in addition to the requirements of 11.3.2.4:

- (1) Each level of new air traffic control towers, served by a single exit, shall be subject to a calculated occupant load of 15 or fewer persons.
- (2) The requirements of 11.3.2.4.1(1) shall not apply to existing air traffic control towers.
- (3) Smoke detection shall be provided throughout air traffic control towers to meet the requirements of partial coverage, as defined in 17.5.3.2 of *NFPA 72, National Fire Alarm and Signaling Code*, and shall include coverage of all of the following:
  - (a) Occupiable areas
  - (b) Common areas
  - (c) Work spaces
  - (d) Equipment areas
  - (e) Means of egress
  - (f) Accessible utility shafts
- (4) The requirements of 11.3.2.4.1(5) shall not apply.
- (5) Rooms or spaces used for the storage, processing, or use of combustible supplies shall be permitted in quantities deemed acceptable by the authority having jurisdiction.

**11.3.4.4.2 Egress for Occupant Load.** Means of egress for air traffic control towers shall be provided for the occupant load, as determined in accordance with 7.3.1.

**11.3.4.4.3 Areas Excluded from Occupant Load.** Shafts, stairs, and spaces and floors not subject to human occupancy shall be excluded from consideration in determining the total calculated occupant load of the tower as required by 11.3.2.4.1(1) and 11.3.4.4.1(1).

**11.3.4.4.4 Single Means of Egress.** A single means of egress shall be permitted from the observation level of an air traffic control tower, as permitted by 11.3.2.4.2.

**11.3.4.4.5 Smokeproof Enclosures.** For other than existing, previously approved air traffic control towers, smokeproof exit enclosures complying with 7.2.3 shall be provided for all air traffic control tower exit stair enclosures.

**11.3.4.4.6 Discharge from Exits.**

**11.3.4.4.6.1** Air traffic control towers shall comply with the requirements of 7.7.2, except as permitted by 11.3.4.4.6.2.

**11.3.4.4.6.2** Existing, single-exit air traffic control towers shall be permitted to have discharge of the exit comply with one of the following:

- (1) Discharge of the exit in a previously approved, single-exit air traffic control tower is permitted to a vestibule or foyer complying with the requirements of 7.7.2(4)(b).
- (2)\* Discharge of the exit in a single-exit air traffic control tower is permitted within the building to a location where two means of egress are available and are arranged to allow travel in independent directions after leaving the exit enclosure, so that both means of egress do not become compromised by the same fire or similar emergency.

**A.11.3.4.4.6.2(2)** Occupants of air traffic control towers might be required by administrative controls to remain in the facility when a fire occurs so they can perform orderly transfer of operations. Methods to limit compromising the means of egress might include a fire resistance-rated separation between discharge paths or smoke control in large spaces.

**11.3.4.5 Protection.**

**11.3.4.5.1 Detection, Alarm, and Communications Systems.** For other than existing, previously approved air traffic control towers, air traffic control towers shall be provided with a fire alarm system in accordance with Section 9.6. Smoke detection shall be provided throughout the air traffic control tower to meet the requirements for selective coverage, as defined in 17.5.3.2 of *NFPA 72, National Fire Alarm and Signaling Code*, and shall include coverage of all of the following:

- (1) At equipment areas
- (2) Outside each opening into exit enclosures
- (3) Along the single means of egress permitted from observation levels in 11.3.2.4.2
- (4) Outside each opening into the single means of egress permitted from observation levels in 11.3.2.4.2

**11.3.4.5.2 Extinguishing Requirements.** New air traffic control towers shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#).

**11.3.4.5.3 Standpipe Requirements.** New air traffic control towers where the floor of the cab is greater than 30 ft (9.1 m) above the lowest level of fire department vehicle access shall be protected throughout with a Class I standpipe system in accordance with [Section 9.7](#). Class I standpipes shall be manual standpipes, as defined in NFPA 14, *Standard for the Installation of Standpipe and Hose Systems*, where permitted by the authority having jurisdiction.

**11.3.4.6 Contents and Furnishings.** Contents and furnishings in air traffic control towers shall comply with [10.3.1](#), [10.3.2](#), [10.3.6](#), and [10.3.7](#).

**11.3.4.7 Uses.** Sleeping areas shall be prohibited in air traffic control towers.

---

## 11.4 Water-Surrounded Structures

### 11.4.1 Application.

**11.4.1.1 General.** The provisions of [Sections 11.1](#) and [11.4](#) shall apply to those structures that are not under the jurisdiction of the U.S. Coast Guard and not designed and arranged in accordance with U.S. Coast Guard regulations.

**11.4.1.2 Definition — Water-Surrounded Structure.** See [3.3.272.12](#).

### 11.4.2 Means of Egress.

**11.4.2.1 General.** The means of egress provisions of the applicable occupancy chapter, [Chapters 12](#) through [42](#), shall apply, except as modified by [11.4.2.2](#) through [11.4.2.10](#).

**11.4.2.2 Means of Egress Components.** (No modifications.)

**11.4.2.3 Capacity of Means of Egress.** Spaces in water-surrounded structures that are not subject to human occupancy because of machinery or equipment shall be exempt from the requirements for capacity of means of egress.

**11.4.2.4 Number of Means of Egress.** (No modifications.)

**11.4.2.5 Arrangement of Means of Egress.** (No modifications.)

**11.4.2.6 Travel Distance to Exits.** (No modifications.)

**11.4.2.7 Discharge from Exits.** Structures permitted to have a single exit per the applicable occupancy chapter shall be permitted to have 100 percent of the exit discharge through areas on the level of exit discharge.

**11.4.2.8 Illumination of Means of Egress.** (No modifications.)

### 11.4.2.9 Emergency Lighting.

**11.4.2.9.1** Locations not routinely inhabited by humans are exempt from emergency lighting requirements.

**11.4.2.9.2** Structures occupied only during daylight hours, with windows arranged to provide the required level of illumination of all portions of the means of egress during such hours, shall be exempt from emergency lighting requirements where approved by the authority having jurisdiction.

**11.4.2.10 Marking of Means of Egress.** Locations not routinely inhabited by humans shall be exempt from marking of means of egress requirements.

### 11.4.3 Protection.

**11.4.3.1 Protection of Vertical Openings.** (No modifications.)

**11.4.3.2 Protection from Hazards.** Every water-surrounded structure, other than structures with only occasional occupancy, shall have automatic, manual, or other protection that is appropriate to the particular hazard and that is designed to minimize danger to occupants in case of fire or other emergency before they have time to use the means of egress.

**11.4.3.3 Interior Finish.** (No modifications.)

**11.4.3.4 Detection, Alarm, and Communications Systems.** (No modifications.)

**11.4.3.5 Extinguishing Requirements.** (No modifications.)

**11.4.3.6 Corridors.** (No modifications.)

---

## 11.5\* Piers

**A.11.5** For further information on pier fire protection, see NFPA 307, *Standard for the Construction and Fire Protection of Marine Terminals, Piers, and Wharves*.

**11.5.1 Application.** The provisions of [Section 11.1](#) shall apply.

### 11.5.2 Number of Means of Egress.

The intent of [11.5.2](#) is to recognize the open nature of a pier and to equate a pier with a public way for purposes of egress arrangement. Note that [11.5.2.1](#) applies to cargo and storage piers, which are occupied by a limited number of people, the majority of whom are accustomed to the arrangement of piers. The risk to life safety is considered minimal under these conditions, and one means of egress is acceptable. The provisions of [11.5.2.2](#) apply to buildings on piers that are not used exclusively to moor cargo vessels and store materials.

**11.5.2.1** Piers used exclusively to moor cargo vessels and to store material shall be exempt from number of means of egress

requirements where provided with proper means of egress from structures thereon to the pier and a single means of access to the mainland, as appropriate to the pier's arrangement.

**11.5.2.2** Buildings on piers not meeting the requirements of **11.5.2.1** and occupied for other than cargo handling and storage shall be in accordance with both of the following:

- (1) Means of egress shall be arranged in accordance with **Chapters 12** through **43**.
- (2) One of the following measures shall be provided on piers extending over 150 ft (46 m) from shore to minimize the possibility that fire under or on the pier blocks the escape of occupants to shore:
  - (a) The pier shall be arranged to provide two separate ways to travel to shore, such as by two well-separated walkways or independent structures.
  - (b) The pier deck shall be open, fire resistive, and set on noncombustible supports.
  - (c) The pier shall be open, unobstructed, and not less than 50 ft (15 m) in width if less than 500 ft (150 m) long, or its width shall be not less than 10 percent of its length if more than 500 ft (150 m) long.
  - (d) The pier deck shall be provided with an approved automatic sprinkler system in accordance with **Section 9.7** for combustible substructures and all superstructures.
  - (e) The sprinkler system specified in **11.5.2.2(2)(d)** shall be supervised where required by the applicable occupancy chapter, **Chapters 12** through **42**.

The provisions of **11.5.2.2** apply to pier structures other than those structures exempted by **11.5.2.1**. Note that these provisions must be applied in addition to those contained in **Chapters 12** through **42**. For piers that extend more than 150 ft (46 m) from shore, the provisions of **11.5.2.2(2)(a)** through (d) are not required to be applied in total; in other words, the pier is required to comply with only one of the items, (a) through (d) [**11.5.2.2(2)(e)** is applied in conjunction with **11.5.2.2(2)(d)**]. **Exhibit 11.4** depicts a

**Exhibit 11.4**

Brighton Palace Pier, Brighton, England. (© Neil Lang, Dreamstime.com)

pier used for assembly and amusement purposes. Brighton Palace Pier in Brighton, England, opened in 1899 and measures 1719 ft (524 m) in length.

## 11.6\* Vehicles and Vessels

**A.11.6** Fire safety information for manufactured home parks is found in NFPA 501A, *Standard for Fire Safety Criteria for Manufactured Home Installations, Sites, and Communities*.

**11.6.1 Vehicles.** Where immobile, attached to a building, or permanently fixed to a foundation, and where subject to human occupancy, the following vehicles shall comply with the requirements of this *Code* that are appropriate to buildings of similar occupancy:

- (1) Trailers
- (2) Railroad cars
- (3) Streetcars
- (4) Buses
- (5) Conveyances similar to those in **11.6.1(1)** through (4)

**11.6.2 Vessels.** Any ship, barge, or other vessel permanently fixed to a foundation or mooring, or unable to get underway by means of its own power, and occupied for purposes other than navigation shall be subject to the requirements of this *Code* that apply to buildings of similar occupancy.

**Exhibit 11.2** depicts the Queen Mary, a retired ocean liner that is permanently moored in Long Beach, California. The ship currently serves as a tourist attraction and houses a hotel, restaurants, and a museum. Because it is no longer capable of getting underway by means of its own power, it meets the criteria of **11.6.2**, and the *Code* would apply to it as it would to a typical building.

## 11.7 Underground and Limited Access Structures

**11.7.1 Application.** The provisions of **Section 11.1** shall apply.

**11.7.2 Special Definitions.** A list of special terms used in **Section 11.7** follows:

- (1) **Limited Access Structure.** See **3.3.272.3**.
- (2) **Underground Structure.** See **3.3.272.11**.

**11.7.3 Special Provisions for Underground and Limited Access Structures.**

**11.7.3.1** A structure or portion of a structure that does not have openings in compliance with **11.7.3.1.1** and **11.7.3.1.2** shall be designated as a limited access structure and shall comply with **11.7.3.4** and **11.7.3.5**.

**11.7.3.1.1 One-Story Structures.** One-story structures shall have finished ground level doors or emergency access openings in accordance with 11.7.3.2 on two sides of the building, spaced not more than 125 ft (38 m) apart on the exterior walls.

**11.7.3.1.2 Multiple-Story Structures.** Multiple-story structures shall comply with the following:

- (1) The story at the finished ground level shall comply with 11.7.3.1.1.
- (2) Other stories shall be provided with emergency access openings in accordance with 11.7.3.2 on two sides of the building, spaced not more than 30 ft (9.1 m) apart.

**11.7.3.2\*** Emergency access openings shall consist of a window, panel, or similar opening that complies with all of the following:

- (1) The opening shall have dimensions of not less than 22 in. (560 mm) in width and 24 in. (610 mm) in height and shall be unobstructed to allow for ventilation and rescue operations from the exterior.
- (2) The bottom of the opening shall be not more than 44 in. (1120 mm) above the floor.
- (3) The opening shall be readily identifiable from both the exterior and interior.
- (4) The opening shall be readily openable from both the exterior and interior.

**A.11.7.3.2** It is not the intent that emergency access openings be readily openable from the exterior by the public but that they be easily opened with normal fire department equipment.

The provision of emergency access openings for ventilation and rescue exempts stories below the level of exit discharge from classification as underground structures. In Exhibit 11.5, the basement is not considered to be underground if all of the following conditions apply:

1. Openings are provided on at least two sides.
2. Openings are located entirely above the adjoining grade level.
3. Openings comprise a minimum of 20 ft<sup>2</sup> per 50 lineal ft (1.9 m<sup>2</sup> per 15 lineal m) of walls.
4.  $X$  = minimum width of 22 in. (560 mm) of unobstructed opening.  
 $Y$  = minimum height of 24 in. (610 mm) of unobstructed opening.  
 $Z$  = maximum of 44 in. (1120 mm) from floor to bottom of opening.
5. Openings are readily identifiable.
6. Openings are readily openable.

As explained in A.11.7.3.2, it is not required that the public be able to readily open access openings from the exterior. Rather, such openings need to be opened easily from the outside by the fire department, using equipment normally carried on fire apparatus. Building occupants should also be able to open them

**Exhibit 11.5**

*Emergency access openings.*

easily from the interior. Openings are permitted in the form of a window, a door, or an access panel.

Note that a structure is not considered to be a limited access structure if certain provisions are made for emergency access openings for ventilation and rescue. The provisions are more stringent for multistory structures than for single-story structures.

**11.7.3.3** A structure or portion of a structure shall not be considered an underground structure if the story is provided, on not less than two sides, with not less than 20 ft<sup>2</sup> (1.9 m<sup>2</sup>) of emergency access opening located entirely above the adjoining finished ground level in each 50 lineal ft (15 lineal m) of exterior enclosing wall area.

**11.7.3.4** Underground and limited access structures, and all areas and floor levels traversed in traveling to the exit discharge, shall be protected by an approved, supervised automatic sprinkler system in accordance with Section 9.7, unless such structures meet one of the following criteria:

- (1) They have an occupant load of 50 or fewer persons in new underground or limited access portions of the structure.
- (2) They have an occupant load of 100 or fewer persons in existing underground or limited access portions of the structure.
- (3) The structure is a one-story underground or limited access structure that is permitted to have a single exit per Chapters 12 through 43, with a common path of travel not greater than 50 ft (15 m).

**11.7.3.5** Underground or limited access portions of structures and all areas traversed in traveling to the exit discharge, other than in one- and two-family dwellings, shall be provided with emergency lighting in accordance with Section 7.9.

## 11.7.4 Additional Provisions for Underground Structures.

**11.7.4.1** The requirements of **11.7.3** shall apply.

**11.7.4.2** Exits from underground structures with an occupant load of more than 100 persons in the underground portions of the structure and having a floor used for human occupancy located more than 30 ft (9.1 m) below the lowest level of exit discharge, or having more than one level located below the lowest level of exit discharge, shall be provided with outside smoke-venting facilities or other means to prevent the exits from becoming charged with smoke from any fire in the areas served by the exits.

**11.7.4.3** The underground portions of an underground structure, other than an existing underground structure, shall be provided with approved automatic smoke venting in accordance with **Section 9.3** where the underground structure has the following features:

- (1) Occupant load of more than 100 persons in the underground portions of the structure
- (2) Floor level used for human occupancy located more than 30 ft (9.1 m) below the lowest level of exit discharge, or more than one level located below the lowest level of exit discharge
- (3) Combustible contents, combustible interior finish, or combustible construction

**11.7.4.4** Exit stair enclosures in underground structures having a floor level used for human occupancy located more than 30 ft (9.1 m) below the lowest level of exit discharge, or having more than one level located below the lowest level of exit discharge, shall be provided with signage in accordance with **7.2.2.5.4** at each floor level landing traversed in traveling to the exit discharge. The signs shall include a chevron-shaped indicator to show direction to the exit discharge.

The provisions contained in **11.7.1** through **11.7.4.4** that regulate life safety in underground and limited access structures are minimal. The intent of the provisions is to supplement, not to provide a means of circumventing, the life safety provisions contained in other chapters of the *Code*. If the building under consideration is a limited access structure or located underground and — due to its occupancy classification — subject to stricter requirements than those contained in **Section 11.7**, the stricter provisions of the *Code* must be applied. For example, the provisions of **12.4.3** — which apply to new assembly occupancies located in limited access or underground structures or portions thereof — require that each level more than 30 ft (9.1 m) below the level of exit discharge be equipped with a mechanical means of moving occupants vertically, such as an elevator or escalator. **Section 11.7** has no such requirement.

Limited access and underground structures pose enhanced risks to life safety, because the buildings cannot be easily vented of products of combustion. In an area from which there is no direct access to the outside and where there are no windows to

allow outside fire department rescue operations and ventilation, fire or smoke might cause occupants to panic. Therefore, additional corrective measures, such as complete automatic sprinkler protection and automatic smoke-venting systems, must be provided where necessary to ensure an adequate level of life safety.

The provisions of **11.7.4.4** address the need for cues to guide occupants toward the exit and level of exit discharge. Traveling upward in an exit stair might appear illogical, because most egress from buildings involves downward travel within an exit stair enclosure. However, the direction of travel chosen by an occupant can depend on how the occupant entered the building. **Paragraph 11.7.4.4** requires signs to be provided within the exit stair enclosure to direct occupants to the exit discharge. The directional indicator must be of the same chevron design as required by **7.10.6.2**.

Although it is not referenced directly by the *Code*, NFPA 520, *Standard on Subterranean Spaces*,<sup>4</sup> offers guidance on protecting occupants in these variations of underground or limited access structures. A subterranean space is defined as a cavern resulting from the extraction of subsurface-located material from underground areas in a manner that does not disturb the surface area of the property, except in the vicinity of the entrances and ventilation openings.

The headquarters for the North American Aerospace Defense Command (NORAD), housed in Cheyenne Mountain, Colorado Springs, Colorado, is an example of a subterranean space. Such spaces are also commonly used as storage occupancies due to their relatively constant climates. These spaces can be massive in size, complete with roadways and rails for transporting goods in and out, and some contain buildings within the spaces. NFPA 520 includes requirements on construction features, such as compartmentation and smoke control; means of egress; fire alarm, detection, and suppression systems; emergency preparedness; and fire department provisions, such as communications systems, preplanning, and access.

## 11.8 High-Rise Buildings

### 11.8.1 General.

**11.8.1.1** The provisions of **Section 11.8** shall apply to the following:

- (1) New high-rise buildings, as defined in **3.3.36.7**
- (2) Existing high-rise buildings as required by **Chapters 13, 15, 17, 19, 21, 23, 26, 29, 31, 33, 37, 39, 40, 42, or 43**

**Section 11.8** does not itself require that any special provisions be applied to high-rise buildings. Instead, it provides a menu of options for high-rise buildings that can be wholly or partially mandated by other *Code* sections. All of the new occupancy chapters require high-rise buildings to comply with the entire package of requirements contained in **Section 11.8**, which is consistent with the provision of **11.8.1.1(1)**.

Exhibit 11.6

Determining if building is high-rise in accordance with the 75 ft (23 m) criterion.

Exhibit 11.6 illustrates the criteria under which a building is classified as high-rise, as specified by the definition of *high-rise building* in 3.3.36.7. Measurement of the vertical distance criterion begins at ground level on the lowest side of the building that provides fire department vehicle access and ends at the floor of the highest occupiable story. If the vertical distance measurement made in this manner exceeds 75 ft (23 m), the building is considered to be a high-rise building.

The 75 ft (23 m) criterion used for defining a high-rise building was first added to the 1988 edition of the *Code*. Previously, individual occupancy chapters set their own criteria. Business and health care occupancies used provisions similar to the 75 ft (23 m) criterion, while residential occupancies used a six-story criterion. The current method establishes consistency for use throughout the *Code*. The current criteria have been accepted fairly well throughout the United States, but some local jurisdictions set a lower height at which high-rise building provisions apply. Although the definition does not include buildings less than 75 ft (23 m) in height, such buildings can experience the same challenges as true high-rise buildings, because they are set back over a larger one-story section, out of reach of fire department ladders. Although the definition does not address the subject completely, it provides a generally acceptable method for determining whether a building is a high-rise building.

High-rise buildings pose several problems, as follows:

1. Potential for wide distribution of smoke to all floors due to significant stack effect (i.e., natural draft) within stair towers and other tall shafts
2. Difficulty in evacuation
3. Difficulty experienced by fire service personnel in reaching the fire

**11.8.1.2** In addition to the requirements of Section 11.8, compliance with all other applicable provisions of this *Code* shall be required.

## 11.8.2 Means of Egress Requirements.

### 11.8.2.1 Reserved.

**11.8.2.2 Elevator Lobby Exit Access Door Locking.** In other than newly constructed high-rise buildings, locks in accordance with 7.2.1.6.3 shall be permitted.

## 11.8.3 Extinguishing Requirements.

**11.8.3.1\*** High-rise buildings shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7. A sprinkler control valve and a waterflow device shall be provided for each floor.

**A.11.8.3.1** Where an occupancy chapter (Chapters 12 through 42) permits the omission of sprinklers in specific spaces, such as small bathrooms and closets in residential occupancies, the building is still considered to be protected throughout for the purposes of 11.8.3.1.

**11.8.3.2** High-rise buildings shall be protected throughout by a Class I standpipe system in accordance with Section 9.7.

Paragraph 11.8.3.2 expands the menu of provisions that can be mandated for high-rise buildings — in accordance with the various occupancy chapters — to include standpipes. Exhibit 11.7 is an example of a typical standpipe.

Although the *Code* has traditionally considered standpipes mainly as property protection devices, limited mandatory standpipe requirements for life safety purposes have been included for many editions. Standpipes are required on stages in assembly occupancies and in detention and correctional occupancies (see 12.4.6.12, 13.4.6.12, 22.3.5.5, and 23.3.5.5). These requirements are based on the following:

1. Occupants will not be able to leave the fire area immediately, either due to the presence of large numbers of people, as is characteristic of an assembly occupancy, or because doors to the outside will be locked, as might be expected in a detention and correctional occupancy.
2. Trained personnel will be present early in the fire development to make effective use of the standpipe and hose.

Standpipes in high-rise buildings can serve to increase life safety, as well as property protection, because of the lengthy evacuation times associated with tall buildings. In many cases, fire emergency plans advise occupants who are not in immediate danger of exposure to fire to remain within the building to allow responding fire service personnel better access to the standpipes within the exit stair enclosures (staged evacuation). Use of standpipes at that time supplements the operation of the required automatic sprinkler system. See the commentary following A.9.6.3.6.2 for additional information on staged evacuation.

Exhibit 11.7

Typical combination sprinkler/standpipe system with a 2½ in. (64 mm) fire department valve.

### 11.8.4 Detection, Alarm, and Communications Systems.

**11.8.4.1\*** A fire alarm system using an approved emergency voice/alarm communication system shall be installed in accordance with [Section 9.6](#).

**A.11.8.4.1** The need for voice communication can be based on a decision regarding staged or partial evacuation versus total evacuation of all floors. The determination of need is a function of occupancy classification and building height.

**11.8.4.2** Two-way telephone service shall be in accordance with [11.8.4.2.1](#) and [11.8.4.2.2](#).

**11.8.4.2.1** Two-way telephone communication service shall be provided for fire department use. This system shall be in accordance with *NFPA 72, National Fire Alarm and Signaling Code*. The communications system shall operate between the emergency command center and every elevator car, every elevator lobby, and each floor level of exit stairs.

**11.8.4.2.2** The requirement of [11.8.4.2.1](#) shall not apply where the fire department radio system is approved as an equivalent system.

### 11.8.5 Emergency Lighting and Standby Power.

**11.8.5.1** Emergency lighting in accordance with [Section 7.9](#) shall be provided.

**11.8.5.2** Requirements for standby power shall be as specified in [11.8.5.2.1](#) through [11.8.5.2.4](#).

**11.8.5.2.1** Type 60, Class 1, Level 1, standby power in accordance with Article 701 of *NFPA 70, National Electrical Code*, and *NFPA 110, Standard for Emergency and Standby Power Systems*, shall be provided.

**11.8.5.2.2** The standby power system shall have a capacity and rating sufficient to supply all equipment required to be connected by [11.8.5.2.4](#).

**11.8.5.2.3** Selective load pickup and load shedding shall be permitted in accordance with *NFPA 70, National Electrical Code*.

**11.8.5.2.4** The standby power system shall be connected to the following:

- (1) Electric fire pump
- (2) Jockey pump, except as otherwise provided in [40.4.2](#) for special-purpose industrial occupancies
- (3) Air compressor serving dry-pipe and pre-action systems, except as otherwise provided in [40.4.2](#) for special-purpose industrial occupancies
- (4) Emergency command center equipment and lighting
- (5) Not less than one elevator serving all floors, with standby power transferable to any elevator
- (6) Mechanical equipment for smokeproof enclosures
- (7) Mechanical equipment required to conform with the requirements of [Section 9.3](#)
- (8) Stairway video monitoring equipment as required by [11.8.8](#)

**11.8.5.3** Power for detection, alarm, and communications systems shall be in accordance with *NFPA 72, National Fire Alarm and Signaling Code*.

### 11.8.6\* Emergency Command Center.

**A.11.8.6** It is not the intent of the paragraph to require any of the equipment in the list, other than the telephone for fire department use, but only to provide the controls, panels, annunciators, and similar equipment at this location if the equipment is provided or required by another section of the *Code*.

**11.8.6.1** An emergency command center shall be provided in a location approved by the fire department.

**11.8.6.2** The emergency command center shall contain the following:

- (1) Voice fire alarm system panels and controls
- (2) Fire department two-way telephone communication service panels and controls where required by another section of this *Code*
- (3) Fire detection and fire alarm system annunciation panels

- (4) Elevator floor location and operation annunciators
- (5) Elevator fire recall switch in accordance with ASME A17.1/CSA B44, *Safety Code for Elevators and Escalators*
- (6) Elevator emergency power selector switch(es) where provided in accordance with ASME A17.1/CSA B44
- (7) Sprinkler valve and waterflow annunciators
- (8) Emergency generator status indicators
- (9) Controls for any automatic stairway door unlocking system
- (10) Fire pump status indicators
- (11) Telephone for fire department use with controlled access to the public telephone system
- (12) Stairway video monitoring equipment as required by 11.8.8

**11.8.7 Emergency Action Plans.** Emergency action plans shall be provided in accordance with 4.8.2.

### 11.8.8 Stairway Video Monitoring.

#### 11.8.8.1\* General.

**A.11.8.8.1** With video systems, such as standard CCTV security systems typically installed in high-rise buildings, real-time images of occupants' and emergency responders' presence and movement (or lack thereof) in exits, especially at multiple locations of the same exit stairway, can provide critical information about current and developing conditions that should be taken into account in emergency management in accordance with the building's Emergency Action Plan.

Having video cameras positioned to capture images of an exit stairway, including just prior to the discharge doorway from the exit, provides information on the number and flow (in persons per minute, for example) of the occupants, among other information, including access by responding fire fighters using stairs if elevators are not available. It is not essential that the camera views and image resolution be sufficient to identify specific individuals. Depending on the context (including security applications), such specific-person identification might be essential, desirable, undesirable or forbidden. For post-incident evaluation and analysis of egress performance, it is helpful to have image quality and camera angle such that the lateral and front-to-back positions of individuals, relative to the stair width, are clear.

For example, a high-rise building could have cameras at the ground level (assuming this is the level of exit discharge) and at every fifth floor above, and perhaps below grade, for each of the exit stairs. As well as providing a reasonable sampling of evacuee presence and movement within the exit stair system (information important for real-time situation awareness), a comparison of times at which particular individuals pass different cameras provides important data on evacuation movement speed and (indirectly) average occupant density, in addition to flow and number of evacuees overall.

When designing and installing a video monitoring system, and in conjunction with the authority having jurisdiction, the following items should be considered in the operation of the system:

- (1) Inspection, testing, and maintenance of equipment
- (2) Duration/hours of operation
- (3) Storage and retention of information
- (4) Activation of the system
- (5) Integration with the building's emergency action plan

**11.8.8.1.1** For high-rise buildings having an occupant load of 4,000 or more persons, real-time remote monitoring of exit stair usage shall be provided in accordance with 11.8.8.2 through 11.8.8.4 and shall be displayed at the emergency command center.

**11.8.8.1.2** Where the monitoring system is integrated with a security system, the security system shall be in accordance with NFPA 731, *Standard for the Installation of Electronic Premises Security Systems*.

**11.8.8.1.3** Where the monitoring system includes video cameras also used for video image smoke detection, the portions of the system used for such detection shall be in accordance with NFPA 72, *National Fire Alarm and Signaling Code*.

**11.8.8.2** Approved video monitoring equipment shall be provided at the exit stairs immediately adjacent to exit stairway discharge doors to capture discharge from, entry to, and passage through the discharge floor landing.

**11.8.8.3** Approved video monitoring equipment shall be provided for exit stairs above the level of exit discharge, at building height intervals not exceeding 5 stories, so that descent and ascent flows on the stairways, at the floor entry landings, can be remotely monitored.

**11.8.8.4** Approved video monitoring equipment shall be provided, at locations stipulated by the authority having jurisdiction, for exit stairs below the level of exit discharge where levels are normally occupied by the public.

The requirements of 11.8.8, which are new to the 2015 edition of the Code, mandate high-rise buildings having an occupant load of 4000 or more persons to be provided with real-time remote monitoring of exit stair usage. This language was developed to assist the fire service, other fire safety personnel, and building management with the monitoring and managing of egress during an emergency in a building. The use of equipment that would provide real-time data to the building's emergency command center could lead to better direction of building evacuations and provide the ability for personnel in the command center to see conditions throughout the building in real time. This would allow incident commanders to observe if an egress route has become untenable, and provide guidance as to where they can most effectively redistribute occupants in the building. Improving situation awareness of the conditions in exit stairs during an evacuation is seen as an important topic with regard to occupant life safety. See the definition of *situation awareness* in 3.3.249 and associated requirements in 4.5.5.

Details regarding the locations of video monitoring equipment are specified by 11.8.8.2 through 11.8.8.4, as depicted by

the highlighted areas in Exhibit 11.8. The equipment is required adjacent to the exit stairway discharge doors in all of the exit stairs throughout the building. In addition, to monitor the flow of occupants in the stairways, additional monitoring equipment must be provided at the floor entry landings at intervals not exceeding five stories for all exit stairs serving floors above the level of exit discharge. The combination of these two locations can provide accurate, real-time information about occupants both in the stairs and departing the exits. Monitoring equipment is only required for those exit stairs serving levels below the level of exit discharge where the levels are normally occupied by the public.

Exhibit 11.8

Stairway video monitoring equipment locations.

## 11.9 Permanent Membrane Structures

The material in Section 11.9 was transferred into the 2000 edition of the Code from NFPA 102, *Standard for Grandstands, Folding and Telescopic Seating, Tents, and Membrane Structures*, so that all the provisions for life safety needed for a permanent membrane structure reside in this Code. Other material from NFPA 102 that is specific to assembly seating was moved to the assembly occupancy chapters — Chapters 12 and 13. The provisions applicable to permanent membrane structures are included in Chapter 11 because they can apply to any occupancy.

### 11.9.1 Application.

**11.9.1.1 General.** The provisions of Section 11.1 shall apply.

**11.9.1.2 Use of Membrane Roofs.** Membrane roofs shall be used in accordance with the following:

- (1) Membrane materials shall not be used where fire resistance ratings are required for walls or roofs.
- (2) Where every part of the roof, including the roof membrane, is not less than 20 ft (6100 mm) above any floor, balcony, or gallery, a noncombustible or limited-combustible membrane shall be permitted to be used as the roof in any construction type.
- (3) With approval of the authority having jurisdiction, membrane materials shall be permitted to be used where every part of the roof membrane is sufficiently above every significant fire potential, such that the imposed temperature cannot exceed the capability of the membrane, including seams, to maintain its structural integrity.

**11.9.1.3 Testing.** Testing of membrane materials for compliance with the requirements of Section 11.9 for use of the categories of noncombustible and limited-combustible materials shall be performed on weathered-membrane material, as defined in 3.3.171.5.

**11.9.1.4 Flame Spread Index.** The flame spread index of all membrane materials exposed within the structure shall be Class A in accordance with Section 10.2.

**11.9.1.5 Roof Covering Classification.** Roof membranes shall have a roof covering classification, as required by the applicable building codes, when tested in accordance with ASTM E 108, *Standard Test Methods for Fire Tests of Roof Coverings*, or ANSI/UL 790, *Test Methods for Fire Tests of Roof Coverings*.

**11.9.1.6 Flame Propagation Performance.**

**11.9.1.6.1** All membrane structure fabric shall meet the flame propagation performance criteria contained in Test Method 2 of NFPA 701, *Standard Methods of Fire Tests for Flame Propagation of Textiles and Films*.

**11.9.1.6.2** One of the following shall serve as evidence that the fabric materials have the required flame propagation performance:

- (1) The authority having jurisdiction shall require a certificate or other evidence of acceptance by an organization acceptable to the authority having jurisdiction.
- (2) The authority having jurisdiction shall require a report of tests made by other inspection authorities or organizations acceptable to the authority having jurisdiction.

**11.9.1.6.3** Where required by the authority having jurisdiction, confirmatory field tests shall be conducted using test specimens from the original material, which shall have been affixed at the time of manufacture to the exterior of the structure.

**Exhibit 11.9**

Example of a tensioned-membrane structure: Denver International Airport. (Photo courtesy of Denver International Airport)

### 11.9.2 Tensioned-Membrane Structures.

One well-known tensioned-membrane structure is the main terminal building at Denver International Airport, as shown in Exhibit 11.9.

**11.9.2.1** The design, materials, and construction of the building shall be based on plans and specifications prepared by a licensed architect or engineer knowledgeable in tensioned-membrane construction.

**11.9.2.2** Material loads and strength shall be based on physical properties of the materials verified and certified by an approved testing laboratory.

**11.9.2.3** The membrane roof for structures in climates subject to freezing temperatures and ice buildup shall be composed of two layers separated by an air space through which heated air can be moved to guard against ice accumulation. As an alternative to the two layers, other approved methods that protect against ice accumulation shall be permitted.

**11.9.2.4** Roof drains shall be equipped with electrical elements to protect against ice buildup that can prevent the drains from functioning. Such heating elements shall be served by on-site standby electrical power in addition to the normal public service. As an alternative to such electrical elements, other approved methods that protect against ice accumulation shall be permitted.

### 11.9.3 Air-Supported and Air-Inflated Structures.

**11.9.3.1 General.** In addition to the general provisions of 11.9.1, the requirements of 11.9.3 shall apply to air-supported and air-inflated structures.

**11.9.3.2 Pressurization (Inflation) System.** The pressurization system shall consist of one or more operating blower units. The system shall include automatic control of auxiliary blower units

to maintain the required operating pressure. Such equipment shall meet the following requirements:

- (1) Blowers shall be powered by continuous-rated motors at the maximum power required.
- (2) Blowers shall have personnel protection, such as inlet screens and belt guards.
- (3) Blower systems shall be weather protected.
- (4) Blower systems shall be equipped with backdraft check dampers.
- (5) Not less than two blower units shall be provided, each of which has capacity to maintain full inflation pressure with normal leakage.
- (6) Blowers shall be designed to be incapable of overpressurization.
- (7) The auxiliary blower unit(s) shall operate automatically if there is any loss of internal pressure or if an operating blower unit becomes inoperative.
- (8) The design inflation pressure and the capacity of each blower system shall be certified by a professional engineer.

#### 11.9.3.3 Standby Power System.

**11.9.3.3.1\*** A fully automatic standby power system shall be provided. The system shall be either an auxiliary engine generator set capable of running the blower system or a supplementary blower unit that is sized for 1 times the normal operating capacity and is powered by an internal combustion engine.

**A.11.9.3.3.1** The requirements of this paragraph can be considered as a Class 4, Type 60, system per NFPA 110, *Standard for Emergency and Standby Power Systems*.

**11.9.3.3.2** The standby power system shall be fully automatic to ensure continuous inflation in the event of any failure of the primary power. The system shall be capable of operating continuously for a minimum of 4 hours.

**11.9.3.3.3** The sizing and capacity of the standby power system shall be certified by a professional engineer.

The indoor sports facility pictured in Exhibit 11.10 is an example of an air-supported structure. Because it houses an assembly occupancy, it must also meet the requirements of Chapter 12 or Chapter 13, as applicable. For such an occupancy, special attention should be paid to the crowd manager requirements of 12.7.6 and 13.7.6.

The "sports dome" pictured in Exhibit 11.10 was destroyed by a blizzard in 2005. Fortunately, it was unoccupied when it collapsed.

### 11.9.4 Maintenance and Operation.

**11.9.4.1** Instructions in both operation and maintenance shall be transmitted to the owner by the manufacturer of the tensioned-membrane, air-supported, or air-inflated structure.

**Exhibit 11.10**

Example of an air-inflated structure: the former Plymouth Sports Dome, Plymouth, Massachusetts.

**11.9.4.2** Annual inspection and required maintenance of each structure shall be performed to ensure safety conditions. At least biennially, the inspection shall be performed by a professional engineer, registered architect, or individual certified by the manufacturer.

## 11.9.5 Services.

### 11.9.5.1 Fired Heaters.

**11.9.5.1.1** Only labeled heating devices shall be used.

**11.9.5.1.2** Fuel-fired heaters and their installation shall be approved by the authority having jurisdiction.

**11.9.5.1.3** Containers for liquefied petroleum gases shall be installed not less than 60 in. (1525 mm) from any temporary membrane structure and shall be in accordance with the provisions of NFPA 58, *Liquefied Petroleum Gas Code*.

**11.9.5.1.4** Tanks shall be secured in the upright position and protected from vehicular traffic.

### 11.9.5.2 Electric Heaters.

**11.9.5.2.1** Only labeled heaters shall be permitted.

**11.9.5.2.2** Electric heaters, their placement, and their installation shall be approved by the authority having jurisdiction.

**11.9.5.2.3** Heaters shall be connected to electricity by electric cable that is suitable for outside use and is of sufficient size to handle the electrical load.

## 11.10 Temporary Membrane Structures

The material in Section 11.10 was transferred into the 2000 edition of the Code from NFPA 102, *Standard for Grandstands,*

*Folding and Telescopic Seating, Tents, and Membrane Structures*, so that all the provisions for life safety needed for a temporary membrane structure reside in this Code. Other material from NFPA 102 that is specific to assembly seating was moved to the assembly occupancy chapters — Chapters 12 and 13. The provisions applicable to temporary membrane structures are included in Chapter 11 because they can apply to any occupancy.

### 11.10.1 Application.

**11.10.1.1 General.** The provisions of Section 11.1 shall apply.

**11.10.1.2 Required Approval.** Membrane structures designed to meet all the requirements of Section 11.10 shall be permitted to be used as temporary buildings subject to the approval of the authority having jurisdiction.

**11.10.1.3 Alternative Requirements.** Temporary tensioned-membrane structures shall be permitted to comply with Section 11.11 instead of Section 11.10.

**11.10.1.4 Roof Covering Classification.** Roof membranes shall have a roof covering classification, as required by the applicable building codes, when tested in accordance with ASTM E 108, *Standard Test Methods for Fire Tests of Roof Coverings*, or ANSI/UL 790, *Test Methods for Fire Tests of Roof Coverings*.

### 11.10.1.5 Flame Propagation Performance.

**11.10.1.5.1** All membrane structure fabric shall meet the flame propagation performance criteria contained in Test Method 2 of NFPA 701, *Standard Methods of Fire Tests for Flame Propagation of Textiles and Films*.

**11.10.1.5.2** One of the following shall serve as evidence that the fabric materials have the required flame propagation performance:

- (1) The authority having jurisdiction shall require a certificate or other evidence of acceptance by an organization acceptable to the authority having jurisdiction.
- (2) The authority having jurisdiction shall require a report of tests made by other inspection authorities or organizations acceptable to the authority having jurisdiction.

**11.10.1.5.3** Where required by the authority having jurisdiction, confirmatory field tests shall be conducted using test specimens from the original material, which shall have been affixed at the time of manufacture to the exterior of the structure.

### 11.10.2 Fire Hazards.

**11.10.2.1** The finished ground level enclosed by any temporary membrane structure, and the finished ground level for a reasonable distance but for not less than 10 ft (3050 mm) outside of such a structure, shall be cleared of all flammable or combustible material or vegetation that is not used for necessary support equipment. The clearing work shall be accomplished to the satisfaction of the authority having jurisdiction prior to the erection

of such a structure. The premises shall be kept free from such flammable or combustible materials during the period for which the premises are used by the public.

**11.10.2.2** Where prohibited by the authority having jurisdiction, smoking shall not be permitted in any temporary membrane structure.

**11.10.3 Fire-Extinguishing Equipment.** Portable fire-extinguishing equipment of approved types shall be furnished and maintained in temporary membrane structures in such quantity and in such locations as directed by the authority having jurisdiction.

#### 11.10.4 Tensioned-Membrane Structures.

**11.10.4.1** The design, materials, and construction of the building shall be based on plans and specifications prepared by a licensed architect or engineer knowledgeable in tensioned-membrane construction.

**11.10.4.2** Material loads and strength shall be based on physical properties of the materials verified and certified by an approved testing laboratory.

**11.10.4.3** The membrane roof for structures in climates subject to freezing temperatures and ice buildup shall be composed of two layers separated by an air space through which heated air can be moved to guard against ice accumulation. As an alternative to the two layers, other approved methods that protect against ice accumulation shall be permitted.

**11.10.4.4** Roof drains shall be equipped with electrical elements to protect against ice buildup that can prevent the drains from functioning. Such heating elements shall be served by on-site standby electrical power in addition to the normal public service. As an alternative to such electrical elements, other approved methods that protect against ice accumulation shall be permitted.

#### 11.10.5 Air-Supported and Air-Inflated Structures.

**11.10.5.1 General.** In addition to the general provisions of 11.10.1, the requirements of 11.10.5 shall apply to air-supported and air-inflated structures.

**11.10.5.2 Pressurization (Inflation) System.** The pressurization system shall consist of one or more operating blower units. The system shall include automatic control of auxiliary blower units to maintain the required operating pressure. Such equipment shall meet the following requirements:

- (1) Blowers shall be powered by continuous-rated motors at the maximum power required.
- (2) Blowers shall have personnel protection, such as inlet screens and belt guards.
- (3) Blower systems shall be weather protected.
- (4) Blower systems shall be equipped with backdraft check dampers.

- (5) Not less than two blower units shall be provided, each of which has capacity to maintain full inflation pressure with normal leakage.
- (6) Blowers shall be designed to be incapable of over-pressurization.
- (7) The auxiliary blower unit(s) shall operate automatically if there is any loss of internal pressure or if an operating blower unit becomes inoperative.
- (8) The design inflation pressure and the capacity of each blower system shall be certified by a professional engineer.

#### 11.10.5.3 Standby Power System.

**11.10.5.3.1** A fully automatic standby power system shall be provided. The system shall be either an auxiliary engine generator set capable of running the blower system or a supplementary blower unit that is sized for 1 times the normal operating capacity and is powered by an internal combustion engine.

**11.10.5.3.2** The standby power system shall be fully automatic to ensure continuous inflation in the event of any failure of the primary power. The system shall be capable of operating continuously for a minimum of 4 hours.

**11.10.5.3.3** The sizing and capacity of the standby power system shall be certified by a professional engineer.

#### 11.10.6 Maintenance and Operation.

**11.10.6.1** Instructions in both operation and maintenance shall be transmitted to the owner by the manufacturer of the tensioned-membrane, air-supported, or air-inflated structure.

**11.10.6.2** Annual inspection and required maintenance of each structure shall be performed to ensure safety conditions. At least biennially, the inspection shall be performed by a professional engineer, registered architect, or individual certified by the manufacturer.

#### 11.10.7 Services.

##### 11.10.7.1 Fired Heaters.

**11.10.7.1.1** Only labeled heating devices shall be used.

**11.10.7.1.2** Fuel-fired heaters and their installation shall be approved by the authority having jurisdiction.

**11.10.7.1.3** Containers for liquefied petroleum gases shall be installed not less than 60 in. (1525 mm) from any temporary membrane structure and shall be in accordance with the provisions of NFPA 58, *Liquefied Petroleum Gas Code*.

**11.10.7.1.4** Tanks shall be secured in the upright position and protected from vehicular traffic.

##### 11.10.7.2 Electric Heaters.

**11.10.7.2.1** Only labeled heaters shall be permitted.

**11.10.7.2.2** Heaters used inside a temporary membrane structure shall be approved.

**11.10.7.2.3** Heaters shall be connected to electricity by electric cable that is suitable for outside use and is of sufficient size to handle the electrical load.

## 11.11 Tents

The material in [Section 11.11](#) was transferred into the Code from NFPA 102, *Standard for Grandstands, Folding and Telescopic Seating, Tents, and Membrane Structures*, so that all the provisions for life safety needed for a tent reside in this Code. Other material from NFPA 102 that is specific to assembly seating was moved to the assembly occupancy chapters — [Chapters 12 and 13](#). The provisions applicable to tents are included in [Chapter 11](#) because they can apply to any occupancy.

### 11.11.1 General.

**11.11.1.1** The provisions of [Section 11.1](#) shall apply.

**11.11.1.2** Tents shall be permitted only on a temporary basis.

**11.11.1.3** Tents shall be erected to cover not more than 75 percent of the premises, unless otherwise approved by the authority having jurisdiction.

### 11.11.2 Flame Propagation Performance.

**11.11.2.1** All tent fabric shall meet the flame propagation performance criteria contained in Test Method 2 of NFPA 701, *Standard Methods of Fire Tests for Flame Propagation of Textiles and Films*.

**11.11.2.2** One of the following shall serve as evidence that the tent fabric materials have the required flame propagation performance:

- (1) The authority having jurisdiction shall require a certificate or other evidence of acceptance by an organization acceptable to the authority having jurisdiction.
- (2) The authority having jurisdiction shall require a report of tests made by other inspection authorities or organizations acceptable to the authority having jurisdiction.

**11.11.2.3** Where required by the authority having jurisdiction, confirmatory field tests shall be conducted using test specimens from the original material, which shall have been affixed at the time of manufacture to the exterior of the tent.

### 11.11.3 Location and Spacing.

**11.11.3.1** There shall be a minimum of 10 ft (3050 mm) between stake lines.

**11.11.3.2** Adjacent tents shall be spaced to provide an area to be used as a means of emergency egress. Where 10 ft (3050 mm) between stake lines does not meet the requirements for means of egress, the distance necessary for means of egress shall govern.

**11.11.3.3** Tents not occupied by the public and not used for the storage of combustible material shall be permitted to be erected less than 10 ft (3050 mm) from other structures where the authority having jurisdiction deems such close spacing to be safe from hazard to the public.

**11.11.3.4** Tents, each not exceeding 1200 ft<sup>2</sup> (112 m<sup>2</sup>) in finished ground level area and located in fairgrounds or similar open spaces, shall not be required to be separated from each other, provided that safety precautions meet the approval of the authority having jurisdiction.

**11.11.3.5** The placement of tents relative to other structures shall be at the discretion of the authority having jurisdiction, with consideration given to occupancy, use, opening, exposure, and other similar factors.

### 11.11.4 Fire Hazards.

**11.11.4.1** The finished ground level enclosed by any tent, and the finished ground level for a reasonable distance, but for not less than 10 ft (3050 mm) outside of such a tent, shall be cleared of all flammable or combustible material or vegetation that is not used for necessary support equipment. The clearing work shall be accomplished to the satisfaction of the authority having jurisdiction prior to the erection of such a tent. The premises shall be kept free from such flammable or combustible materials during the period for which the premises are used by the public.

#### 11.11.4.2 Smoking.

**11.11.4.2.1** Smoking shall not be permitted in any tent, unless approved by the authority having jurisdiction.

**11.11.4.2.2** In rooms or areas where smoking is prohibited, plainly visible signs shall be posted that read as follows:

NO SMOKING

**11.11.5 Fire-Extinguishing Equipment.** Portable fire-extinguishing equipment of approved types shall be furnished and maintained in tents in such quantity and in such locations as directed by the authority having jurisdiction.

### 11.11.6 Services.

#### 11.11.6.1 Fired Heaters.

**11.11.6.1.1** Only labeled heating devices shall be used.

**11.11.6.1.2** Fuel-fired heaters and their installation shall be approved by the authority having jurisdiction.

**11.11.6.1.3** Containers for liquefied petroleum gases shall be installed not less than 60 in. (1525 mm) from any tent and shall be in accordance with the provisions of NFPA 58, *Liquefied Petroleum Gas Code*.

**11.11.6.1.4** Tanks shall be secured in the upright position and protected from vehicular traffic.

**11.11.6.2 Electric Heaters.**

**11.11.6.2.1** Only labeled heaters shall be permitted.

**11.11.6.2.2** Heaters used inside a tent shall be approved.

**11.11.6.2.3** Heaters shall be connected to electricity by electric cable that is suitable for outside use and is of sufficient size to handle the electrical load.

# New and Existing Assembly Occupancies

Chapters 12 and 13 are the first of the numerous occupancy chapters that address a specific building use based on the occupancy classification system developed in Chapter 6. The occupancy chapters of the Code work together with the core chapters to implement the fundamental requirements of the core chapters, as appropriate to a specific use. The occupancy chapters provide a complete road map to all applicable provisions in the core chapters via the mandatory references and specific permissions contained in the occupancy chapters.

The requirements for assembly occupancies are based on protecting concentrations of occupants in a building or area. Exhibit 12/13.1 shows densely packed spectators at an outdoor sporting event. The requirements of Chapters 12 and 13 make it safe for persons to assemble in such concentrated uses.

The occupant load factors for assembly uses (see Table 7.3.1.2) accurately reflect the large numbers of occupants in a given area that are characteristic of such use. Large numbers of occupants present unique challenges, such as arranging and designing the egress facilities to move the occupants efficiently and quickly. In addition, there are issues that must be balanced, such as sloping the floor to achieve line of sight for audience spectators (e.g., during theater performances, sporting events, or concerts) without creating stepped aisles that are too steep to use effectively. Exhibit 12/13.2 shows a stadium stepped aisle with handrails as required by the Code.

Exhibit 12/13.1

Densely packed spectators at an outdoor sporting event. (Photo courtesy of Jake Pauls)

The level of life safety mandated by Chapters 12 and 13 addresses many conditions that are often taken for granted by the public. The exit access from occupant seating areas to aisles in a movie theater, for example, is regulated by these chapters, as is the arrangement of tables and chairs in a restaurant (see 12/13.2.5.7). This regulation provides a reasonable egress path if a fire occurs.

Section 12/13.4 addresses special provisions and contains a series of specific and unique rules for assembly occupancies. The concept of smoke-protected assembly seating (see 12/13.4.2) is intended to provide a realistic egress capacity for an assembly occupancy that performs under fire conditions as if it were outdoors. This concept departs somewhat from the prescriptive rules usually imposed on an occupancy. The use of smoke-protected

Exhibit 12/13.2

Stadium stepped aisle. (Photo courtesy of Jake Pauls)

## CHAPTER 12 • New

assembly seating, however, requires a life safety evaluation in accordance with 12/13.4.1 that addresses many aspects associated with the potential threat to a large number of occupants.

Other special subjects addressed in Section 12/13.4 include stages and platforms (12/13.4.6), projection rooms (12/13.4.7), special amusement buildings (12/13.4.8), grandstands (12/13.4.9), folding and telescopic seating (12/13.4.10), and airport loading walkways (12/13.4.11).

Assembly occupancies include, but are not limited to, buildings or portions of buildings used for gatherings of 50 or more people for such purposes as deliberation, worship, entertainment, eating, drinking, amusement, or awaiting transportation. Assembly occupancies also include special amusement buildings (such as a fun house attraction at an amusement park or a multilevel play structure in a fast-food restaurant), regardless of occupant load (see item 2 of 6.1.2.1 and 12/13.4.7). Exhibit 12/13.3 shows the exterior of a special amusement building in Orlando, Florida. The building turrets and exterior are dramatic and enticing to visitors, but the special amusement aspect occurs inside, where a mechanized ride takes patrons through special effects areas.

Exhibit 12/13.3

Special amusement building exterior.

## CHAPTER 13 • Existing

For other than special amusement buildings, the criteria for assembly occupancy classification include the 50-person threshold addressed in the previous paragraph and consideration of the activities in which those persons are involved. The activities that lead to the classification of an occupancy as an assembly occupancy include those detailed in item 1 of 6.1.2.1 — deliberation, worship, entertainment, eating, drinking, amusement, awaiting transportation, or similar uses. For example, working at a desk in a large open-plan office area is not an assembly use, so the presence of 50 or more persons in the office space constitutes a business occupancy, not an assembly occupancy. Examples of assembly occupancies include the following, if they have an occupant load of at least 50 persons:

1. Armories
2. Assembly halls
3. Auditoriums
4. Bowling establishments
5. Churches
6. Club rooms
7. Conference rooms
8. Courtrooms
9. Dance halls
10. Discotheques
11. Drinking establishments
12. Exposition halls
13. Gymnasiums
14. Libraries

The 50-person threshold associated with assembly occupancies captures the point where the gathering of persons in proximity to each other increases their risk from fire and similar emergency. Assembly occupancies can have occupant loads of many thousands of persons. Exhibit 12/13.4 shows a baseball park with seating for more than 42,000 persons.

Passenger stations and terminals of air, surface, underground, and marine public transportation facilities are also considered assembly occupancies. If the jurisdiction enforcing the Code has adopted NFPA 130, *Standard for Fixed Guideway Transit and Passenger Rail Systems*,<sup>1</sup> requirements for transit stations might fall under NFPA 130 rather than this Code. See NFPA 130 for additional details. Exhibit 12/13.5 shows a rapid rail public

## CHAPTER 12 • New

Rapid rail station with high concentration of patrons on platform. (Photo courtesy of Jake Pauls)

transportation station in the Washington, DC, metropolitan area. Note the high concentration of patrons on the platform where they await the arrival of a train.

Assembly occupancies with an occupant load of fewer than 50 persons (except for special amusement buildings) are considered incidental to the predominant occupancy in which they are located. For example, a conference room with an occupant load of fewer than 50 persons (see 7.3.1.2) that is located in an office area is considered part of the overall business occupancy. A freestanding diner with an occupant load of fewer than 50 persons is normally assigned a mercantile occupancy classification.

## CHAPTER 13 • Existing

Regardless of occupancy classification, the occupant load for areas of assembly use needs to be calculated based on the use of the space, not the occupancy classification, using the occupant load factors of Table 7.3.1.2 for assembly uses.

Exhibit 12/13.6 shows a meeting room that is set up to accommodate an occupant load of fewer than 50 persons. The room is in a hotel function room area where the rooms serve multiple functions. The arrangement shown does not constitute an assembly occupancy, but the room meets the requirements of Chapters 12 and 13 for assembly occupancies so as to permit larger crowds, as might occur for a stand-up reception as shown in Exhibit 12/13.7.

Exhibit 12/13.6

Meeting room setup for fewer than 50 persons not constituting an assembly occupancy.

Stand-up reception for more than 50 persons constituting an assembly occupancy. (Photo courtesy of Jake Pauls)

## CHAPTER 12 • New

## 12.1 General Requirements

### 12.1.1 Application.

**12.1.1.1** The requirements of this chapter shall apply to new buildings or portions thereof used as an assembly occupancy. (See [1.3.1](#).)

**12.1.1.2 Administration.** The provisions of [Chapter 1](#), Administration, shall apply.

**12.1.1.3 General.** The provisions of [Chapter 4](#), General, shall apply.

The text of [12/13.1.1.2](#) and [12/13.1.1.3](#) reminds the user that the administrative provisions of [Chapter 1](#) and the general provisions of [Chapter 4](#) apply.

The provisions for new assembly occupancies are addressed in [Chapter 12](#); the provisions for existing assembly occupancies (i.e., existing conditions in assembly occupancies) are addressed in [Chapter 13](#).

In editions of the *Code* prior to 2006, renovations, additions, and changes of occupancy were required to comply with the

## CHAPTER 13 • Existing

## 13.1 General Requirements

### 13.1.1 Application.

**13.1.1.1** The requirements of this chapter shall apply to existing buildings or portions thereof currently occupied as assembly occupancies, unless otherwise specified by [13.1.1.4](#). (See [3.3.190.2](#) for definition of assembly occupancy.)

**13.1.1.2 Administration.** The provisions of [Chapter 1](#), Administration, shall apply.

**13.1.1.3 General.** The provisions of [Chapter 4](#), General, shall apply.

**13.1.1.4** An existing building housing an assembly occupancy established prior to the effective date of this *Code* shall be permitted to be approved for continued use if it conforms to, or is made to conform to, the provisions of this *Code* to the extent that, in the opinion of the authority having jurisdiction, reasonable life safety against the hazards of fire, explosion, and panic is provided and maintained.

**13.1.1.5** Additions to existing buildings shall conform to the requirements of [4.6.7](#).

**13.1.1.6** Existing portions of buildings shall be upgraded if the addition results in an increase in the required minimum number of separate means of egress in accordance with [7.4.1.2](#).

**13.1.1.7** Existing portions of the structure shall not be required to be modified, provided that both of the following criteria are met:

- (1) The new construction has not diminished the fire safety features of the facility.
- (2) The addition does not result in an increase in the required minimum number of separate means of egress in accordance with [7.4.1.2](#).

**13.1.1.8** An assembly occupancy in which an occupant load increase results in an increase in the required minimum number of separate means of egress, in accordance with [7.4.1.2](#), shall meet the requirements for new construction.

requirements for new construction. For assembly occupancies, such renovations, additions, and changes of occupancy were required to meet the provisions of [Chapter 12](#), while existing conditions were subject to the provisions of [Chapter 13](#). The subject is now addressed by [Chapter 43](#), Building Rehabilitation. The chapter was written to promote the adaptive reuse of existing

## CHAPTER 12 • New

buildings without sacrificing the needed level of life safety. The provisions of [Chapter 43](#) blend the requirements for new construction with those for existing conditions so as to require additional life safety features as the rehabilitation work category increases in complexity. The rehabilitation work categories are repair, renovation, modification, reconstruction, change of use, change of occupancy classification, and addition. See [4.6.7](#), [4.6.11](#), and [Chapter 43](#).

[Paragraph 13.1.1.5](#) mandates that additions to existing assembly occupancies meet the requirements of [4.6.7](#), which mandates the use of [Chapter 43](#). Per [43.8.1.1\(1\)](#), the addition must comply with the requirements for new construction (i.e., [Chapter 12](#) for new assembly occupancies). The provisions of [43.8.1.1\(2\)](#) require that the existing portion of the building comply with the requirements for existing conditions (i.e., [Chapter 13](#) for existing assembly occupancies), but [13.1.1.6](#) adds a requirement. Per [13.1.1.6](#), if construction of an addition causes the occupant load to increase to the point that [7.4.1.2](#) would require an increase in the required minimum number of means of egress, then the existing portion of the building must be upgraded to meet the requirements for new construction.

For example, prior to the addition, the floor area of an existing assembly occupancy might be such that the occupant load is 900 persons, which, per [7.4.1.2](#) (and [13.2.4.3](#)), requires the assembly occupancy to be provided with three means of egress. After the addition, the increased floor area accommodates an

### 12.1.2\* Classification of Occupancy. See [6.1.2](#).

**A.12.1.2** Assembly occupancy requirements should be determined on a room-by-room basis, a floor-by-floor basis, and a total building basis. The requirements for each room should be based on the occupant load of that room, and the requirements for each floor should be based on the occupant load of that floor, but the requirements for the assembly building overall should be based on the total occupant load. Therefore, it is quite feasible to have several assembly occupancies with occupant loads of 300 or less grouped together in a single building. Such a building would be an assembly occupancy with an occupant load of over 1000.

The 1994 edition of the *Code* was the last to subclassify assembly occupancies as Class A, Class B, or Class C. The subclassification scheme was based on the number of occupants and permitted requirements to be written for application to one or more of the subclasses. In subsequent editions of the *Code*, different requirements apply to different assembly occupancies with different occupant loads. Such requirements explicitly state the occupant load threshold at which the particular requirement becomes applicable. For example, see the minimum construction requirements in [Table 12/13.1.6](#) that apply, for a given construction type and a given floor elevation level, to occupant loads of 300 or 1000.

## CHAPTER 13 • Existing

occupant load of 1100 persons, which, per [7.4.1.2](#), requires four means of egress. The increase in required minimum number of means of egress — from three to four — results in the existing assembly occupancy being subject to the provisions of [Chapter 12](#) for new assembly occupancies.

The provisions of [13.1.1.8](#) are similar to those of [13.1.1.6](#) in that, if the occupant load increases so that an increase in the required minimum number of separate means of egress is mandated by [7.4.1.2](#), the existing building must be modified to comply with the requirements of [Chapter 12](#) for new assembly occupancies. [Paragraph 13.1.1.6](#) addresses such changes occurring as a result of an addition; [13.1.1.8](#) encompasses such situations as renovation of an existing building or a higher occupant load being granted by the authority having jurisdiction (AHJ) under the provisions of [7.3.1.3](#).

For example, large dining tables might be replaced by small cocktail tables, permitting a larger occupant load, even though the building size has not increased. The occupant load prior to the change in table size was 550 persons, which, per [13.2.4.2](#), requires the assembly occupancy to be provided with two means of egress. After the new tables are installed, the occupant load is increased to 650 persons, which, per [13.2.4.3](#), requires three means of egress. The increase in required minimum number of means of egress — from two to three — results in the existing assembly occupancy being subject to the provisions of [Chapter 12](#) for new assembly occupancies.

### 13.1.2\* Classification of Occupancy. See [6.1.2](#).

**A.13.1.2** Assembly occupancy requirements should be determined on a room-by-room basis, a floor-by-floor basis, and a total building basis. The requirements for each room should be based on the occupant load of that room, and the requirements for each floor should be based on the occupant load of that floor, but the requirements for the assembly building overall should be based on the total occupant load. Therefore, it is quite feasible to have several assembly occupancies with occupant loads of 300 or less grouped together in a single building. Such a building would be an assembly occupancy with an occupant load of over 1000.

[Exhibit 12/13.8](#) can be used to illustrate a situation in which occupant loads of assembly use spaces are to be aggregated for purposes of assembly occupancy classification and application of the provisions of [Chapters 12](#) and [13](#). Part (a) of [Exhibit 12/13.8](#) depicts six meeting rooms used by adults for training in a wing of an office building. Each room has an occupant load of 49 persons, calculated using the assembly use occupant load factor for less concentrated use, without fixed seating, from [Table 7.3.1.2](#). Each room is considered individually for purposes of testing its occupant load against the 50-person assembly occupancy threshold of [6.1.2.1](#). None of the six rooms meets the 50-person

## CHAPTER 12 • New

criterion, so there is no assembly occupancy classification. Per 6.1.14.1.3(2), the assembly use meeting rooms are permitted to be classified as business occupancies, based on their being incidental to the predominant business occupancy. The meeting rooms are exempt from the aggregation of occupant load on a floor-by-floor basis, as detailed in A.12/13.1.2, because, as business occupancies, they are not subject to the provisions of Chapters 12 and 13 for assembly occupancies.

In Part (b) of Exhibit 12/13.8, three of the meeting rooms have been increased in size so that one has an occupant load of 90 persons and the other two each have an occupant load of 120 persons. Each of these meeting rooms, considered individually, has an occupant load in excess of the 50-person criterion of 6.1.2.1 so as to create an assembly occupancy. For purposes of applying the provisions of Chapters 12 and 13 to each of the assembly occupancy meeting rooms, the occupant load of each room is considered alone. For example, the requirement of 12/13.2.2.2.3 for panic hardware applies to doors in a required means of egress from an area having an occupant load of 100 or more persons. The panic hardware provisions do not apply to the doors in the meeting room with the 90-person occupant load, but they do apply to the doors in the two 120-person rooms and (as explained in the paragraph that follows) to the door from the corridor to the outside.

Additionally, the occupant loads of the three assembly occupancy meeting rooms are aggregated to produce an assembly occupancy with a 330-person occupant load for purposes of applying the provisions of Chapters 12 and 13. Per 12/13.3.4.1.1, an alarm system is required for assembly occupancies with occupant loads of more than 300 persons. The 330-person combined occupant load of the three assembly occupancy meeting rooms mandates the alarm system requirement, although none of the three meeting rooms has a sufficient occupant load by itself to require the installation of an alarm system.

### 12.1.3 Multiple Occupancies.

**12.1.3.1 General.** Multiple occupancies shall be in accordance with 6.1.14.

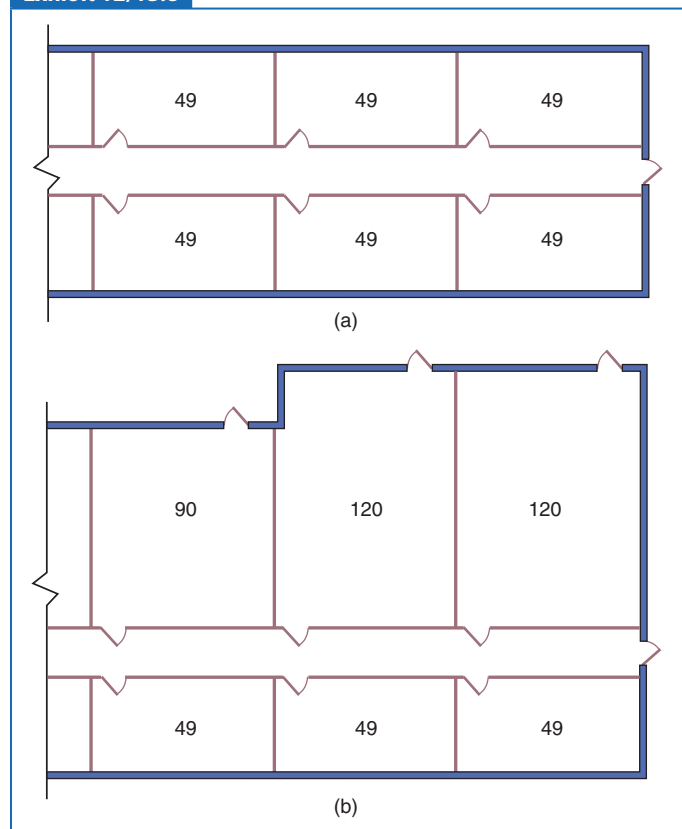

**12.1.3.2** Atrium walls in accordance with 6.1.14.4.6 shall be permitted to serve as part of the separation required by 6.1.14.4.1 for creating separated occupancies on a story-by-story basis.

**12.1.3.3\* Simultaneous Occupancy.** Exits shall be sufficient for simultaneous occupancy of both the assembly occupancy and other parts of the building, except where the authority having jurisdiction determines that the conditions are such that simultaneous occupancy will not occur.

**A.12.1.3.3** For example, an assembly room for the residents of a detention occupancy will not normally be subject to simultaneous occupancy.

## CHAPTER 13 • Existing

## Exhibit 12/13.8

Assembly occupancy classification and aggregation of occupant loads.

### 13.1.3 Multiple Occupancies.

**13.1.3.1 General.** Multiple occupancies shall be in accordance with 6.1.14.

**13.1.3.2** Atrium walls in accordance with 6.1.14.4.6 shall be permitted to serve as part of the separation required by 6.1.14.4.1 for creating separated occupancies on a story-by-story basis.

**13.1.3.3\* Simultaneous Occupancy.** Exits shall be sufficient for simultaneous occupancy of both the assembly occupancy and other parts of the building, except where the authority having jurisdiction determines that the conditions are such that simultaneous occupancy will not occur.

**A.13.1.3.3** For example, an assembly room for the residents of a detention occupancy will not normally be subject to simultaneous occupancy.

## CHAPTER 12 • New

The provision of 12/13.1.3.2 permits use of the provision of 6.1.14.4.6 relative to atrium walls being part of the separation that creates separated occupancies. See the commentary following 6.1.14.4.6.

The provision of 12/13.1.3.3 that exempts exits from the simultaneous occupancy requirement should be used judiciously, with all possible uses being considered before it is

#### 12.1.3.4 Assembly and Mercantile Occupancies in Mall Buildings.

**12.1.3.4.1** The provisions of Chapter 12 shall apply to the assembly occupancy tenant space.

**12.1.3.4.2** The provisions of 36.4.4 shall be permitted to be used outside the assembly occupancy tenant space.

The provisions of 12/13.1.3.4 address the common situation in which mall buildings include assembly occupancies in addition to mercantile and other occupancies. Exhibit 12/13.9 shows a food court located in a large alcove to the side of the mall of a mall building. The mall building pictured is predominantly comprised of mercantile occupancies. The assembly occupancies are required to comply with the requirements of Chapters 12 and 13 up to the point in the egress system at which the occupants reach the mall. The remainder of the egress path — which passes through the mall and discharges to the public way — is addressed in the mercantile occupancy chapters in the specialized mall building provisions of 36/37.4.4. Subsection 36/37.4.4 requires that egress from the mall be sufficient for an occupant load based on the gross leasable area of the overall mall building, not a calculation directly related to the area of only the mall (i.e., the covered pedestrian way that connects the various stores and assembly areas). Although this calculation method does not take into consideration the actual number of persons sent into the mall from the assembly occupancy, it is reliable. The concept is addressed in the commentary following 36.4.4.13.2.

#### 12.1.4 Definitions.

**12.1.4.1 General.** For definitions, see Chapter 3, Definitions.

**12.1.4.2\* Special Definitions.** The following is a list of special terms used in this chapter:

- (1) **Aisle Accessway.** (See 3.3.11.)
- (2) **Aisle Stair.** (See 3.3.265.1.)
- (3) **Exhibit.** (See 3.3.79.)
- (4) **Exhibitor.** (See 3.3.80.)
- (5) **Exposition.** (See 3.3.86.)
- (6) **Exposition Facility.** (See 3.3.90.1.)
- (7) **Festival Seating.** (See 3.3.239.1.)
- (8) **Flow Time.** (See 3.3.117.)

## CHAPTER 13 • Existing

judged whether simultaneous occupancy will occur. For example, a school gymnasium might normally be used only by the school occupants; however, it might be used by an outside group during school hours, such as occurs when school gymnasiums function as polling locations on election day. A means of egress system sized to accommodate simultaneous occupancy provides maximum flexibility in the use of the building.

#### 13.1.3.4 Assembly and Mercantile Occupancies in Mall Buildings.

**13.1.3.4.1** The provisions of Chapter 13 shall apply to the assembly occupancy tenant space.

**13.1.3.4.2** The provisions of 37.4.4 shall be permitted to be used outside the assembly occupancy tenant space.

Exhibit 12/13.9

Assembly occupancy food court in a predominantly mercantile occupancy mall building.

#### 13.1.4 Definitions.

**13.1.4.1 General.** For definitions, see Chapter 3, Definitions.

**13.1.4.2\* Special Definitions.** The following is a list of special terms used in this chapter:

- (1) **Aisle Accessway.** (See 3.3.11.)
- (2) **Aisle Stair.** (See 3.3.265.1.)
- (3) **Exhibit.** (See 3.3.79.)
- (4) **Exhibitor.** (See 3.3.80.)
- (5) **Exposition.** (See 3.3.86.)
- (6) **Exposition Facility.** (See 3.3.90.1.)
- (7) **Festival Seating.** (See 3.3.239.1.)
- (8) **Flow Time.** (See 3.3.117.)

## CHAPTER 12 • New

- (9) **Fly Gallery.** (See 3.3.118.)
- (10) **Gridiron.** (See 3.3.128.)
- (11) **Legitimate Stage.** (See 3.3.264.1.)
- (12) **Life Safety Evaluation.** (See 3.3.160.)
- (13) **Multilevel Play Structure.** (See 3.3.272.5.)
- (14) **Multipurpose Assembly Occupancy.** (See 3.3.190.2.1.)
- (15) **Pinrail.** (See 3.3.210.)
- (16) **Platform.** (See 3.3.211.)
- (17) **Proscenium Wall.** (See 3.3.288.2.)
- (18) **Regular Stage.** (See 3.3.264.2.)
- (19) **Smoke-Protected Assembly Seating.** (See 3.3.239.4.)
- (20) **Special Amusement Building.** (See 3.3.36.10.)
- (21) **Stage.** (See 3.3.264.)
- (22) **Temporary Platform.** (See 3.3.211.1.)

**A.12.1.4.2** An understanding of the term *accessory room* might be useful to the enforcer of the *Code*, although the term is not used within the *Code*. An accessory room includes a dressing room, the property master's work and storage rooms, the carpenter's room, or similar rooms necessary for legitimate stage operations.

The terms in 12/13.1.4.2 have special meanings with respect to assembly occupancies. The commentary that follows addresses some of the terms. For definitions of all these terms, see Chapter 3.

The term *aisle accessway* is that part of the exit access (typically the row space occupied by a person's legs and feet) located between where an occupant is seated and an aisle. For seating at tables (e.g., classroom style), the aisle accessway is typically the space located between the back of an occupant's chair and the table immediately behind. See 12/13.2.5.5 and 12/13.2.5.7.

The definitions of the terms *exhibit*, *exhibitor*, *exposition*, and *exposition facility* relate to the provisions in 12/13.7.5. The terms are consistent with terms used by the exposition industry.

The term *festival seating* is addressed in 12/13.2.5.4.1.

The term *flow time* is used in the technical literature on egress and is important to understand in relation to the *Code's* requirements for the capacity of means of egress. Flow time is the time taken by a crowd to pass, for example, through a doorway during group egress. Flow time contributes to the total time needed to evacuate an area after an emergency is detected and an alarm is sounded. In the case of large assembly buildings, flow time is often the largest component of total evacuation time, which also includes the time taken to respond to an alarm before egress begins and to travel the length of an egress route. Although Chapters 12 and 13 of the *Code* do not specifically require that flow time be used, the term is provided to help improve understanding of the nominal performance expected in complying with particular egress capacity requirements.

The term *life safety evaluation* is used in 12/13.1.7.3, 12/13.2.5.4.1(2), 12/13.4.1, and 12/13.4.2.2. See A.12/13.4.1.1 and A.12/13.4.1.3 in particular. A life safety evaluation addresses

## CHAPTER 13 • Existing

- (9) **Fly Gallery.** (See 3.3.118.)
- (10) **Gridiron.** (See 3.3.128.)
- (11) **Legitimate Stage.** (See 3.3.264.1.)
- (12) **Life Safety Evaluation.** (See 3.3.160.)
- (13) **Multilevel Play Structure.** (See 3.3.272.5.)
- (14) **Pinrail.** (See 3.3.210.)
- (15) **Platform.** (See 3.3.211.)
- (16) **Proscenium Wall.** (See 3.3.288.2.)
- (17) **Regular Stage.** (See 3.3.264.2.)
- (18) **Smoke-Protected Assembly Seating.** (See 3.3.239.4.)
- (19) **Special Amusement Building.** (See 3.3.36.10.)
- (20) **Stage.** (See 3.3.264.)
- (21) **Temporary Platform.** (See 3.3.211.1.)

**A.13.1.4.2** An understanding of the term *accessory room* might be useful to the enforcer of the *Code*, although the term is not used within the *Code*. An accessory room includes a dressing room, the property master's work and storage rooms, the carpenter's room, or similar rooms necessary for legitimate stage operations.

more than fire safety. A life safety evaluation considers all life safety hazards that could endanger occupants and require rapid egress or other measures to maintain occupant safety. For example, fire might not be the most likely hazard in some large assembly facilities. Injuries and deaths might result from the actions of a large number of people occupying a limited space during normal occupancy conditions, such as when spectators become especially enthusiastic during an event. A sudden change in weather at an outdoor facility or a partial structural collapse might cause occupants to attempt to escape an area. Such situations must be taken into account during a life safety evaluation. In some cases, special expertise will be required to assess, design, or manage social and behavioral factors in addition to fire and structural safety considerations. In general, the life safety evaluation requires a comprehensive understanding of occupant characteristics, especially if densely crowded conditions exist.

The use of structures termed as *multilevel play structures* has become commonplace. Some are entities unto themselves and draw patrons strictly because of the amusement offered. Others are operated in conjunction with some other business, such as the play structures attached to fast-food restaurants. Multilevel play structures are considered special amusement buildings. Special amusement buildings are assembly occupancies, regardless of occupant load. See 6.1.2.1 and 12/13.4.8.

The term *multipurpose assembly occupancy* is synonymous with the term *multipurpose room*, as used in 12.3.5.3(1). Multipurpose rooms are often part of a school, office building, fellowship hall, or other occupancy.

The definition of the term *special amusement building* (see 3.3.36.10), which has application in the provisions of 12/13.4.8,

## CHAPTER 12 • New

addresses both the structure of such a building and its use. The structure might be a permanent building or a semitrailer truck or other similar enclosure that is semipermanent or mobile. Special amusement buildings are not open-air structures. Structures that are not fully enclosed (e.g., a merry-go-round with a roof and no side walls) are not special amusement buildings as explained in [A.3.3.36.10](#). The definition also includes special amusement buildings within larger structures, such as an amusement building within a shopping mall. Theaters, movie houses, or similar assembly occupancies used for amusement or entertainment are not defined as special amusement buildings.

The terms *platform* and *stage* are defined so as to differentiate between the two. The definition of stage should be examined in conjunction with the definition of platform. The critical features in defining a stage are hanging curtains, drops, and scenery. An arrangement without these features is most likely a platform. The intent is to include nontheatrical stages, such as those in many grade schools, under the definition of platform. [Exhibit 12/13.10](#) shows a platform in an elementary school multipurpose room. However, many school stages are actually regular stages, because they use scenery. Hanging curtains commonly used on platforms are normally used to conceal lighting or to provide a more aesthetic appearance. A potential problem is the arrangement commonly known as theater-in-the-round. For

**12.1.5 Classification of Hazard of Contents.** Contents of assembly occupancies shall be classified in accordance with the provisions of [Section 6.2](#).

**12.1.6 Minimum Construction Requirements.** Assembly occupancies shall be limited to the building construction types specified in [Table 12.1.6](#), based on the number of stories in height as defined in [4.6.3](#), unless otherwise permitted by the following (*see 8.2.1*):

- (1) This requirement shall not apply to outdoor grandstands of Type I or Type II construction.
- (2) This requirement shall not apply to outdoor grandstands of Type III, Type IV, or Type V construction that meet the requirements of [12.4.9](#).
- (3) This requirement shall not apply to grandstands of noncombustible construction supported by the floor in a building meeting the construction requirements of [Table 12.1.6](#).
- (4) This requirement shall not apply to assembly occupancies within mall buildings in accordance with [36.4.4](#).

In the 2006 and earlier editions of the *Code*, [Table 12.1.6](#) and [Table 13.1.6](#) were based on levels above the level of exit discharge (LED). Thus, in a normal building with the level of exit discharge at finished ground level (grade), the term “1 level above LED” referred to the second story of the building. Since the 2009 edition of the *Code*, the minimum construction tables for all

## CHAPTER 13 • Existing

**Exhibit 12/13.10**

*Platform in a multipurpose room.*

*Code-application purposes, if a theater-in-the-round uses scenery, leg drops, or curtains suspended on or above the performance area or space, the space is considered a stage; if it uses only lighting with a valance to hide the electrical fixtures, it is a platform.*

**13.1.5 Classification of Hazard of Contents.** Contents of assembly occupancies shall be classified in accordance with the provisions of [Section 6.2](#).

**13.1.6 Minimum Construction Requirements.** Assembly occupancies shall be limited to the building construction types specified in [Table 13.1.6](#), based on the number of stories in height as defined in [4.6.3](#), unless otherwise permitted by the following (*see 8.2.1*):

- (1) This requirement shall not apply to outdoor grandstands of Type I or Type II construction.
- (2) This requirement shall not apply to outdoor grandstands of Type III, Type IV, or Type V construction that meet the requirements of [13.4.9](#).
- (3) This requirement shall not apply to grandstands of noncombustible construction supported by the floor in a building meeting the construction requirements of [Table 13.1.6](#).
- (4) This requirement shall not apply to assembly occupancies within mall buildings in accordance with [37.4.4](#).

occupancies that regulate construction type have been consistently formatted to reference “stories in height.” See [4.6.3](#).

The 1942 Coconut Grove Night Club fire in Boston illustrated the effect of a combustible structure, combustible interior finish materials, and a multilevel configuration on the severity of a fire and its death count. [Exhibit 12/13.11](#) and [Exhibit 12/13.12](#)

X: Permitted for assembly of any occupant load.

X1: Permitted for assembly of any occupant load, but limited to one story below the level of exit discharge.

X2: Permitted for assembly limited to an occupant load of 1000 or less, and limited to one story below the level of exit discharge.

X3: Permitted for assembly limited to an occupant load of 1000 or less.

X4: Permitted for assembly limited to an occupant load of 300 or less.

NP: Not permitted.

<sup>a</sup>Protected by an approved, supervised automatic sprinkler system in accordance with Section 9.7 in the following locations:

- (1) Throughout the story of the assembly occupancy
- (2) Throughout all stories below the story of the assembly occupancy, including all stories below the level of exit discharge
- (3) In the case of an assembly occupancy located below the level of exit discharge, throughout all stories intervening between the story of the assembly occupancy and the level of exit discharge, including the level of exit discharge

<sup>b</sup>See 4.6.3.

<sup>c</sup>Where every part of the structural framework of roofs in Type I or Type II construction is 20 ft (6100 mm) or more above the floor immediately below, omission of all fire protection of the structural members is permitted, including protection of trusses, roof framing, decking, and portions of columns above 20 ft (6100 mm).

<sup>d</sup>In open-air fixed seating facilities, including stadia, omission of fire protection of structural members exposed to the outside atmosphere is permitted where substantiated by an approved engineering analysis.

<sup>e</sup>Where seating treads and risers serve as floors, such seating treads and risers are permitted to be of 1-hour fire resistance-rated construction. Structural members supporting seating treads and risers are required to conform to the requirements of Table 12.1.6. Joints between seating tread and riser units are permitted to be unrated, provided that such joints do not involve separation from areas containing high hazard contents and the facility is constructed and operated in accordance with 12.4.2.

CHAPTER 13 • Existing

**Exhibit 12/13.13**

Beverly Hills Supper Club following 1977 fire.

Based in part on the lessons learned from the Coconut Grove fire, the *Code* limits the number of persons in assembly occupancies located in buildings that are not of the highest fire-resistive construction types. Construction Types I(443), I(332), and II(222) represent the most highly fire-resistive forms of construction. Their inherent structural stability under fire makes these construction types acceptable for any assembly occupancy. As the fire resistance of the structure diminishes from Type II(111) to Type V(000) construction, the location of assembly occupancies within the building and the permitted number of occupants are restricted. The construction types referenced in **Table 12.1.6** and **Table 13.1.6** are based on NFPA 220, *Standard on Types of Building Construction*,<sup>3</sup> which extracts its material from NFPA 5000®, *Building Construction and Safety Code*.<sup>4</sup> See **8.2.1.2** and **Table A.8.2.1.2**.

Note that **Table 12.1.6** and **Table 13.1.6** address the location of the assembly occupancy and not the total number of stories in the building. For example, if the building in question were five stories in height, of Type II(111) construction, and sprinklered (to the extent required by footnote a), an assembly occupancy with an occupant load in excess of 1000 persons would be permitted to be located on floors 1 through 3, but not on floors 4 and 5. An assembly occupancy with occupant load of 1000 or fewer persons could be located on floor 4, but not on floor 5.

The extent of the required sprinkler protection (see footnote a in **Table 12.1.6** and **Table 13.1.6**) is illustrated in **Exhibit 12/13.14** for a new building with assembly occupancy and in **Exhibit 12/13.15** for an existing building with assembly occupancy.

In **Exhibit 12/13.14**, in the building on the left, a new assembly occupancy with an occupant load greater than 300 persons is located on the fifth floor of an eight-story, Type II(222) building. Automatic sprinkler protection is required on the fifth-story assembly occupancy floor and all floors below, including those below grade level. In the building on the right in **Exhibit 12/13.14**,

## CHAPTER 12 • New

## CHAPTER 13 • Existing

Exhibit 12/13.14

New building with assembly occupancy — extent of required sprinkler protection.

a new assembly occupancy is located in the subbasement, two levels below the level of exit discharge of an eight-story, Type II(222) building. Automatic sprinkler protection is required on the subbasement assembly occupancy floor, the basement level between the subbasement and the level of exit discharge, and the level of exit discharge.

In Exhibit 12/13.15, in the building on the left, an existing assembly occupancy with an occupant load greater than 1000 persons is located on the fifth floor of an eight-story, Type II(222) building. Automatic sprinkler protection is required on the fifth-story assembly occupancy floor and all floors intervening between the fifth story and the level of exit discharge, including the level of exit discharge if any openings exist between the level of exit discharge and the enclosed exit stairs serving the assembly occupancy. In the building on the right in Exhibit 12/13.15, an existing assembly occupancy is located in the subbasement, two levels below the level of exit discharge of an eight-story, Type II(222) building. Automatic sprinkler protection is required

### 12.1.7 Occupant Load.

**12.1.7.1\* General.** The occupant load, in number of persons for whom means of egress and other provisions are required, shall be determined on the basis of the occupant load factors of Table 7.3.1.2 that are characteristic of the use of the space or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

**A.12.1.7.1** The increase in occupant load above that calculated using occupant load factors from Table 7.3.1.2 is permitted if the provisions of 12.1.7.1 are followed. The owner or operator has the right to submit plans and to be permitted an increase in occupant load if the plans comply with the Code. The authority having jurisdiction is permitted to reject the plan for increase in occupant load if the plan is unrealistic, inaccurate, or otherwise does not

Exhibit 12/13.15

Existing building with assembly occupancy — extent of required sprinkler protection.

on the subbasement assembly occupancy floor, the basement level between the subbasement and the level of exit discharge, and the level of exit discharge if any openings exist between the level of exit discharge and the enclosed exit stairs serving the assembly occupancy.

The three primary subsections that address automatic sprinkler protection that might be required in assembly occupancies are 12/13.1.6 (minimum construction requirements), 12/13.3.5 (extinguishment requirements), and 12/13.4.4 (high-rise buildings). Each of these subsections is to be applied independently of the other to determine whether automatic sprinkler protection is required. For example, the provisions of 12/13.3.5 and 12/13.4.4 might not require sprinklers, while the provisions of 12/13.1.6 might require sprinklers for an assembly occupancy with a given occupant load, based on building construction type and location within the building. If one subsection requires sprinklers while the others do not, sprinklers are required to be provided.

### 13.1.7 Occupant Load.

**13.1.7.1\* General.** The occupant load, in number of persons for whom means of egress and other provisions are required, shall be determined on the basis of the occupant load factors of Table 7.3.1.2 that are characteristic of the use of the space or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

**A.13.1.7.1** The increase in occupant load above that calculated using occupant load factors from Table 7.3.1.2 is permitted if the provisions of 13.1.7.1 are followed. The owner or operator has the right to submit plans and to be permitted an increase in occupant load if the plans comply with the Code. The authority having jurisdiction is permitted to reject the plan for increase in occupant load if the plan is unrealistic, inaccurate, or otherwise does not

## CHAPTER 12 • New

properly reflect compliance with other *Code* requirements. It is not the intent of the provisions of 12.1.7.1 to prohibit an increase in occupant load solely on the basis of exceeding the limits calculated using occupant load factors from Table 7.3.1.2.

To assist in preventing serious overcrowding incidents in sports arenas, stadia, and similar occupancies, spectator standing room should not be permitted between the seating areas and the playing areas, except in horse race and dog track facilities.

Where a capacity or near-capacity audience is anticipated, all seating should be assigned with tickets showing the section, row, and seat number.

Where standing room is permitted, the capacity of the standing area should meet the following criteria:

- (1) The capacity should be determined on the basis of 5 ft<sup>2</sup> (0.46 m<sup>2</sup>) per person.
- (2) The capacity should be added to the seating capacity in determining egress requirements.
- (3) The capacity should be located to the rear of the seating area.
- (4) The capacity should be assigned standing-room-only tickets according to the area designated for the purpose.

The number of tickets sold, or otherwise distributed, should not exceed the aggregate number of seats plus the approved standing room numbers.

**12.1.7.1.1** In areas not in excess of 10,000 ft<sup>2</sup> (930 m<sup>2</sup>), the occupant load shall not exceed one person in 5 ft<sup>2</sup> (0.46 m<sup>2</sup>).

**12.1.7.1.2** In areas in excess of 10,000 ft<sup>2</sup> (930 m<sup>2</sup>), the occupant load shall not exceed one person in 7 ft<sup>2</sup> (0.65 m<sup>2</sup>).

Occupant load factors appear in Table 7.3.1.2. Note that occupant load factors are provided in Chapter 7, a core chapter, because occupant load is based on the use of the space, not on the occupancy classification. For example, a small conference room for approximately 30 persons located in a business occupancy doesn't have the requisite 50 persons to constitute an assembly occupancy. The occupancy classification is business, but the occupant load of the conference room is calculated using an occupant load factor from Table 7.3.1.2 for an assembly

## CHAPTER 13 • Existing

properly reflect compliance with other *Code* requirements. It is not the intent of the provisions of 13.1.7.1 to prohibit an increase in occupant load solely on the basis of exceeding the limits calculated using occupant load factors from Table 7.3.1.2.

Existing auditorium and arena structures might not be designed for the added occupant load beyond the fixed seating. The authority having jurisdiction should consider exit access and aisles before permitting additional occupant load in areas using seating such as festival seating or movable seating on the auditorium or arena floor area.

To assist in preventing serious overcrowding incidents in sports arenas, stadia, and similar occupancies, spectator standing room should not be permitted between the seating areas and the playing areas, except in horse race and dog track facilities.

Where a capacity or near-capacity audience is anticipated, all seating should be assigned with tickets showing the section, row, and seat number.

Where standing room is permitted, the capacity of the standing area should meet the following criteria:

- (1) The capacity should be determined on the basis of 5 ft<sup>2</sup> (0.46 m<sup>2</sup>) per person.
- (2) The capacity should be added to the seating capacity in determining egress requirements.
- (3) The capacity should be located to the rear of the seating area.
- (4) The capacity should be assigned standing-room-only tickets according to the area designated for the purpose.

The number of tickets sold, or otherwise distributed, should not exceed the aggregate number of seats plus the approved standing room numbers.

**13.1.7.1.1** In areas not in excess of 10,000 ft<sup>2</sup> (930 m<sup>2</sup>), the occupant load shall not exceed one person in 5 ft<sup>2</sup> (0.46 m<sup>2</sup>).

**13.1.7.1.2** In areas in excess of 10,000 ft<sup>2</sup> (930 m<sup>2</sup>), the occupant load shall not exceed one person in 7 ft<sup>2</sup> (0.65 m<sup>2</sup>).

**13.1.7.1.3** The authority having jurisdiction shall be permitted to establish the occupant load as the number of persons for which the existing means of egress is adequate, provided that measures are established to prevent occupancy by a greater number of persons.

use, not a business use. Thus, the occupant load factors belong in Chapter 7 so that they can be employed based on the use of the space, regardless of the occupancy classification.

Paragraphs 12/13.1.7.1, 12/13.1.7.1.1, and 12/13.1.7.1.2 limit the permitted increase in occupant load to avoid overcrowding, which affects the movement characteristics of the occupants. If people are crowded into a space so that each person occupies less than 7 ft<sup>2</sup> (0.65 m<sup>2</sup>), movement approaches a shuffle; where each person occupies less than 3 ft<sup>2</sup> (0.28 m<sup>2</sup>), "jam point" is approached,

## CHAPTER 12 • New

and all movement by occupants comes to a virtual stop. **Exhibit 12/13.16** shows crowd packing at approximately  $3 \text{ ft}^2$  ( $0.28 \text{ m}^2$ ) per person at an outdoor sporting event. **Exhibit 12/13.17** shows crowd queuing at approximately  $7 \text{ ft}^2$  ( $0.65 \text{ m}^2$ ) per person at the entrance to an amusement park attraction.

**Exhibit 12/13.16**

Crowd packing at approximately  $3 \text{ ft}^2$  ( $0.28 \text{ m}^2$ ) per person. (Photo courtesy of Jake Pauls)

**Exhibit 12/13.17**

Crowd queuing at approximately  $7 \text{ ft}^2$  ( $0.65 \text{ m}^2$ ) per person.

## CHAPTER 13 • Existing

Some *Code* users have questioned why the  $5 \text{ ft}^2$  ( $0.46 \text{ m}^2$ ) and  $7 \text{ ft}^2$  ( $0.65 \text{ m}^2$ ) maximum packing density factors of **12/13.1.7.1.1** and **12/13.1.7.1.2** are not included as part of **Table 7.3.1.2**. The occupant load factors in **Table 7.3.1.2** are for calculating occupant load based on use of the space, regardless of the occupancy classification. The maximum packing density criteria of **12/13.1.7.1.1** and **12/13.1.7.1.2** are specifically for application to assembly occupancies and, therefore, belong in the assembly occupancy chapters. The requirement of **12/13.1.7.1.2**, that the occupant load not exceed one person in  $7 \text{ ft}^2$  ( $0.65 \text{ m}^2$ ) of floor area, recognizes that, in assembly venues larger than  $10,000 \text{ ft}^2$  ( $930 \text{ m}^2$ ), patrons will crowd the portion of the space that is nearest the attraction (e.g., the space near the performance stage). The uneven distribution of occupants in the space will result in persons near the attraction having less than  $7 \text{ ft}^2$  ( $0.65 \text{ m}^2$ ) of area; those occupants furthest from the attraction will have more than  $7 \text{ ft}^2$  ( $0.65 \text{ m}^2$ ); and the average for the entire space might be around  $5 \text{ ft}^2$  ( $0.46 \text{ m}^2$ ) per person. In venues smaller than  $10,000 \text{ ft}^2$  ( $930 \text{ m}^2$ ), patrons are not expected to crowd the stage area, as most of the space provides for reasonable proximity to the attraction. These smaller, more evenly occupied venues are permitted an occupant load calculated at  $5 \text{ ft}^2$  ( $0.46 \text{ m}^2$ ) per person.

Note that **13.1.7.1.3**, applicable to existing assembly occupancies, has no counterpart in **Chapter 12** for new assembly occupancies. **Paragraph 13.1.7.1.3** permits the authority having jurisdiction to set aside the calculated occupant load and establish the occupant load of an existing assembly occupancy as the number of persons for which the existing means of egress is adequate. In other words, rather than forcing an existing assembly occupancy to unnecessarily upgrade its egress system, the existing system is permitted to serve, provided that the maximum number of persons present can be effectively regulated. The occupant load is to be posted, and staff is to strictly enforce the posted occupant load. For example, the calculated occupant load — derived by dividing the available floor area by the occupant load factors that represent the uses — might be 1110 persons. Yet, the existing egress system [e.g., three door openings that are each 64 in. ( $1625 \text{ mm}$ ) wide] might accommodate only 960 persons. If the AHJ believes that the existing assembly occupancy itself can enforce an occupant load of not more than 960, then an occupant load of 960 can be established. Thus, a fourth exit with capacity for at least 150 persons does not have to be added retroactively. **Paragraph 13.1.7.1.3** and **43.4.2** are the only provisions in the *Code* that permit the established occupant load to be less than the calculated occupant load. The exemption was written to recognize that the occupant load factors characteristic of assembly uses are small [e.g.,  $7 \text{ ft}^2$  or  $15 \text{ ft}^2$  ( $0.65 \text{ m}^2$  or  $1.4 \text{ m}^2$ ) per person] when compared to those characteristic of industrial and residential uses [e.g.,  $100 \text{ ft}^2$  or  $200 \text{ ft}^2$  ( $9.3 \text{ m}^2$

## CHAPTER 12 • New

or 18.6 m<sup>2</sup>) per person]. These small occupant load factors result in large occupant loads for even modestly sized areas.

Numerous occupant load factors for assembly uses are presented in **Table 7.3.1.2**. The occupant load factors characteristic of assembly uses reflect the data developed from surveys of typical assembly occupancies. The commentary that follows explains some of these factors.

One of the assembly use occupant load factors is for concentrated use at 7 net ft<sup>2</sup> (0.65 net m<sup>2</sup>) per person. The phrase “one person per 7 net ft<sup>2</sup> (0.65 net m<sup>2</sup>)” means that one person is assumed to be present for each 7 ft<sup>2</sup> (0.65 m<sup>2</sup>) of net floor area that is available to be used by occupants. Another assembly use occupant load factor is for less concentrated use at 15 net ft<sup>2</sup> (1.4 net m<sup>2</sup>) per person. The phrase “one person per 15 net ft<sup>2</sup> (1.4 net m<sup>2</sup>)” means that one person is assumed to be present for each 15 ft<sup>2</sup> (1.4 m<sup>2</sup>) of net floor area that is available to be used by occupants. See **3.3.21.2.2** for the definition of *net floor area*.

The term *concentrated use* is intended to describe a condition that has meaning only in comparison to the related term *less concentrated use*. The word *concentrated* relates to the density at which persons can occupy such space. Where furniture precludes persons from occupying the same space taken by the furniture, there will be fewer persons per unit area than if no furniture were present, or if the space occupied by the furniture could simultaneously be occupied by people (e.g., persons seated in chairs).

The 7 ft<sup>2</sup> (0.65 m<sup>2</sup>) concentrated use occupant load factor is based on open floor space with people standing comfortably. This factor also can be used to calculate the occupant load in a multipurpose room where portable chairs are placed for meetings, film viewing, or lectures. The 15 ft<sup>2</sup> (1.4 m<sup>2</sup>) less concentrated use occupant load factor is intended for use where a certain amount of space is occupied by furniture. An example is a space furnished with tables and chairs, as in a restaurant or conference room.

Often a controversy exists regarding where to use an occupant load factor of 7 ft<sup>2</sup> (0.65 m<sup>2</sup>) versus 15 ft<sup>2</sup> (1.4 m<sup>2</sup>). These factors are based on concentrated versus less concentrated use, and the selection of one over the other is based strictly on judgment. Because the occupant load is used in determining the required egress capacity and the construction, alarm, and sprinkler requirements, it is usually safer to provide features for the larger occupant load than to try to enforce, usually with great difficulty, a smaller occupant load limit. Designing the egress system to accommodate the larger occupant load affords the facility with much greater flexibility of use over the life of the building.

The occupant load factor for kitchens has particular application to assembly uses, which are often characterized by food service and an associated kitchen. The kitchen occupant load factor helps to clarify the method of calculating the total occupant load

## CHAPTER 13 • Existing

in restaurants and cafeterias where a portion of the floor area is used as a kitchen. Note that the occupant load of the kitchen is calculated by using gross area in accordance with footnote *a* to **Table 7.3.1.2**. The 100 gross ft<sup>2</sup> (9.3 gross m<sup>2</sup>) factor takes into consideration the stoves, sinks, counters, and culinary machinery found in a kitchen.

The 100 ft<sup>2</sup> (9.3 m<sup>2</sup>) gross area associated with the occupant load factor for library stack areas takes into consideration the existence of bookshelves and permanent aisles. Reading rooms typically can be occupied at a higher density than stack areas, and an occupant load factor of 50 ft<sup>2</sup> (4.6 m<sup>2</sup>) of net area per person is specified for such areas. **Exhibit 12/13.18** shows a library stack area. **Exhibit 12/13.19** illustrates a library reading room.

Swimming pools, pool decks, exercise rooms, skating rinks, and casino or gaming rooms are often parts of assembly occupancies. The occupant load factors for such areas are presented in **Table 7.3.1.2** to help piece together a realistic occupant load for the entire assembly space. **Exhibit 12/13.20** shows an exercise room with equipment. **Exhibit 12/13.21** shows an exercise room without equipment.

The occupant load factor for stages is provided because it is necessary to include the occupant load of a stage in the total occupant load. The occupant load factor allows for the occupant load of a stage to be calculated with consistency.

**Exhibit 12/13.18**

Library stack area for which Code specifies an occupant load factor of 100 ft<sup>2</sup> (9.3 m<sup>2</sup>) per person.

## CHAPTER 12 • New

Exhibit 12/13.19

Library reading room for which Code specifies an occupant load factor of 50 ft<sup>2</sup> (4.6 m<sup>2</sup>) net area per person.

Exhibit 12/13.20

Exercise room with equipment for which Code specifies an occupant load factor of 50 ft<sup>2</sup> (4.6 m<sup>2</sup>) per person.

Consideration needs to be given to the actual use of a room or space. A multi-use room might have several occupant loads, with each load applicable to a specific arrangement and use. This situation is especially common in multipurpose rooms in schools and hotels.

Exhibit 12/13.22 illustrates a net 2500 ft<sup>2</sup> (net 232 m<sup>2</sup>) room with two 46 in. (1170 mm) clear width doors. If the room were to be used as a banquet room with tables and chairs, its occupant load would be based on the net 15 ft<sup>2</sup> (net 1.4 m<sup>2</sup>) per person occupant load factor characteristic of a less concentrated use.

## CHAPTER 13 • Existing

Exhibit 12/13.21

Exercise room without equipment for which Code specifies an occupant load factor of 15 ft<sup>2</sup> (1.4 m<sup>2</sup>) per person.

Exhibit 12/13.22

Acceptable scenario where calculated occupant load is less than number of persons that means of egress can safely accommodate.

The occupant load calculation would divide 2500 net ft<sup>2</sup> by 15 net ft<sup>2</sup> (232 net m<sup>2</sup> by 1.4 net m<sup>2</sup>) per person for an occupant load of 167 persons. However, if the room were to be used for a stand-up cocktail party with essentially no furniture, the occupant load would be based on the net 7 ft<sup>2</sup> (net 0.65 m<sup>2</sup>) per person factor characteristic of concentrated use. The occupant load calculation would divide 2500 net ft<sup>2</sup> by 7 net ft<sup>2</sup> (232 net m<sup>2</sup> by 0.65 net m<sup>2</sup>) per person, for an occupant load of 357 persons. Thus, based on the two planned forms of assembly use, the room has two occupant loads.

The egress capacity from the room is limited by the width available from the two 46 in. (1170 mm) clear width doors. The egress capacity is calculated by dividing the 46 in. (1170 mm) clear width by the 0.2 in. (5 mm) per person capacity factor for level travel, and then multiplying by 2 (because of the two

## CHAPTER 12 • New

identical doors). The calculation determines that the room has an egress capacity of 460 occupants. Because each of the occupant loads calculated is less than the egress capacity, the situation is satisfactory.

As noted in the previous two paragraphs, both egress capacity and occupant load must be considered in establishing the permissible occupant load for a room or area. **Exhibit 12/13.23** illustrates a net 3600 ft<sup>2</sup> (net 334 m<sup>2</sup>) room with two 36 in. (915 mm) clear width doors. The egress capacity of the room is calculated by dividing the 36 in. (915 mm) clear width of the doors by the 0.2 in. (5 mm) per person capacity factor for level travel specified by **Table 7.3.3.1**, and then multiplying by 2. The calculation produces an egress capacity of 360 occupants. However, an occupant load for the same room, calculated based on 7 ft<sup>2</sup> (0.65 m<sup>2</sup>) per person, results in an occupant load of 514 persons. **Section 7.3** requires that egress capacity be provided for

**Exhibit 12/13.23**

*Unacceptable scenario where calculated occupant load is larger than egress capacity.*

**12.1.7.2 Waiting Spaces.** In theaters and other assembly occupancies where persons are admitted to the building at times when seats are not available, or when the permitted occupant load has been reached based on **12.1.7.1** and persons are allowed to wait in a lobby or similar space until seats or space is available, all of the following requirements shall apply:

- (1) Such use of a lobby or similar space shall not encroach upon the required clear width of exits.
- (2) The waiting spaces shall be restricted to areas other than the required means of egress.
- (3) Exits shall be provided for the waiting spaces on the basis of one person for each 3 ft<sup>2</sup> (0.28 m<sup>2</sup>) of waiting space area.

## CHAPTER 13 • Existing

the occupant load determined by application of the occupant load factor. Therefore, for new assembly occupancies, the egress capacity must be increased to accommodate at least 514 persons, via a minimum of three means of egress as required by **12.2.4.1** and **7.4.1.2**. For existing assembly occupancies, either the egress capacity must be increased to accommodate at least 514 persons or the occupant load can be set at 360 occupants — the number of persons for which the existing means of egress is adequate — in accordance with **13.1.7.1.3**. The latter occupant load requires specific approval by the authority having jurisdiction after it has been ensured that measures are in place to prevent occupancy by more than 360 persons in the existing assembly occupancy.

The accessibility of a room's exit access doors is as important as the egress capacity of that room. Therefore, where an increase in occupant load is permitted over that established by **12/13.1.7.1**, it is required by **7.3.1.3** that adequate aisle accessways and aisles leading to the room exit access doors be provided. Where tables abut an aisle, the spacing must allow for chairs as well as the required aisle width. Consideration should be given to the likelihood that, when occupants leave during an emergency, they might not take time to move chairs out of the aisles. See **12/13.2.5.7.3** and **12/13.2.5.8.3**.

Dining and drinking areas make the most frequent use of the provisions of **7.3.1.3** for occupant load increases. There have been large banquet layouts where the occupant load was successfully increased to reflect an occupant load factor of 11 ft<sup>2</sup> (1 m<sup>2</sup>) per person instead of the 15 ft<sup>2</sup> (1.4 m<sup>2</sup>) per person specified by **Table 7.3.1.2**. In cases where the occupant load is increased above that calculated using the occupant load factor of **Table 7.3.1.2**, the authority having jurisdiction should require diagrams showing fixture and furniture layouts and should enforce adherence to approved layouts. As noted previously, one room might have several approved occupant loads, depending on the various layouts.

**13.1.7.2 Waiting Spaces.** In theaters and other assembly occupancies where persons are admitted to the building at times when seats are not available, or when the permitted occupant load has been reached based on **13.1.7.1** and persons are allowed to wait in a lobby or similar space until seats or space is available, all of the following requirements shall apply:

- (1) Such use of a lobby or similar space shall not encroach upon the required clear width of exits.
- (2) The waiting spaces shall be restricted to areas other than the required means of egress.
- (3) Exits shall be provided for the waiting spaces on the basis of one person for each 3 ft<sup>2</sup> (0.28 m<sup>2</sup>) of waiting space area.

## CHAPTER 12 • New

- (4) Exits for waiting spaces shall be in addition to the exits specified for the main auditorium area and shall conform in construction and arrangement to the general rules for exits given in this chapter.

Although 12/13.1.7.1.1 limits occupant density to one person for each available 5 ft<sup>2</sup> (0.46 m<sup>2</sup>), 12/13.1.7.2(3) permits a density of one person per 3 ft<sup>2</sup> (0.28 m<sup>2</sup>) for specially designated waiting spaces. The waiting space cannot be located in, or interfere with, the egress routes from the rest of the assembly occupancy. As shown in Exhibit 12/13.24, such waiting spaces might be associated with a theater where patrons wait for the audience seating chamber to clear of people attending a previous show before entering and taking their seats for the next performance. A similar waiting space might be established to the side of the entrance foyer of a restaurant where diners await a table. Space at a bar where patrons gather to place a drink order does not qualify as a waiting space for purposes of the provisions of 12/13.1.7.2.

**12.1.7.3 Life Safety Evaluation.** Where the occupant load of an assembly occupancy exceeds 6000, a life safety evaluation shall be performed in accordance with 12.4.1.

The life safety evaluation required for large assembly occupancies by 12/13.1.7.3 recognizes that fixed protection and suppression systems alone do not ensure safe egress where large numbers of people are present. Expected crowd behavior is part

**12.1.7.4 Outdoor Facilities.** In outdoor facilities, where approved by the authority having jurisdiction, the number of occupants who are each provided with not less than 15 ft<sup>2</sup> (1.4 m<sup>2</sup>) of lawn surface shall be permitted to be excluded from the maximum occupant load of 6000 of 12.1.7.3 in determining the need for a life safety evaluation.

Paragraph 12/13.1.7.4 recognizes that where outdoor assembly occupancy patrons are each provided with at least 15 ft<sup>2</sup> (1.4 m<sup>2</sup>)

## 12.2 Means of Egress Requirements

**12.2.1 General.** All means of egress shall be in accordance with Chapter 7 and this chapter.

## CHAPTER 13 • Existing

- (4) Exits for waiting spaces shall be in addition to the exits specified for the main auditorium area and shall conform in construction and arrangement to the general rules for exits given in this chapter.

Exhibit 12/13.24

*Designated waiting spaces arranged not to encroach on required means of egress.*

**13.1.7.3 Life Safety Evaluation.** Where the occupant load of an assembly occupancy exceeds 6000, a life safety evaluation shall be performed in accordance with 13.4.1.

of such an evaluation, as is consideration of techniques to manage any behavioral problems. See 12/13.4.1 and, in particular, A.12/13.4.1.3, which outlines the many factors that might need to be considered in a required life safety evaluation.

**13.1.7.4 Outdoor Facilities.** In outdoor facilities, where approved by the authority having jurisdiction, the number of occupants who are each provided with not less than 15 ft<sup>2</sup> (1.4 m<sup>2</sup>) of lawn surface shall be permitted to be excluded from the maximum occupant load of 6000 of 13.1.7.3 in determining the need for a life safety evaluation.

of lawn surface, their predicted behavior obviates the need for further scrutiny via a life safety evaluation.

## 13.2 Means of Egress Requirements

**13.2.1 General.** All means of egress shall be in accordance with Chapter 7 and this chapter.

## CHAPTER 12 • New

The provision of 12/13.2.1 mandates that means of egress be in compliance with Chapter 7. Many provisions of Chapter 7, including the following, apply without having to be individually mandated by an occupancy chapter:

1. The provisions of 7.1.7 for changes in level in means of egress apply. Exhibit 12/13.25 shows a small elevation change in the meeting room area of a hotel. The stair treads have the exaggerated depth as required by 7.1.7.2.2; the presence and location of each step are marked with contrasting tape to meet the requirement of 7.1.7.2.4; handrails are provided at both sides of the stair as required for new construction by 7.2.2.4.1; and a placard stating “please watch your step” is provided as an extra precaution.

2. The provisions of 7.1.8 for guards apply. Exhibit 12/13.26 shows guards protecting a floor opening where there is more than 30 in. (760 mm) to fall at the sides of an open stair in an airport terminal building. The guards meet the minimum 42 in. (1065 mm) height requirement of 7.2.2.4.6.2 and the 4 in. (100 mm) diameter sphere requirement for the intermediate rails as required by 7.2.2.4.6.3.

3. The provisions of 7.2.2.4.5 for handrails apply. Exhibit 12/13.27 shows a child tripping on a stair at an outdoor

Exhibit 12/13.25

Egress route with small elevation difference in meeting room area. (Photo courtesy of Jake Pauls)

## 12.2.2 Means of Egress Components.

**12.2.2.1 Components Permitted.** Components of means of egress shall be limited to the types described in 12.2.2.2 through 12.2.2.12.

## CHAPTER 13 • Existing

sporting event. The child holds an adult’s hand and the adult grasps the required handrail. At the right side of the same stair run, a child holds the handrail with both hands. Other adults on both runs of stairs use the handrails while descending the stairs.

Exhibit 12/13.26

Guards at floor opening in airport terminal building.

Exhibit 12/13.27

Stair fall and use of handrails at outdoor sporting event. (Photo courtesy of Jake Pauls)

## 13.2.2 Means of Egress Components.

**13.2.2.1 Components Permitted.** Components of means of egress shall be limited to the types described in 13.2.2.2 through 13.2.2.12.

## CHAPTER 12 • New

**Paragraph 12/13.2.2.1** limits components within the required means of egress to those detailed in 12/13.2.2.2 through 12/13.2.2.12. Note that it is not required that each component addressed in these paragraphs be used; rather, if a component is used, the provisions of **Chapter 7** that apply to the component, as modified by **Chapters 12 and 13**, must be followed.

Escalators are permitted to be part of a means of egress in existing occupancies (see 13.2.2.8), but they are not recognized as such in new construction. Note that **Chapter 7** does not credit

**12.2.2.2 Doors.**

**12.2.2.2.1** Doors complying with 7.2.1 shall be permitted.

**12.2.2.2.2** Assembly occupancies with occupant loads of 300 or less in malls [see 36.4.4.2(4)] shall be permitted to have horizontal or vertical security grilles or doors complying with 7.2.1.4.1(3) on the main entrance/exits.

**12.2.2.2.3** Any door in a required means of egress from an area having an occupant load of 100 or more persons shall be permitted to be provided with a latch or lock only if the latch or lock is panic hardware or fire exit hardware complying with 7.2.1.7, unless otherwise permitted by one of the following:

- (1) This requirement shall not apply to delayed-egress locks as permitted in 12.2.2.2.5.
- (2) This requirement shall not apply to access-controlled egress doors as permitted in 12.2.2.2.6.

**12.2.2.2.4** Locking devices complying with 7.2.1.5.5 shall be permitted to be used on a single door or a single pair of doors if both of the following conditions apply:

- (1) The door or pair of doors serve as the main exit and the assembly occupancy has an occupant load not greater than 500.
- (2) Any latching devices on such a door(s) from an assembly occupancy having an occupant load of 100 or more are released by panic hardware or fire exit hardware.

**12.2.2.2.5** Delayed-egress locks complying with 7.2.1.6.1 shall be permitted on doors other than main entrance/exit doors.

**12.2.2.2.6** Doors in the means of egress shall be permitted to be equipped with an approved access control system complying with 7.2.1.6.2, and such doors shall not be locked from the egress side when the assembly occupancy is occupied. (See 7.2.1.1.3.)

**12.2.2.2.7** Elevator lobby exit access door locking in accordance with 7.2.1.6.3 shall be permitted.

**12.2.2.2.8** Revolving doors complying with the requirements of 7.2.1.10 shall be permitted.

## CHAPTER 13 • Existing

escalators that serve within the required means of egress in new construction. These devices can be (and often are) installed in assembly occupancies, but they cannot obstruct or interfere with the required means of egress. However, where a new assembly occupancy is located more than 30 ft (9.1 m) below the level of exit discharge, 12.4.3.3.2 requires a mechanical means of moving people vertically to the level of exit discharge. This requirement can be satisfied via an escalator or an elevator.

**13.2.2.2 Doors.**

**13.2.2.2.1** Doors complying with 7.2.1 shall be permitted.

**13.2.2.2.2** Assembly occupancies with occupant loads of 300 or less in malls [see 37.4.4.2(4)] shall be permitted to have horizontal or vertical security grilles or doors complying with 7.2.1.4.1(3) on the main entrance/exits.

**13.2.2.2.3** Any door in a required means of egress from an area having an occupant load of 100 or more persons shall be permitted to be provided with a latch or lock only if the latch or lock is panic hardware or fire exit hardware complying with 7.2.1.7, unless otherwise permitted by one of the following:

- (1) This requirement shall not apply to delayed-egress locks as permitted in 13.2.2.2.5.
- (2) This requirement shall not apply to access-controlled egress doors as permitted in 13.2.2.2.6.

**13.2.2.2.4** Locking devices complying with 7.2.1.5.5 shall be permitted to be used on a single door or a single pair of doors if both of the following conditions apply:

- (1) The door or pair of doors serve as the main exit from assembly occupancies having an occupant load not greater than 600.
- (2) Any latching devices on such a door(s) from an assembly occupancy having an occupant load of 100 or more are released by panic hardware or fire exit hardware.

**13.2.2.2.5** Delayed-egress locks complying with 7.2.1.6.1 shall be permitted on doors other than main entrance/exit doors.

**13.2.2.2.6** Doors in the means of egress shall be permitted to be equipped with an approved access control system complying with 7.2.1.6.2, and such doors shall not be locked from the egress side when the assembly occupancy is occupied. (See 7.2.1.1.3.)

**13.2.2.2.7** Elevator lobby exit access door locking in accordance with 7.2.1.6.3 shall be permitted.

**13.2.2.2.8** Revolving doors complying with the requirements of 7.2.1.10 for new construction shall be permitted.

## CHAPTER 12 • New

**12.2.2.2.9** The provisions of 7.2.1.11.1.1 to permit turnstiles where revolving doors are permitted shall not apply.

**12.2.2.2.10** No turnstiles or other devices that restrict the movement of persons shall be installed in any assembly occupancy in such a manner as to interfere with required means of egress facilities.

The provision of 12/13.2.2.2.2 permits, for example, small restaurants in mall buildings to use the security grilles or doors addressed by 7.2.1.4.1(3).

Paragraph 12/13.2.2.2.3 requires doors that latch or lock to be provided with panic hardware or fire exit hardware if the door serves an area having an occupant load of 100 or more persons. The panic hardware (or, for fire-rated doors, the fire exit hardware) releases the latch when occupants depress the actuating bar or push pad, as might occur when a crowd pushes up against a door so as to hinder normal unlatching via turning a doorknob or lever. Exhibit 12/13.28 shows panic hardware for the release of the latch on door leaves that are not fire rated but provide emergency egress from an airline club room at an airport. Non-emergency access into and out of the club is controlled and limited to the main entrance/exit. The sign advises that the doors are for emergency use only.

In Exhibit 12/13.29, the doors from room A are permitted to be latched or locked and provided with a traditional doorknob or lever to release the latch, as the 60-person occupant load is less than the 100-person threshold. Room B has an occupant load of 110 persons and is provided with two doors to the corridor. The area served by the doors is the entire room (not half the room) with its 110-person occupant load, which exceeds the 100-person threshold. If the doors from room B are provided

Exhibit 12/13.28

Panic hardware for latch release on emergency use doors from airport club room.

## CHAPTER 13 • Existing

**13.2.2.2.9** The provisions of 7.2.1.11.1.1 to permit turnstiles where revolving doors are permitted shall not apply.

**13.2.2.2.10** No turnstiles or other devices that restrict the movement of persons shall be installed in any assembly occupancy in such a manner as to interfere with required means of egress facilities.

Exhibit 12/13.29

Occupant load determines which doors require panic hardware.

with a latch or lock, panic hardware (or fire exit hardware if the door has a fire protection rating) is required as the means for releasing the latch or lock. Similarly, the doors from the corridor to the outside serve an area comprised of all the rooms with doors to the corridor. The combined occupant load of those rooms exceeds the 100-person threshold, so panic hardware is required if those doors are provided with a latch or lock. An example of an assembly occupancy that might have no latches or locks on its doors, so as to be exempted from the panic hardware requirement, is a highway tourist information center with a restaurant that is open 24 hours per day, 365 days per year.

Paragraph 12/13.2.2.2.4 recognizes the particular key-operated dead bolt lock described in 7.2.1.5.5. Using a key-operated dead bolt lock in an assembly occupancy is permitted where all the conditions of 7.2.1.5.5 and 12/13.2.2.2.4 are met. The assembly occupancy is limited to an occupant load of not more than 500 persons in new assembly occupancies and not more than 600 persons in existing assembly occupancies. Use is limited to the main exit, based on the assumption that the lock will need to be released for the facility to operate. The main exit is limited to a single door or single pair of doors to help ensure that the main exit will be unlocked whenever the building is occupied.

Although delayed-egress locks are addressed by 12/13.2.2.2.3(1) as an exemption to the requirement to provide panic hardware for doors that latch or lock, 12/13.2.2.2.5 further describes the exemption for delayed-egress locks. It permits delayed-egress hardware meeting the requirements of 7.2.1.6.1 to be used on all but the main exit. In addition to other requirements, 7.2.1.6.1 requires that the building be protected throughout by either an approved, supervised automatic sprinkler

## CHAPTER 12 • New

system or an approved, supervised automatic fire detection system. **Exhibit 12/13.30** shows delayed-egress hardware on a door for daily use by authorized staff, as well as for emergency use by all building occupants in an underground pedestrian tunnel connecting two airport terminal buildings. The yellow placard provides the emergency use information required by **7.2.1.6.1.1(4)**. The white placard mounted above the emergency use placard advises that the door is alarmed, an access code is needed to operate the door, and an identification badge is needed for travel through spaces on the other side of the door. The conflicting messages have the potential to confuse occupants attempting to egress the building under emergency conditions.

Although access-controlled egress doors are permitted by **12/13.2.2.2.3(2)** to omit panic hardware for doors that latch or lock, **12/13.2.2.2.6** further describes the permission for access control door-locking systems complying with **7.2.1.6.2**. Note that the access-controlled hardware is permitted to function in its normal fashion, whereby the door is locked from the egress side and a motion sensor unlocks the door, only when the assembly occupancy is not occupied. In other words, the access-controlled hardware is only for after-hours use.

**Exhibit 12/13.30**

Door with delayed-egress hardware and conflicting information placards.

## CHAPTER 13 • Existing

The provision of **12/13.2.2.2.7** permits use of the elevator lobby exit access door-locking provisions of **7.2.1.6.3**. **Paragraph 7.2.1.6.3** details 14 criteria that must be met as an alternative to the requirements of **7.4.1.6** that each elevator landing or lobby must have access to at least one exit without the use of a key, a tool, special knowledge, or special effort. See **7.4.1.6** and **7.2.1.6.3**.

Revolving doors in accordance with the provisions of **7.2.1.10** specific to new revolving doors are permitted by **12/13.2.2.2.8** in new and existing assembly occupancies. **Exhibit 12/13.31** shows a revolving door at the main entrance/exit of a restaurant. A side-hinged swinging door is provided at one side of the revolving door to satisfy the requirement of **7.2.1.10.1(6)**. A second side-hinged swinging door is provided at the other side of the revolving door so that the two doors together satisfy the provision of **12/13.2.3.6.2** that requires the main entrance/exit to have sufficient width to accommodate one-half of the total occupant load.

**Exhibit 12/13.32** shows a revolving gate that functions like a one-way revolving door to permit patrons of a public transportation system to leave the station but not enter. Although the gate looks like a revolving door, it does not have the collapsibility features required by **7.2.1.10.1**. The required egress path is provided by the side-hinged swinging door at the right of the photo. The egress door, which latches, is provided with panic hardware for latch releasing as required by **12/13.2.2.2.3**. The swinging door is alarmed and used only for emergency egress. Patrons use the revolving gate on a day-to-day basis.

Turnstiles are often used in assembly occupancies to control ingress. The provision of **7.2.1.11.1** prohibits turnstiles from obstructing any required means of egress unless otherwise permitted by **7.2.1.11.1.1**. The provision of **7.2.1.11.1.1** permits patrons to encounter turnstiles in their egress path if the turnstiles do not exceed a given height if they turn freely in the

**Exhibit 12/13.31**

Revolving door at main entrance/exit of restaurant.

## CHAPTER 12 • New

Exhibit 12/13.32

Revolving gate with required egress provided by swinging door at right.

direction of egress travel, and if the occupancy chapter permits revolving doors. Although revolving doors are permitted in assembly occupancies by 12/13.2.2.2.8, the provision of 12/13.2.2.2.9 prohibits the use of 7.2.1.11.1.1. The effect is that the prohibition on turnstiles obstructing any required means of

### 12.2.2.3 Stairs.

**12.2.2.3.1 General.** Stairs complying with 7.2.2 shall be permitted, unless one of the following criteria applies:

- (1)\* Stairs serving seating that is designed to be repositioned shall not be required to comply with 7.2.2.3.1.

**A.12.2.2.3.1(1)** The seating plan and the means of egress should be reviewed each time the seating is substantially rearranged.

- (2) This requirement shall not apply to stages and platforms as permitted by 12.4.6.1.2.
- (3) The stairs connecting only a stage or platform and the immediately adjacent assembly seating shall be permitted to have a handrail in the center only or on one side only.
- (4) The stairs connecting only a stage or platform and the immediately adjacent assembly seating shall be permitted to omit the guards required by 7.1.8 where both of the following criteria are met:
- The guard would restrict audience sight lines to the stage or platform.
  - The height between any part of the stair and the adjacent floor is not more than 42 in. (1065 mm).

### 12.2.2.3.2 Catwalk, Gallery, and Gridiron Stairs.

## CHAPTER 13 • Existing

Exhibit 12/13.33

Turnstiles used to control ingress but not serving as required egress. (Photo courtesy of Jake Pauls)

egress, as mandated in the base requirement of 7.2.1.11.1 and reinforced by the requirement of 12/13.2.2.2.10, applies. Exhibit 12/13.33 shows turnstiles used to control ingress to an outdoor assembly venue. The required egress is provided by gates off to the side, which are not within the photo field.

### 13.2.2.3 Stairs.

**13.2.2.3.1 General.** Stairs complying with 7.2.2 shall be permitted, unless one of the following criteria applies:

- (1)\* Stairs serving seating that is designed to be repositioned shall not be required to comply with 7.2.2.3.1.

**A.13.2.2.3.1(1)** The seating plan and the means of egress should be reviewed each time the seating is substantially rearranged.

- (2) This requirement shall not apply to stages and platforms as permitted by 13.4.6.
- (3) The stairs connecting only a stage or platform and the immediately adjacent assembly seating shall be permitted to have a handrail in the center only or on one side only.
- (4) The stairs connecting only a stage or platform and the immediately adjacent assembly seating shall be permitted to omit the guards required by 7.1.8 where both of the following criteria are met:
- The guard would restrict audience sight lines to the stage or platform.
  - The height between any part of the stair and the adjacent floor is not more than 42 in. (1065 mm).

### 13.2.2.3.2 Catwalk, Gallery, and Gridiron Stairs.

## CHAPTER 12 • New

**12.2.2.3.2.1** Noncombustible grated stair treads and landing floors shall be permitted in means of egress from lighting and access catwalks, galleries, and gridirons.

**12.2.2.3.2.2** Spiral stairs complying with 7.2.2.2.3 shall be permitted in means of egress from lighting and access catwalks, galleries, and gridirons.

Assembly occupancies with large occupant loads often need egress stairs of great width to accommodate the number of patrons apportioned to an egress path. Stairs with great width are required to be provided with intermediate handrails for compliance with 7.2.2.4.1.2. Exhibit 12/13.34 shows an outdoor stair serving an arena building. Numerous intermediate handrails are provided across the entire width of the stair.

Assembly venues such as upscale restaurants enhance their décor with architectural elements like curved stairs. Curved stairs are addressed in 7.2.2.2.2, and their use does not require occupancy chapter permission, other than a recognition of stairs, in general, as provided by 12/13.2.2.3. Exhibit 12/13.35 shows a curved stair in a restaurant. The curved stair is effectively marked and lighted so as to make apparent the location of each tread relative to the risers.

Assembly occupancies with theater-type seating typically use sloped floors to help provide the sight lines needed for viewing the attraction at the front of the room. The floor slope is often sufficient to require stepped aisles, because a ramped aisle would exceed the slope criteria of Table 7.2.5.3(a). The stepped aisles are treated as stairs for purposes of applying the requirements of Chapters 12 and 13. Such stairs are required to comply with 7.2.2 by 12/13.2.5.6.4.2 except as otherwise addressed by

Exhibit 12/13.34

*Intermediate handrails on wide stair serving as egress from an arena. (Photo courtesy of Jake Pauls)*

## CHAPTER 13 • Existing

**13.2.2.3.2.1** Noncombustible grated stair treads and landing floors shall be permitted in means of egress from lighting and access catwalks, galleries, and gridirons.

**13.2.2.3.2.2** Spiral stairs complying with 7.2.2.2.3 shall be permitted in means of egress from lighting and access catwalks, galleries, and gridirons.

Exhibit 12/13.35

*Curved stair that is effectively marked and lighted. (Photo courtesy of Jake Pauls)*

Chapters 12 and 13. For example, see Table 12/13.2.3.2, and the associated provisions of 12/13.2.3.3, where stairs (i.e., stepped aisles) are sized differently from the criteria in Chapter 7 to account for riser heights in excess of the 7 in. (180 mm) specified for new stairs in Table 7.2.2.2.1.1(a).

Paragraph 7.2.2.3.1.1 requires that stairs within required means of egress be of permanent fixed construction, unless they serve seating that is designed to be repositioned and, thus, are exempted by 12/13.2.2.3.1(1). In some theaters, for example, entire seating sections are moved to accommodate the performance area requirements for a particular presentation. The stairs serving these movable seating sections cannot easily be of fixed permanent construction.

The provisions of 12/13.2.2.3.1(3) and (4) recognize the need to reduce obstructions to sight lines where stairs project from a stage or platform directly into an audience seating area.

## CHAPTER 12 • New

**Exhibit 12/13.36** shows a stair at the side of a portable platform where the stair does not impair sight lines for the audience, which is seated to face the front of the platform. The absence of a handrail makes stair use dangerous, especially given that the stair users are often challenged by projected light or other non-uniform lighting conditions. **Exhibit 12/13.37** shows a similar platform where the stair is safer to use, given the presence of handrails.

**Exhibit 12/13.36**

*Platform stair without handrails. (Photo courtesy of Jake Pauls)*

**12.2.2.4 Smokeproof Enclosures.** Smokeproof enclosures complying with 7.2.3 shall be permitted.

**12.2.2.5 Horizontal Exits.** Horizontal exits complying with 7.2.4 shall be permitted.

**12.2.2.6 Ramps.** Ramps complying with 7.2.5 shall be permitted, and the following alternatives shall also apply:

- (1) Ramps not part of an accessible means of egress and serving only stages or nonpublic areas shall be permitted to have a slope not steeper than 1 in 8.
- (2) Ramped aisles not part of an accessible means of egress shall be permitted to have a slope not steeper than 1 in 8.

**12.2.2.7 Exit Passageways.** Exit passageways complying with 7.2.6 shall be permitted.

**12.2.2.8 Reserved.**

Escalators are permitted to serve in the means of egress for existing installations where the applicable existing occupancy chapter permits. The provision of 13.2.2.8 permits existing escalators

## CHAPTER 13 • Existing

**Exhibit 12/13.37**

**12.2.2.9 Reserved.****12.2.2.10 Fire Escape Ladders.**

**12.2.2.10.1** Fire escape ladders complying with 7.2.9 shall be permitted.

**12.2.2.10.2** For ladders serving catwalks, the three-person limitation in 7.2.9.1(3) shall be permitted to be increased to ten persons.

**12.2.2.11 Alternating Tread Devices.** Alternating tread devices complying with 7.2.11 shall be permitted.

**12.2.2.12 Areas of Refuge.** Areas of refuge complying with 7.2.12 shall be permitted.

**12.2.3 Capacity of Means of Egress.**

**12.2.3.1 General.** The capacity of means of egress shall be in accordance with one of the following:

- (1) Section 7.3 for other than theater-type seating or smoke-protected assembly seating
- (2) 12.2.3.2 for rooms with theater-type seating or similar seating arranged in rows
- (3) 12.4.2 for smoke-protected assembly seating

**12.2.3.2\* Theater-Type Seating.** Minimum clear widths of aisles and other means of egress serving theater-type seating, or

**13.2.2.9 Fire Escape Stairs.** Fire escape stairs complying with 7.2.8 shall be permitted.

**13.2.2.10 Fire Escape Ladders.**

**13.2.2.10.1** Fire escape ladders complying with 7.2.9 shall be permitted.

**13.2.2.10.2** For ladders serving catwalks, the three-person limitation in 7.2.9.1(3) shall be permitted to be increased to ten persons.

**13.2.2.11 Alternating Tread Devices.** Alternating tread devices complying with 7.2.11 shall be permitted.

**13.2.2.12 Areas of Refuge.** Areas of refuge complying with 7.2.12 shall be permitted.

**13.2.3 Capacity of Means of Egress.**

**13.2.3.1 General.** The capacity of means of egress shall be in accordance with one of the following:

- (1) Section 7.3 for other than theater-type seating or smoke-protected assembly seating
- (2) 13.2.3.2 for rooms with theater-type seating or similar seating arranged in rows
- (3) 13.4.2 for smoke-protected assembly seating

**13.2.3.2\* Theater-Type Seating.** Minimum clear widths of aisles and other means of egress serving theater-type seating, or

## CHAPTER 12 • New

Table 12.2.3.2 Capacity Factors

	Stairs		Passageways, Ramps, and Doorways	
	in.	mm	in.	mm
Unlimited	0.3 AB	7.6 AB	0.22 C	5.6 C

similar seating arranged in rows, shall be in accordance with Table 12.2.3.2.

**A.12.2.3.2** The provisions of 12.2.3.2 should be applied within the audience seating chamber and to the room doors. The capacity of means of egress components encountered after leaving the audience seating chamber, such as concourses, lobbies, exit stair enclosures, and the exit discharge, should be calculated in accordance with Section 7.3.

**12.2.3.3 Width Modifications.** The minimum clear widths shown in Table 12.2.3.2 shall be modified in accordance with all of the following:

- (1) If risers exceed 7 in. in height, the stair width in Table 12.2.3.2 shall be multiplied by factor A, where A equals the following:

$$A = 1 + \frac{\text{riser height} - 7}{5} \quad [12.2.3.3(1)]$$

- (2) If risers exceed 178 mm in height, the stair width in Table 12.2.3.2 shall be multiplied by factor A, where A equals the following:

$$A = 1 + \frac{\text{riser height} - 178}{125} \quad [12.2.3.3(2)]$$

- (3) Stairs not having a handrail within a 30 in. (760 mm) horizontal distance shall be 25 percent wider than otherwise calculated; that is, their width shall be multiplied by factor B, where B equals the following:

$$B = 1.25 \quad [12.2.3.3(3)]$$

- (4) Ramps steeper than 1 in 10 slope where used in ascent shall have their width increased by 10 percent; that is, their width shall be multiplied by factor C, where C equals the following:

$$C = 1.10 \quad [12.2.3.3(4)]$$

**12.2.3.4 Lighting and Access Catwalks.** The requirements of 12.2.3.2 and 12.2.3.3 shall not apply to lighting and access catwalks as permitted by 12.4.6.9.

## CHAPTER 13 • Existing

similar seating arranged in rows, shall be in accordance with Table 13.2.3.2.

**A.13.2.3.2** The provisions of 13.2.3.2 should be applied within the audience seating chamber and to the room doors. The capacity of means of egress components encountered after leaving the audience seating chamber, such as concourses, lobbies, exit stair enclosures, and the exit discharge, should be calculated in accordance with Section 7.3.

**13.2.3.3 Width Modifications.** The minimum clear widths shown in Table 13.2.3.2 shall be modified in accordance with all of the following:

- (1) If risers exceed 7 in. in height, the stair width in Table 13.2.3.2 shall be multiplied by factor A, where A equals the following:

$$A = 1 + \frac{\text{riser height} - 7}{5} \quad [13.2.3.3(1)]$$

- (2) If risers exceed 178 mm in height, the stair width in Table 13.2.3.2 shall be multiplied by factor A, where A equals the following:

$$A = 1 + \frac{\text{riser height} - 178}{125} \quad [13.2.3.3(2)]$$

- (3) Stairs not having a handrail within a 30 in. (760 mm) horizontal distance shall be 25 percent wider than otherwise calculated; that is, their width shall be multiplied by factor B, where B equals the following:

$$B = 1.25 \quad [13.2.3.3(3)]$$

- (4) Ramps steeper than 1 in 10 slope where used in ascent shall have their width increased by 10 percent; that is, their width shall be multiplied by factor C, where C equals the following:

$$C = 1.10 \quad [13.2.3.3(4)]$$

**13.2.3.4 Lighting and Access Catwalks.** The requirements of 13.2.3.2 and 13.2.3.3 shall not apply to lighting and access catwalks as permitted by 13.4.6.9.

## CHAPTER 12 • New

## 12.2.3.5 Reserved.

Paragraph 12/13.2.3.2 applies to egress serving theater-type seating or similar seating arranged in rows in assembly occupancies that are not smoke protected. See 12/13.2.3.1(2). If the assembly occupancy provides smoke-protected seating, the provisions of 12/13.4.2 and the capacity factors of Table 12/13.4.2.3 apply.

In using Table 12/13.2.3.2, the capacity factors might need to be adjusted using factors *A*, *B*, and *C*. Stair (i.e., stepped aisle) capacity is calculated at 0.3 in. (7.6 mm) per person only if the riser height and horizontal distance to a handrail meet specific criteria. If the stair riser height exceeds 7 in. (178 mm), the 0.3 in. (7.6 mm) per person factor must be multiplied by factor *A*, which is calculated using the formula in 12/13.2.3.3(1). If the stair does not have a handrail within a 30 in. (760 mm) horizontal distance, the 0.3 in. (7.6 mm) per person factor must be multiplied by factor *B*, which equals 1.25 per 12/13.2.3.3(3). If both the riser geometry and handrail deviations occur, the 0.3 in. (7.6 mm) per person factor must be multiplied by both a factor *A* that is greater than 1.0 and a factor *B* of 1.25.

If the stair riser height does not exceed 7 in. (178 mm), factor *A* is still used but is to equal 1.0. Similarly, if the stair does have a handrail within a 30 in. (760 mm) horizontal distance, factor *B* is still used but is to equal 1.0.

For most occupancies, egress capacity involving horizontal travel is calculated at 0.2 in. (5 mm) per person. In Table 12/13.2.3.2, egress capacity within the audience seating chamber is penalized by 10 percent to 0.22 in. (5.6 mm) per person. Further, the presence of factor *C* indicates that additional modification of the capacity factor is necessary if the egress travel involves ascending a ramp with a slope steeper than 1 in 10. In such cases, the 0.22 in. (5.6 mm) per person capacity factor must be multiplied by a factor *C* of 1.10 per 12/13.2.3.3(4).

If the travel does not involve ascending a ramp with a slope steeper than 1 in 10, factor *C* is still used but is to equal 1.0.

### Capacity Factor Modification

The comparative examples that follow demonstrate modification of the capacity factors of Table 12/13.2.3.2.

#### Example 1

**Inch/Pound Units.** An auditorium has 5000 seats. It is not smoke protected. One stair is 70 in. wide; riser height is 7 in.; handrails are positioned at each side; an additional handrail runs

## CHAPTER 13 • Existing

**13.2.3.5 Bleachers Aisles.** In seating composed entirely of bleachers for which the row-to-row dimension is 28 in. (710 mm) or less, and from which front egress is not limited, aisles shall not be required to exceed 66 in. (1675 mm) in width.

along the center of the aisle. One ramp is 44 in. wide and rises with a slope of 1 in 12 to the rear exit access door.

The capacity of the stair is determined using the 0.3 *AB* formula from Table 12/13.2.3.2. Because the riser height does not exceed 7 in., factor *A* = 1.0. Because there is a handrail within a 30 in. horizontal distance, factor *B* = 1.0. Substituting gives

$$\begin{aligned} \text{Stair capacity} &= \frac{70 \text{ in.}}{(0.3)(1.0)(1.0) \text{ in. per person}} \\ &= 233 \text{ persons} \end{aligned}$$

The capacity of the ramp is determined using the 0.22 *C* formula from Table 12/13.2.3.2. Factor *C* must be considered, because the ramp is used in the upward direction for egress. Because the ramp slope does not exceed 1 in 10, factor *C* = 1.0. Substituting gives

$$\begin{aligned} \text{Ramp capacity} &= \frac{44 \text{ in.}}{(0.22)(1.0) \text{ in. per person}} \\ &= 200 \text{ persons} \end{aligned}$$

**SI Units.** An auditorium has 5000 seats. It is not smoke protected. One stair is 1780 mm wide; riser height is 178 mm; handrails are positioned at each side; an additional handrail runs along the center of the aisle. One ramp is 1120 mm wide and rises with a slope of 1 in 12 to the rear exit access door.

The capacity of the stair is determined using the 7.6 *AB* formula from Table 12/13.2.3.2. Because the riser height does not exceed 178 mm, factor *A* = 1.0. Because there is a handrail within a 760 mm horizontal distance, factor *B* = 1.0. Substituting gives

$$\begin{aligned} \text{Stair capacity} &= \frac{1780 \text{ mm}}{(7.6)(1.0)(1.0) \text{ mm per person}} \\ &= 234 \text{ persons} \end{aligned}$$

The capacity of the ramp is determined using the 5.6 *C* formula from Table 12/13.2.3.2. Factor *C* must be considered, because the ramp is used in the upward direction for egress. Because the ramp slope does not exceed 1 in 10, factor *C* = 1.0. Substituting gives

$$\begin{aligned} \text{Ramp capacity} &= \frac{1120 \text{ mm}}{(5.6)(1.0) \text{ mm per person}} \\ &= 200 \text{ persons} \end{aligned}$$

#### Example 2

**Inch/Pound Units.** An auditorium has 5000 seats. It is not smoke protected. One stair is 70 in. wide; riser height is 7.5 in.;

## CHAPTER 12 • New

handrails are positioned at each side; there is no handrail along the center of the aisle. One ramp is 44 in. wide and rises with a slope of 1 in 9 to the rear exit access door.

The capacity of the stair is determined using the 0.3 AB formula from Table 12/13.2.3.2. Because the riser height exceeds 7 in., factor A must be calculated using the following formula in 12/13.2.3.3(1):

$$A = 1 + \frac{7.5 - 7.0}{5} = 1.1$$

Because there is no handrail within a 30 in. horizontal distance, factor B = 1.25 per 12/13.2.3.3(3). Substituting gives

$$\begin{aligned} \text{Stair capacity} &= \frac{70 \text{ in.}}{(0.3)(1.1)(1.25) \text{ in. per person}} \\ &= 170 \text{ persons} \end{aligned}$$

The capacity of the ramp is determined using the 0.22 C formula from Table 12/13.2.3.2. Because the ramp is used in ascent for egress and the slope exceeds 1 in 10, factor C = 1.10 per 12/13.2.3.3(4). Substituting gives

$$\begin{aligned} \text{Ramp capacity} &= \frac{44 \text{ in.}}{(0.22)(1.10) \text{ in. per person}} \\ &= 182 \text{ persons} \end{aligned}$$

**SI Units.** An auditorium has 5000 seats. It is not smoke protected. One stair is 1780 mm wide; riser height is 190 mm;

### 12.2.3.6 Main Entrance/Exit.

**12.2.3.6.1** Every assembly occupancy shall be provided with a main entrance/exit.

**12.2.3.6.2** The main entrance/exit width shall be as follows:

- (1) The main entrance/exit shall be of a width that accommodates two-thirds of the total occupant load in the following assembly occupancies:
  - (a) Dance halls
  - (b) Discotheques
  - (c) Nightclubs
  - (d) Assembly occupancies with festival seating
- (2) In assembly occupancies, other than those listed in 12.2.3.6.2(1), the main entrance/exit shall be of a width that accommodates one-half of the total occupant load.

**12.2.3.6.3** The main entrance/exit shall be at the level of exit discharge or shall connect to a stairway or ramp leading to a street.

**12.2.3.6.4** Access to the main entrance/exit shall be as follows:

- (1) Each level of the assembly occupancy shall have access to the main entrance/exit, and such access shall have the

## CHAPTER 13 • Existing

handrails are positioned at each side; there is no handrail along the center of the aisle. One ramp is 1120 mm wide and rises with a slope of 1 in 9 to the rear exit access door.

The capacity of the stair is determined using the 7.6 AB formula from Table 12/13.2.3.2. Because the riser height exceeds 178 mm, factor A must be calculated using the following formula in 12/13.2.3.3(2):

$$A = 1 + \frac{190 - 178}{125} = 1.1$$

Because there is no handrail within a 760 mm horizontal distance, factor B = 1.25 per 12/13.2.3.3(3). Substituting gives

$$\begin{aligned} \text{Stair capacity} &= \frac{1780 \text{ mm}}{(7.6)(1.1)(1.25) \text{ mm per person}} \\ &= 170 \text{ persons} \end{aligned}$$

The capacity of the ramp is determined using the 5.6 C formula from Table 12/13.2.3.2. Because the ramp is used in ascent for egress and the slope exceeds 1 in 10, factor C = 1.10 per 12/13.2.3.3(4). Substituting gives

$$\begin{aligned} \text{Ramp capacity} &= \frac{1120 \text{ mm}}{(5.6)(1.10) \text{ mm per person}} \\ &= 182 \text{ persons} \end{aligned}$$

### 13.2.3.6 Main Entrance/Exit.

**13.2.3.6.1** Every assembly occupancy shall be provided with a main entrance/exit.

**13.2.3.6.2** The main entrance/exit shall be of a width that accommodates one-half of the total occupant load.

**13.2.3.6.3** The main entrance/exit shall be at the level of exit discharge or shall connect to a stairway or ramp leading to a street.

**13.2.3.6.4 Reserved.**

## CHAPTER 12 • New

capacity to accommodate two-thirds of the occupant load of such levels in the following assembly occupancies:

- (a) Dance halls
  - (b) Discotheques
  - (c) Nightclubs
  - (d) Assembly occupancies with festival seating
- (2) In assembly occupancies, other than those listed in 12.2.3.6.4(1), each level of the assembly occupancy shall have access to the main entrance/exit, and such access shall have the capacity to accommodate one-half of the occupant load of such levels.

For the 2015 edition of the *Code*, the category of *bars with live entertainment* was deleted from 12.2.3.6.4(1) for consistency

**12.2.3.6.5** Where the main entrance/exit from an assembly occupancy is through a lobby or foyer, the aggregate capacity of all exits from the lobby or foyer shall be permitted to provide the required capacity of the main entrance/exit, regardless of whether all such exits serve as entrances to the building.

**12.2.3.6.6\*** In assembly occupancies where there is no well-defined main entrance/exit, exits shall be permitted to be distributed around the perimeter of the building, provided that the total exit width furnishes not less than 100 percent of the width needed to accommodate the permitted occupant load.

**A.12.2.3.6.6** The original *Code* wording exempted sports arenas and railway stations. If an assembly occupancy was not similar to a sports arena or railway station, it was often judged ineligible to use the provision of 12.2.3.6.6. A list of exempted assembly venues also raises the question of why other occupancies are not included and necessitates additions to the list. For example, an Exhibit hall of very large size might have several main entrances/exits. A theater extending the width of a block cannot really have a main entrance/exit in one confined location. A restaurant might have a main entrance serving the parking lot and another main entrance for those entering from the street. The authority having jurisdiction needs to determine where such arrangements are acceptable.

**12.2.3.7 Other Exits.** Each level of an assembly occupancy shall have access to the main entrance/exit and shall be provided with additional exits of a width to accommodate not less than one-half of the total occupant load served by that level.

**12.2.3.7.1** Additional exits shall discharge in accordance with 12.2.7.

**12.2.3.7.2** Additional exits shall be located as far apart as practicable and as far from the main entrance/exit as practicable.

**12.2.3.7.3** Additional exits shall be accessible from a cross aisle or a side aisle.

## CHAPTER 13 • Existing

with 12.2.3.6.2 and 12.3.5.1. See the commentary relative to 12.2.3.6.2, which follows 12.2.3.8.

**13.2.3.6.5** Where the main entrance/exit from an assembly occupancy is through a lobby or foyer, the aggregate capacity of all exits from the lobby or foyer shall be permitted to provide the required capacity of the main entrance/exit, regardless of whether all such exits serve as entrances to the building.

**13.2.3.6.6\*** In assembly occupancies where there is no well-defined main entrance/exit, exits shall be permitted to be distributed around the perimeter of the building, provided that the total exit width furnishes not less than 100 percent of the width needed to accommodate the permitted occupant load.

**A.13.2.3.6.6** The original *Code* wording exempted sports arenas and railway stations. If an assembly occupancy was not similar to a sports arena or railway station, it was often judged ineligible to use the provision of 13.2.3.6.6. A list of exempted assembly venues also raises the question of why other occupancies are not included and necessitates additions to the list. For example, an Exhibit hall of very large size might have several main entrances/exits. A theater extending the width of a block cannot really have a main entrance/exit in one confined location. A restaurant might have a main entrance serving the parking lot and another main entrance for those entering from the street. The authority having jurisdiction needs to determine where such arrangements are acceptable.

**13.2.3.7 Other Exits.** Each level of an assembly occupancy shall have access to the main entrance/exit and shall be provided with additional exits of a width to accommodate not less than one-half of the total occupant load served by that level.

**13.2.3.7.1** Additional exits shall discharge in accordance with 13.2.7.

**13.2.3.7.2** Additional exits shall be located as far apart as practicable and as far from the main entrance/exit as practicable.

**13.2.3.7.3** Additional exits shall be accessible from a cross aisle or a side aisle.

## CHAPTER 12 • New

**12.2.3.7.4** In assembly occupancies where there is no well-defined main entrance/exit, exits shall be permitted to be distributed around the perimeter of the building, provided that the total exit width furnishes not less than 100 percent of the width required to accommodate the permitted occupant load.

**12.2.3.8 Minimum Corridor Width.** The width of any exit access corridor serving 50 or more persons shall be not less than 44 in. (1120 mm).

In February of 2003, a fire at The Station nightclub in West Warwick, Rhode Island, claimed 100 patrons' lives. The fire began when pyrotechnics ignited exposed, acoustical foamed plastic panels that lined the walls and ceiling of a platform serving as a stage for the musical group performing to a capacity crowd. Patrons died as the fire spread faster than they could egress the building. More than 30 bodies were found blocking the main entrance/exit. Some reviewers of the disaster might judge the patrons as having panicked, while others might say the patrons behaved rationally in trying to move toward the exit that they had used to enter the nightclub, but their actions created a crowd crush. The facility was far from being *Code* compliant. The pyrotechnic devices (gerbs) used were designed for a venue with a much higher ceiling. The exposed foamed plastic panels lining the walls and ceiling of the performers' platform were prohibited materials and were noted as distinct hazards by existing *Code* requirements applicable to interior wall and ceiling finishes.

The National Institute of Standards and Technology (NIST) issued *Report of the Technical Investigation of The Station Nightclub Fire*.<sup>5</sup> The key findings related to emergency egress included the following:

1. The nightclub patrons first recognized danger 24 seconds after the pyrotechnics ignited the foam. The bulk of the crowd began to evacuate around the time that the band stopped playing (30 seconds after ignition).
2. About two-thirds of the occupants attempted to leave through the main entrance; many were unsuccessful.
3. Prior to 90 seconds into the fire, a crowd crush occurred at the main entrance that almost entirely disrupted the flow of the evacuation through the front exit.
4. The event that precipitated the crowd crush likely was related to the arrangement of the single interior door with merging streams of traffic and the pressure to escape the rapidly deteriorating conditions in the main area of the nightclub.
5. Measurements in a fire test conducted on a mock-up of a portion of The Station nightclub platform and dance floor produced — within 90 seconds — temperatures, heat fluxes, and combustion gases well in excess of accepted survivability limits.
6. A computer simulation of the full nightclub fire suggests that conditions around the dance floor, sunroom, and dart room would have led to severe incapacitation or death within about

## CHAPTER 13 • Existing

**13.2.3.7.4** In assembly occupancies where there is no well-defined main entrance/exit, exits shall be permitted to be distributed around the perimeter of the building, provided that the total exit width furnishes not less than 100 percent of the width required to accommodate the permitted occupant load.

90 seconds after ignition of the foam for anyone remaining standing in those areas — and not much longer even for those close to the nightclub floor.

The intent of **12/13.2.3.6** is to require that 50 percent or more of the occupants are able to egress through the same door(s) they used to enter the building. The door through which an occupant enters a building is generally the door most familiar to the occupant. The occupant can be expected to attempt to use that door for emergency egress. The term *main entrance/exit* clarifies that the *Code* intends the main entrance to an assembly occupancy to be designated as the main exit.

The 50 percent main entrance capacity criterion was established prior to 1970. Since the 2006 edition, **12.2.3.6.2** increased to two-thirds the minimum capacity required at the main entrance/exit for new nightclub-type assembly occupancies. The provision was not made retroactively applicable to existing assembly occupancies, as that would have imposed an unreasonable burden.

The provision of **12.2.3.6.2** was revised for the 2012 edition of the *Code*. The list of nightclub-type assembly occupancies was revised to delete the entry for *bars with live entertainment*. Defining the characteristics that constitute a bar with live entertainment is difficult. Would the presence of a folk singer with a guitar sitting on a stool raise the danger level to that of a nightclub, as was learned from the fire at The Station nightclub, and thereby justify requiring that the main entrance accommodate a minimum of two-thirds of the occupant load?

Note that **12.2.3.7** continues to require that the other exits (i.e., exits other than the main entrance/exit) provide capacity for not less than 50 percent of the occupant load. Thus, new nightclub-type assembly occupancies are required to provide capacity for 117 percent of the occupant load, calculated as  $\frac{2}{3} + \frac{1}{2} = 1.17$ .

As an example of the requirements of **12/13.2.3.6.2** and **12/13.2.3.7**, if a new assembly occupancy (other than a nightclub-type assembly occupancy) or an existing assembly occupancy has an occupant load of 900 persons, the main exit would have to accommodate 450 persons (one-half). The other exits would have to accommodate the remaining 450 persons. For a new nightclub-type assembly occupancy with an occupant load of 900 persons, the main exit would have to accommodate 600 persons (two-thirds), and the other exits would have to accommodate 450 persons (one-half), for a total of 1050 persons (117 percent).

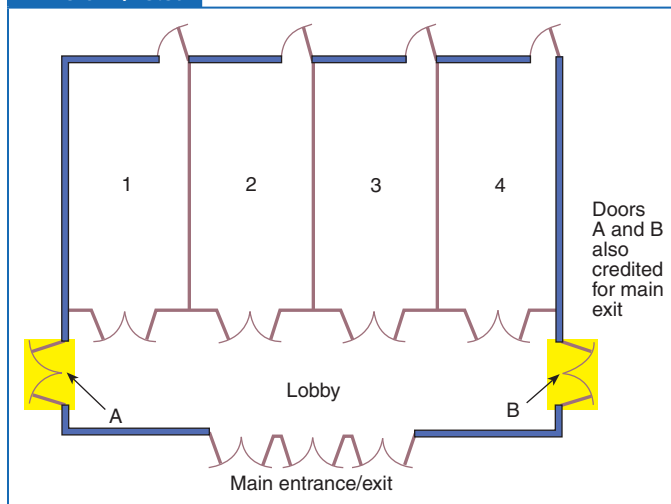

## CHAPTER 12 • New

Where the main entrance is through a lobby, a majority of the occupants can be expected to return to the lobby area during emergency egress. If the lobby has additional doors that are not used as entrance doors (e.g., doors A and B in [Exhibit 12/13.39](#)), the occupants are likely to use these doors, because they have reached the lobby, with which they are familiar. Thus, [12/13.2.3.6.5](#) permits all the lobby doors to serve collectively as the required main exit. See [Exhibit 12/13.39](#).

[Paragraph 12/13.2.3.6.6](#) acknowledges that some assembly occupancy buildings have no well-defined main entrance/exit. Occupants enter the building by doors in multiple walls. Under emergency egress conditions, all occupants will not attempt to use one common group of doors, because some occupants are familiar with certain doors, while others are familiar with other doors. In such cases, it is the intent that egress width be distributed among the various exits without any one exit being required to provide 50 percent of the egress capacity. See also [12/13.2.3.7.4](#).

A major change occurred in the 1991 edition of the *Code* with the deletion of a requirement that exits, other than the main exit, had to accommodate two-thirds of the occupant load, which resulted in a 16⅓ percent overdesign. For new nightclub-like assembly occupancies, [12.2.3.6.2\(1\)](#) reinstates the two-thirds concept but applies it to the main entrance/exit, which is

Exhibit 12/13.39

Main entrance/exit.

### 12.2.4\* Number of Means of Egress.

**A.12.2.4** It is not the intent to require four means of egress from each level of an assembly occupancy building having a total occupant load of more than 1000 where, individually, the floors have occupant loads of less than 1000.

## CHAPTER 13 • Existing

expected to experience use by the majority of the occupants, as explained in the previous paragraph.

The minimum 44 in. (1120 mm) width for exit access corridors serving 50 or more persons in new assembly occupancies — required by [12.2.3.8](#) — allows more than one file of persons to travel along the corridor simultaneously. The minimum width also permits persons capable of traveling at normal speed to pass persons who are slower, rather than queuing behind them. Concourses and wide thoroughfares through assembly occupancies are often confused with corridors, as the term *corridor* is not defined in [Chapter 3](#). Although the minimum 44 in. (1120 mm) corridor width requirement does not apply to a concourse, the width needed to accommodate the portion of the large occupant load expected to move in that direction often results in a required capacity width that exceeds 44 in. (1120 mm). [Exhibit 12/13.40](#) shows a portion of a concourse with large required width. An electric cart is stored to the side of the concourse and outside the required width. Note the floor marking that indicates where the cart is permitted to be positioned when stored.

Exhibit 12/13.40

Cart storage area delineated by floor markings so as not to intrude on required egress width.

### 13.2.4\* Number of Means of Egress.

**A.13.2.4** It is not the intent to require four means of egress from each level of an assembly occupancy building having a total occupant load of more than 1000 where, individually, the floors have occupant loads of less than 1000.

## CHAPTER 12 • New

**12.2.4.1** The number of means of egress shall be in accordance with [Section 7.4](#), other than exits for fenced outdoor assembly occupancies in accordance with [12.2.4.4](#).

**12.2.4.2** Reserved.

**12.2.4.3** Reserved.

**12.2.4.4** A fenced outdoor assembly occupancy shall have not less than two remote means of egress from the enclosure in accordance with [7.5.1.3](#), unless otherwise required by one of the following:

- (1) If more than 6000 persons are to be served by such means of egress, there shall be not less than three means of egress.
- (2) If more than 9000 persons are to be served by such means of egress, there shall be not less than four means of egress.

**12.2.4.5** Balconies or mezzanines having an occupant load not exceeding 50 shall be permitted to be served by a single means of egress, and such means of egress shall be permitted to lead to the floor below.

**12.2.4.6** Balconies or mezzanines having an occupant load exceeding 50, but not exceeding 100, shall have not less than two remote means of egress, but both such means of egress shall be permitted to lead to the floor below.

**12.2.4.7** Balconies or mezzanines having an occupant load exceeding 100 shall have means of egress as described in [7.4.1](#).

**12.2.4.8** A second means of egress shall not be required from lighting and access catwalks, galleries, and gridirons where a means of escape to a floor or a roof is provided. Ladders, alternating tread devices, or spiral stairs shall be permitted in such means of escape.

The title of [12/13.2.4](#) helps to clarify that multiple means of egress, not just multiple exits, are required.

Assembly occupancy spaces, other than on small balconies or mezzanines as detailed in [12/13.2.4.5](#), are required to be provided with a minimum of two means of egress. Any room occupied for assembly use by at least 50 persons, so as to constitute an assembly occupancy, must be provided with two means of egress from the room (e.g., two exit access doors to a corridor). A room with an occupant load of 49 or fewer persons, used for adult education so as to constitute a business occupancy, has no direct requirement for providing a second exit access from the room. The business occupancy room is permitted a single means of egress (e.g., an exit access door to a corridor), provided that the allowable common path of travel is not exceeded.

## CHAPTER 13 • Existing

**13.2.4.1** The number of means of egress shall be in accordance with [Section 7.4](#), other than fenced outdoor assembly occupancies in accordance with [13.2.4.4](#), unless otherwise permitted by [13.2.4.2](#) or [13.2.4.3](#).

**13.2.4.2** Assembly occupancies with occupant loads of 600 or fewer shall have two separate means of egress.

**13.2.4.3** Assembly occupancies with occupant loads greater than 600 but fewer than 1000 shall have three separate means of egress.

**13.2.4.4** A fenced outdoor assembly occupancy shall have not less than two widely separated means of egress from the enclosure, unless otherwise required by one of the following:

- (1) If more than 6000 persons are to be served by such means of egress, there shall be not less than three means of egress.
- (2) If more than 9000 persons are to be served by such means of egress, there shall be not less than four means of egress.

**13.2.4.5** Balconies or mezzanines having an occupant load not exceeding 50 shall be permitted to be served by a single means of egress, and such means of egress shall be permitted to lead to the floor below.

**13.2.4.6** Balconies or mezzanines having an occupant load exceeding 50, but not exceeding 100, shall have not less than two remote means of egress, but both such means of egress shall be permitted to lead to the floor below.

**13.2.4.7** Balconies or mezzanines having an occupant load exceeding 100 shall have means of egress as described in [7.4.1](#).

**13.2.4.8** A second means of egress shall not be required from lighting and access catwalks, galleries, and gridirons where a means of escape to a floor or a roof is provided. Ladders, alternating tread devices, or spiral stairs shall be permitted in such means of escape.

As the concentration or number of people in an assembly occupancy increases, the need for simultaneous egressing by a sizable group of occupants increases. Therefore, to reduce jamming at doorways (which might lead to panic and disorder), in accordance with the provisions of [Section 7.4](#), more than two exits are needed for large occupant loads.

By permitting a single means of egress from a small balcony or mezzanine, [12/13.2.4.5](#) provides a relaxation in requirements for balconies and mezzanines that do not accommodate more than 50 people, such as choir lofts. See also [12/13.2.5.1.2](#), which increases the permitted common path of travel to 75 ft (23 m) from an area with not more than 50 occupants.

The balconies or mezzanines addressed by [12/13.2.4.6](#) might typically be found in restaurants or small theaters. The

## CHAPTER 12 • New

provisions explain that it is important to have two remote means of egress, but, because the total number of occupants does not exceed 100, it is reasonable to permit occupants to egress onto the floor below.

Any balcony or mezzanine that can accommodate more than 100 people, as addressed by 12/13.2.4.7, should be treated as a separate floor with regard to the number of means of egress. Such treatment avoids overloading the means of egress on the

## 12.2.5 Arrangement of Means of Egress.

### 12.2.5.1 General.

**12.2.5.1.1** Means of egress shall be arranged in accordance with Section 7.5.

**12.2.5.1.2** A common path of travel shall be permitted for the first 20 ft (6100 mm) from any point where the common path serves any number of occupants, and for the first 75 ft (23 m) from any point where the common path serves not more than 50 occupants.

**12.2.5.1.3** Dead-end corridors shall not exceed 20 ft (6100 mm).

**12.2.5.2 Access Through Hazardous Areas.** Means of egress from a room or space for assembly purposes shall not be permitted through kitchens, storerooms, restrooms, closets, platforms, stages, projection rooms, or hazardous areas as described in 12.3.2.

**12.2.5.3 Auditorium and Arena Floors.** Where the floor area of auditoriums and arenas is used for assembly occupancy activities/events, not less than 50 percent of the occupant load shall have means of egress provided without passing through adjacent fixed seating areas.

The remoteness of exit accesses, exits, and exit discharges is an important concept addressed by Chapter 7. Exit accesses, exits, and exit discharges that are located too close to each other can quickly become unusable during a single fire. The provisions of 4.5.3.1 require remoteness of means of egress paths to the point that a single fire will not simultaneously block two routes. The remoteness requirements of Section 7.5 must be met.

Revolving rooftop assembly occupancies require special consideration; as the structure revolves, exit signs are often lost from view. To provide an unobstructed panoramic view, the exterior ring-shaped floor area revolves around a small stationary interior core where the exits are often located. In many cases, the two exits are too close to each other to meet remoteness criteria. Usually, at least one stairway from the building core involves a horizontal passage on the floor below to transfer occupants from that stairway to the normal, remotely located exit stairways. This transfer, because it is a continuation of the

## CHAPTER 13 • Existing

floor below and provides mezzanine occupants with independent travel paths in case of fire on the floor below.

Paragraph 12.2.4.4 employs the remoteness criteria of 7.5.1.3. In 13.2.4.4, applicable to existing situations, the two means of egress for fenced outdoor assembly occupancies are required to be “widely separated” — a subjective term that is difficult to enforce consistently.

## 13.2.5 Arrangement of Means of Egress.

### 13.2.5.1 General.

**13.2.5.1.1** Means of egress shall be arranged in accordance with Section 7.5.

**13.2.5.1.2** A common path of travel shall be permitted for the first 20 ft (6100 mm) from any point where the common path serves any number of occupants, and for the first 75 ft (23 m) from any point where the common path serves not more than 50 occupants.

**13.2.5.1.3** Dead-end corridors shall not exceed 20 ft (6100 mm).

**13.2.5.2 Access Through Hazardous Areas.** Means of egress shall not be permitted through kitchens, storerooms, restrooms, closets, platforms, stages, or hazardous areas as described in 13.3.2.

### 13.2.5.3 Reserved.

exit stair enclosure within the core, must be made via an exit passageway with a fire resistance rating equal to that required for the exit stair enclosure.

Although exit access and exit placement must meet the remoteness criteria of Section 7.5, it is not practical to require immediate access to egress paths from every point in a building. Rather, occupants are permitted to be forced to travel in only one direction for a limited distance before reaching a point where travel in more than one direction becomes possible. This limited travel in one direction is called *common path of travel* (see definition in 3.3.47). See the commentary associated with A.7.5.1.5.

Paragraph 12/13.2.5.1.2 establishes two allowable common paths of travel limitations as follows:

1. 20 ft (6100 mm), regardless of occupant load
2. 75 ft (23 m) where serving not more than 50 persons

## CHAPTER 12 • New

The provision of 12/13.2.5.1.2 is difficult to understand. It should be interpreted to mean that the common path of travel limitations are as follows:

1. 20 ft (6100 mm), where the common path serves more than 50 persons
2. 75 ft (23 m) where the common path serves not more than 50 persons

Additionally, 12/13.2.5.5.6 permits a 30 ft (9.1 m) common path of travel between a point within an aisle accessway and the aisle serving a seating row. Paragraph 12/13.4.2.9 permits a 50 ft (15 m) common path of travel in seating areas in smoke-

#### 12.2.5.4 General Requirements for Access and Egress Routes Within Assembly Areas.

**12.2.5.4.1** Festival seating, as defined in 3.3.239.1, shall be prohibited within a building, unless otherwise permitted by one of the following:

- (1) Festival seating shall be permitted in assembly occupancies having occupant loads of 250 or less.
- (2) Festival seating shall be permitted in assembly occupancies where occupant loads exceed 250, provided that an approved life safety evaluation has been performed. (See 12.4.1.)

**12.2.5.4.2\*** Access and egress routes shall be maintained so that any individual is able to move without undue hindrance, on personal initiative and at any time, from an occupied position to the exits.

**A.12.2.5.4.2** This requirement and the associated requirement of 12.2.5.4.3 have the effect of prohibiting festival seating, unless it truly is a form of seating, such as lawn seating, where generous spaces are commonly maintained between individuals and small groups so that people can circulate freely at any time. Such lawn seating is characterized by densities of about one person per 15 ft<sup>2</sup> (1.4 m<sup>2</sup>). Both requirements prohibit uncontrolled crowd situations, such as in front of stages at rock music concerts where the number and density of people is uncontrolled by architectural or management features.

**12.2.5.4.3\*** Access and egress routes shall be maintained so that crowd management, security, and emergency medical personnel are able to reach any individual at any time, without undue hindrance.

**A.12.2.5.4.3** This requirement is intended to facilitate rapid emergency access to individuals who are experiencing a medical emergency, especially in the case of cardiopulmonary difficulties, where there is a need for rapid medical attention from trained personnel. The requirement also addresses the need for security

## CHAPTER 13 • Existing

protected assembly seating. Thus, the common path of travel limitations are numerous for assembly occupancies.

The requirement of 12/13.2.5.2 clarifies that exit access travel is not permitted to pass through areas subject to locking or areas presenting a hazard level higher than that normally associated with an assembly occupancy, including platforms and stages.

The provision of 12.2.5.3, which applies only to new assembly occupancies, is intended to reduce the amount of merging and sharing of means of egress by persons in fixed seating areas and those who are forced to travel from the arena floor up into the seating sections to egress the building.

#### 13.2.5.4 General Requirements for Access and Egress Routes Within Assembly Areas.

**13.2.5.4.1** Festival seating, as defined in 3.3.239.1, shall be prohibited within a building, unless otherwise permitted by one of the following:

- (1) Festival seating shall be permitted in assembly occupancies having occupant loads of 250 or less.
- (2) Festival seating shall be permitted in assembly occupancies where occupant loads exceed 250, provided that an approved life safety evaluation has been performed. (See 13.4.1.)

**13.2.5.4.2\*** Access and egress routes shall be maintained so that any individual is able to move without undue hindrance, on personal initiative and at any time, from an occupied position to the exits.

**A.13.2.5.4.2** This requirement and the associated requirement of 13.2.5.4.3 have the effect of prohibiting festival seating, unless it truly is a form of seating, such as lawn seating, where generous spaces are commonly maintained between individuals and small groups so that people can circulate freely at any time. Such lawn seating is characterized by densities of about one person per 15 ft<sup>2</sup> (1.4 m<sup>2</sup>). Both requirements prohibit uncontrolled crowd situations, such as in front of stages at rock music concerts where the number and density of people is uncontrolled by architectural or management features.

**13.2.5.4.3\*** Access and egress routes shall be maintained so that crowd management, security, and emergency medical personnel are able to reach any individual at any time, without undue hindrance.

**A.13.2.5.4.3** This requirement is intended to facilitate rapid emergency access to individuals who are experiencing a medical emergency, especially in the case of cardiopulmonary difficulties, where there is a need for rapid medical attention from trained personnel. The requirement also addresses the need for security

## CHAPTER 12 • New

and law enforcement personnel to reach individuals whose behavior is endangering themselves and others.

**12.2.5.4.4\*** The width of aisle accessways and aisles shall provide sufficient egress capacity for the number of persons accommodated by the catchment area served by the aisle accessway or aisle in accordance with [12.2.3.2](#), or for smoke-protected assembly seating in accordance with [12.4.2](#).

**A.12.2.5.4.4** The catchment area served by an aisle accessway or aisle is the portion of the total space that is naturally served by the aisle accessway or aisle. Hence, the requirement for combining the required capacity where paths converge is, in effect, a restatement of the idea of a catchment area. The establishment of catchment areas should be based on a balanced use of all means of egress, with the number of persons in proportion to egress capacity.

**12.2.5.4.5** Where aisle accessways or aisles converge to form a single path of egress travel, the required egress capacity of that path shall be not less than the combined required capacity of the converging aisle accessways and aisles.

**12.2.5.4.6** Those portions of aisle accessways and aisles where egress is possible in either of two directions shall be uniform in required width, unless otherwise permitted by [12.2.5.4.7](#).

**12.2.5.4.7** The requirement of [12.2.5.4.6](#) shall not apply to those portions of aisle accessways where the required width, not including the seat space described by [12.2.5.7.3](#), does not exceed 12 in. (305 mm).

**12.2.5.4.8** In the case of side boundaries for aisle accessways or aisles, other than those for nonfixed seating at tables, the clear width shall be measured to boundary elements such as walls, guardrails, handrails, edges of seating, tables, and side edges of treads, and said measurement shall be made horizontally to the vertical projection of the elements, resulting in the smallest width measured perpendicularly to the line of travel.

Outdoor festival seating is illustrated in [Exhibit 12/13.41](#). The term *festival seating* likely evolved from outdoor festivals held in open areas. Festival seating has been abused — at both indoor and outdoor events — where the assembled spectators are not controllable in terms of their numbers, location, or behavior. A rock music concert is an example of an event where the festival seating concept might become decidedly un-festive when unmanageable crowds of standing (not seated) people form in front of the stage area and circulation routes through the assembled crowd are completely lost. Injuries caused by bodies crushing against bodies or portions of the structure are likely when this situation occurs. [Exhibit 12/13.42](#) shows an indoor music

## CHAPTER 13 • Existing

and law enforcement personnel to reach individuals whose behavior is endangering themselves and others.

**13.2.5.4.4\*** The width of aisle accessways and aisles shall provide sufficient egress capacity for the number of persons accommodated by the catchment area served by the aisle accessway or aisle in accordance with [13.2.3.2](#), or for smoke-protected assembly seating in accordance with [13.4.2](#).

**A.13.2.5.4.4** The catchment area served by an aisle accessway or aisle is the portion of the total space that is naturally served by the aisle accessway or aisle. Hence, the requirement for combining the required capacity where paths converge is, in effect, a restatement of the idea of a catchment area. The establishment of catchment areas should be based on a balanced use of all means of egress, with the number of persons in proportion to egress capacity.

**13.2.5.4.5** Where aisle accessways or aisles converge to form a single path of egress travel, the required egress capacity of that path shall be not less than the combined required capacity of the converging aisle accessways and aisles.

**13.2.5.4.6** Those portions of aisle accessways and aisles where egress is possible in either of two directions shall be uniform in required width, unless otherwise permitted by [13.2.5.4.7](#).

**13.2.5.4.7** The requirement of [13.2.5.4.6](#) shall not apply to those portions of aisle accessways where the required width, not including the seat space described by [13.2.5.7.3](#), does not exceed 12 in. (305 mm).

**13.2.5.4.8** In the case of side boundaries for aisle accessways or aisles, other than those for nonfixed seating at tables, the clear width shall be measured to boundary elements such as walls, guardrails, handrails, edges of seating, tables, and side edges of treads, and said measurement shall be made horizontally to the vertical projection of the elements, resulting in the smallest width measured perpendicularly to the line of travel.

event constituting festival seating, as general admission occurs, where no attendee has a reserved spot; no chairs are provided; no attendee sits on the floor; and attendees stand. Indoor festival seating is subject to the requirements of [12/13.2.5.4.1](#).

A description of a typical crowd crush is found in a report titled "Observations of Crowd Conditions at Rock Concert in Exhibition Stadium, Toronto, 16 July 1980," by J. L. Pauls.<sup>6</sup> Because the number and arrangement of people in this instance were not controlled throughout the event, there were eventually some 30,000 to 40,000 people distributed unevenly in an area of about 125,000 ft<sup>2</sup> (10,600 m<sup>2</sup>). The result was an average density of about 1 person per 3.5 ft<sup>2</sup> (0.33 m<sup>2</sup>). However, due to

CHAPTER 12 • New

Exhibit 12/13.41

Festival seating at an outdoor athletic event. (Photo courtesy of Jake Pauls)

Exhibit 12/13.42

Indoor festival seating where attendees stand.

localized crowding at the stage area, several thousand people were at crushing densities of about 1 person per 2 ft<sup>2</sup> (0.19 m<sup>2</sup>). Both normal access and emergency access into this congested area were all but impossible, and management efforts to instruct people to move back toward less densely occupied areas proved futile. Incidents such as this led to the requirements of 12/13.2.5.4.1, which prohibit indoor festival seating for more than 250 persons unless an approved life safety evaluation is utilized.

In performance-oriented language, 12/13.2.5.4.2 prohibits overcrowding and the blocking of aisles and other portions of the exit access. See the explanation in A.12/A.13.2.5.4.2.

CHAPTER 13 • Existing

In addition to providing life safety under fire conditions, the requirements of 12/13.2.5.4.3 address the emergency and non-emergency movement of people. Because of the potential for ingress and egress paths to become blocked by the large crowds characteristic of many assembly occupancies, it is important that crowd management, security, and emergency medical personnel are able to move to any individual without undue hindrance at any time. The ability to deal effectively with an emergency while the problem is small often precludes having to deal with a larger emergency later.

The width referenced in 12/13.2.5.4.4 refers to the egress capacity-driven width requirements of 12/13.2.3. The capacity-related width requirements must be considered along with the other minimum width requirements detailed in 12/13.2.5.6.3. The applicable minimum width requirement is the larger of the widths established by the two sets of requirements.

Exhibit 12/13.43 illustrates how catchment areas would be allotted in the case of a theater with four egress doors having approximately equal egress capacity. Note that catchment area apportionment for normal, nonemergency uses often will make use of only some of the available exit access paths and exits, particularly those provided by the main entrance/exit. This arrangement might be quite different from a catchment area

Exhibit 12/13.43

Catchment areas based on balanced use of all means of egress in proportion to egress capacity.

## CHAPTER 12 • New

apportionment based on a balanced distribution of people in proportion to the egress capacity of individual exits. Facility management procedures must allow for the difficulties of informing people of, and directing them to, all the available means of egress, especially when normally used, familiar routes become blocked in an emergency.

Note that the phrase “required egress capacity” is used in 12/13.2.5.4.5 to clarify that the combined required width of the egress routes might be smaller than their combined actual widths. Widths that exceed *Code* minimums might be provided voluntarily to facilitate day-to-day operations.

**12.2.5.5\* Aisle Accessways Serving Seating Not at Tables.**

**A.12.2.5.5** For purposes of the means of egress requirements of this *Code*, tablet-arm chair seating is not considered seating at tables. Dinner theater–style configurations are required to comply with the aisle accessway provisions applying to seating at tables and the aisle requirements of 12.2.5.6, if the aisles contain steps or are ramped. (See also 7.1.7 and A.7.1.7.2.)

**12.2.5.5.1\*** The required clear width of aisle accessways between rows of seating shall be determined as follows:

- (1) Horizontal measurements shall be made, between vertical planes, from the back of one seat to the front of the most forward projection of the seat immediately behind it.
- (2) Where the entire row consists of automatic- or self-rising seats that comply with ASTM F 851, *Standard Test Method for Self-Rising Seat Mechanisms*, the measurement shall be permitted to be made with the seats in the up position.

**A.12.2.5.5.1** Seats having reclining backs are assumed to be in their most upright position when unoccupied.

The term *aisle accessway* is defined in 3.3.11 as “the initial portion of an exit access that leads to an aisle.” Exhibit 12/13.44 illustrates the aisle accessways formed by rows of chairs. The space between each row of chairs (indicated by the arrows) is an aisle accessway.

The method for measuring the width of an aisle accessway formed by rows of chairs is illustrated in Exhibit 12/13.45. In Part (a) in Exhibit 12/13.45, the seats are not self-rising. In Part (b), the seats are self-rising, as detailed in 12/13.2.5.5.1(2).

## CHAPTER 13 • Existing

Per 12/13.2.5.4.6, if egress travel is possible in two directions, all portions of the aisle or aisle accessway must meet or exceed the minimum width required for any other portion of the aisle or aisle accessway. Generally, this prohibits aisles and aisle accessways from being hourglass shaped, allowing them to accommodate efficient egress travel that might have to reverse direction because of blockage at one end of the aisle or aisle accessway.

**13.2.5.5\* Aisle Accessways Serving Seating Not at Tables.**

**A.13.2.5.5** For purposes of the means of egress requirements of this *Code*, tablet-arm chair seating is not considered seating at tables. Dinner theater–style configurations are required to comply with the aisle accessway provisions applying to seating at tables and the aisle requirements of 13.2.5.6, if the aisles contain steps or are ramped. (See also 7.1.7 and A.7.1.7.2.)

**13.2.5.5.1\*** The required clear width of aisle accesses between rows of seating shall be determined as follows:

- (1) Horizontal measurements shall be made, between vertical planes, from the back of one seat to the front of the most forward projection of the seat immediately behind it.
- (2) Where the entire row consists of automatic- or self-rising seats that comply with ASTM F 851, *Standard Test Method for Self-Rising Seat Mechanisms*, the measurement shall be permitted to be made with the seats in the up position.

**A.13.2.5.5.1** Seats having reclining backs are assumed to be in their most upright position when unoccupied.

*Aisle accessways.*

Exhibit 12/13.45

Measurement of width of aisle accessway formed by rows of chairs.

**12.2.5.5.2** The aisle accessway between rows of seating shall have a clear width of not less than 12 in. (305 mm), and this minimum shall be increased as a function of row length in accordance with 12.2.5.5.4, 12.2.5.5.5, and 12.2.5.5.6.

**12.2.5.5.3** If used by not more than four persons, no minimum clear width shall be required for the portion of an aisle accessway having a length not exceeding 6 ft (1830 mm), measured from the center of the seat farthest from the aisle.

**12.2.5.5.4** The increase in aisle accessway width required by 12.2.5.5.2 shall not apply to grandstands, bleachers, and folding and telescopic seating, provided that the number of seats between the farthest seat and an aisle does not exceed that shown in Table 12.4.9.2.5

**12.2.5.5.5\*** Rows of seating served by aisles or doorways at both ends shall not exceed 100 seats per row.

**A.12.2.5.5.5** The system known as *continental seating* has one pair of egress doors provided for every five rows that is located close to the ends of the rows. In previous editions of the *Code*, such egress doors were required to provide a clear width of not less than 66 in. (1675 mm) discharging into a foyer, into a lobby, or to the exterior of the building. This continental seating arrangement can result in egress flow times (i.e., with nominal flow

**13.2.5.5.2** The aisle accessway between rows of seating shall have a clear width of not less than 12 in. (305 mm), and this minimum shall be increased as a function of row length in accordance with 13.2.5.5.4, 13.2.5.5.5, and 13.2.5.5.6.

**13.2.5.5.3** If used by not more than four persons, no minimum clear width shall be required for the portion of an aisle accessway having a length not exceeding 6 ft (1830 mm), measured from the center of the seat farthest from the aisle.

**13.2.5.5.4** The increase in aisle accessway width required by 13.2.5.5.2 shall not apply to grandstands, bleachers, and folding and telescopic seating, provided that the number of seats between the farthest seat and an aisle does not exceed that shown in Table 13.4.9.2.5.

**13.2.5.5.5\*** Rows of seating served by aisles or doorways at both ends shall not exceed 100 seats per row.

**A.13.2.5.5.5** The system known as *continental seating* has one pair of egress doors provided for every five rows that is located close to the ends of the rows. In previous editions of the *Code*, such egress doors were required to provide a clear width of not less than 66 in. (1675 mm) discharging into a foyer, into a lobby, or to the exterior of the building. This continental seating arrangement can result in egress flow times (i.e., with nominal flow

## CHAPTER 12 • New

times of approximately 100 seconds, rather than 200 seconds) that are approximately one-half as long as those resulting where side aisles lead to more remote doors. Such superior egress flow time performance is desirable in some situations; however, special attention should be given either to a comparably good egress capacity for other parts of the egress system or to sufficient space to accommodate queuing outside the seating space.

**12.2.5.5.5.1** The 12 in. (305 mm) minimum clear width of aisle accessway specified in [12.2.5.5.2](#) shall be increased by 0.3 in. (7.6 mm) for every seat over a total of 14 but shall not be required to exceed 22 in. (560 mm).

**12.2.5.5.5.2** The requirement of [12.2.5.5.5.1](#) shall not apply to smoke-protected assembly seating as permitted by [12.4.2.7](#).

**12.2.5.5.6** Rows of seating served by an aisle or doorway at one end only shall have a path of travel not exceeding 30 ft (9.1 m) in length from any seat to an aisle.

**12.2.5.5.6.1** The 12 in. (305 mm) minimum clear width of aisle accessway specified in [12.2.5.5.2](#) shall be increased by 0.6 in. (15 mm) for every seat over a total of seven.

**12.2.5.5.6.2** The requirements of [12.2.5.5.5](#) and [12.2.5.5.5.1](#) shall not apply to smoke-protected assembly seating as permitted by [12.4.2.8](#) and [12.4.2.9](#).

**12.2.5.5.7** Rows of seating using tablet-arm chairs shall be permitted only if the clear width of aisle accessways complies with the requirements of [12.2.5.5](#) when measured under one of the following conditions:

- (1) The clear width is measured with the tablet arm in the usable position.
- (2) The clear width is measured with the tablet arm in the stored position where the tablet arm automatically returns to the stored position when raised manually to a vertical position in one motion and falls to the stored position by force of gravity.

**12.2.5.5.8** The depth of seat boards shall be not less than 9 in. (230 mm) where the same level is not used for both seat boards and footboards.

**12.2.5.5.9** Footboards, independent of seats, shall be provided so that there is no horizontal opening that allows the passage of a ½ in. (13 mm) diameter sphere.

The text of [A.12/A.13.2.5.5.5](#) relates the expected egress flow time performance of continental seating, as addressed by the *Code* prior to 1988, to the egress flow time performance of the more flexible requirements for egress width related to capacity. See [Exhibit 12/13.46](#) for an example of continental seating. In

## CHAPTER 13 • Existing

times of approximately 100 seconds, rather than 200 seconds) that are approximately one-half as long as those resulting where side aisles lead to more remote doors. Such superior egress flow time performance is desirable in some situations; however, special attention should be given either to a comparably good egress capacity for other parts of the egress system or to sufficient space to accommodate queuing outside the seating space.

**13.2.5.5.5.1** The 12 in. (305 mm) minimum clear width of aisle accessway specified in [13.2.5.5.2](#) shall be increased by 0.3 in. (7.6 mm) for every seat over a total of 14 but shall not be required to exceed 22 in. (560 mm).

**13.2.5.5.5.2** The requirement of [13.2.5.5.5.1](#) shall not apply to smoke-protected assembly seating as permitted by [13.4.2.7](#).

**13.2.5.5.6** Rows of seating served by an aisle or doorway at one end only shall have a path of travel not exceeding 30 ft (9.1 m) in length from any seat to an aisle.

**13.2.5.5.7** The depth of seat boards shall be not less than 9 in. (230 mm) where the same level is not used for both seat boards and footboards.

**13.2.5.5.8** Footboards, independent of seats, shall be provided so that there is no horizontal opening that allows the passage of a ½ in. (13 mm) diameter sphere.

earlier editions of the *Code*, this arrangement was required where there were more than 14 seats in a row. A maximum of 100 seats was permitted for one row.

Currently, the *Code* permits design flexibility, based on the continental seating principle of variable minimum spacing for rows

CHAPTER 12 • New

Exhibit 12/13.46

Arrangement of seats and aisles with continental seating.

of seats and row length, using the provisions of 12/13.2.5.5.5.1. As reference points for each end of the spacing range, the newer requirement uses the previous 12 in. (305 mm) of clearance for rows up to 14 seats in length and 22 in. (560 mm) for rows over 47 seats in length. For example, rows with 47 seats require a clearance of 21.9 in. (555 mm). This clearance is calculated by subtracting 14 from 47 and multiplying the result, 33, by 0.3 in. (7.6 mm) to obtain 9.9 in. (250 mm), which is added to the 12 in. (305 mm) minimum aisle accessway width to obtain the total required clear aisle accessway width of 21.9 in. (555 mm). Because the aisle accessway width is not required to exceed 22 in. (560 mm), rows with 48 to 100 seats require 22 in. (560 mm) of clear aisle accessway width.

The current flexibility, which applies to all seating arranged in rows, is based on the assumption that the egress time required for a seating arrangement will be influenced more by the capacity of routes downstream from the rows of seating than by the rows' clear widths. Subsection 12/13.2.3 provides a standardized method for calculating the widths of those routes serving the space containing the seating. The combination of 12/13.2.3 and 12/13.2.5.5 offers designers of theaters, in particular, a great deal of flexibility in laying out blocks of seating while still requiring a standard of egress flow time performance that is based on traditionally accepted egress performance. Traditional performance, nominally about 200 seconds of flow time, is achieved through the application of specific requirements on aisle and cross-aisle design. For example, rows longer than 14 seats are permitted,

CHAPTER 13 • Existing

and egress door locations can be more flexibly determined than is permitted under the continental seating rules contained in previous Code editions.

Exhibit 12/13.47 illustrates the seating layout for a theater with 630 seats in a single unbroken area, with 21 rows ranging uniformly in length from 20 seats at row 1 to 40 seats at row 21. The required minimum aisle accessway clear width between the front row (with 20 seats) and the row behind it (with 21 seats) is 14.1 in. (360 mm), calculated as follows:

$$12 \text{ in.} + [(21 - 14 \text{ seats}) \times 0.3 \text{ in./seat}] = 12 + 2.1 = 14.1 \text{ in.}$$

or

$$305 \text{ mm} + [(21 - 14 \text{ seats}) \times 7.6 \text{ mm/seat}] = 305 + 53 \approx 360 \text{ mm}$$

The required minimum aisle accessway clear width between the back row (with 40 seats) and the row in front of it (with 39 seats) is 19.8 in. (505 mm), calculated as follows:

$$12 \text{ in.} + [(40 - 14 \text{ seats}) \times 0.3 \text{ in./seat}] = 12 + 7.8 = 19.8 \text{ in.}$$

or

$$305 \text{ mm} + [(40 - 14 \text{ seats}) \times 7.6 \text{ mm/seat}] = 305 + 198 \approx 505 \text{ mm}$$

Exhibit 12/13.47

Minimum aisle accessway clear widths.

## CHAPTER 12 • New

The designer has the option of making the clear widths of all aisle accessways uniform and at least 19.8 in. (505 mm) wide or progressively increasing them from 14.1 in. (360 mm) at the front to 19.8 in. (505 mm) at the back.

For the theater shown in [Exhibit 12/13.47](#), the option of a traditional layout can be used. The traditional arrangement is a maximum of 14 seats per row for rows served by aisles at both ends, and a maximum of 7 seats per row where the row is served by an aisle at only one end and abuts the wall at the other end. This layout would require that more space be devoted to aisles and cross aisles, but this lost space might be partly offset by the minimum 12 in. (305 mm) aisle accessway clear width permitted of such rows of seating.

In a seating row served by an aisle at one end only, the occupant of the seat farthest from the aisle must be able to reach the aisle with not more than 30 ft (9.1 m) of aisle accessway travel in accordance with [12/13.2.5.5.5](#). [Exhibit 12/13.48](#) illustrates a seating row served by an aisle at one end only where, upon reaching the aisle, it is not immediately possible to move in either of two egress directions because of the obstruction to egress created by the rear wall of the room. The aisle accessway (point X to point Y) cannot exceed 30 ft (9.1 m). However, upon reaching the aisle, the common path of travel measurement does not end; it continues to point Z, which is the first point at which travel in two independent directions becomes possible. Per [12/13.2.5.1.2](#), the common path of travel (point X to point Z) is permitted to be

Exhibit 12/13.48

Maximum 30 ft (9.1 m) aisle accessway length (point X to point Y) for seating row served by aisle at one end only.

### 12.2.5.6 Aisles Serving Seating Not at Tables.

#### 12.2.5.6.1 General.

**12.2.5.6.1.1** Aisles shall be provided so that the number of seats served by the nearest aisle is in accordance with [12.2.5.5.2](#) through [12.2.5.5.5](#), unless otherwise permitted by [12.2.5.6.1.2](#).

## CHAPTER 13 • Existing

75 ft (23 m), because the area served does not exceed 50 persons (in this case, 28 occupants, based on two rows of seats with 14 seats per row).

In rows of tablet-arm chairs on which the tablet arms are fixed in the in-use position, the chairs must be arranged to meet the row spacing requirements of [12/13.2.5.5](#). [Exhibit 12/13.49](#) illustrates this provision.

Although the clear space between the back of a seat and the leading edge of the tablet arm of a chair located behind that seat varies, depending on row length, in accordance with the requirements of [12/13.2.5.5](#), the clear space cannot be less than 12 in. (305 mm). [Paragraph 12/13.2.5.5.7](#) addresses tablet-arm chairs with self-storing tablet arms, which present little threat to life safety.

Exhibit 12/13.49

Minimum spacing between rows of seats with fixed tablet arms.

### 13.2.5.6 Aisles Serving Seating Not at Tables.

#### 13.2.5.6.1 General.

**13.2.5.6.1.1** Aisles shall be provided so that the number of seats served by the nearest aisle is in accordance with [13.2.5.5.2](#) through [13.2.5.5.5](#), unless otherwise permitted by [13.2.5.6.1.2](#).

## CHAPTER 12 • New

**12.2.5.6.1.2** Aisles shall not be required in bleachers, provided that all of the following conditions are met:

- (1) Egress from the front row shall not be obstructed by a rail, a guard, or other obstruction.
- (2) The row spacing shall be 28 in. (710 mm) or less.
- (3) The rise per row, including the first row, shall be 6 in. (150 mm) or less.
- (4) The number of rows shall not exceed 16.
- (5) The seat spaces shall not be physically defined.
- (6) Seat boards that are also used as stepping surfaces for descent shall provide a walking surface with a width not less than 12 in. (305 mm), and, where a depressed footboard exists, the gap between seat boards of adjacent rows shall not exceed 12 in. (305 mm), measured horizontally.
- (7) The leading edges of seat boards used as stepping surfaces shall be provided with a contrasting marking stripe so that the location of the leading edge is readily apparent, particularly where viewed in descent, and the following shall also apply:
  - (a) The marking stripe shall be not less than 1 in. (25 mm) wide and shall not exceed 2 in. (51 mm) in width.
  - (b) The marking stripe shall not be required where bleacher surfaces and environmental conditions, under all conditions of use, are such that the location of each leading edge is readily apparent, particularly when viewed in descent.

**12.2.5.6.2 Dead-End Aisles.** Dead-end aisles shall not exceed 20 ft (6100 mm) in length, unless otherwise permitted by one of the following:

- (1) A dead-end aisle shall be permitted to exceed 20 ft (6100 mm) in length where seats served by the dead-end aisle are not more than 24 seats from another aisle, measured along a row of seats having a clear width of not less than 12 in. (305 mm) plus 0.6 in. (15 mm) for each additional seat over a total of 7 in the row.
- (2) A 16-row, dead-end aisle shall be permitted in folding and telescopic seating and grandstands.
- (3) Aisle termination in accordance with [12.4.2.11](#) for smoke-protected assembly seating shall be permitted.

Bleacher seating, as addressed in [12/13.2.5.6.1.2](#), does not have seat backs. Provided that the row-to-row dimension does not exceed 28 in. (710 mm) and egress is not restricted from the front of the bleacher, occupants can effectively walk on the seating surfaces and not rely on aisles.

**Paragraph 12/13.2.5.6.2(1)** formally recognizes the inherent redundancy that exists where a block of seating rows is served

## CHAPTER 13 • Existing

**13.2.5.6.1.2** Aisles shall not be required in bleachers, provided that all of the following conditions are met:

- (1) Egress from the front row shall not be obstructed by a rail, a guard, or other obstruction.
- (2) The row spacing shall be 28 in. (710 mm) or less.
- (3) The rise per row, including the first row, shall be 6 in. (150 mm) or less.
- (4) The number of rows shall not exceed 16.
- (5) The seat spaces shall not be physically defined.
- (6) Seat boards that are also used as stepping surfaces for descent shall provide a walking surface with a width of not less than 12 in. (305 mm), and, where a depressed footboard exists, the gap between seat boards of adjacent rows shall not exceed 12 in. (305 mm), measured horizontally.
- (7) The leading edges of seat boards used as stepping surfaces shall be provided with a contrasting marking stripe so that the location of the leading edge is readily apparent, particularly where viewed in descent, and the following shall also apply:
  - (a) The marking stripe shall be not less than 1 in. (25 mm) wide and shall not exceed 2 in. (51 mm) in width.
  - (b) The marking stripe shall not be required where bleacher surfaces and environmental conditions, under all conditions of use, are such that the location of each leading edge is readily apparent, particularly when viewed in descent.

**13.2.5.6.2 Dead-End Aisles.** Dead-end aisles shall not exceed 20 ft (6100 mm) in length, unless otherwise permitted by one of the following:

- (1) A dead-end aisle shall be permitted to exceed 20 ft (6100 mm) in length where seats served by the dead-end aisle are not more than 24 seats from another aisle, measured along a row of seats having a clear width of not less than 12 in. (305 mm) plus 0.6 in. (15 mm) for each additional seat over a total of 7 in the row.
- (2) A 16-row, dead-end aisle shall be permitted in folding and telescopic seating and grandstands.
- (3) Aisle termination in accordance with [13.4.2.11](#) for smoke-protected assembly seating shall be permitted.
- (4) Bleacher aisles in accordance with [13.2.3.5](#) shall not be considered as dead-end aisles.

by more than one aisle, so that the problem created by the blockage of any one aisle can be mitigated by greater movement along rows to reach a more distant aisle. The exemption recognizes that movement along rows (even with the constricted row widths) provides many routes that permit faster movement to alternative aisles than would be possible with a dedicated cross aisle. This exemption is useful in arenas and the-

## CHAPTER 12 • New

aters where it is not easy to provide a cross aisle or a door at the end of an aisle, but where it is relatively easy to reach a remote aisle and its associated exit by moving along the aisle accessways created by the seating rows. Note that 12/13.2.5.6.2(1)

**12.2.5.6.3\* Minimum Aisle Width.** The minimum clear width of aisles shall be sufficient to provide egress capacity in accordance with 12.2.3.1 but shall be not less than the following:

- (1) 48 in. (1220 mm) for stairs having seating on each side, or 36 in. (915 mm) where the aisle does not serve more than 50 seats
- (2) 36 in. (915 mm) for stairs having seating on only one side
- (3) 23 in. (585 mm) between a handrail and seating, or between a guardrail and seating where the aisle is subdivided by a handrail
- (4) 42 in. (1065 mm) for level or ramped aisles having seating on both sides, or 36 in. (915 mm) where the aisle does not serve more than 50 seats
- (5) 36 in. (915 mm) for level or ramped aisles having seating on only one side
- (6) 23 in. (585 mm) between a handrail or a guardrail and seating where the aisle does not serve more than five rows on one side

**A.12.2.5.6.3** It is the intent to permit handrails to project not more than 3½ in. (90 mm) into the clear width of aisles required by 12.2.5.6.3.

Where the minimum aisle width specified by 12/13.2.5.6.3 is wider than that calculated for a required egress capacity, as is often the case, the width specified by 12/13.2.5.6.3 is the minimum required width. The requirements of 12/13.2.5.6.3 take into account the width needed by individuals moving alone or with others, overtaking others, and moving in counterflow past others on aisles. Differing movement behavior and the need for handrails on different walking surfaces, such as stepped aisles versus level aisles, are considered. Exhibit 12/13.50 shows how intensively an aisle stair subdivided by a center handrail can be used. Exhibit 12/13.51 shows an overhead view of a large male walking down a similar aisle stair.

Paragraph 12/13.2.5.6.3(6) is based on the requirement for handrails in aisle stairs. It specifically addresses the allowance for extending such handrails down the center of aisles for as many as five rows, leaving only about 23 in. (585 mm) of nominal width clear to the side of the handrail. This width is readily used by

## CHAPTER 13 • Existing

requires increased aisle accessway clear width to facilitate travel along the seating rows to reach alternative aisles. At the row length limit of 24 seats, the required aisle accessway clear width for use of this exemption is 22.2 in. (565 mm).

**13.2.5.6.3\* Minimum Aisle Width.** The minimum clear width of aisles shall be sufficient to provide egress capacity in accordance with 13.2.3.1 but shall be not less than the following:

- (1) 42 in. (1065 mm) for stairs having seating on each side, except that the minimum clear width shall be permitted to be not less than 30 in. (760 mm) for catchment areas having not more than 60 seats
- (2) 36 in. (915 mm) for stairs having seating on only one side, or 30 in. (760 mm) for catchment areas having not more than 60 seats
- (3) 20 in. (510 mm) between a handrail and seating or between a guardrail and seating where the aisle is subdivided by a handrail
- (4) 42 in. (1065 mm) for level or ramped aisles having seating on both sides, except that the minimum clear width shall be not less than 30 in. (760 mm) for catchment areas having not more than 60 seats
- (5) 36 in. (915 mm) for level or ramped aisles having seating on only one side, or 30 in. (760 mm) for catchment areas having not more than 60 seats
- (6) 23 in. (585 mm) between a handrail or a guardrail and seating where the aisle does not serve more than five rows on one side

**A.13.2.5.6.3** It is the intent to permit handrails to project not more than 3½ in. (90 mm) into the clear width of aisles required by 13.2.5.6.3.

Exhibit 12/13.50

## CHAPTER 12 • New

Exhibit 12/13.51

Overhead view of aisle stair with center handrail. (Photo courtesy of Jake Pauls)

#### 12.2.5.6.4 Aisle Stairs and Aisle Ramps.

**12.2.5.6.4.1\*** The following shall apply to aisle stairs and aisle ramps:

- (1) Aisles having a gradient steeper than 1 in 20, but not steeper than 1 in 8, shall consist of an aisle ramp.
- (2) Aisles having a gradient steeper than 1 in 8 shall consist of an aisle stair.

**A.12.2.5.6.4.1** Technical information about the convenience and safety of ramps and stairs having gradients in the region of 1 in 8 clearly suggests that the goal should be slopes for ramps that are less steep and combinations of stair risers and treads that are, for example, superior to 4 in. (100 mm) risers and 32 in. (865 mm) treads. This goal should be kept in mind by designers in establishing the gradient of seating areas to be served by aisles.

**12.2.5.6.4.2** Aisle stairs shall comply with 7.2.2 except as otherwise addressed by this chapter.

**12.2.5.6.4.3** Table 7.2.2.2.1.1(a) and Table 7.2.2.2.1.1(b) shall not apply to aisle stairs.

## CHAPTER 13 • Existing

individuals moving in single or staggered file and can be used with tolerable inconvenience where people must pass each other on the same side of the handrail. This provision of the Code might be useful in cases where a short stub aisle is needed to serve rows of seating immediately beside a vomitory.

Generally, the effective width of aisles is often somewhat wider than is necessary for egress stairs or corridors that are bounded on both sides by wall construction. One important exception to this generalization occurs where many people are attempting to sit on undivided benches or bleachers served by an aisle. The 18 in. (455 mm) spacing usually provided for each person is often too small, and there is a natural tendency for people to extend their legs, hips, and shoulders into a significant part of the aisle width. Therefore, it is prudent when designing for crowded, nonchair seating to increase either the width of the seat per person or the minimum aisle widths to facilitate normal circulation in the aisles under nonemergency conditions. It is expected that the individuals encroaching on the aisle width will stand and move during emergency egress so as to restore the aisle to its full, required egress width.

#### 13.2.5.6.4 Aisle Stairs and Aisle Ramps.

**13.2.5.6.4.1\*** The following shall apply to aisle stairs and aisle ramps:

- (1) Aisles having a gradient steeper than 1 in 20, but not steeper than 1 in 8, shall consist of an aisle ramp.
- (2) Aisles having a gradient steeper than 1 in 8 shall consist of an aisle stair.

**A.13.2.5.6.4.1** Technical information about the convenience and safety of ramps and stairs having gradients in the region of 1 in 8 clearly suggests that the goal should be slopes for ramps that are less steep and combinations of stair risers and treads that are, for example, superior to 4 in. (100 mm) risers and 32 in. (865 mm) treads. This goal should be kept in mind by designers in establishing the gradient of seating areas to be served by aisles.

**13.2.5.6.4.2** Aisle stairs, other than approved existing aisle stairs, shall comply with 7.2.2 except as otherwise addressed by this chapter.

**13.2.5.6.4.3** Table 7.2.2.2.1.1(a) and Table 7.2.2.2.1.1(b) shall not apply to aisle stairs.

## CHAPTER 12 • New

**12.2.5.6.5 Aisle Stair Treads.** Aisle stair treads shall meet all of the following criteria:

- (1) There shall be no variation in the depth of adjacent treads that exceeds  $\frac{3}{16}$  in. (4.8 mm), unless otherwise permitted by 12.2.5.6.5(2).
- (2) Construction-caused nonuniformities in tread depth shall be permitted, provided that both of the following criteria are met:
  - (a) The nonuniformity does not exceed  $\frac{3}{8}$  in. (10 mm).
  - (b) The aisle tread depth is 22 in. (560 mm) or greater.
- (3)\* Tread depth shall be not less than 11 in. (280 mm).

**A.12.2.5.6.5(3)** Tread depth is more important to stair safety than is riser height. Therefore, in cases where the seating area gradient is less than 5 in 11, it is recommended that the tread dimension be increased beyond 11 in. (280 mm), rather than reducing the riser height. Where the seating area gradient exceeds 8 in 11, it is recommended that the riser height be increased while maintaining a tread depth of not less than 11 in. (280 mm).

- (4) All treads shall extend the full width of the aisle.

## CHAPTER 13 • Existing

**13.2.5.6.4.4** The limitation on height between landings in Table 7.2.5.3(a) and Table 7.2.5.3(b) shall not apply to aisle ramps and landings.

**13.2.5.6.5 Aisle Stair Treads.** Aisle stair treads shall meet all of the following criteria:

- (1) There shall be no variation in the depth of adjacent treads that exceeds  $\frac{3}{16}$  in. (4.8 mm), unless otherwise permitted by 13.2.5.6.5(2), (5), or (6).
- (2) Construction-caused nonuniformities in tread depth shall be permitted, provided that both of the following criteria are met:
  - (a) The nonuniformity does not exceed  $\frac{3}{8}$  in. (10 mm).
  - (b) The aisle tread depth is 22 in. (560 mm) or greater.
- (3)\* Tread depth shall be not less than 11 in. (280 mm).

**A.13.2.5.6.5(3)** Tread depth is more important to stair safety than is riser height. Therefore, in cases where the seating area gradient is less than 5 in 11, it is recommended that the tread dimension be increased beyond 11 in. (280 mm), rather than reducing the riser height. Where the seating area gradient exceeds 8 in 11, it is recommended that the riser height be increased while maintaining a tread depth of not less than 11 in. (280 mm).

- (4) All treads shall extend the full width of the aisle.
- (5)\* In aisle stairs where a single intermediate tread is provided halfway between seating platforms, such intermediate treads shall be permitted to be of a relatively smaller but uniform depth but shall be not less than 13 in. (330 mm).

**A.13.2.5.6.5(5)** Completely uniform tread dimensions are preferred over aisle stair designs where tread depths alternate between relatively small intermediate treads between seating platforms and relatively large treads at seating platforms. A larger tread that is level with the seating platform is not needed to facilitate easy access to, and egress from, a row of seating. If this arrangement is used, it is important to provide a tread depth that is better than minimum for the intermediate tread; hence, 13 in. (330 mm) is specified. Where nonuniformities exist due to construction tolerance, they should not exceed  $\frac{3}{16}$  in. (4.8 mm) between adjacent treads.

- (6) All of the following shall apply to grandstands, bleachers, and folding and telescopic seating:
  - (a) Steps shall not be required to be provided in aisles to overcome differences in level unless the gradient exceeds 1 unit of rise in 10 units of run.
  - (b) Where the rise of the seating platform exceeds 11 in. (280 mm), an intermediate step shall be provided for the full width of the aisle and shall be proportioned to provide two steps of equal rise per platform.

## CHAPTER 12 • New

The provisions of 12/13.2.5.6.4 refer to a ramp's counterpart to an aisle stair as an *aisle ramp*, rather than a *ramp*.

The requirements of 12/13.2.5.6.4 address the need to design aisle stairs and aisle ramps, for example, with all the attention and care required for stairs and ramps in general, plus additional care due to the unique design and use conditions encountered with aisles serving seating arranged in rows. Extra attention is especially necessary where large elevation differences exist between the rows of seating. Paragraph 12/13.2.5.6.4.1(1) addresses aisles in terms of steepness. Ideally, designing aisle ramps with a gradient of approximately 1 in 8 is to be avoided; however, sight lines might dictate the use of such aisle ramp slopes in some situations. These aisle ramps are relatively steep and problematic for people with walking difficulties. Stairs with a very small rise and long treads also present problems, notably trips and missteps, because the presence of low-height risers might not be evident, especially when a crowd is present. Generally, people using aisle stairs are also distracted because of the unusual aisle length, the presence of other people in the aisles, and the presence of those entering the aisles from adjoining seating rows. Therefore, aisle stairs must be designed with considerable care and attention to human factors.

Allowing unequal-sized treads within aisle stairs, a practice previously believed to be useful in facilitating access to seat rows, is not permitted by the *Code* for new assembly occupancies. Even with the increased minimum tread size requirement of older editions of the *Code*, the end result (larger treads at the seat row entry level and smaller intermediate treads between seat row levels) was not as beneficial in terms of stair safety as that provided by consistently sized treads. The desirability of uniformly sized treads holds even for treads as large as 20 in. (510 mm) in depth (assuming a relatively low riser height). Handrails (required by 12/13.2.5.6.9) help to compensate for the stretched but consistent stride length that might be needed in such long-tread aisle stairs. It is preferable to keep treads uniform, so that the risk of misstepping, particularly the risk of overstepping on relatively smaller treads, is reduced.

For existing aisle stairs, 13.2.5.6.5(5) continues to recognize an intermediate tread between seating platforms but requires that the intermediate treads be uniform in depth and at least 13 in. (330 mm) deep. This exaggerated depth makes the

## CHAPTER 13 • Existing

- (c) Where the rise of the seating platform exceeds 18 in. (455 mm), two intermediate steps for the full width of the aisle shall be provided and proportioned to provide three steps of equal rise per platform that are uniform and not less than 9 in. (230 mm).
- (d) The full length of the nose of each step in the aisle, as required by 13.2.5.6.5(6)(c), shall be conspicuously marked.

intermediate tread more obvious and provides a deep surface on which users place their feet. Exhibit 12/13.52 shows an aisle stair with intermediate treads between seating platforms where the tread depth of the intermediate treads is less than the tread depth at the seating platforms. Exhibit 12/13.53 shows an aisle stair where the intermediate treads have the same tread depth as the seating platform treads.

Special attention must be given to careful design detailing and construction practice in relation to the placement of treads in aisle stairs. Careful site supervision is recommended to avoid serious problems both in cast-in-place concrete construction and in precast concrete construction of aisle stairs. Field research

studies of situations where aisle step dimensions are not consistent indicate that the incidence of missteps rises significantly where tolerances of tread uniformity exceed those specified by 12/13.2.5.6.5.

Paragraph 12/13.2.5.6.5(2) recognizes that construction-caused nonuniformities are unavoidable. It limits such construction-caused nonuniformities to  $\frac{3}{8}$  in. (10 mm) and compensates to avoid misstepping by increasing the tread depth to a minimum of 22 in. (560 mm). The increased tread depth will cause most users to change their stepping cadence over that used on stairs with the traditional 11 in. (280 mm) tread depth. The

**12.2.5.6.6 Aisle Stair Risers.** Aisle stair risers shall meet all of the following criteria:

- (1) Riser heights shall be not less than 4 in. (100 mm) in aisle stairs, unless aisle stairs are those in folding and telescopic seating.
- (2) The riser height of aisle stairs in folding and telescopic seating shall be permitted to be not less than 3½ in. (90 mm).
- (3) Riser heights shall not exceed 8 in. (205 mm), unless otherwise permitted by 12.2.5.6.6(4) or 12.2.5.6.6(5).

Exhibit 12/13.54

change in cadence should help to heighten the stair user's awareness of nonuniformities in tread depth. Exhibit 12/13.54 shows inspection for uniformity in the installation of precast concrete seating sections at the time of stadium construction.

If treads do not extend the full width of the aisle, a pocket (or drop-off) might occur between the side edge of the tread and the side edge of the seat nearest the aisle. The requirement of 12/13.2.5.6.5(4), that treads extend the full width of the aisle, is intended to avoid such drop-offs and prevent missteps and falls.

**13.2.5.6.6 Aisle Stair Risers.** Aisle stair risers shall meet the following criteria:

- (1) Riser heights shall be not less than 4 in. (100 mm) in aisle stairs, unless aisle stairs are those in folding and telescopic seating.
- (2) The riser height of aisle stairs in folding and telescopic seating shall be permitted to be not less than 3½ in. (90 mm).
- (3) Riser heights shall not exceed 8 in. (205 mm), unless otherwise permitted by 13.2.5.6.6(4) or 13.2.5.6.6(5).

## CHAPTER 12 • New

- (4) The riser height of aisle stairs in folding and telescopic seating shall be permitted to be not more than 11 in. (280 mm).
- (5) Where the gradient of an aisle is steeper than 8 in. (205 mm) in rise in 11 in. (280 mm) of run for the purpose of maintaining necessary sight lines in the adjoining seating area, the riser height shall be permitted to exceed 8 in. (205 mm) but shall not exceed 9 in. (230 mm).
- (6) Riser heights shall be designed to be uniform in each aisle, and the construction-caused nonuniformities shall not exceed  $\frac{3}{16}$  in. (4.8 mm) between adjacent risers, unless the conditions of 12.2.5.6.6(7) or 12.2.5.6.6(8) are met.
- (7) Riser height shall be permitted to be nonuniform where both of the following criteria are met:
  - (a) The nonuniformity shall be only for the purpose of accommodating changes in gradient necessary to maintain sight lines within a seating area, in which case the nonuniformity shall be permitted to exceed  $\frac{3}{16}$  in. (4.8 mm) but shall not be greater than  $\frac{1}{2}$  in. (13 mm) between adjacent risers.
  - (b) **Reserved.**
  - (c) Where nonuniformities exceed  $\frac{3}{16}$  in. (4.8 mm) between adjacent risers, the exact location of such nonuniformities shall be indicated by a distinctive marking stripe on each tread at the nosing or leading edge adjacent to the nonuniform risers.
- (8) Construction-caused nonuniformities in riser height shall be permitted to exceed  $\frac{3}{16}$  in. (4.8 mm) where all of the following criteria are met:
  - (a) The riser height shall be designed to be nonuniform.
  - (b) The construction-caused nonuniformities shall not exceed  $\frac{3}{8}$  in. (10 mm) where the aisle tread depth is less than 22 in. (560 mm).
  - (c) The construction-caused nonuniformities shall not exceed  $\frac{3}{4}$  in. (19 mm) where the aisle tread depth is 22 in. (560 mm) or greater.
  - (d) Where nonuniformities exceed  $\frac{3}{16}$  in. (4.8 mm) between adjacent risers, the exact location of such nonuniformities shall be indicated by a distinctive marking stripe on each tread at the nosing or leading edge adjacent to the nonuniform risers.

**12.2.5.6.7 Aisle Stair Profile.** Aisle stairs shall comply with all of the following:

- (1) Aisle risers shall be vertical or sloped under the tread projection at an angle not to exceed 30 degrees from vertical.
- (2) Tread projection not exceeding  $1\frac{1}{2}$  in. (38 mm) shall be permitted.

## CHAPTER 13 • Existing

- (4) The riser height of aisle stairs in folding and telescopic seating shall be permitted to be not more than 11 in. (280 mm).
- (5) Where the gradient of an aisle is steeper than 8 in. (205 mm) in rise in 11 in. (280 mm) of run for the purpose of maintaining necessary sight lines in the adjoining seating area, the riser height shall be permitted to exceed 8 in. (205 mm) but shall not exceed 11 in. (280 mm).
- (6) Riser heights shall be designed to be uniform in each aisle, and the construction-caused nonuniformities shall not exceed  $\frac{3}{16}$  in. (4.8 mm) between adjacent risers, unless the conditions of 13.2.5.6.6(7) or 13.2.5.6.6(8) are met.
- (7) Riser height shall be permitted to be nonuniform where all of the following criteria are met:
  - (a) The nonuniformity shall be only for the purpose of accommodating changes in gradient necessary to maintain sight lines within a seating area, in which case the nonuniformity shall be permitted to exceed  $\frac{3}{16}$  in. (4.8 mm) but shall not be greater than  $\frac{1}{2}$  in. (13 mm) between adjacent risers.
  - (b) Approved existing nonuniformities for the purpose of accommodating changes in gradient necessary to maintain sight lines within a seating area shall be permitted.
  - (c) Where nonuniformities exceed  $\frac{3}{16}$  in. (4.8 mm) between adjacent risers, the exact location of such nonuniformities shall be indicated by a distinctive marking stripe on each tread at the nosing or leading edge adjacent to the nonuniform risers.
- (8) Construction-caused nonuniformities in riser height shall be permitted to exceed  $\frac{3}{16}$  in. (4.8 mm) where all of the following criteria are met:
  - (a) The riser height shall be designed to be nonuniform.
  - (b) The construction-caused nonuniformities shall not exceed  $\frac{3}{8}$  in. (10 mm) where the aisle tread depth is less than 22 in. (560 mm).
  - (c) The construction-caused nonuniformities shall not exceed  $\frac{3}{4}$  in. (19 mm) where the aisle tread depth is 22 in. (560 mm) or greater.
  - (d) Where nonuniformities exceed  $\frac{3}{16}$  in. (4.8 mm) between adjacent risers, the exact location of such nonuniformities shall be indicated by a distinctive marking stripe on each tread at the nosing or leading edge adjacent to the nonuniform risers.

**13.2.5.6.7 Aisle Stair Profile.** Aisle stairs shall comply with all of the following:

- (1) Aisle risers shall be vertical or sloped under the tread projection at an angle not to exceed 30 degrees from vertical.
- (2) Tread projection not exceeding  $1\frac{1}{2}$  in. (38 mm) shall be permitted.

## CHAPTER 12 • New

- (3) Tread projection shall be uniform in each aisle, except as otherwise permitted by 12.2.5.6.7(4).
- (4) Construction-caused projection nonuniformities not exceeding ¼ in. (6.4 mm) shall be permitted.

At the minimum slope for which the *Code* requires the use of aisle stairs (i.e., slopes steeper than 1 in 8 for which an aisle ramp would be too steep for safe, general use), there is a riser height of 4 in. (100 mm) for which the seat platform is 32 in. (810 mm) deep. At such low riser heights, which present a tripping hazard if people do not detect the risers, the tread nosing marking requirement in 12/13.2.5.6.10 is especially significant.

Editions of the *Code* prior to 1988 permitted new aisle stairs to have a maximum riser height of 11 in. (280 mm). Current editions of the *Code* limit the maximum riser height for new aisle stairs to 9 in. (230 mm). In addition to reducing movement safety, the unusually high risers of some aisle stairs reduce the speed and efficiency of movement, especially in the descending direction. This is taken into account in 12/13.2.3.3 where, for each additional 1 in. (25 mm) of riser height above 7 in. (178 mm), an additional 20 percent must be added to the required capacity-related width of the aisle to satisfy *Code* requirements and achieve an acceptable egress flow time performance.

A special case is made for severely nonuniform riser heights [those beyond the usual ⅜ in. (4.8 mm) tolerance] in situations where there is a break in the slope of a seating deck to maintain adequate sight lines. The seating deck slope might change incrementally at each row, or, more commonly, a large change might occur at one or more locations. At such locations, there is often a

**12.2.5.6.8 Aisle Landings.** Where the path of travel on a stair, an aisle stair, or aisle ramp continues to another stair of different rise or tread depth, another aisle stair of different rise or tread depth, or another aisle ramp of different slope, there shall be a landing whose depth is equal to or greater than the width of the aisle stair or ramp, unless otherwise permitted by one of the following:

- (1) No landing shall be required within aisle stairs with nonuniform risers, as permitted by 12.2.5.6.6(7).
- (2) No landing shall be required between aisle ramps of different slopes.
- (3) No landing shall be required between an aisle ramp and an aisle accessway or between an aisle stair and an aisle accessway.
- (4) A minimum 30 in. (760 mm) deep landing shall be permitted between an aisle stair and a stair with the same tread depths or between an aisle stair and another aisle stair with the same tread depths.

## CHAPTER 13 • Existing

- (3) Tread projection shall be uniform in each aisle, except as otherwise permitted by 13.2.5.6.7(4).
- (4) Construction-caused projection nonuniformities not exceeding ¼ in. (6.4 mm) shall be permitted.

change in the row-to-row elevation that greatly exceeds the ⅜ in. (4.8 mm) tolerance. Aisle step riser heights will, as a consequence, change radically at this point. It is the duty of the designer and owner to alert people using the aisle to this unusual change in the riser dimensions. The required marking at each tread is addressed in 12/13.2.5.6.6(7)(c).

Construction-caused nonuniformities in riser height are permitted to exceed ⅜ in. (4.8 mm) in accordance with 12/13.2.5.6.6(8). The nonuniformity is permitted to be ¾ in. (19 mm) where the tread depth is exaggerated to a minimum 22 in. (560 mm). The increased tread depth will cause most users to change their stepping cadence compared to that used on stairs with the traditional 11 in. (280 mm) tread depth. The change in cadence should help to heighten the stair user's awareness of nonuniformities in riser height. Note that 13.2.5.6.6(7)(b) permits existing nonuniformities in riser height that exceed the tolerances specified in 13.2.5.6.6(7)(a) to be continued in use if approved.

The aisle stair profile provisions of 12/13.2.5.6.7 have been in the *Code* since the 2006 edition. The profile is impacted by the construction tolerance for the seating units, so the criteria are intended to complete the provisions related to construction-caused nonuniformities addressed in 12/13.2.5.6.5(2) and 12/13.2.5.6.6(8).

**13.2.5.6.8 Aisle Landings.** Where the path of travel on a stair, an aisle stair, or aisle ramp continues to another stair of different rise or tread depth, another aisle stair of different rise or tread depth, or another aisle ramp of different slope, there shall be a landing whose depth is equal to or greater than the width of the aisle stair or ramp, unless otherwise permitted by one of the following:

- (1) No landing shall be required within aisle stairs with nonuniform risers as permitted by 13.2.5.6.6(7).
- (2) No landing shall be required between aisle ramps of different slopes.
- (3) No landing shall be required between an aisle ramp and an aisle accessway or between an aisle stair and an aisle accessway.
- (4) A minimum 30 in. (760 mm) deep landing shall be permitted between an aisle stair and a stair with the same tread depths or between an aisle stair and another aisle stair with the same tread depths.

## CHAPTER 12 • New

- (5) A minimum 30 in. (760 mm) deep landing shall be permitted between an aisle stair and a stair with greater tread depth in the descending direction and between an aisle stair and another aisle stair with greater tread depth in the descending direction.
- (6) A minimum 30 in. (760 mm) deep landing shall be permitted between an aisle stair and a stair with less tread depth in the descending direction and between an aisle stair and another aisle stair with less tread depth in the descending direction.
- (7) A minimum 22 in. (560 mm) deep landing shall be permitted between an aisle ramp and a stair and between an aisle ramp and an aisle stair.
- (8) No landing depth shall be required to exceed 48 in. (1220 mm).

The provisions of 12/13.2.5.6.8 are new to the 2015 edition of the Code. The provisions require landings along a travel path whenever any of the following conditions occur:

1. A stair transitions to another stair of different riser height
2. A stair transitions to another stair of different tread depth
3. A stair transitions to another stair of different riser height and different tread depth
4. A stair transitions to an aisle stair of different riser height
5. A stair transitions to an aisle stair of different tread depth
6. A stair transitions to an aisle stair of different riser height and different tread depth
7. An aisle stair transitions to another aisle stair of different riser height
8. An aisle stair transitions to another aisle stair of different tread depth
9. An aisle stair transitions to another aisle stair of different riser height and different tread depth
10. An aisle stair transitions to a stair of different riser height
11. An aisle stair transitions to a stair of different tread depth
12. An aisle stair transitions to a stair of different riser height and different tread depth
13. A stair transitions to an aisle ramp
14. An aisle stair transitions to an aisle ramp
15. An aisle ramp transitions to a stair
16. An aisle ramp transitions to an aisle stair

Any of the sixteen conditions listed above creates a change to the travel path that might cause occupants to misstep, trip, or fall.

#### 12.2.5.6.9\* Aisle Handrails.

**A.12.2.5.6.9** Failure to provide a handrail within a 30 in. (760 mm) horizontal distance of all required portions of the aisle stair width means that the egress capacity calculation is required to be modified as specified by 12.2.3.3(3). This modification

## CHAPTER 13 • Existing

- (5) A minimum 30 in. (760 mm) deep landing shall be permitted between an aisle stair and a stair with greater tread depth in the descending direction and between an aisle stair and another aisle stair with greater tread depth in the descending direction.
- (6) A minimum 30 in. (760 mm) deep landing shall be permitted between an aisle stair and a stair with less tread depth in the descending direction and between an aisle stair and another aisle stair with less tread depth in the descending direction.
- (7) A minimum 22 in. (560 mm) deep landing shall be permitted between an aisle ramp and a stair and between an aisle ramp and an aisle stair.
- (8) No landing depth shall be required to exceed 48 in. (1220 mm).
- (9) Approved existing installations shall be permitted.

A level landing serves as a safer transition, because occupants — upon recognizing a landing before they move onto it — change their movement to accommodate the landing. Similarly, they recognize the next segment of their travel path to be something different than a landing and change their movement to accommodate the specifics of the next travel component encountered.

The depth of the landing is required to be equal to or greater than the width of the stair or ramp, but that requirement is relaxed by the provisions of 12/13.2.5.6.8(3) through (8). The conditions of 12/13.2.5.6.8(4) through (6), permitting the required landing not to have to exceed 30 in. (760 mm) in depth, could be reduced to one exemption covering the three cases cited. The technical committee chose to present 12/13.2.5.6.8(4) through (6) as three separate exemptions to permit the 30 in. (760 mm) criterion in any of the three provisions to be easily changed in a future revision cycle, should that be necessary after users gain experience with the requirement for landings.

Note that the text of 12/13.2.5.6.8 addresses what could be a seventeenth condition in the list above — an aisle ramp transitions to another aisle ramp of different slope. Such condition is exempted from the landing requirement by 12/13.2.5.6.8(2).

Lastly, the provision of 12/13.2.5.6.8(1) exempts aisle stairs with nonuniform riser heights, as might be found in parabolic-shaped seating bowls, from the requirement to provide landings.

#### 13.2.5.6.9\* Aisle Handrails.

**A.13.2.5.6.9** Failure to provide a handrail within a 30 in. (760 mm) horizontal distance of all required portions of the aisle stair width means that the egress capacity calculation is required to be modified as specified by 13.2.3.3(3). This modification

## CHAPTER 12 • New

might lead to an increase in the aisle width. Although this increase will compensate for reduced egress efficiency, it does not help individuals walking on such portions of stairs to recover from missteps, other than by possibly marginally reducing the crowding that might exacerbate the problem of falls. (See also 7.2.2.4.)

**12.2.5.6.9.1** Ramped aisles having a gradient exceeding 1 in 20 and aisle stairs shall be provided with handrails at one side or along the centerline and shall also be in accordance with 7.2.2.4.5.1, 7.2.2.4.5.5, and 7.2.2.4.5.6.

**12.2.5.6.9.2** Where seating exists on both sides of the aisle, the handrails shall be noncontinuous with gaps or breaks at intervals not exceeding five rows to facilitate access to seating and to allow crossing from one side of the aisle to the other.

**12.2.5.6.9.3** The gaps or breaks permitted by 12.2.5.6.9.1 shall have a clear width of not less than 22 in. (560 mm) and shall not exceed 36 in. (915 mm), measured horizontally, and the handrail shall have rounded terminations or bends.

**12.2.5.6.9.4** Where handrails are provided in the middle of aisle stairs, an additional intermediate rail shall be located approximately 12 in. (305 mm) below the main handrail.

**12.2.5.6.9.5** Where an aisle transition stair does not have seating at its sides, a handrail shall be provided on both sides of the aisle, and the provision of 12.2.5.6.9.6 shall also apply.

**12.2.5.6.9.6** Where an aisle stair leading to the aisle transition stair is provided with a center handrail and the aisle landing is less than 48 in. (1220 mm) in the direction of travel, a center handrail shall also be provided on the aisle transition stair.

**12.2.5.6.9.7** Handrails shall not be required where otherwise permitted by one of the following:

- (1) Handrails shall not be required for ramped aisles having a gradient not steeper than 1 in 8 and having seating on both sides where the aisle does not serve as an accessible route.
- (2) The requirement for a handrail shall be satisfied by the use of a guard provided with a rail that complies with the graspability requirements for handrails and is located at a consistent height between 34 in. and 42 in. (865 mm and 1065 mm), measured as follows:
  - (a) Vertically from the top of the rail to the leading edge (nosing) of stair treads
  - (b) Vertically from the top of the rail to the adjacent walking surface in the case of a ramp

The Code requires handrails on aisle stairs in new construction, even where riser heights are less than 7 in. (180 mm). This requirement is a result of increased experience with the provision and use of aisle handrails, as well as a general realization

## CHAPTER 13 • Existing

might lead to an increase in the aisle width. Although this increase will compensate for reduced egress efficiency, it does not help individuals walking on such portions of stairs to recover from missteps, other than by possibly marginally reducing the crowding that might exacerbate the problem of falls. (See also 7.2.2.4.)

**13.2.5.6.9.1** Ramped aisles having a gradient exceeding 1 in 12 and aisle stairs shall be provided with handrails at one side or along the centerline and shall also be in accordance with 7.2.2.4.5.1, 7.2.2.4.5.5, and 7.2.2.4.5.6.

**13.2.5.6.9.2** Where seating exists on both sides of the aisle, the handrails shall be noncontinuous with gaps or breaks at intervals not exceeding five rows to facilitate access to seating and to allow crossing from one side of the aisle to the other.

**13.2.5.6.9.3** The gaps or breaks permitted by 13.2.5.6.9.1 shall have a clear width of not less than 22 in. (560 mm) and shall not exceed 36 in. (915 mm), measured horizontally, and the handrail shall have rounded terminations or bends.

**13.2.5.6.9.4** Where handrails are provided in the middle of aisle stairs, an additional intermediate rail shall be located approximately 12 in. (305 mm) below the main handrail.

**13.2.5.6.9.5** Where an aisle transition stair does not have seating at its sides, a handrail shall be provided on both sides of the aisle, and the provision of 13.2.5.6.9.6 shall also apply.

**13.2.5.6.9.6** Where an aisle stair leading to the aisle transition stair is provided with a center handrail and the aisle landing is less than 48 in. (1220 mm) in the direction of travel, a center handrail shall also be provided on the aisle transition stair.

**13.2.5.6.9.7** Handrails shall not be required where otherwise permitted by one of the following:

- (1) Handrails shall not be required for ramped aisles having a gradient not steeper than 1 in 8 and having seating on both sides.
- (2) The requirement for a handrail shall be satisfied by the use of a guard provided with a rail that complies with the graspability requirements for handrails and is located at a consistent height between 34 in. and 42 in. (865 mm and 1065 mm), measured as follows:
  - (a) Vertically from the top of the rail to the leading edge (nosing) of stair treads
  - (b) Vertically from the top of the rail to the adjacent walking surface in the case of a ramp
- (3) Handrails shall not be required where risers do not exceed 7 in. (180 mm) in height.

that aisles pose unique challenges to users that might go beyond those encountered on other stairs. Exhibit 12/13.55 and Exhibit 12/13.56 illustrate the extensive use of handrails on aisle stairs. Field research studies show that aisle stair handrails have

CHAPTER 12 • New

Exhibit 12/13.55

Children using handrail on aisle stair. (Photo courtesy of Jake Pauls)

Exhibit 12/13.56

Persons of varied ages using handrail on aisle stair. (Photo courtesy of Jake Pauls)

been used about twice as often as handrails provided to meet Code requirements for non-aisle stairs. This high level of use is not surprising, given the unusual lengths, varied step geometries, and highly complex use conditions of assembly occupancy aisle stairs. Aside from their value in increasing the safety and comfort of people using the aisles, handrails also help to improve egress efficiency. This benefit is taken into account in calculation of egress capacity. See 12/13.2.3.3(3).

Exhibit 12/13.57 shows people using the backs of bench seating as handholds while moving on an aisle stair where handrails are not provided.

The required gaps between sections of center-aisle handrails are illustrated in Exhibit 12/13.58. Spacing such gaps as frequently as every three rows is recommended where there is extensive use of aisles during events. A spacing of up to five rows

CHAPTER 13 • Existing

between gaps might be acceptable where there is little use of the aisles during events and little counterflow at any time. Gap size should be kept at the lower end of the permitted range of 22 in. to 36 in. (560 mm to 915 mm) where the aisles are

## CHAPTER 12 • New

unusually steep and handrail use is especially valuable in reducing the risk of falls.

**Paragraph 12/13.2.5.6.9.7(2)** takes into account the proven utility of handrails that are higher than those normally permitted, even with the increase in handrail height range [from 34 in.

#### 12.2.5.6.10\* Aisle Marking.

**A.12.2.5.6.10** Certain tread cover materials such as plush carpets, which are often used in theaters, produce an inherently well-marked tread nosing under most lighting conditions. On the other hand, concrete treads have nosings with a sharp edge and, especially under outdoor lighting conditions, are difficult to discriminate. Therefore, concrete treads require an applied marking stripe. The slip resistance of such marking stripes should be similar to the rest of the treads, and no tripping hazard should be created; luminescent, self-luminous, and electroluminescent tread markings have the advantage of being apparent in reduced light or in the absence of light.

**12.2.5.6.10.1** A contrasting marking stripe shall be provided on each tread at the nosing or leading edge so that the location of such tread is readily apparent, particularly when viewed in descent.

**12.2.5.6.10.2** The marking stripe shall be not less than 1 in. (25 mm) wide and shall not exceed 2 in. (51 mm) in width.

**12.2.5.6.10.3** The marking stripe shall not be required where tread surfaces and environmental conditions, under all conditions of use, are such that the location of each tread is readily apparent, particularly when viewed in descent.

**Exhibit 12/13.59** illustrates step visibility where construction nosing materials have the effect of providing the contrasting marking stripes required by **12/13.2.5.6.10**. Step visibility difficulties are commonly encountered in outdoor facilities with concrete stair treads. Without nosing markings, there is little indication of the exact location of each tread nosing. The distractions of the venue event, such as the playing field, justify making the steps as obvious as possible. Each situation needs to be carefully evaluated, with mock-ups at the design stage and inspection of actual conditions during use, to determine whether any improvements are warranted in marking and lighting such stepped aisles.

Indoor stepped aisles also require nosing markings, unless the tread surfaces meet the provisions of **12/13.2.5.6.10.3**. **Exhibit 12/13.60** shows nosing marking attempted with the use of tape that is set back from the nosing or leading edge of the tread. Note that the tape is not permanent and has peeled back

## CHAPTER 13 • Existing

to 38 in. (865 mm to 965 mm)] introduced with the 1988 edition of the *Code*. A guardrail that is 42 in. (1065 mm) high (such as at the side of an aisle where there is a vomitory) can be considered a usable handrail if it offers graspability as required for handrails. See **7.2.2.4.4**.

#### 13.2.5.6.10\* Aisle Marking.

**A.13.2.5.6.10** Certain tread cover materials such as plush carpets, which are often used in theaters, produce an inherently well-marked tread nosing under most lighting conditions. On the other hand, concrete treads have nosings with a sharp edge and, especially under outdoor lighting conditions, are difficult to discriminate. Therefore, concrete treads require an applied marking stripe. The slip resistance of such marking stripes should be similar to the rest of the treads, and no tripping hazard should be created; luminescent, self-luminous, and electroluminescent tread markings have the advantage of being apparent in reduced light or in the absence of light.

**13.2.5.6.10.1** A contrasting marking stripe shall be provided on each tread at the nosing or leading edge so that the location of such tread is readily apparent, particularly when viewed in descent.

**13.2.5.6.10.2** The marking stripe shall be not less than 1 in. (25 mm) wide and shall not exceed 2 in. (51 mm) in width.

**13.2.5.6.10.3** The marking stripe shall not be required where tread surfaces and environmental conditions, under all conditions of use, are such that the location of each tread is readily apparent, particularly when viewed in descent.

**Exhibit 12/13.59**

## CHAPTER 12 • New

Exhibit 12/13.60

Stepped aisle nosing marking attempted with nonpermanent tape.  
(Photo courtesy of Jake Pauls)

from the tread. Had the tape been positioned at the nosing or leading edge of the tread, as required by 12/13.2.5.6.10.1, it would have been subject to greater wear by users and would have failed earlier. Exhibit 12/13.61 shows nosing marking achieved by the use of contrasting floor covering at the leading edge of the tread. Its presence and effectiveness are expected to last for years.

#### 12.2.5.7\* Aisle Accessways Serving Seating at Tables.

**A.12.2.5.7** For purposes of the means of egress requirements of this Code, seating at counters or at other furnishings is considered to be the same as seating at tables.

**12.2.5.7.1** The required clear width of an aisle accessway shall be not less than 12 in. (305 mm) where measured in accordance with 12.2.5.7.3 and shall be increased as a function of length in accordance with 12.2.5.7.4, unless otherwise permitted by 12.2.5.7.2.

**12.2.5.7.2\*** If used by not more than four persons, no minimum clear width shall be required for the portion of an aisle accessway having a length not exceeding 6 ft (1830 mm) and located farthest from an aisle.

**A.12.2.5.7.2** Effectively, where the aisle accessway is bounded by movable seating, the 12 in. (305 mm) minimum width might be increased by about 15 in. to 30 in. (380 mm to 760 mm) as seating is pushed in toward tables. Moreover, it is such movement of chairs during normal and emergency egress situations that makes the zero-clearance allowance workable. The allowance also applies to booth seating where people sitting closest to the aisle normally move out ahead of people farthest from the aisle.

## CHAPTER 13 • Existing

Exhibit 12/13.61

#### 13.2.5.7\* Aisle Accessways Serving Seating at Tables.

**A.13.2.5.7** For purposes of the means of egress requirements of this Code, seating at counters or at other furnishings is considered to be the same as seating at tables.

**13.2.5.7.1** The required clear width of an aisle accessway shall be not less than 12 in. (305 mm) where measured in accordance with 13.2.5.7.3 and shall be increased as a function of length in accordance with 13.2.5.7.4, unless otherwise permitted by 13.2.5.7.2.

**13.2.5.7.2\*** If used by not more than four persons, no minimum clear width shall be required for the portion of an aisle accessway having a length not exceeding 6 ft (1830 mm) and located farthest from an aisle.

**A.13.2.5.7.2** Effectively, where the aisle accessway is bounded by movable seating, the 12 in. (305 mm) minimum width might be increased by about 15 in. to 30 in. (380 mm to 760 mm) as seating is pushed in toward tables. Moreover, it is such movement of chairs during normal and emergency egress situations that makes the zero-clearance exception workable. The exception also applies to booth seating where people sitting closest to the aisle normally move out ahead of people farthest from the aisle.

## CHAPTER 12 • New

**12.2.5.7.3\*** Where nonfixed seating is located between a table and an aisle accessway or aisle, the measurement of required clear width of the aisle accessway or aisle shall be made to a line 19 in. (485 mm), measured perpendicularly to the edge of the table, away from the edge of said table.

**A.12.2.5.7.3** See **A.12.2.5.8.3**.

**12.2.5.7.4\*** The minimum required clear width of an aisle accessway, measured in accordance with **12.2.5.4.8** and **12.2.5.7.3**, shall be increased beyond the 12 in. (305 mm) requirement of **12.2.5.7.1** by ½ in. (13 mm) for each additional 12 in. (305 mm) or fraction thereof beyond 12 ft (3660 mm) of aisle accessway length, where measured from the center of the seat farthest from an aisle.

**A.12.2.5.7.4** The minimum width requirement as a function of accessway length is as follows:

- (1) 0 in. (0 mm) for the first 6 ft (1830 mm) of length toward the exit
- (2) 12 in. (305 mm) for the next 6 ft (1830 mm); that is, up to 12 ft (3660 mm) of length
- (3) 12 in. to 24 in. (305 mm to 610 mm) for lengths from 12 ft to 36 ft (3.7 m to 11 m), the maximum length to the closest aisle or egress doorway permitted by **12.2.5.7.5**

Any additional width needed for seating is to be added to these widths, as described in **12.2.5.8.3**.

**12.2.5.7.5** The path of travel along the aisle accessway shall not exceed 36 ft (11 m) from any seat to the closest aisle or egress doorway.

**Paragraph 12/13.2.5.7.2** exempts a portion of the aisle accessway from the minimum width requirement under the specific conditions illustrated in **Exhibit 12/13.62**. The groupings of four chairs within the first 6 ft (1830 mm) of the aisle accessway are unregulated with respect to spacing. From the 6 ft (1830 mm) point away from the wall to the point where the aisle accessway reaches the aisle, the minimum width requirement of **12/13.2.5.7.1** applies.

**Figure A.12/13.2.5.8.3** illustrates the provisions of **12/13.2.5.7.3** and **12/13.2.5.8.3**. These requirements provide guidance on how aisle accessways and aisles with movable chairs are to be measured.

**Exhibit 12/13.63** illustrates the maximum length of aisle accessway at tables permitted with the minimum 12 in. (305 mm) clear width. The aisle accessway width is greater than or equal to 12 in. (305 mm), with increased spacing of 0.5 in. (13 mm) for each additional 12 in. (305 mm) of aisle accessway beyond the initial 12 ft (3660 mm) from the center of the seat farthest from an aisle. In accordance with **12/13.2.5.7.3**, the presence of chairs

## CHAPTER 13 • Existing

**13.2.5.7.3\*** Where nonfixed seating is located between a table and an aisle accessway or aisle, the measurement of required clear width of the aisle accessway or aisle shall be made to a line 19 in. (485 mm), measured perpendicularly to the edge of the table, away from the edge of said table.

**A.13.2.5.7.3** See **A.13.2.5.8.3**.

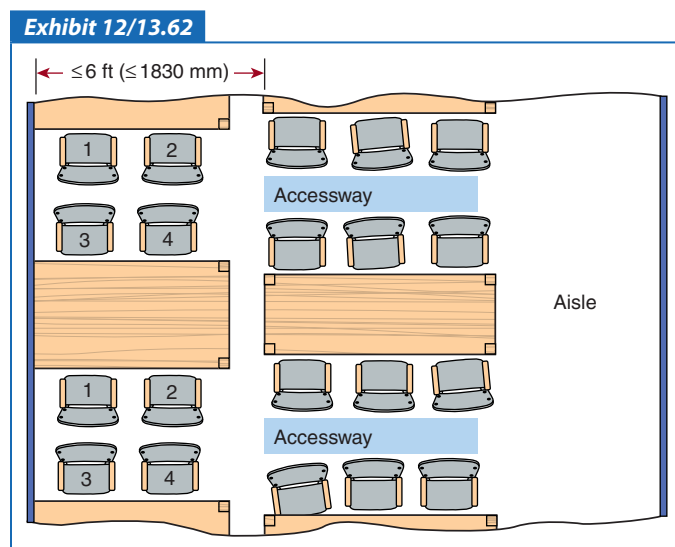

**13.2.5.7.4\*** The minimum required clear width of an aisle accessway, measured in accordance with **13.2.5.4.8** and **13.2.5.7.3**, shall be increased beyond the 12 in. (305 mm) requirement of **13.2.5.7.1** by ½ in. (13 mm) for each additional 12 in. (305 mm) or fraction thereof beyond 12 ft (3660 mm) of aisle accessway length, where measured from the center of the seat farthest from an aisle.

**A.13.2.5.7.4** The minimum width requirement as a function of accessway length is as follows:

- (1) 0 in. (0 mm) for the first 6 ft (1830 mm) of length toward the exit
- (2) 12 in. (305 mm) for the next 6 ft (1830 mm); that is, up to 12 ft (3660 mm) of length
- (3) 12 in. to 24 in. (305 mm to 610 mm) for lengths from 12 ft to 36 ft (3.7 m to 11 m), the maximum length to the closest aisle or egress doorway permitted by **13.2.5.7.5**

Any additional width needed for seating is to be added to these widths, as described in **13.2.5.8.3**.

**13.2.5.7.5** The path of travel along the aisle accessway shall not exceed 36 ft (11 m) from any seat to the closest aisle or egress doorway.

*First 6 ft (1830 mm) of aisle accessway serving four or fewer persons exempted from minimum aisle accessway width.*

CHAPTER 12 • New

Minimum aisle accessway at tables.

at one side of the aisle accessway increases the table-to-table spacing by 19 in. (485 mm).

Exhibit 12/13.64 illustrates the maximum length permitted for an aisle accessway serving seating at tables. The total length of the table is slightly more than 72 ft (22 m). Seating at longer tables requires a 36 in. (915 mm) aisle in accordance with the minimum width requirements of 12/13.2.5.8.2 instead of an aisle accessway. For the arrangement shown in Exhibit 12/13.64, the aisle accessway clear width, X, is 12 in. (305 mm) plus 0.5 in. (13 mm) for each additional 12 in. (305 mm) of aisle accessway length beyond the initial 12 ft (3.7 m) from the center seat farthest from an aisle. The aisle accessway clear width is calculated as follows:

12.2.5.8 Aisles Serving Seating at Tables.

12.2.5.8.1\* Aisles that contain steps or that are ramped, such as aisles serving dinner theater–style configurations, shall comply with the requirements of 12.2.5.6.

A.12.2.5.8.1 See 7.1.7 and A.7.1.7.2 for special circulation safety precautions applicable where small elevation differences occur.

12.2.5.8.2\* The width of aisles serving seating at tables shall be not less than 44 in. (1120 mm) where serving an occupant load exceeding 50, and 36 in. (915 mm) where serving an occupant load of 50 or fewer.

A.12.2.5.8.2 It is important to make facilities accessible to people using wheelchairs. See ICC/ANSI A117.1, *American National Standard for Accessible and Usable Buildings and Facilities*, which provides guidance on appropriate aisle widths.

12.2.5.8.3\* Where nonfixed seating is located between a table and an aisle, the measurement of required clear width of the aisle shall be made to a line 19 in. (485 mm), measured perpendicularly to the edge of the table, away from the edge of said table.

A.12.2.5.8.3 Figure A.12.2.5.8.3 shows typical measurements involving seating and tables abutting an aisle. For purposes of the means of egress requirements of this Code, seating at counters or other furnishings is considered to be the same as seating at tables.

CHAPTER 13 • Existing

Maximum 36 ft (11 m) permitted for an aisle accessway serving seating at tables.

For inch/pound units,

$$\begin{aligned} X &= 12 \text{ in.} + [0.5 \text{ in./ft} (36 \text{ ft} - 12 \text{ ft})] \\ &= 12 \text{ in.} + [0.5 \text{ in./ft} (24 \text{ ft})] \\ &= 12 \text{ in.} + 12 \text{ in.} \\ &= 24 \text{ in.} \end{aligned}$$

For metric units,

$$\begin{aligned} 13 \text{ mm}/305 \text{ mm} &= 42.6 \text{ mm/m} \\ X &= 305 \text{ mm} + [42.6 \text{ mm/m} (11 \text{ m} - 3.7 \text{ m})] \\ &= 305 \text{ mm} + [42.6 \text{ mm/m} (7.3 \text{ m})] \\ &= 305 \text{ mm} + 310 \text{ mm} \\ &= 615 \text{ mm} \end{aligned}$$

With the 19 in. (485 mm) space required for the chairs, the table-to-table spacing must be ≥ 43 in. (≥ 1090 mm).

13.2.5.8 Aisles Serving Seating at Tables.

13.2.5.8.1\* Aisles that contain steps or that are ramped, such as aisles serving dinner theater–style configurations, shall comply with the requirements of 13.2.5.6.

A.13.2.5.8.1 See 7.1.7 and A.7.1.7.2 for special circulation safety precautions applicable where small elevation differences occur.

13.2.5.8.2\* The width of aisles serving seating at tables shall be not less than 44 in. (1120 mm) where serving an occupant load exceeding 50, and 36 in. (915 mm) where serving an occupant load of 50 or fewer.

A.13.2.5.8.2 It is important to make facilities accessible to people using wheelchairs. See ICC/ANSI A117.1, *American National Standard for Accessible and Usable Buildings and Facilities*, which provides guidance on appropriate aisle widths.

13.2.5.8.3\* Where nonfixed seating is located between a table and an aisle, the measurement of required clear width of the aisle shall be made to a line 19 in. (485 mm), measured perpendicularly to the edge of the table, away from the edge of said table.

A.13.2.5.8.3 Figure A.13.2.5.8.3 shows typical measurements involving seating and tables abutting an aisle. Note that, for purposes of the means of egress requirements of this Code, seating at counters or other furnishings is considered to be the same as seating at tables.

## CHAPTER 12 • New

Figure A.12.2.5.8.3 Seating at Tables Abutting an Aisle.

### 12.2.5.9 Approval of Layouts.

**12.2.5.9.1** Where required by the authority having jurisdiction, plans drawn to scale showing the arrangement of furnishings or equipment shall be submitted to the authority by the building owner, manager, or authorized agent to substantiate conformance with the provisions of 12.2.5.

**12.2.5.9.2** The layout plans shall constitute the only acceptable arrangement, unless one of the following criteria is met:

- (1) The plans are revised.
- (2) Additional plans are submitted and approved.
- (3) Temporary deviations from the specifications of the approved plans are used, provided that the occupant load is not increased and the intent of 12.2.5.9 is maintained.

The provision of 12/13.2.5.9.1 can be used by the authority having jurisdiction to regulate the placement of temporary power wiring run across the floor in occupied areas. Temporary power wiring should be run across the floor only where necessary and taped/covered so as not to present a tripping hazard. Exhibit 12/13.65 shows temporary wiring run across an aisle floor in an assembly seating area so as to create a tripping hazard.

## CHAPTER 13 • Existing

Figure A.13.2.5.8.3 Seating at Tables Abutting an Aisle.

### 13.2.5.9 Approval of Layouts.

**13.2.5.9.1** Where required by the authority having jurisdiction, plans drawn to scale showing the arrangement of furnishings or equipment shall be submitted to the authority by the building owner, manager, or authorized agent to substantiate conformance with the provisions of 13.2.5.

**13.2.5.9.2** The layout plans shall constitute the only acceptable arrangement, unless one of the following criteria is met:

- (1) The plans are revised.
- (2) Additional plans are submitted and approved.
- (3) Temporary deviations from the specifications of the approved plans are used, provided that the occupant load is not increased and the intent of 13.2.5.9 is maintained.

#### Exhibit 12/13.65

Temporary wiring run across floor that creates tripping hazard. (Photo courtesy of Jake Pauls)

## CHAPTER 12 • New

**12.2.6 Travel Distance to Exits.**

**12.2.6.1** Travel distance shall be measured in accordance with [Section 7.6](#).

**12.2.6.2** Exits shall be arranged so that the total length of travel from any point to reach an exit shall not exceed 200 ft (61 m) in any assembly occupancy, unless otherwise permitted by one of the following:

- (1) The travel distance shall not exceed 250 ft (76 m) in assembly occupancies protected throughout by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#).
- (2) The travel distance requirement shall not apply to smoke-protected assembly seating as permitted by [12.4.2.12](#), [12.4.2.13](#), and [12.4.2.14](#).

Travel distance in assembly occupancies is required to be measured in accordance with [Section 7.6](#). See [7.6.1](#) through [7.6.7](#).

Travel distance to exits from balconies or galleries that are served by unenclosed stairways must be measured to include the distance on the slope of the stair in the plane of the nosings, per [7.6.5](#), and the distance from the bottom of the stair to the exterior exit door at the level of discharge, as illustrated in [Exhibit 12/13.66](#).

**12.2.7 Discharge from Exits.**

**12.2.7.1** Exit discharge shall comply with [Section 7.7](#).

**12.2.7.2** The level of exit discharge shall be measured at the point of principal entrance to the building.

**12.2.7.3** Where the principal entrance to an assembly occupancy is via a terrace, either raised or depressed, such terrace shall be permitted to be considered to be the first story in height for the purposes of [Table 12.1.6](#) where all of the following criteria are met:

- (1) The terrace is at least as long, measured parallel to the building, as the total width of the exit(s) it serves but not less than 60 in. (1525 mm) long.
- (2) The terrace is at least as wide, measured perpendicularly to the building, as the exit(s) it serves but not less than 10 ft (3050 mm) wide.

## CHAPTER 13 • Existing

**13.2.6 Travel Distance to Exits.**

**13.2.6.1** Travel distance shall be measured in accordance with [Section 7.6](#).

**13.2.6.2** Exits shall be arranged so that the total length of travel from any point to reach an exit shall not exceed 200 ft (61 m) in any assembly occupancy, unless otherwise permitted by one of the following:

- (1) The travel distance shall not exceed 250 ft (76 m) in assembly occupancies protected throughout by an approved automatic sprinkler system in accordance with [Section 9.7](#).
- (2) The travel distance requirement shall not apply to smoke-protected assembly seating as permitted by [13.4.2.12](#), [13.4.2.13](#), and [13.4.2.14](#).

**Exhibit 12/13.66**

*Measurement of travel distance from balcony with egress by unenclosed stairs.*

**13.2.7 Discharge from Exits.**

**13.2.7.1** Exit discharge shall comply with [Section 7.7](#).

**13.2.7.2** The level of exit discharge shall be measured at the point of principal entrance to the building.

**13.2.7.3** Where the principal entrance to an assembly occupancy is via a terrace, either raised or depressed, such terrace shall be permitted to be considered to be the first story in height for the purposes of [Table 13.1.6](#) where all of the following criteria are met:

- (1) The terrace is at least as long, measured parallel to the building, as the total width of the exit(s) it serves but not less than 60 in. (1525 mm) long.
- (2) The terrace is at least as wide, measured perpendicularly to the building, as the exit(s) it serves but not less than 60 in. (1525 mm) wide.

## CHAPTER 12 • New

- (3) Required stairs leading from the terrace to the finished ground level are protected in accordance with 7.2.2.6.3 or are not less than 10 ft (3050 mm) from the building.

The Code specifies that 10 ft (3050 mm) is the minimum terrace depth necessary to allow people to exit the building into a depressed or raised area without causing a jamming effect at the exit. The same result was intended in requiring stairs to be at least 10 ft (3050 mm) from the face of the building, unless they are protected as provided in Chapter 7. The requirements of 12.2.7.3 are illustrated in Exhibit 12/13.67. Assuming that stair D serves exit B plus one-half of entrance A, and that stair E serves exit C plus one-half of entrance A, then  $X$  must be equal to or greater than the largest one of the following:

1. 10 ft (3050 mm), per 12.2.7.3(2)
2. 5 ft (1525 mm) +  $\frac{1}{2}$  of 14 ft (4270 mm) = 12 ft (3660 mm)
3. 6 ft (1830 mm) +  $\frac{1}{2}$  of 14 ft (4270 mm) = 13 ft (3960 mm)

Therefore,  $X \geq 13$  ft ( $\geq 3960$  mm).

**12.2.8 Illumination of Means of Egress.** Means of egress, other than for private party tents not exceeding 1200 ft<sup>2</sup> (112 m<sup>2</sup>), shall be illuminated in accordance with Section 7.8.

### 12.2.9 Emergency Lighting.

**12.2.9.1** Emergency lighting shall be provided in accordance with Section 7.9.

**12.2.9.2** Private party tents not exceeding 1200 ft<sup>2</sup> (112 m<sup>2</sup>) shall not be required to have emergency lighting.

### 12.2.10 Marking of Means of Egress.

**12.2.10.1** Means of egress shall be provided with signs in accordance with Section 7.10.

## CHAPTER 13 • Existing

- (3) Required stairs leading from the terrace to the finished ground level are protected in accordance with 7.2.2.6.3 or are not less than 10 ft (3050 mm) from the building.

Exhibit 12/13.67

*New assembly occupancy with depressed terrace as principal entrance.*

**13.2.8 Illumination of Means of Egress.** Means of egress, other than for private party tents not exceeding 1200 ft<sup>2</sup> (112 m<sup>2</sup>), shall be illuminated in accordance with Section 7.8.

### 13.2.9 Emergency Lighting.

**13.2.9.1** Emergency lighting, other than that permitted by 13.2.9.3, shall be provided in accordance with Section 7.9.

**13.2.9.2** Private party tents not exceeding 1200 ft<sup>2</sup> (112 m<sup>2</sup>) shall not be required to have emergency lighting.

**13.2.9.3** Assembly occupancies with an occupant load not exceeding 300 and used exclusively for a place of worship shall not be required to have emergency lighting.

### 13.2.10 Marking of Means of Egress.

**13.2.10.1** Means of egress shall be provided with signs in accordance with Section 7.10.

## CHAPTER 12 • New

**12.2.10.2** Exit markings shall not be required on the seating side of vomitories from seating areas where exit marking is provided in the concourse and where such marking is readily apparent from the vomitories.

**12.2.10.3** Evacuation diagrams in accordance with 7.10.8.5 shall be provided.

Exit signs are particularly helpful in large assembly occupancy buildings where occupants travel far from the main entrance/exit used to enter the building. Some of the doors to which the EXIT signs lead occupants are for staff use only on a day-to-day basis or lead to secure areas where occupants are not permitted except during fire or similar emergency. Exhibit 12/13.68 shows an EXIT sign at a point in an airport concourse that is in a satellite building at which the occupants arrive via an underground train. The occupants are not familiar with the exit locations.

## 12.2.11 Special Means of Egress Features.

### 12.2.11.1 Guards and Railings.

## CHAPTER 13 • Existing

**13.2.10.2** Exit markings shall not be required on the seating side of vomitories from seating areas where exit marking is provided in the concourse and where such marking is readily apparent from the vomitories.

**13.2.10.3** Evacuation diagrams in accordance with 7.10.8.5 shall be provided.

Exhibit 12/13.68

EXIT sign in airport concourse where exit locations are unfamiliar to occupants.

## 13.2.11 Special Means of Egress Features.

**13.2.11.1 Guards and Railings: Boxes, Balconies, and Galleries.** Boxes, balconies, and galleries shall meet the following criteria:

- (1) The fasciae of boxes, balconies, and galleries shall rise not less than 26 in. (660 mm) above the adjacent floor or shall have substantial railings not less than 26 in. (660 mm) above the adjacent floor.
- (2) The height of the rail above footrests on the adjacent floor immediately in front of a row of seats shall be not less than 26 in. (660 mm), and the following also shall apply:
  - (a) Railings at the ends of aisles shall be not less than 36 in. (915 mm) high for the full width of the aisle.
  - (b) Railings at the end of aisles shall be not less than 36 in. (915 mm) high at the ends of aisles where steps occur.

## CHAPTER 12 • New

## CHAPTER 13 • Existing

**12.2.11.1.1\* Sight Line–Constrained Rail Heights.** Unless subject to the requirements of 12.2.11.1.2, a fascia or railing system complying with the guard requirements of 7.2.2.4, and having a height of not less than 26 in. (660 mm), shall be provided where the floor or footboard elevation is more than 30 in. (760 mm) above the floor or the finished ground level below, and where the fascia or railing system would otherwise interfere with the sight lines of immediately adjacent seating.

**A.12.2.11.1.1** This requirement includes provisions of guards and rails at the front of boxes, galleries, and balconies, and at aisle accessways adjacent to vomitories and orchestra pits.

**12.2.11.1.2 At Foot of Aisles.**

**12.2.11.1.2.1** A fascia or railing system complying with the guard requirements of 7.2.2.4 shall be provided for the full width of the aisle where the foot of the aisle is more than 30 in. (760 mm) above the floor or the finished ground level below.

**12.2.11.1.2.2** The fascia or railing shall be not less than 36 in. (915 mm) high and shall provide not less than 42 in. (1065 mm), measured diagonally, between the top of the rail and the nosing of the nearest tread.

**12.2.11.1.3 At Cross Aisles.** Guards and railings at cross aisles shall meet the following criteria:

- (1) Cross aisles located behind seating rows shall be provided with railings not less than 26 in. (660 mm) above the adjacent floor of the aisle.
- (2) The requirement of 12.2.11.1.3(1) shall not apply where the backs of seats located at the front of the aisle project 24 in. (610 mm) or more above the adjacent floor of the aisle.

- (3) Aisle accessways adjacent to orchestra pits and vomitories, and all cross aisles, shall be provided with railings not less than 26 in. (660 mm) above the adjacent floor.
- (4) The requirement of 13.2.11.1(3) shall not apply where the backs of seats located at the front of the aisle project 24 in. (610 mm) or more above the adjacent floor of the aisle.
- (5) Guardrails shall not be required on the audience side of stages, raised platforms, and other raised floor areas such as runways, ramps, and side stages used for entertainment or presentations.
- (6) Permanent guardrails shall not be required at vertical openings in the performance area of stages.
- (7) Guardrails shall not be required where the side of an elevated walking surface is required to be open for the normal functioning of special lighting or for access and use of other special equipment.
- (8) Where a guard is ordinarily required but not provided in accordance with 13.2.11.1(5) or (6), a written plan shall be developed and maintained to mitigate the fall hazards of unguarded raised floor areas and vertical openings on stages.

## CHAPTER 12 • New

## CHAPTER 13 • Existing

- (3) Where cross aisles exceed 30 in. (760 mm) above the floor or the finished ground level below, guards shall be provided in accordance with 7.2.2.4.

**12.2.11.1.4 At Side and Back of Seating Areas.** Guards complying with the guard requirements of 7.2.2.4 shall be provided with a height not less than 42 in. (1065 mm) above the aisle, aisle accessway, or footboard where the floor elevation exceeds 30 in. (760 mm) above the floor or the finished ground level to the side or back of seating.

**12.2.11.1.5 Below Seating.** Openings between footboards and seat boards shall be provided with intermediate construction so that a 4 in. (100 mm) diameter sphere cannot pass through the opening.

**12.2.11.1.6 Locations Not Requiring Guards.**

**12.2.11.1.6.1** Guards shall not be required in the following locations:

- (1) On the audience side of stages, raised platforms, and other raised floor areas such as runways, ramps, and side stages used for entertainment or presentations
- (2) At vertical openings in the performance area of stages
- (3) Where the side of an elevated walking surface is required to be open for the normal functioning of special lighting or for access and use of other special equipment.

**12.2.11.1.6.2\*** Where a guard is ordinarily required but not provided in accordance with 12.2.11.1.6(1) or (2), a written plan shall be developed and maintained to mitigate the fall hazards of unguarded raised floor areas and vertical openings on stages.

**A.12.2.11.1.6.2** The written plan should identify the unguarded areas and should include precautions and provisions to mitigate the fall hazard. Such precautions and provisions might include the following:

- (1) Training
- (2) Choreography
- (3) Blocking
- (4) Rehearsal
- (5) Restricted access to the stage
- (6) Restricted access to unguarded edges
- (7) Warning lights
- (8) Audible warnings
- (9) Tactile edges
- (10) Warning barriers
- (11) Signage
- (12) Temporary barriers
- (13) Personal fall protection
- (14) Fall restraint
- (15) Spotters

## CHAPTER 12 • New

The requirements for guards and handrails for new assembly seating areas were revised for the 1997 edition of the *Code* and have been carried forward. The requirements for guards and handrails for existing assembly seating areas retain the pre-1997 format and content. The provisions for new construction are, thus, different from those applicable to existing facilities. The commentary that follows addresses new installations first and existing arrangements second.

Paragraphs 12.2.11.1.1 and 12.2.11.1.2 clarify that new assembly seating area guards, where the floor is more than 30 in. (760 mm) above the floor or grade below, must comply with the guard requirements of 7.2.2.4. This requirement includes the provision for intermediate rails or balusters to meet the 4 in. (100 mm) diameter sphere requirement of 7.2.2.4.6.3, which is illustrated in Exhibit 12/13.69.

Paragraph 12.2.11.1.1 permits a guard height of 26 in. (660 mm) at the front of seating but not at the foot of aisles.

Exhibit 12/13.69

New assembly occupancy building with railings installed in accordance with 12.2.11.1.1 and 12.2.11.1.2.

## CHAPTER 13 • Existing

Further, the 26 in. (660 mm) height allowance applies only if a 36 in. (915 mm) height rail [as permitted by 12.2.11.1.2.2 in lieu of the typical 42 in. (1065 mm) height guard detailed in 7.2.2.4.6] would otherwise interfere with sight lines of immediately adjacent seating. Note that the heading for 12.2.11.1.1 is Sight Line–Constrained Rail Heights. The minimum 26 in. (660 mm) height is illustrated in Exhibit 12/13.69.

Paragraph 12.2.11.1.2.1 requires that a guard be provided at the foot of an aisle if there is more than a 30 in. (760 mm) vertical distance to fall. Again, such guards must meet the guard requirements of 7.2.2.4.6 and must be at least 36 in. (915 mm) in height. See Exhibit 12/13.69. Where earlier editions of the *Code* required a 42 in. (1065 mm) guard at the foot of a stepped aisle, the current requirement of 12.2.11.1.2.2 is for a minimum 36 in. (915 mm) guard height, with a minimum of 42 in. (1065 mm), measured diagonally between the top of the guardrail and the nosing of the nearest step tread. This requirement is illustrated in Exhibit 12/13.70.

Exhibit 12/13.70

New assembly occupancy building with railing installed at foot of stepped aisle in accordance with 12.2.11.1.2.2.

Where there is a stepped aisle, the requirement of 12.2.11.1.2.2 to provide a minimum of 42 in. (1065 mm), measured diagonally between the top of the guardrail and the nosing of the nearest step tread, will force the guardrail height to be greater than 36 in. (915 mm) if the first riser is positioned too close, horizontally, to the guard. For example, if the first riser is positioned 28 in. (710 mm) horizontally from the guard and an 8 in. (205 mm) riser height is used, the minimum 42 in. (1065 mm) diagonal distance requirement will force the guardrail height to be a minimum of 39 in. (990 mm). For the same riser height of

CHAPTER 12 • New

8 in. (205 mm), a 36 in. (915 mm) high guardrail at the foot of the stepped aisle would require that the first step riser be positioned at least 31 in. (785 mm), horizontally, from the guardrail.

Paragraph 13.2.11.1 addresses guards and railings in existing assembly occupancies.

Exhibit 12/13.71 illustrates the requirements of 13.2.11.1(1) and (2). Rail height at the fascia end of a ramped aisle or a stepped aisle must not be less than 36 in. (915 mm).

It is not the intent of the Code to reduce the height of guards where sight lines are not a problem, such as with cross aisles at the rear or top of seating areas or where cross aisles are sufficiently below seating that a proper height guard will not interfere with sight lines.

Existing assembly occupancy building with railings installed in accordance with 13.2.11.1(1) and 13.2.11.1(2).

**12.2.11.2 Lockups.** Lockups in assembly occupancies shall comply with the requirements of 22.4.5.

CHAPTER 13 • Existing

Note that, for existing assembly occupancies, the railings described by 13.2.11.1(1) and (2) are, in fact, railings and not the guards required by 7.2.2.4.6. As depicted in Exhibit 12/13.71, there is no requirement for intermediate rails or balusters — the assembly seating rails are not required to meet the 4 in. (100 mm) diameter sphere requirement of 7.2.2.4.6.3. This provision is more lenient than the requirements applicable to new assembly occupancies, where 12.2.11.1 requires a railing system to comply with the guard requirements of 7.2.2.4 (see Exhibit 12/13.69).

The Code requires a barrier along the downhill side of a cross aisle for both new construction and existing buildings. The barrier might consist of a rail or the backs of the seats that abut the downhill side of the aisle where the backs project 24 in. (610 mm) or more above the cross aisle. The difference between the 24 in. (610 mm) back height and the required 26 in. (660 mm) railing is not sufficient to require the railing. See Exhibit 12/13.72.

The provisions of 12.2.11.1.6.2 and 13.2.11.1(8) are new to the 2015 edition of the Code. Guards are permitted to be omitted by 12.2.11.1.6(1), 12.2.11.1.6(2), 13.2.11.1(5), and 13.2.11.1(6) to help preserve audience sight lines and not interfere with a stage performance. The exemptions themselves do not provide remedial action for providing the safety that would be provided by the presence of guards. The requirement for the written plan is intended to lead to mitigation of the fall hazard. The text of A.12.2.11.1.6.2 provides guidance on the precautions that need to be taken.

Barrier for cross aisles.

**13.2.11.2 Lockups.** Lockups in assembly occupancies, other than approved existing lockups, shall comply with the requirements of 23.4.5.

## CHAPTER 12 • New

The term *lockup* is defined in 3.3.166 as “an incidental use area in other than a detention and correctional occupancy where occupants are restrained and such occupants are mostly incapable of self-preservation because of security measures not under the occupants’ control.” Examples of lockups in assembly occupancies include a holding area for customs/immigration violators at

## 12.3 Protection

**12.3.1 Protection of Vertical Openings.** Any vertical opening shall be enclosed or protected in accordance with Section 8.6, unless otherwise permitted by one of the following:

- (1)\* Stairs or ramps shall be permitted to be unenclosed between balconies or mezzanines and main assembly areas located below, provided that the balcony or mezzanine is open to the main assembly area.

**A.12.3.1(1)** The allowance for unenclosed stairs or ramps presumes the balcony or mezzanine complies with the other provisions of the *Code*, such as travel distance to exits in accordance with 12.2.6 and number of exits in accordance with 12.2.4. For the purposes of this exception, a balcony with glazing that provides a visual awareness of the main assembly area is considered open.

- (2) Exit access stairs from lighting and access catwalks, galleries, and gridirons shall not be required to be enclosed.
- (3) Assembly occupancies protected by an approved, supervised automatic sprinkler system in accordance with Section 9.7 shall be permitted to have unprotected vertical openings between any two adjacent floors, provided that such openings are separated from unprotected vertical openings serving other floors by a barrier complying with 8.6.5.
- (4) Assembly occupancies protected by an approved, supervised automatic sprinkler system in accordance with Section 9.7 shall be permitted to have convenience stair openings in accordance with 8.6.9.2.

## CHAPTER 13 • Existing

an international airport and a holding area for unruly patrons at a sports arena. The provisions of Chapters 12 and 13 alone are not adequate to ensure life safety for those who are detained by security measures not under their control. Lockups in assembly occupancies are required to meet the provisions of 22/23.4.5, which complete the needed package of protection features.

## 13.3 Protection

**13.3.1 Protection of Vertical Openings.** Any vertical opening shall be enclosed or protected in accordance with Section 8.6, unless otherwise permitted by one of the following:

- (1)\* Stairs or ramps shall be permitted to be unenclosed between balconies or mezzanines and main assembly areas located below, provided that the balcony or mezzanine is open to the main assembly area.

**A.13.3.1(1)** The allowance for unenclosed stairs or ramps presumes the balcony or mezzanine complies with the other provisions of the *Code*, such as travel distance to exits in accordance with 13.2.6 and number of exits in accordance with 13.2.4. For the purposes of this exception, a balcony with glazing that provides a visual awareness of the main assembly area is considered open.

- (2) Exit access stairs from lighting and access catwalks, galleries, and gridirons shall not be required to be enclosed.
- (3) Assembly occupancies protected by an approved, supervised automatic sprinkler system in accordance with Section 9.7 shall be permitted to have unprotected vertical openings between any two adjacent floors, provided that such openings are separated from unprotected vertical openings serving other floors by a barrier complying with 8.6.5.
- (4) Assembly occupancies protected by an approved, supervised automatic sprinkler system in accordance with Section 9.7 shall be permitted to have convenience stair openings in accordance with 8.6.9.2.
- (5) Use of the following alternative materials shall be permitted where assemblies constructed of such materials are in good repair and free of any condition that would diminish their original fire resistance characteristics:
  - (a) Existing wood lath and plaster
  - (b) Existing ½ in. (13 mm) gypsum wallboard
  - (c) Existing installations of ¼ in. (6.3 mm) thick wired glass that are, or are rendered, inoperative and fixed in the closed position
  - (d) Other existing materials having similar fire resistance capabilities

## CHAPTER 12 • New

The provision of 12/13.3.1(3) permits any two adjacent floors to be open to each other in a sprinklered building, provided that other openings to other floors are separated from the floor areas using the provision of 12/13.3.1(3) by fire-rated barriers in accordance with 8.6.5. The provision of 12/13.3.1(4) recognizes one additional method for permitting unenclosed stair openings.

Assembly occupancies make extensive use of vertical openings to provide multiple floors with a feeling of openness and to make them function as one space. Exhibit 12/13.73 shows a library where multiple floors are open to each other via an atrium. Atria are not specifically referenced in 12/13.3.1, but there is a general requirement that vertical openings be protected in accordance with Section 8.6. The atrium provisions of 8.6.7 are worded such that an atrium in compliance with the provisions of 8.6.7 is permitted, unless prohibited by Chapters 11 through 43. The provisions of 12/13.3.1 do not prohibit an atrium.

### 12.3.2 Protection from Hazards.

#### 12.3.2.1 Service Equipment, Hazardous Operations or Processes, and Storage Facilities.

**12.3.2.1.1** Rooms containing high-pressure boilers, refrigerating machinery of other than the domestic refrigerator type, large transformers, or other service equipment subject to explosion shall meet both of the following requirements:

- (1) Such rooms shall not be located directly under or abutting required exits.
- (2) Such rooms shall be separated from other parts of the building by fire barriers in accordance with Section 8.3 having a minimum 1-hour fire resistance rating or shall be protected by automatic extinguishing systems in accordance with Section 8.7.

**12.3.2.1.2** Rooms or spaces for the storage, processing, or use of materials specified in 12.3.2.1.2(1) through (3) shall be protected in accordance with one of the following:

- (1) Separation from the remainder of the building by fire barriers having a minimum 1-hour fire resistance rating or protection of such rooms by automatic extinguishing systems as specified in Section 8.7 in the following areas:
  - (a) Boiler and furnace rooms, unless otherwise permitted by one of the following:
    - i. The requirement of 12.3.2.1.2(1)(a) shall not apply to rooms enclosing furnaces, heating and air-handling equipment, or compressor equipment with a

### 13.3.2 Protection from Hazards.

#### 13.3.2.1 Service Equipment, Hazardous Operations or Processes, and Storage Facilities.

**13.3.2.1.1** Rooms containing high-pressure boilers, refrigerating machinery of other than the domestic refrigerator type, large transformers, or other service equipment subject to explosion shall meet both of the following requirements:

- (1) Such rooms shall not be located directly under or abutting required exits.
- (2) Such rooms shall be separated from other parts of the building by fire barriers in accordance with Section 8.3 that have a minimum 1-hour fire resistance rating or shall be protected by automatic extinguishing systems in accordance with Section 8.7.

**13.3.2.1.2** Rooms or spaces for the storage, processing, or use of materials specified in 13.3.2.1.2(1) through (3) shall be protected in accordance with the following:

- (1) Separation from the remainder of the building by fire barriers having a minimum 1-hour fire resistance rating or protection of such rooms by automatic extinguishing systems as specified in Section 8.7 in the following areas:
  - (a) Boiler and furnace rooms, unless otherwise protected by one of the following:
    - i. The requirement of 13.3.2.1.2(1)(a) shall not apply to rooms enclosing furnaces, heating and air-handling equipment, or compressor equipment with a

## CHAPTER 12 • New

- total aggregate input rating less than 200,000 Btu (211 MJ), provided that such rooms are not used for storage.
- ii. The requirement of 12.3.2.1.2(1)(a) shall not apply to attic locations of the rooms addressed in 12.3.2.1.2(1)(a)(i), provided that such rooms comply with the draftstopping requirements of 8.6.11.
- (b) Rooms or spaces used for the storage of combustible supplies in quantities deemed hazardous by the authority having jurisdiction
  - (c) Rooms or spaces used for the storage of hazardous materials or flammable or combustible liquids in quantities deemed hazardous by recognized standards
- (2) Separation from the remainder of the building by fire barriers having a minimum 1-hour fire resistance rating and protection of such rooms by automatic extinguishing systems as specified in Section 8.7 in the following areas:
    - (a) Laundrie
    - (b) Maintenance shops, including woodworking and painting areas
    - (c) Rooms or spaces used for processing or use of combustible supplies deemed hazardous by the authority having jurisdiction
    - (d) Rooms or spaces used for processing or use of hazardous materials or flammable or combustible liquids in quantities deemed hazardous by recognized standards
  - (3) Protection as permitted in accordance with 9.7.1.2 where automatic extinguishing is used to meet the requirements of 12.3.2.1.2(1) or (2).

The intent of 12/13.3.2.1.2 is to specify the degree of protection necessary for certain hazardous areas. The requirements are separated into three subdivisions: 12/13.3.2.1.2(1) and (2), which are based on the degree of hazard, and 12/13.3.2.1.2(3), which addresses the use of the domestic water supply for sprinklers used to protect the hazardous area. The hazards noted in 12/13.3.2.1.2(1) are required to be enclosed in 1-hour fire resistance-rated construction or be protected by sprinklers. If the sprinkler option is chosen, an enclosure is still required; however, the enclosure need not be fire rated. In new construction, the enclosure must be formed by smoke partitions (see 8.7.1.2 and Section 8.4); existing enclosures must form a membrane against the passage of smoke.

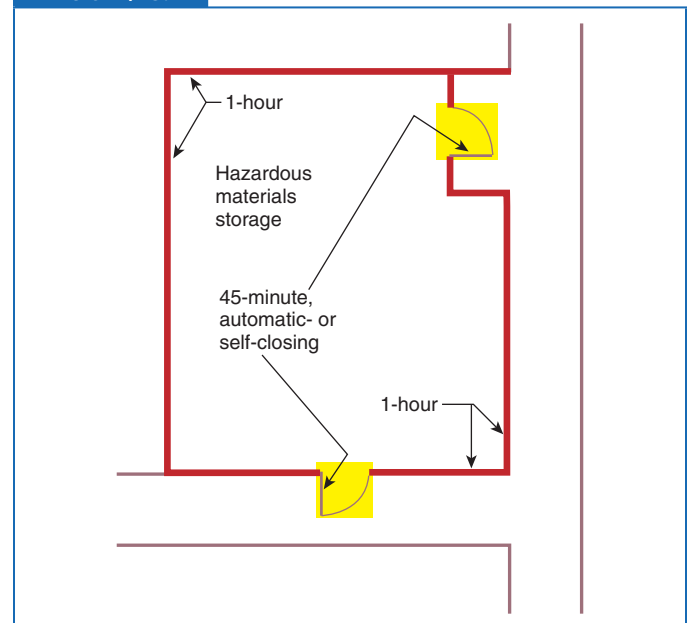

The hazards noted in 12/13.3.2.1.2(2) must be enclosed in 1-hour fire resistance-rated construction and be protected by automatic sprinklers.

Exhibit 12/13.74 through Exhibit 12/13.76 illustrate the three methods of protection specified by 12/13.3.2.1.2. Exhibit 12/13.74 and Exhibit 12/13.75 illustrate the two options for complying with 12/13.3.2.1.2(1); that is, separation via fire-rated barriers or protection by automatic sprinklers. Exhibit 12/13.76 illustrates the requirement of 12/13.3.2.1.2(2) that both fire resistance-rated separation and automatic sprinkler protection be provided.

## CHAPTER 13 • Existing

- total aggregate input rating less than 200,000 Btu (211 MJ), provided that such rooms are not used for storage.
- ii. The requirement of 13.3.2.1.2(1)(a) shall not apply to attic locations of the rooms addressed in 13.3.2.1.2(1)(a)(i), provided that such rooms comply with the draftstopping requirements of 8.6.11.
- (b) Rooms or spaces used for the storage of combustible supplies in quantities deemed hazardous by the authority having jurisdiction
  - (c) Rooms or spaces used for the storage of hazardous materials or flammable or combustible liquids in quantities deemed hazardous by recognized standards
- (2) Separation from the remainder of the building by fire barriers having a minimum 1-hour fire resistance rating and protection of such rooms by automatic extinguishing systems as specified in Section 8.7 in the following areas:
    - (a) Laundries
    - (b) Maintenance shops, including woodworking and painting areas
    - (c) Rooms or spaces used for processing or use of combustible supplies deemed hazardous by the authority having jurisdiction
    - (d) Rooms or spaces used for processing or use of hazardous materials or flammable or combustible liquids in quantities deemed hazardous by recognized standards
  - (3) Protection as permitted in accordance with 9.7.1.2 where automatic extinguishing is used to meet the requirements of 13.3.2.1.2(1) or (2).

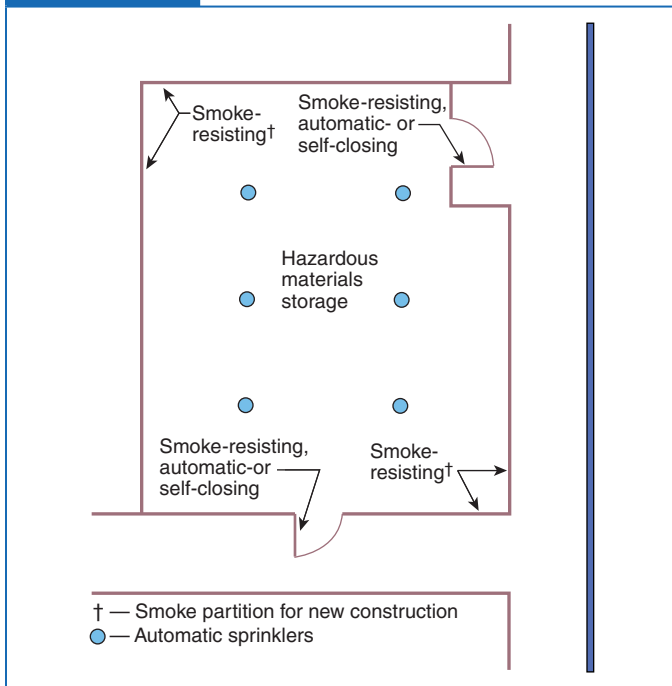

Exhibit 12/13.74

Protection of hazardous areas using fire-rated enclosure.

CHAPTER 12 • New

Exhibit 12/13.75

Protection of hazardous areas using automatic sprinklers.

**12.3.2.2 Cooking Equipment.** Cooking equipment shall be protected in accordance with 9.2.3, unless the cooking equipment is one of the following types:

- (1) Outdoor equipment
- (2) Portable equipment not flue-connected
- (3) Equipment used only for food warming

**12.3.3 Interior Finish.**

**12.3.3.1 General.** Interior finish shall be in accordance with Section 10.2.

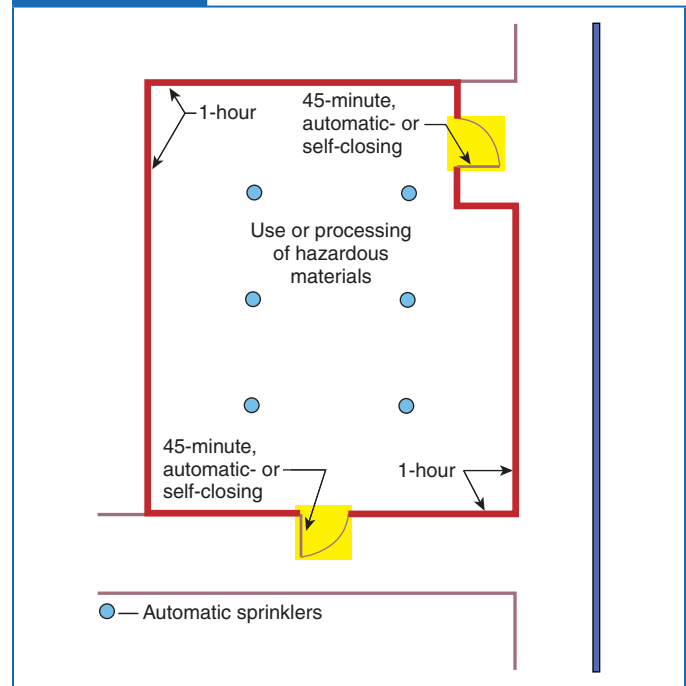

**12.3.3.2 Corridors, Lobbies, and Enclosed Stairways.** Interior wall and ceiling finish materials complying with Section 10.2 shall be Class A or Class B in all corridors and lobbies and shall be Class A in enclosed stairways.

**12.3.3.3 Assembly Areas.** Interior wall and ceiling finish materials complying with Section 10.2 shall be Class A or Class B in general assembly areas having occupant loads of more than 300 and shall be Class A, Class B, or Class C in assembly areas having occupant loads of 300 or fewer.

**12.3.3.4 Screens.** Screens on which pictures are projected shall comply with requirements of Class A or Class B interior finish in accordance with Section 10.2.

CHAPTER 13 • Existing

Exhibit 12/13.76

Protection of hazardous areas using both fire-rated enclosure and automatic sprinklers.

**13.3.2.2 Cooking Equipment.** Cooking equipment shall be protected in accordance with 9.2.3, unless the cooking equipment is one of the following types:

- (1) Outdoor equipment
- (2) Portable equipment not flue-connected
- (3) Equipment used only for food warming

**13.3.3 Interior Finish.**

**13.3.3.1 General.** Interior finish shall be in accordance with Section 10.2.

**13.3.3.2 Corridors, Lobbies, and Enclosed Stairways.** Interior wall and ceiling finish materials complying with Section 10.2 shall be Class A or Class B in all corridors and lobbies and shall be Class A in enclosed stairways.

**13.3.3.3 Assembly Areas.** Interior wall and ceiling finish materials complying with Section 10.2 shall be Class A or Class B in general assembly areas having occupant loads of more than 300 and shall be Class A, Class B, or Class C in assembly areas having occupant loads of 300 or fewer.

**13.3.3.4 Screens.** Screens on which pictures are projected shall comply with requirements of Class A or Class B interior finish in accordance with Section 10.2.

## CHAPTER 12 • New

Interior wall finish can include partitions that are not walls. For example, washroom water closet (i.e., toilet enclosure) partitions are to be treated by the requirements applicable to wall finish. See A.10.2.1.5. Exhibit 12/13.77 shows decorative wood partitions that functionally separate a hotel lobby from a coffee shop seating area. The partitions and the large column that is wrapped in similar wood should be treated as interior wall finish applicable to the requirements of 12/13.3.3.

Evaluation of existing interior finish is sometimes difficult. Where flame spread characteristics cannot be readily determined, the questionable material should be removed or treated with approved flame retardants. Where treatment cannot reduce flame spread to the required limits, automatic sprinklers might be provided to help compensate for the deficiency.

### 12.3.3.5 Interior Floor Finish.

**12.3.3.5.1** Interior floor finish shall comply with Section 10.2.

**12.3.3.5.2** Interior floor finish in exit enclosures and exit access corridors and in spaces not separated from them by walls complying with 12.3.6 shall be not less than Class II.

**12.3.3.5.3** Interior floor finish shall comply with 10.2.7.1 or 10.2.7.2, as applicable.

### 12.3.4 Detection, Alarm, and Communications Systems.

#### 12.3.4.1 General.

**12.3.4.1.1** Assembly occupancies with occupant loads of more than 300 and all theaters with more than one audience-viewing room shall be provided with an approved fire alarm system in accordance with 9.6.1 and 12.3.4, unless otherwise permitted by 12.3.4.1.2.

**12.3.4.1.2** Assembly occupancies that are a part of a multiple occupancy protected as a mixed occupancy (*see 6.1.14*) shall be permitted to be served by a common fire alarm system, provided that the individual requirements of each occupancy are met.

## CHAPTER 13 • Existing

#### Exhibit 12/13.77

*Partitions to be treated as interior wall finish.*

### 13.3.3.5 Interior Floor Finish. (No requirements.)

### 13.3.4 Detection, Alarm, and Communications Systems.

#### 13.3.4.1 General.

**13.3.4.1.1** Assembly occupancies with occupant loads of more than 300 and all theaters with more than one audience-viewing room shall be provided with an approved fire alarm system in accordance with 9.6.1 and 13.3.4, unless otherwise permitted by 13.3.4.1.2, 13.3.4.1.3, or 13.3.4.1.4.

**13.3.4.1.2** Assembly occupancies that are a part of a multiple occupancy protected as a mixed occupancy (*see 6.1.14*) shall be permitted to be served by a common fire alarm system, provided that the individual requirements of each occupancy are met.

**13.3.4.1.3** Voice communication or public address systems complying with 13.3.4.3.6 shall not be required to comply with 9.6.1.

**13.3.4.1.4** The requirement of 13.3.4.1.1 shall not apply to assembly occupancies where, in the judgment of the authority having jurisdiction, adequate alternative provisions exist or are provided for the discovery of a fire and for alerting the occupants promptly.

## CHAPTER 12 • New

**12.3.4.2 Initiation.**

**12.3.4.2.1** Initiation of the required fire alarm system shall be by both of the following means:

- (1) Manual means in accordance with 9.6.2.1(1), unless otherwise permitted by one of the following:
  - (a) The requirement of 12.3.4.2.1(1) shall not apply where initiation is by means of an approved automatic fire detection system in accordance with 9.6.2.1(2) that provides fire detection throughout the building.
  - (b) The requirement of 12.3.4.2.1(1) shall not apply where initiation is by means of an approved automatic sprinkler system in accordance with 9.6.2.1(3) that provides fire detection and protection throughout the building.
- (2) Where automatic sprinklers are provided, initiation of the fire alarm system by sprinkler system waterflow, even where manual fire alarm boxes are provided in accordance with 12.3.4.2.1(1)

**12.3.4.2.2** The initiating device shall be capable of transmitting an alarm to a receiving station, located within the building, that is constantly attended when the assembly occupancy is occupied.

**12.3.4.2.3\*** In assembly occupancies with occupant loads of more than 300, automatic detection shall be provided in all hazardous areas that are not normally occupied, unless such areas are protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.

**A.12.3.4.2.3** The intent is to require detectors only in nonsprinklered hazardous areas that are unoccupied. When the building is occupied, the detectors in the unoccupied, unsprinklered hazardous areas will initiate occupant notification. If the building is unoccupied, the fire in the nonsprinklered hazardous area is not a life safety issue, and the detectors, upon activation, are not required to notify anyone. The signal from a detector is permitted to be sent to a control panel in an area that is occupied when the building is occupied, but that is unoccupied when the building is unoccupied, without the need for central station monitoring or the equivalent.

**12.3.4.3 Notification.** The required fire alarm system shall activate an audible and visible alarm in a constantly attended receiving station within the building when occupied for purposes of initiating emergency action.

**12.3.4.3.1** Positive alarm sequence in accordance with 9.6.3.4 shall be permitted.

**12.3.4.3.2 Reserved.**

## CHAPTER 13 • Existing

**13.3.4.2 Initiation.**

**13.3.4.2.1** Initiation of the required fire alarm system shall be by both of the following means, and the system shall be provided with an emergency power source:

- (1) Manual means in accordance with 9.6.2.1(1), unless otherwise permitted by one of the following:
  - (a) The requirement of 13.3.4.2.1(1) shall not apply where initiation is by means of an approved automatic fire detection system in accordance with 9.6.2.1(2) that provides fire detection throughout the building.
  - (b) The requirement of 13.3.4.2.1(1) shall not apply where initiation is by means of an approved automatic sprinkler system in accordance with 9.6.2.1(3) that provides fire detection and protection throughout the building.
- (2) Where automatic sprinklers are provided, initiation of the fire alarm system by sprinkler system waterflow, even where manual fire alarm boxes are provided in accordance with 13.3.4.2.1(1)

**13.3.4.2.2** The initiating device shall be capable of transmitting an alarm to a receiving station, located within the building, that is constantly attended when the assembly occupancy is occupied.

**13.3.4.2.3\*** In assembly occupancies with occupant loads of more than 300, automatic detection shall be provided in all hazardous areas that are not normally occupied, unless such areas are protected throughout by an approved automatic sprinkler system in accordance with Section 9.7.

**A.13.3.4.2.3** The intent is to require detectors only in nonsprinklered hazardous areas that are unoccupied. Where the building is occupied, the detectors in the unoccupied, unsprinklered hazardous areas will initiate occupant notification. If the building is unoccupied, the fire in the nonsprinklered hazardous area is not a life safety issue, and the detectors, upon activation, are not required to notify anyone. The signal from a detector is permitted to be sent to a control panel in an area that is occupied when the building is occupied, but that is unoccupied when the building is unoccupied, without the need for central station monitoring or the equivalent.

**13.3.4.3 Notification.** The required fire alarm system shall activate an audible alarm in a constantly attended receiving station within the building when occupied for purposes of initiating emergency action.

**13.3.4.3.1** Positive alarm sequence in accordance with 9.6.3.4 shall be permitted.

**13.3.4.3.2** A pre-signal system in accordance with 9.6.3.3 shall be permitted.

## CHAPTER 12 • New

**12.3.4.3.3** Occupant notification shall be by means of voice announcements in accordance with 9.6.3.9, initiated by the person in the constantly attended receiving station.

**12.3.4.3.4** Occupant notification shall be by means of visible signals in accordance with 9.6.3.5, initiated by the person in the constantly attended receiving station, unless otherwise permitted by 12.3.4.3.5.

**12.3.4.3.5\*** Visible signals shall not be required in the assembly seating area, or the floor area used for the contest, performance, or entertainment, where the occupant load exceeds 1000 and an approved, alternative visible means of occupant notification is provided. (See 9.6.3.5.7.)

**A.12.3.4.3.5** Examples of devices that might be used to provide alternative visible means include scoreboards, message boards, and other electronic devices.

**12.3.4.3.6** The announcement shall be permitted to be made via a voice communication or public address system in accordance with 9.6.3.9.2.

**12.3.4.3.7** Where the authority having jurisdiction determines that a constantly attended receiving station is impractical, both of the following shall be provided:

- (1) Automatically transmitted evacuation or relocation instructions shall be provided in accordance with *NFPA 72, National Fire Alarm and Signaling Code*.
- (2) The system shall be monitored by a supervising station in accordance with *NFPA 72*.

Paragraph 12/13.3.4.1.2 clarifies that a common alarm system can be used within a building that houses occupancies in addition to an assembly occupancy, provided that the system meets the alarm requirements applicable to each of those occupancies. This provision permits an assembly occupancy in a school, hotel, hospital, mall, or other building to be served by the same fire alarm as the predominant occupancy, provided that it also meets the requirements applicable to alarm systems in an assembly occupancy.

Paragraph 13.3.4.1.3 permits an existing voice communication system or public address system installed to comply with 13.3.4.3.6 to be exempt from the installation requirements of *NFPA 72*<sup>®</sup>, *National Fire Alarm and Signaling Code*,<sup>7</sup> including electrical supervision and secondary power. In *Code* editions through 2006, alarm systems in new assembly occupancies were afforded the same exemption under the belief that the daily use of the voice communication system would provide adequate self-supervision and sufficient need to keep the system in good working order. The 2009 edition of the *Code* required new alarm

## CHAPTER 13 • Existing

**13.3.4.3.3** Occupant notification shall be by means of voice announcements in accordance with 9.6.3.9 initiated by the person in the constantly attended receiving station.

**13.3.4.3.4 Reserved.**

**13.3.4.3.5 Reserved.**

**13.3.4.3.6** The announcement shall be permitted to be made via a voice communication or public address system in accordance with 9.6.3.9.2.

**13.3.4.3.7** Where the authority having jurisdiction determines that a constantly attended receiving station is impractical, automatically transmitted evacuation or relocation instructions shall be provided in accordance with *NFPA 72, National Fire Alarm and Signaling Code*.

systems in assembly occupancies to provide occupant notification by means of voice announcements in accordance with 9.6.3.9. The provisions of 9.6.3.9 permit automatically transmitted or live voice evacuation or relocation instructions, used to notify occupants, to comply with either *NFPA 72* or the criteria of 9.6.3.9.2, which require, among other features, secondary power. The text of A.9.6.3.9.2 explains that 9.6.3.9.2 is meant to be used for facilities such as large assembly venues in which the configuration (e.g., large-volume spaces), function, and human behavior (including elevated levels of occupant-generated noise) present challenges with respect to effective occupant notification by standard means in accordance with *NFPA 72*. Because the routine operation of large-venue assembly occupancies demands highly reliant, acoustically capable, and sufficiently audible public address systems, properly trained staff can be relied on to use these public address systems to effect occupant notification.

Paragraph 13.3.4.1.4, which applies only to existing assembly occupancies, specifically allows the authority having jurisdiction to permit the continued use of existing alternative means

## CHAPTER 12 • New

for discovering fire and alerting occupants — even if such means do not meet the myriad requirements of *NFPA 72*.

The provisions of **12/13.3.4.2.3** recognize that a fire developing in an unoccupied, nonsprinklered, hazardous area while the assembly area is in use could go undiscovered. Although separated by 1-hour fire resistance-rated barriers, these hazardous areas can present a significant hazard to occupants. Because a fire alarm system is already required, the additional requirement for either heat or smoke detection, as appropriate, is not a significant burden. Where sprinkler protection is provided, the fire is expected to be controlled, permitting early detection to be exempted.

The intent of **12/13.3.4.3** is to provide an alarm system that will not elicit a panic reaction from occupants. The panic reaction is avoided by providing a system that will permit activation by manual fire alarm boxes as required by **9.6.2** but that will not sound an audible alarm in the seating or audience areas of the assembly occupancy. In lieu of the audible alarm throughout the assembly occupancy, the system must provide an audible alarm (and, for new installations, a visible alarm) in a constantly attended location. “Constantly attended,” in this case, means that the alarm panel must be attended while the assembly occupancy is in use. From that constantly attended location, voice messages that instruct the occupants can be issued via a public address or voice communication system. This method allows for the orderly evacuation of the occupants and the issuance of proper evacuation instructions rather than simply providing an evacuation alarm that might produce panic. The *Code* permits the use of recorded or electronically synthesized evacuation

### 12.3.5 Extinguishment Requirements.

**12.3.5.1** The following assembly occupancies shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with **9.7.1.1(1)**:

- (1) Dance halls
- (2) Discotheques
- (3) Nightclubs
- (4) Assembly occupancies with festival seating

**12.3.5.2** Any building containing one or more assembly occupancies where the aggregate occupant load of the assembly occupancies exceeds 300 shall be protected by an approved, supervised automatic sprinkler system in accordance with **Section 9.7** as follows (*see also 12.1.6, 12.2.6, 12.3.2, and 12.3.6*):

- (1) Throughout the story containing the assembly occupancy
- (2) Throughout all stories below the story containing the assembly occupancy

## CHAPTER 13 • Existing

instructions that will automatically be played upon initiation of the system. With the approval of the AHJ, this arrangement is permitted to be used in lieu of the attended station.

**Exhibit 12/13.78** shows an alarm system occupant notification appliance. The appliance provides visible signals as required for new systems as well as an audible alerting tone to get the attention of occupants. The required voice message is then delivered over separate speakers.

**Exhibit 12/13.78**

*Alarm system appliance to provide visible signal and initial audible alerting tone to occupants.*

### 13.3.5 Extinguishment Requirements. See also 13.1.6, 13.2.6, and 13.3.2.

**13.3.5.1** Where the occupant load exceeds 100, the following assembly occupancies shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with **9.7.1.1(1)**:

- (1) Dance halls
- (2) Discotheques
- (3) Nightclubs
- (4) Assembly occupancies with festival seating

**13.3.5.2** Any assembly occupancy used or capable of being used for exhibition or display purposes shall be protected throughout by an approved automatic sprinkler system in accordance with **Section 9.7** where the exhibition or display area exceeds 15,000 ft<sup>2</sup> (1400 m<sup>2</sup>).

## CHAPTER 12 • New

- (3) In the case of an assembly occupancy located below the level of exit discharge, throughout all stories intervening between that story and the level of exit discharge, including the level of exit discharge

**12.3.5.3** The requirements of **12.3.5.2** shall not apply to the following:

- (1)\* Assembly occupancies consisting of a single multipurpose room of less than 12,000 ft<sup>2</sup> (1115 m<sup>2</sup>) that are not used for exhibition or display and are not part of a mixed occupancy

**A.12.3.5.3(1)** It is the intent to permit a single multipurpose room of less than 12,000 ft<sup>2</sup> (1115 m<sup>2</sup>) to have certain small rooms as part of the single room. These rooms could be a kitchen, an office, an equipment room, and the like. It is also the intent that an addition could be made to an existing building, without requiring that the existing building be sprinklered, where both the new and existing buildings have independent means of egress and a fire-rated separation is provided to isolate one building from the other.

A school gymnasium with egress independent of, and separated from, the school would be included in this exception, as would a function hall attached to a church with a similar egress arrangement.

- (2) Gymnasiums, skating rinks, and swimming pools used exclusively for participant sports with no audience facilities for more than 300 persons
- (3)\* Locations in stadia and arenas as follows:
- Over the floor areas used for contest, performance, or entertainment, provided that the roof construction is more than 50 ft (15 m) above the floor level, and use is restricted to low fire hazard uses
  - Over the seating areas, provided that use is restricted to low fire hazard uses
  - Over open-air concourses where an approved engineering analysis substantiates the ineffectiveness of the sprinkler protection due to building height and combustible loading

**A.12.3.5.3(3)** Examples of low fire hazard uses include spectator sporting events, concerts, and performances on platforms.

The following uses are not low fire hazard uses: concerts and performances on stages; tradeshow; exhibitions and display of combustible items; displays of vehicles, boats, or similar items; or events using open flames or pyrotechnic effects.

- (4) Locations in unenclosed stadia and arenas as follows:
- Press boxes of less than 1000 ft<sup>2</sup> (93 m<sup>2</sup>)
  - Storage facilities of less than 1000 ft<sup>2</sup> (93 m<sup>2</sup>) if enclosed with not less than 1-hour fire resistance-rated construction

## CHAPTER 13 • Existing

**13.3.5.3** The sprinklers specified by **13.3.5.2** shall not be required where otherwise permitted in the following locations:

- (1) Locations in stadia and arenas as follows:
- Over the floor areas used for contest, performance, or entertainment
  - Over the seating areas
  - Over open-air concourses where an approved engineering analysis substantiates the ineffectiveness of the sprinkler protection due to building height and combustible loading
- (2) Locations in unenclosed stadia and arenas as follows:
- Press boxes of less than 1000 ft<sup>2</sup> (93 m<sup>2</sup>)
  - Storage facilities of less than 1000 ft<sup>2</sup> (93 m<sup>2</sup>) if enclosed with not less than 1-hour fire resistance-rated construction

## CHAPTER 12 • New

- (c) Enclosed areas underneath grandstands that comply with [12.4.9.5](#)

**12.3.5.4** Where another provision of this chapter requires an automatic sprinkler system, the sprinkler system shall be installed in accordance with [9.7.1.1\(1\)](#).

**Subsection 12/13.3.5** is one of the three primary locations within the chapter where automatic sprinkler protection might be required. The others are [12/13.1.6](#) and [12/13.4.4](#), which apply to minimum construction requirements and high-rise buildings, respectively. Each of these subsections is to be applied independently to determine whether automatic sprinkler protection is required. For example, if the building is not high-rise and [12/13.1.6](#) does not require sprinklers for a particular assembly occupancy on the basis of building construction type and location within the building, [12.3.5](#) might require automatic sprinklers for that assembly occupancy based on use or occupant load, or [13.3.5](#) might require automatic sprinklers based on use or floor area that is capable of being used for exhibition purposes. If one subsection requires sprinklers and the others do not, sprinklers must be provided.

The requirements of [12.3.5.1](#) for new nightclub-type assembly occupancies to be sprinklered, and of [13.3.5.1](#) for existing nightclub-type assembly occupancies with more than a 100-person occupant load to be sprinklered, were added to the *Code* in 2006. The provisions were developed in response to the February 2003 fire at The Station nightclub in West Warwick, Rhode Island, which claimed the lives of 100 patrons. The fire and the key findings related to emergency egress reported by the National Institute of Standards and Technology (NIST) are described in the commentary following [12.2.3.8](#).

The provisions of [12/13.3.5.1](#) were revised for the 2012 edition of the *Code*. Previously, an entry for *bars with live entertainment* was included in the list of nightclub-type assembly occupancies requiring sprinklers. Defining the characteristics that constitute a bar with live entertainment is difficult. Would the presence of a folk singer with a guitar sitting on a stool raise the danger level to that of a nightclub, as was learned from the fire at The Station nightclub, and thereby justify sprinklering? Such questions convinced the technical committee to delete *bars with live entertainment* from the list.

The requirement of [12.3.5.2](#) for automatic sprinkler protection for new assembly occupancies with an occupant load in excess of 300 persons was prompted by the occurrence of fires involving assembly occupancies, most notably the Beverly Hills Supper Club fire in 1977<sup>8</sup> and the MGM Grand Hotel fire in 1980.<sup>9</sup>

**Paragraph 12.3.5.2** was revised for the 2009 edition of the *Code* to clarify that a 300-person occupant load threshold is to be applied to the aggregate occupant load of all the assembly occupancies in the building. For example, if there are two assembly occupancies in the building, and each has an occupant load

## CHAPTER 13 • Existing

- (c) Enclosed areas underneath grandstands that comply with [13.4.9.5](#)

**13.3.5.4** Where another provision of this chapter requires an automatic sprinkler system, the sprinkler system shall be installed in accordance with [9.7.1.1\(1\)](#).

of 160 persons, the 300-person threshold of [12.3.5.2](#) is exceeded so as to require sprinklers. The extent of the sprinkler system is addressed by [12.3.5.2\(1\)](#), (2), and (3).

The exemptions to the sprinkler requirement of [12.3.5.2](#), as contained in [12.3.5.3](#), are important in that they limit the areas or buildings requiring sprinkler protection. Two of the exemptions in [12.3.5.3](#), related to stadia and arenas, were revised for the 2012 edition of the *Code*, but similar exemptions in [13.3.5.3](#) for existing situations were left unchanged. The provision of [12.3.5.3\(3\)\(a\)](#) was revised to add criteria for minimum clearance between the floor and roof and a restriction to low fire hazard uses. The provision of [12.3.5.3\(3\)\(b\)](#) was revised to add a restriction that the seating area have low fire hazard uses.

The concepts used in footnote a of [Table 12.1.6](#) and [Table 13.1.6](#) are also used with regard to those areas that must be sprinklered — see [12.3.5.2\(1\)](#), (2), and (3). If a five-story building has an assembly occupancy on the first floor, the floors above the assembly occupancy are not required to be sprinklered by the assembly occupancy provisions; however, the applicable occupancy chapter might require sprinklering of those floors. If the assembly occupancy were on the fifth floor, then the fifth floor and all floors below it would be required to be sprinklered.

**Paragraph 12.3.5.3(1)** exempts sprinkler protection for multipurpose assembly occupancies that are contained in one room, have an area of less than 12,000 ft<sup>2</sup> (1115 m<sup>2</sup>), and are not used as an exhibition hall or for a display room. Exhibit and display halls have been shown to be fire and life safety problems because of their high fuel load and potential for rapid fire spread.

The text of [A.12.3.5.3\(1\)](#) clarifies that it is not the intent of [12.3.5.3\(1\)](#) to prohibit the presence of normal ancillary spaces. However, a number of assembly rooms or a mixed occupancy would not be permitted to use this exemption.

**Paragraph 12.3.5.3(2)** exempts gymnasiums, skating rinks (including ice and roller rinks), and swimming pools where there is an audience or spectator gallery with an occupant load of 300 or fewer persons. If the skating rink or swimming pool can be floored over and used for other purposes, then the multipurpose room requirements contained in [12.3.5.3\(1\)](#) might apply. If the spectator gallery has an occupant load greater than 300, then an automatic sprinkler system is required. In effect, [12.3.5.3\(2\)](#) exempts the participants on the gym floor, on the skating rink, or in the swimming pool from being counted as part of the 300-person threshold at which the provisions of [12.3.5.2](#) apply.

Two major questions that arise with regard to [12.3.5](#) deal with multiple occupancies (especially assembly/educational)

## CHAPTER 12 • New

and multiple assembly occupancies (especially religious halls with multipurpose rooms).

With regard to multiple occupancies, 6.1.14.3 states that, if mixed occupancies provisions are to be used to protect a multiple occupancy, the most stringent requirements applicable to any of the involved occupancies must be provided for all occupancies. Therefore, new schools with assembly occupancies with an occupant load in excess of 300 need to be fully sprinklered, unless the multiple occupancy is treated as separated occupancies in accordance with 6.1.14.4, which would require independent exit access systems and substantial fire-rated separating construction. If separated occupancies can be established, only the assembly occupancy with an occupant load in excess of 300 would need to be sprinklered. Also, multipurpose assembly rooms in a multiple occupancy assembly and educational occupancies building utilizing the separated occupancies provisions of 6.1.14.4 could potentially use 12.3.5.3(1) for exemption from

**12.3.6 Corridors.** Interior corridors and lobbies shall be constructed in accordance with 7.1.3.1 and Section 8.3, unless otherwise permitted by one of the following:

- (1) Corridor and lobby protection shall not be required where assembly rooms served by the corridor or lobby have at least 50 percent of their exit capacity discharging directly to the outside, independent of corridors and lobbies.
- (2) Corridor and lobby protection shall not be required in buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.
- (3) Lobbies serving only one assembly area that meet the requirements for intervening rooms (*see* 7.5.1.6) shall not be required to have a fire resistance rating.
- (4) Where the corridor ceiling is an assembly having a 1-hour fire resistance rating where tested as a wall, the corridor walls shall be permitted to terminate at the corridor ceiling.
- (5) Corridor and lobby protection shall not be required in buildings protected throughout by an approved, total (complete) coverage smoke detection system providing occupant notification and installed in accordance with Section 9.6.

The corridor provisions of 12.3.6 apply only to new assembly occupancies.

Paragraph 12.3.6(1) permits corridor protection to be eliminated but requires 50 percent of the egress capacity of each assembly room to be direct to the outside, independent of corridors or lobbies. This requirement permits theaters, for example, to use nonrated doors between the audience seating chamber and the lobby. Nonrated doors are not required to latch. The absence of the latch helps to avoid the disruptive noise

## CHAPTER 13 • Existing

the sprinkler requirement. Paragraph 12.3.5.3(1) emphasizes that the assembly occupancy is essentially a single room and, thus, cannot be part of a multiple occupancy building protected as mixed occupancies in accordance with 6.1.14.3.

Paragraph 12.3.5.3(1) was originally intended for a typical fellowship hall, such as a VFW, an American Legion, or a Grange hall. Some ancillary rooms, such as kitchens, restrooms, storage rooms, or minor offices, will exist, and it is not the intent that these ancillary spaces disqualify a facility from using this exemption [see A.12.3.5.3(1)]; however, it is the intent that the facility consist essentially of only one major room.

The provisions of 13.3.5.2 — which apply to existing assembly occupancies used or capable of being used for exhibition or display purposes — are not as stringent as those for new assembly occupancies. This requirement would apply to many facilities over 15,000 ft<sup>2</sup> (1400 m<sup>2</sup>), unless fixed seating or similar permanent obstruction to exhibition use is provided.

**13.3.6 Corridors.** (No requirements.)

associated with unlatching the door any time an occupant enters or leaves the room.

Paragraph 12.3.6(2) recognizes the excellent record of automatic sprinkler systems in controlling a fire while the fire is small. However, this exemption requires the entire building, not only the assembly area, to be sprinklered.

Paragraph 12.3.6(3) recognizes the situation where the lobby serves only one assembly space and where, from a fire safety perspective, it can be considered part of that assembly space.

## CHAPTER 12 • New

Paragraph 12.3.6(4) does not exempt the facility from providing fire-rated corridor walls. It permits the rated fire barrier to terminate tight against a ceiling that is constructed to be equivalent to a 1-hour wall.

## 12.4 Special Provisions

Subsection 12.4.1 was revised by a tentative interim amendment (TIA).

### 12.4.1 Life Safety Evaluation.

The life safety evaluation (LSE) detailed in 12/13.4.1 is required under any of three conditions that follow:

1. Where the occupant load exceeds 6000 persons — see 12/13.1.7.3 and 12/13.1.7.4
2. Where indoor festival seating (i.e., a form of general admission) is used for more than 250 persons — see 12/13.2.5.4.1(2)
3. Where a reduction in egress path sizing occurs for the special arrangement known as smoke-protected assembly seating — see 12/13.4.2.2

The LSE provisions of 12.4.1 were expanded for the 2015 edition of the *Code* to improve their utility. Historically the LSE was performed, approved by the AHJ, updated for special or unusual conditions as needed, and presented to the AHJ for re-approval on a yearly basis. The LSE was lacking in that it did not tie together, at the time the facility was designed and built, the physical elements and how the facility was to be managed.

**12.4.1.1\* General.** Where a life safety evaluation is required by other provisions of this *Code*, it shall comply with the following:

- (1) The life safety evaluation shall be performed by persons acceptable to the AHJ.
- (2) The life safety evaluation shall include a written assessment of safety measures for conditions listed in 12.4.1.2 and of the building systems and facility management in accordance with 12.4.1.3.
- (3) The life safety evaluation shall be approved annually by the AHJ and shall be updated for special or unusual conditions in accordance with the provisions of 13.4.1 for existing assembly occupancies.

**A.12.4.1.1** Life safety evaluations are examples of performance-based approaches to life safety. In this respect, significant guidance in the form and process of life safety evaluations is provided by Chapter 5, keeping in mind the fire safety emphasis in

## CHAPTER 13 • Existing

Paragraph 12.3.6(5) recognizes the excellent record of automatic smoke detection systems in providing early warning. However, this exemption requires the entire building, not only the assembly area, to be equipped with smoke detectors.

## 13.4 Special Provisions

Subsection 13.4.1 was revised by a tentative interim amendment (TIA).

### 13.4.1 Life Safety Evaluation.

For the 2015 edition of the *Code*, a new assembly venue subject to the LSE must be assessed prior to construction to ensure that the needed physical elements are part of the design. Also, facility management must be evaluated prior to building occupancy. The expanded LSE provisions help to facilitate better communication among the designers and those who manage the facilities after construction. The goal is to provide managers with safety systems that are compatible with actual building use.

Similarly, the LSE provisions of 13.4.1 for existing assembly occupancies were expanded to include the changes made to 12.4.1 other than those related to preconstruction criteria. In addition to the building systems and facility management assessments, the LSE criteria include requirements for a life safety narrative, floor plans, engineering analysis and calculations, operational plans, and a systems reference guide.

**13.4.1.1\* General.** Where a life safety evaluation is required by other provisions of this *Code*, it shall comply with the following:

- (1) The life safety evaluation shall be performed by persons acceptable to the AHJ.
- (2) The life safety evaluation shall include a written assessment of safety measures for conditions listed in 13.4.1.2 and of the building systems and facility management in accordance with 13.4.1.3.
- (3) The life safety evaluation shall be approved annually by the AHJ and shall be updated for special or unusual conditions in accordance with the provisions of 13.4.1 for existing assembly occupancies.

**A.13.4.1.1** Life safety evaluations are examples of performance-based approaches to life safety. In this respect, significant guidance in the form and process of life safety evaluations is provided by Chapter 5, keeping in mind the fire safety emphasis in

## CHAPTER 12 • New

**Chapter 5.** Performance criteria, scenarios, evaluation, safety factors, documentation, maintenance, and periodic assessment (including a warrant of fitness) all apply to the broader considerations in a life safety evaluation. A life safety evaluation deals not only with fire but also with storms, collapse, crowd behavior, and other related safety considerations for which a checklist is provided in **A.12.4.1.3**. **Chapter 5** provides guidance, based on fire safety requirements, for establishing a documented case showing that products of combustion in all conceivable fire scenarios will not significantly endanger occupants using means of egress in the facility (e.g., due to fire detection, automatic suppression, smoke control, large-volume space, or management procedures). Moreover, means of egress facilities plus facility management capabilities should be adequate to cope with scenarios where certain egress routes are blocked for some reason.

In addition to making realistic assumptions about the capabilities of persons in the facility (e.g., an assembled crowd including many disabled persons or persons unfamiliar with the facility), the life safety evaluation should include a factor of safety of not less than 2.0 in all calculations relating to hazard development time and required egress time (the combination of flow time and other time needed to detect and assess an emergency condition, initiate egress, and move along the egress routes). The factor of safety takes into account the possibility that half of the egress routes might not be used (or be usable) in certain situations.

Regarding crowd behavior, the potential hazards created by larger masses of people and greater crowd densities (which can be problematic during ingress, occupancy, and egress) demand that technology be used by designers, managers, and authorities responsible for buildings to compensate for the relaxed egress capacity provisions of **Table 12.4.2.3**. In very large buildings for assembly use, the hazard of crowd crushes can exceed that of fire or structural failure. Therefore, the building designers, managers, event planners, security personnel, police authorities, and fire authorities, as well as the building construction authorities, should understand the potential problems and solutions, including coordination of their activities. For crowd behavior, this understanding includes factors of space, energy, time, and information, as well as specific crowd management techniques, such as metering. Published guidance on these factors and techniques is found in the *SFPE Handbook of Fire Protection Engineering*, Section 3, Chapter 13, pp. 3-342–3-366 (Proulx, G., “Movement of People”), and the publications referenced therein.

**Table 12.2.3.2** and **Table 12.4.2.3** are based on a linear relationship between number of seats and nominal flow time, with not less than 200 seconds (3.3 minutes) for 2000 seats plus 1 second for every additional 50 seats up to 25,000. Beyond 25,000 total seats, the nominal flow time is limited to 660 seconds (11 minutes). Nominal flow time refers to the flow time for the

## CHAPTER 13 • Existing

**Chapter 5.** Performance criteria, scenarios, evaluation, safety factors, documentation, maintenance, and periodic assessment (including a warrant of fitness) all apply to the broader considerations in a life safety evaluation. A life safety evaluation deals not only with fire but also with storms, collapse, crowd behavior, and other related safety considerations for which a checklist is provided in **A.13.4.1.3**. **Chapter 5** provides guidance, based on fire safety requirements, for establishing a documented case showing that products of combustion in all conceivable fire scenarios will not significantly endanger occupants using means of egress in the facility (e.g., due to fire detection, automatic suppression, smoke control, large-volume space, or management procedures). Moreover, means of egress facilities plus facility management capabilities should be adequate to cope with scenarios where certain egress routes are blocked for some reason.

In addition to making realistic assumptions about the capabilities of persons in the facility (e.g., an assembled crowd including many disabled persons or persons unfamiliar with the facility), the life safety evaluation should include a factor of safety of not less than 2.0 in all calculations relating to hazard development time and required egress time (the combination of flow time and other time needed to detect and assess an emergency condition, initiate egress, and move along the egress routes). This factor of safety takes into account the possibility that half of the egress routes might not be used (or be usable) in certain situations.

Regarding crowd behavior, the potential hazards created by larger masses of people and greater crowd densities (which can be problematic during ingress, occupancy, and egress) demand that technology be used by designers, managers, and authorities responsible for buildings to compensate for the relaxed egress capacity provisions of **Table 13.4.2.3**. In very large buildings for assembly use, the hazard of crowd crushes can exceed that of fire or structural failure. Therefore, the building designers, managers, event planners, security personnel, police authorities, and fire authorities, as well as the building construction authorities, should understand the potential problems and solutions, including coordination of their activities. For crowd behavior, this understanding includes factors of space, energy, time, and information, as well as specific crowd management techniques, such as metering. Published guidance on these factors and techniques is found in the *SFPE Handbook of Fire Protection Engineering*, Section 3, Chapter 13, pp. 3-342–3-366 (Proulx, G., “Movement of People”), and the publications referenced therein.

**Table 13.2.3.2** and **Table 13.4.2.3** are based on a linear relationship between number of seats and nominal flow time, with not less than 200 seconds (3.3 minutes) for 2000 seats plus 1 second for every additional 50 seats up to 25,000. Beyond 25,000 total seats, the nominal flow time is limited to 660 seconds (11 minutes). Nominal flow time refers to the flow time for the

## CHAPTER 12 • New

most able group of patrons; some groups less familiar with the premises or less able groups might take longer to pass a point in the egress system. Although three or more digits are noted in the tables, the resulting calculations should be assumed to provide only two significant figures of precision.

**12.4.1.2 Conditions to Be Assessed.** Life safety evaluations shall include an assessment of all of the following conditions and related appropriate safety measures:

- (1) Nature of the events and the participants and attendees
- (2) Access and egress movement, including crowd density problems
- (3) Medical emergencies
- (4) Fire hazards
- (5) Permanent and temporary structural systems
- (6) Severe weather conditions
- (7) Earthquakes
- (8) Civil or other disturbances
- (9) Hazardous materials incidents within and near the facility
- (10) Relationships among facility management, event participants, emergency response agencies, and others having a role in the events accommodated in the facility

**12.4.1.3\* Building Systems and Facility Management Assessments.** Life safety evaluations shall include assessments of both building systems and facility management upon which reliance is placed for the safety of facility occupants, and such assessments shall consider scenarios appropriate to the facility.

**A.12.4.1.3** Factors to be considered in a life safety evaluation include the following:

- (1) Nature of the events being accommodated, including the following:
  - (a) Ingress, intra-event movement, and egress patterns
  - (b) Ticketing and seating policies/practices
  - (c) Event purpose (e.g., sports contest, religious meeting)
  - (d) Emotional qualities (e.g., competitiveness) of event
  - (e) Time of day when event is held
  - (f) Time duration of single event
  - (g) Time duration of attendees' occupancy of the building
- (2) Occupant characteristics and behavior, including the following:
  - (a) Homogeneity
  - (b) Cohesiveness
  - (c) Familiarity with building
  - (d) Familiarity with similar events
  - (e) Capability (as influenced by factors such as age, physical abilities)
  - (f) Socioeconomic factors

## CHAPTER 13 • Existing

most able group of patrons; some groups less familiar with the premises or less able groups might take longer to pass a point in the egress system. Although three or more digits are noted in the tables, the resulting calculations should be assumed to provide only two significant figures of precision.

**13.4.1.2 Conditions to Be Assessed.** Life safety evaluations shall include an assessment of all of the following conditions and related appropriate safety measures:

- (1) Nature of the events and the participants and attendees
- (2) Access and egress movement, including crowd density problems
- (3) Medical emergencies
- (4) Fire hazards
- (5) Permanent and temporary structural systems
- (6) Severe weather conditions
- (7) Earthquakes
- (8) Civil or other disturbances
- (9) Hazardous materials incidents within and near the facility
- (10) Relationships among facility management, event participants, emergency response agencies, and others having a role in the events accommodated in the facility

**13.4.1.3\* Building Systems and Facility Management Assessments.** Life safety evaluations shall include assessments of both building systems and facility management upon which reliance is placed for the safety of facility occupants, and such assessments shall consider scenarios appropriate to the facility.

**A.13.4.1.3** Factors to be considered in a life safety evaluation might include the following:

- (1) Nature of the events being accommodated, including the following:
  - (a) Ingress, intra-event movement, and egress patterns
  - (b) Ticketing and seating policies/practices
  - (c) Event purpose (e.g., sports contest, religious meeting)
  - (d) Emotional qualities (e.g., competitiveness) of event
  - (e) Time of day when event is held
  - (f) Time duration of single event
  - (g) Time duration of attendees' occupancy of the building
- (2) Occupant characteristics and behavior, including the following:
  - (a) Homogeneity
  - (b) Cohesiveness
  - (c) Familiarity with building
  - (d) Familiarity with similar events
  - (e) Capability (as influenced by factors such as age, physical abilities)
  - (f) Socioeconomic factors

## CHAPTER 12 • New

- (g) Small minority involved with recreational violence
- (h) Emotional involvement with the event and other occupants
  - (i) Use of alcohol or drugs
  - (j) Food consumption
  - (k) Washroom utilization
- (3) Management, including the following:
  - (a) Clear, contractual arrangements for facility operation/ use as follows:
    - i. Between facility owner and operator
    - ii. Between facility operator and event promoter
    - iii. Between event promoter and performer
    - iv. Between event promoter and attendee
    - v. With police forces
    - vi. With private security services
    - vii. With ushering services
  - (b) Experience with the building
  - (c) Experience with similar events and attendees
  - (d) Thorough, up-to-date operations manual
  - (e) Training of personnel
  - (f) Supervision of personnel
  - (g) Communications systems and utilization
  - (h) Ratios of management and other personnel to attendees
    - (i) Location/distribution of personnel
    - (j) Central command location
    - (k) Rapport between personnel and attendees
    - (l) Personnel support of attendee goals
  - (m) Respect of attendees for personnel due to the following:
    - i. Dress (uniform) standards
    - ii. Age and perceived experience
    - iii. Personnel behavior, including interaction
    - iv. Distinction between crowd management and control
      - v. Management concern for facility quality (e.g., cleanliness)
      - vi. Management concern for entire event experience of attendees (i.e., not just during occupancy of the building)
- (4) Emergency management preparedness, including the following:
  - (a) Complete range of emergencies addressed in operations manual
  - (b) Power loss
  - (c) Fire
  - (d) Severe weather
  - (e) Earthquake
  - (f) Crowd incident
  - (g) Terrorism
  - (h) Hazardous materials

## CHAPTER 13 • Existing

- (g) Small minority involved with recreational violence

## CHAPTER 12 • New

- (nn) Route choices, especially for vertical travel
- (oo) Resting/waiting areas
- (pp) Levels of service (overall crowd movement quality)
- (qq) Services
- (rr) Washroom provision and distribution
- (ss) Concessions
- (tt) First aid and EMS facilities
- (uu) General attendee services

A scenario-based approach to performance-based fire safety is addressed in **Chapter 5**. In addition to using such scenarios and, more generally, the attention to performance criteria, evaluation, safety factors, documentation, maintenance, and periodic assessment required when the **Chapter 5** option is used, life safety evaluations should consider scenarios based on characteristics important in assembly occupancies. These characteristics include the following:

- (1) Whether there is a local or mass awareness of an incident, event, or condition that might provoke egress
- (2) Whether the incident, event, or condition stays localized or spreads
- (3) Whether or not egress is desired by facility occupants
- (4) Whether there is a localized start to any egress or mass start to egress
- (5) Whether exits are available or not available

Examples of scenarios and sets of characteristics that might occur in a facility follow.

*Scenario 1.* Characteristics: mass start, egress desired (by management and attendees), exits not available, local awareness.

Normal egress at the end of an event occurs just as a severe weather condition induces evacuees at the exterior doors to retard or stop their egress. The backup that occurs in the egress system is not known to most evacuees, who continue to press forward, potentially resulting in a crowd crush.

*Scenario 2.* Characteristics: mass start, egress not desired (by management), exits possibly not available, mass awareness.

An earthquake occurs during an event. The attendees are relatively safe in the seating area. The means of egress outside the seating area are relatively unsafe and vulnerable to aftershock damage. Facility management discourages mass egress until the means of egress can be checked and cleared for use.

*Scenario 3.* Characteristics: local start, incident stays local, egress desired (by attendees and management), exits available, mass awareness.

A localized civil disturbance (e.g., firearms violence) provokes localized egress, which is seen by attendees, generally, who then decide to leave also.

## CHAPTER 13 • Existing

- (nn) Route choices, especially for vertical travel
- (oo) Resting/waiting areas
- (pp) Levels of service (overall crowd movement quality)
- (qq) Services
- (rr) Washroom provision and distribution
- (ss) Concessions
- (tt) First aid and EMS facilities
- (uu) General attendee services

A scenario-based approach to performance-based fire safety is addressed in **Chapter 5**. In addition to utilizing such scenarios and, more generally, the attention to performance criteria, evaluation, safety factors, documentation, maintenance, and periodic assessment required when the **Chapter 5** option is used, life safety evaluations should consider scenarios based on characteristics important in assembly occupancies. These characteristics include the following:

- (1) Whether there is a local or mass awareness of an incident, event, or condition that might provoke egress
- (2) Whether the incident, event, or condition stays localized or spreads
- (3) Whether or not egress is desired by facility occupants
- (4) Whether there is a localized start to any egress or mass start to egress
- (5) Whether exits are available or not available

Examples of scenarios and sets of characteristics that might occur in a facility follow.

*Scenario 1.* Characteristics: mass start, egress desired (by management and attendees), exits not available, local awareness.

Normal egress at the end of an event occurs just as a severe weather condition induces evacuees at the exterior doors to retard or stop their egress. The backup that occurs in the egress system is not known to most evacuees, who continue to press forward, potentially resulting in a crowd crush.

*Scenario 2.* Characteristics: mass start, egress not desired (by management), exits possibly not available, mass awareness.

An earthquake occurs during an event. The attendees are relatively safe in the seating area. The means of egress outside the seating area are relatively unsafe and vulnerable to aftershock damage. Facility management discourages mass egress until the means of egress can be checked and cleared for use.

*Scenario 3.* Characteristics: local start, incident stays local, egress desired (by attendees and management), exits available, mass awareness.

A localized civil disturbance (e.g., firearms violence) provokes localized egress, which is seen by attendees, generally, who then decide to leave also.

CHAPTER 12 • New

*Scenario 4.* Characteristics: mass start, egress desired (by attendees), incident spreads, exits not available, mass awareness.

In an open-air facility unprotected from wind, precipitation, and lightning, sudden severe weather prompts egress to shelter, but not from the facility. The means of egress congest and block quickly as people in front stop once they are under shelter, while people behind them continue to press forward, potentially resulting in a crowd crush.

These scenarios illustrate some of the broader factors to be taken into account when assessing the capability of both building systems and management features on which reliance is placed in a range of situations, not just fire emergencies. Some scenarios also illustrate the conflicting motivations of management and attendees, based on differing perceptions of danger and differing knowledge of hazards, countermeasures, and capabilities. Mass egress might not be the most appropriate life safety strategy in some scenarios, such as Scenario 2.

**Table A.12.4.1.3** summarizes the characteristics in the scenarios and provides a framework for developing other characteristics and scenarios that might be important for a particular facility, hazard, occupant type, event, or management.

CHAPTER 13 • Existing

*Scenario 4.* Characteristics: mass start, egress desired (by attendees), incident spreads, exits not available, mass awareness.

In an open-air facility unprotected from wind, precipitation, and lightning, sudden severe weather prompts egress to shelter but not from the facility. The means of egress congest and block quickly as people in front stop once they are under shelter, while people behind them continue to press forward, potentially resulting in a crowd crush.

These scenarios illustrate some of the broader factors to be taken into account when assessing the capability of both building systems and management features on which reliance is placed in a range of situations, not just fire emergencies. Some scenarios also illustrate the conflicting motivations of management and attendees based on differing perceptions of danger and differing knowledge of hazards, countermeasures, and capabilities. Mass egress might not be the most appropriate life safety strategy in some scenarios, such as Scenario 2.

**Table A.13.4.1.3** summarizes the characteristics in the scenarios and provides a framework for developing other characteristics and scenarios that might be important for a particular facility, hazard, occupant type, event, or management.

## CHAPTER 12 • New

**12.4.1.3.1 Building Systems.** Prior to issuance of the building permit, the design team shall provide the AHJ with building systems documentation in accordance with 12.4.1.4.

**12.4.1.3.2 Facility Management.** Prior to issuance of the certificate of occupancy, the facility management shall provide the AHJ with facility management documentation in accordance with 12.4.1.5.

**12.4.1.3.3 Life Safety Evaluation.**

**12.4.1.3.3.1** Prior to issuance of the building permit, the persons performing the life safety evaluation shall confirm that the building systems provide appropriate safety measures.

**12.4.1.3.3.2** Prior to issuance of the certificate of occupancy, the persons performing the life safety evaluation shall confirm that the facility management and operational plans provide appropriate safety measures.

**12.4.1.3.3.3** The AHJ shall approve the acceptable persons performing the life safety evaluation in a timely manner to enable the design team and facility management to resolve concerns to the satisfaction of the persons performing the life safety evaluation prior to their submission.

**12.4.1.4 Life Safety Building Systems Document.** The AHJ shall be provided with a life safety building systems document providing the information required in 12.4.1.4.2 through 12.4.1.4.4.

**12.4.1.4.1 Document Distribution.** The persons performing the life safety evaluation, the AHJ, the A/E design team, and the building owner shall receive a copy of the life safety building systems document prior to issuance of the building permit.

**12.4.1.4.2 Life Safety Narrative.** A life safety narrative shall be provided describing the following:

- (1) Building occupancy, construction type, and intended uses and events
- (2) Building area and population capacity of the proposed facility
- (3) Principal fire and life safety features/strategies for the building, including — as applicable — the following:
  - (a) Egress
  - (b) Access control
  - (c) Fire barriers, smoke barriers, and smoke partitions
  - (d) Fire suppression systems
  - (e) Smoke control/protection
  - (f) Fire detection and alarm
  - (g) PA system
  - (h) Emergency elevator operation
  - (i) Emergency power and lighting
  - (j) Provisions for patrons with disabilities

## CHAPTER 13 • Existing

**13.4.1.3.1 Building Systems.** Documentation of the building systems in accordance with 13.4.1.4 shall be provided upon request of the AHJ.

**13.4.1.3.2 Facility Management.** Facility management shall provide the AHJ with facility management documentation in accordance with 13.4.1.5 upon request of the AHJ.

**13.4.1.3.3 Life Safety Evaluation.** The life safety evaluation shall confirm that the building systems and the facility management and operational plans provide appropriate safety measures.

**13.4.1.4 Life Safety Building Systems Document.** The AHJ shall be provided with a life safety building systems document providing the information required in 13.4.1.4.2 through 13.4.1.4.4.

**13.4.1.4.1 Reserved.**

**13.4.1.4.2 Life Safety Narrative.** A life safety narrative shall be provided describing the following:

- (1) Building occupancy, construction type, and intended uses and events
- (2) Building area and population capacity of the proposed facility
- (3) Principal fire and life safety features/strategies for the building, including — as applicable — the following:
  - (a) Egress
  - (b) Access control
  - (c) Fire barriers, smoke barriers, and smoke partitions
  - (d) Fire suppression systems
  - (e) Smoke control/protection
  - (f) Fire detection and alarm
  - (g) PA system
  - (h) Emergency elevator operation
  - (i) Emergency power and lighting
  - (j) Provisions for patrons with disabilities

## CHAPTER 12 • New

- (k) Fire department access
- (l) Fire/Emergency command center
- (4) Exterior construction design parameters used/applied

**12.4.1.4.3 Life Safety Floor Plans.** Life safety floor plans of each level shall be provided — as applicable — with the following:

- (1) Occupant load, exit location, egress capacity, main entrance/exit, horizontal exits, travel distance, and exit discharge
- (2) Fire barriers, smoke barriers, and smoke partitions
- (3) Areas of smoke-protected assembly occupancy
- (4) Separate smoke-protected areas or zones
- (5) Areas of other occupancy type and separations
- (6) Unprotected vertical openings
- (7) Event plans for each anticipated type of event depicting the following:
  - (a) Seating configuration
  - (b) Exhibit booth layout
  - (c) Stage location
  - (d) Occupant load, egress capacity required, exits provided, and travel distance
  - (e) Any floor or stage use restrictions
  - (f) Plan and/or section drawing indicating areas where the roof construction is more than 50 ft (15 m) above floor level and areas where sprinkler protection is omitted
  - (g) Areas of refuge — interior and exterior

**12.4.1.4.4 Engineering Analysis and Calculations.** An engineering analysis shall be provided with the following:

- (1) Smoke protection analysis to substantiate the use of smoke-protected assembly seating as follows:
  - (a) Performance-based design methods approved by the AHJ
  - (b) Smoke control requirements per NFPA 92, *Standard for Smoke Control Systems*
  - (c) Smoke control assumptions, such as fire scenario description, fire size quantification, and smoke development/smoke movement analysis
  - (d) Proposed testing protocol for smoke control system and pass/fail criteria
  - (e) Timed egress analysis and assumed flow rates and travel speeds
- (2) Sprinkler protection calculations, including an engineering analysis substantiating locations in accordance with 12.3.5.3 where sprinkler protection would be ineffective due to height and combustible loading
- (3) Load diagram of rigging/load capacity of gridiron, fly loft, or long-span roof structure used for hanging overhead objects

**12.4.1.5 Life Safety Management Document.** The AHJ shall be provided with a life safety management document providing the information required in 12.4.1.5.2 through 12.4.1.5.7.

## CHAPTER 13 • Existing

- (k) Fire department access
- (l) Fire/Emergency command center
- (4) Exterior construction design parameters used/applied

**13.4.1.4.3 Life Safety Floor Plans.** Life safety floor plans of each level shall be provided — as applicable — with the following:

- (1) Occupant load, exit location, egress capacity, main entrance/exit, horizontal exits, travel distance, and exit discharge
- (2) Fire barriers, smoke barriers, and smoke partitions
- (3) Areas of smoke-protected assembly occupancy
- (4) Separate smoke-protected areas or zones
- (5) Areas of other occupancy type and separations
- (6) Unprotected vertical openings
- (7) Event plans for each anticipated type of event depicting the following:
  - (a) Seating configuration
  - (b) Exhibit booth layout
  - (c) Stage location
  - (d) Occupant load, egress capacity required, exits provided, and travel distance
  - (e) Any floor or stage use restrictions
  - (f) Plan and/or section drawing indicating areas where the roof construction is more than 50 ft (15 m) above floor level and areas where sprinkler protection is omitted
  - (g) Areas of refuge — interior and exterior

**13.4.1.4.4 Engineering Analysis and Calculations.** An engineering analysis shall be provided with the following:

- (1) Smoke protection analysis to substantiate the use of smoke-protected assembly seating as follows:
  - (a) Performance-based design methods approved by the AHJ
  - (b) Smoke control requirements per NFPA 92, *Standard for Smoke Control Systems*
  - (c) Smoke control assumptions, such as fire scenario description, fire size quantification, and smoke development/smoke movement analysis
  - (d) Proposed testing protocol for smoke control system and pass/fail criteria
  - (e) Timed egress analysis and assumed flow rates and travel speeds
- (2) Sprinkler protection calculations, including an engineering analysis substantiating locations in accordance with 13.3.5.3 where sprinkler protection would be ineffective due to height and combustible loading
- (3) Load diagram of rigging/load capacity of gridiron, fly loft, or long-span roof structure used for hanging overhead objects

**13.4.1.5 Life Safety Management Document.** The AHJ shall be provided with a life safety management document providing the information required in 13.4.1.5.2 through 13.4.1.5.7.

## CHAPTER 12 • New

**12.4.1.5.1 Document Distribution.** The persons performing the life safety evaluation, the AHJ, the A/E design team, and the building owner shall receive a copy of the life safety management document prior to issuance of the certificate of occupancy.

**12.4.1.5.2 Facility Management and Operational Plans.** Facility management and operational plans shall address the following:

- (1) Best practices adopted or recognized
- (2) Emergency plans
- (3) Evacuation plans
- (4) Shelter-in-place plans, including capacities and protection considerations
- (5) Crowd management training plan
- (6) Safety plans, which include the following:
  - (a) Training plans
  - (b) Safety equipment plans
- (7) Fire alarm, smoke control system protocol, and testing plans
- (8) First aid or medical treatment plans, which include the following:
  - (a) Defined levels of service
  - (b) Standing orders adopted
  - (c) Supply and equipment plan
- (9) Housekeeping plans — biological, medical, hazardous materials cleaning
- (10) Emergency communication plans, which include the following:
  - (a) Chain of authority and incident command system employed
  - (b) Contact information for the following:
    - i. Venue personnel
    - ii. Emergency management and response organizations, such as fire, police, medical, utility, transportation, and key stakeholders
  - (c) Communication systems
  - (d) Standard announcement for incidents or emergency situations
- (11) Risk and threat assessment for venue and surrounding area for the following:
  - (a) Severe weather
  - (b) Hazardous materials
  - (c) Terrorism
  - (d) Hostile intruder
- (12) Operating procedures and protocols for risks, such as the following:
  - (a) Severe weather preparedness and monitoring plans
  - (b) Hazardous materials incidence response plans
  - (c) Terrorism response plans
  - (d) Hostile intruder response plans
- (13) First responder response/arrival routes plans

## CHAPTER 13 • Existing

**13.4.1.5.1 Reserved.**

**13.4.1.5.2 Facility Management and Operational Plans.** Facility management and operational plans shall address the following:

- (1) Best practices adopted or recognized
- (2) Emergency plans
- (3) Evacuation plans
- (4) Shelter-in-place plans including capacities and protection considerations
- (5) Crowd management training plans
- (6) Safety plans, which include the following:
  - (a) Training plans
  - (b) Safety equipment plans
- (7) Fire alarm, smoke control system protocol, and testing plans
- (8) First aid or medical treatment plans, which include the following:
  - (a) Defined levels of service
  - (b) Standing orders adopted
  - (c) Supply and equipment plan
- (9) Housekeeping plans — biological, medical, hazardous materials cleaning
- (10) Emergency communication plans, which include the following:
  - (a) Chain of authority and incident command system employed
  - (b) Contact information for the following:
    - i. Venue personnel
    - ii. Emergency management and response organizations, such as fire, police, medical, utility, transportation, and key stakeholders
  - (c) Communication systems
  - (d) Standard announcement for incidents or emergency situations
- (11) Risk and threat assessment for venue and surrounding area for the following:
  - (a) Severe weather
  - (b) Hazardous materials
  - (c) Terrorism
  - (d) Hostile intruder
- (12) Operating procedures and protocols for risks, such as the following:
  - (a) Severe weather preparedness and monitoring plans
  - (b) Hazardous materials incidence response plans
  - (c) Terrorism response plans
  - (d) Hostile intruder response plans
- (13) First responder response/arrival routes plans

## CHAPTER 12 • New

- (14) Alcohol management plans
- (15) Food safety plans
- (16) Rigging and temporary performance structure, which includes the following:
  - (a) Design and safety review plans
  - (b) Emergency action plans
- (17) Chemical and hazardous materials information and data
- (18) Barrier and wall protection plans for motor sports or similar events

**12.4.1.5.3 Records.** Records of the facility management plans, including procedures and location, shall be maintained for the following:

- (1) Crowd management training
- (2) Safety training
- (3) Fire alarm, smoke control system maintenance, and test records
- (4) First aid or medical treatment and regulation compliance

**12.4.1.5.4 Building Systems Reference Guide.** A building systems reference guide shall be provided in accordance with [12.4.1.5.4.1](#) through [12.4.1.5.4.3](#).

**12.4.1.5.4.1** A basic life safety building systems reference guide shall be developed and maintained.

**12.4.1.5.4.2** The life safety building systems reference guide shall contain the important and key information for the venue management's use when planning events/activities for the safety of patrons, performers/participants, employees, and vendors.

**12.4.1.5.4.3** The life safety building systems document in accordance with [12.4.1.4](#) shall be permitted to be used, and additionally the life safety building systems reference guide shall include the following:

- (1) Occupant capacity of every space/room
- (2) Egress flow diagrams, including assumed flow rates, and capacities of all aisles and hallways, including public and nonpublic areas
- (3) Capacities of all exterior doors and/or choke points in immediate perimeter areas
- (4) Limitations or assumptions for ingress control that could be in place during an emergency egress/evacuation, including control gates, queuing barriers, and turnstiles
- (5) Capacities of immediate perimeter exterior walkways, including assumed flow rates for exterior areas
- (6) Assumed egress paths for normal conditions — transportation modes
- (7) Management level sequencing charts for alarm and emergency communication systems, the manual, or override options/instructions that include the following:
  - (a) List of codes or alarm signals
  - (b) Location of manual overrides

## CHAPTER 13 • Existing

- (14) Alcohol management plans
- (15) Food safety plans
- (16) Rigging and temporary performance structure, which includes the following:
  - (a) Design and safety review plans
  - (b) Emergency action plans
- (17) Chemical and hazardous materials information and data
- (18) Barrier and wall protection plans for motor sports or similar events

**13.4.1.5.3 Records.** Records of the facility management plans, including procedures and location, shall be maintained for the following:

- (1) Crowd management training
- (2) Safety training
- (3) Fire alarm, smoke control system maintenance, and test records
- (4) First aid or medical treatment and regulation compliance

**13.4.1.5.4 Building Systems Reference Guide.** A building systems reference guide shall be provided in accordance with [13.4.1.5.4.1](#) through [13.4.1.5.4.3](#).

**13.4.1.5.4.1** A basic life safety building systems reference guide shall be developed and maintained.

**13.4.1.5.4.2** The life safety building systems reference guide shall contain the important and key information for the venue management's use when planning events/activities for the safety of patrons, performers/participants, employees, and vendors.

**13.4.1.5.4.3** The life safety building systems document in accordance with [13.4.1.4](#) shall be permitted to be used, and additionally the life safety building systems reference guide shall include the following:

- (1) Occupant capacity of every space/room
- (2) Egress flow diagrams, including assumed flow rates, and capacities of all aisles and hallways, including public and nonpublic areas
- (3) Capacities of all exterior doors and/or choke points in immediate perimeter areas
- (4) Limitations or assumptions for ingress control that could be in place during an emergency egress/evacuation, including control gates, queuing barriers, and turnstiles
- (5) Capacities of immediate perimeter exterior walkways, including assumed flow rates for exterior areas
- (6) Assumed egress paths for normal conditions — transportation modes
- (7) Management level sequencing charts for alarm and emergency communication systems, the manual, or override options/instructions that include the following:
  - (a) List of codes or alarm signals
  - (b) Location of manual overrides

## CHAPTER 12 • New

- (c) Description of sequence of operations during an alarm, such as exhaust fans operate or doors open
- (8) Principal fire and life safety features/strategies, such as sprinklers, smoke control, fire alarm notifications, PA system, emergency power, and fire department access
- (9) Assumptions when developing occupancy plans for venue floor, open areas, and nonevent spaces, such as the following:
  - (a) Event floor plans/setup diagrams for each typical event/activity
  - (b) Fire sprinkler and smoke protection capabilities
- (10) Severe weather shelter areas, locations, structure considerations (limitations), capacities (occupancy and density factor)
- (11) Command center, which includes the following:
  - (a) Location (formal or informal)
  - (b) Structural integrity considerations
  - (c) Redundant locations and/or capabilities
  - (d) Jurisdictional rights — assumed and/or applied
- (12) Locations and capacities of wheelchair and mobility-impaired seating
- (13) Locations and capacities of areas of refuge and other safe areas
- (14) Rigging or structural load capacities of grids, truss structure, fly lofts, ceilings, floors, ramps, and staging
- (15) List of locations of emergency equipment, such as fire extinguishers, fire hose cabinets, fire hydrants, and AEDs
- (16) Sequencing of electrical service, such as the following:
  - (a) Emergency generators and charts of all areas illuminated during power outages
  - (b) Multiple electrical feed capabilities
- (17) List of mechanical, movable equipment in the facility
- (18) Potential hazards in the surrounding neighborhood, including train tracks and propane stations
- (19) Assumptions or accommodations considered and used in design

**12.4.1.5.5** The facility management plans shall be maintained and adjusted as necessary for changes to the venue structure, operating purposes and style, and event occupancy.

**12.4.1.5.6** Facility management and operational plans shall be submitted to the AHJ annually.

**12.4.1.5.7** For events and activities at the venue that are outside the normal operating conditions or vary from the normal facility management plans, the following shall apply:

- (1) Facility management shall perform an event/activity-specific facility management plan for the AHJ to review.
- (2) Approval of the AHJ for the specific facility management plan shall occur prior to such event.

## CHAPTER 13 • Existing

- (c) Description of sequence of operations during an alarm, such as exhaust fans operate or doors open
- (8) Principal fire and life safety features/strategies, such as sprinklers, smoke control, fire alarm notifications, PA system, emergency power, and fire department access
- (9) Assumptions when developing occupancy plans for venue floor, open areas, and nonevent spaces, such as the following:
  - (a) Event floor plans/setup diagrams for each typical event/activity
  - (b) Fire sprinkler and smoke protection capabilities
- (10) Severe weather shelter areas, locations, structure considerations (limitations), capacities (occupancy and density factor)
- (11) Command center, which includes the following:
  - (a) Location (formal or informal)
  - (b) Structural integrity considerations
  - (c) Redundant locations and/or capabilities
  - (d) Jurisdictional rights — assumed and/or applied
- (12) Locations and capacities of wheelchair and mobility-impaired seating
- (13) Locations and capacities of “areas of refuge and other safe areas
- (14) Rigging or structural load capacities of grids, truss structure, fly lofts, ceilings, floors, ramps, and staging
- (15) List of locations of emergency equipment, such as fire extinguishers, fire hose cabinets, fire hydrants, and AEDs
- (16) Sequencing of electrical service, such as the following:
  - (a) Emergency generators and charts of all areas illuminated during power outages
  - (b) Multiple electrical feed capabilities
- (17) List of mechanical, movable equipment in the facility
- (18) Potential hazards in the surrounding neighborhood, including train tracks and propane stations
- (19) Assumptions or accommodations considered and used in design

**13.4.1.5.5** The facility management plans shall be maintained and adjusted as necessary for changes to the venue structure, operating purposes and style, and event occupancy.

**13.4.1.5.6** Facility management and operational plans shall be submitted to the AHJ annually.

**13.4.1.5.7** For events and activities at the venue that are outside the normal operating conditions or vary from the normal facility management plans, the following shall apply:

- (1) Facility management shall perform an event/activity-specific facility management plan for the AHJ to review.
- (2) Approval of the AHJ for the specific facility management plan shall occur prior to such event.

## CHAPTER 12 • New

**12.4.2\* Smoke-Protected Assembly Seating.**

**A.12.4.2** Outdoor facilities are not accepted as inherently smoke-protected but must meet the requirements of smoke-protected assembly seating in order to utilize the special requirements for means of egress.

To be considered smoke protected and thus be permitted to use the reduced egress capacity criteria of [Table 12/13.4.2.3](#), a building must be sprinklered, be provided with features that prevent it from becoming smoke-logged, and — most important — be assessed using a life safety evaluation conducted in accordance with [12/13.4.1](#).

The expansive material contained in [12/13.4.1](#) and [A.12/A.13.4.1.3](#) emphasizes that conducting a life safety evaluation is a complex process that should not be attempted by most Code practitioners. Such an evaluation must demonstrate that all life safety hazards have been considered and that control

**12.4.2.1** To be considered smoke protected, an assembly seating facility shall comply with both of the following:

- (1) All enclosed areas with walls and ceilings in buildings or structures containing smoke-protected assembly seating shall be protected with an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#), unless otherwise permitted by one of the following:
  - (a) The requirement of [12.4.2.1\(1\)](#) shall not apply to the floor area used for contest, performance, or entertainment, provided that the roof construction is more than 50 ft (15 m) above the floor level and use is restricted to low fire hazard uses.
  - (b) Sprinklers shall not be required to be located over the floor area used for contest, performance, or entertainment and over the seating areas where an approved engineering analysis substantiates the ineffectiveness of the sprinkler protection due to building height and combustible loading.
- (2) All means of egress serving a smoke-protected assembly seating area shall be provided with smoke-actuated ventilation facilities or natural ventilation designed in accordance with both of the following criteria:
  - (a) The ventilation system shall be designed to maintain the level of smoke at not less than 6 ft (1830 mm) above the floor of the means of egress.
  - (b) The ventilation system shall be in accordance with *NFPA 92, Standard for Smoke Control Systems*.

**12.4.2.2** To use the provisions of smoke-protected assembly seating, a facility shall be subject to a life safety evaluation in accordance with [12.4.1](#).

**12.4.2.3** Minimum clear widths of aisles and other means of egress serving smoke-protected assembly seating shall be in accordance with [Table 12.4.2.3](#).

## CHAPTER 13 • Existing

**13.4.2\* Smoke-Protected Assembly Seating.**

**A.13.4.2** Outdoor facilities are not accepted as inherently smoke-protected but must meet the requirements of smoke-protected assembly seating in order to use the special requirements for means of egress.

measures have been provided to ensure that occupants evacuating the building will not be endangered by conditions developing faster than the time required to clear the means of egress. The AHJ needs to realize that, if an evaluation doesn't cover nearly all of the subjects addressed in [A.12/A.13.4.1.3](#), it should not be approved. A reduced egress capacity system in accordance with [12/13.4.2.3](#), but for which the life safety evaluation is inadequate, is itself an inadequate egress system. The reduced capacity factors of [Table 12/13.4.2.3](#) are not to be used as a matter of right; rather, their use needs to be earned by providing a comprehensive life safety evaluation.

**13.4.2.1** To be considered smoke protected, an assembly seating facility shall comply with both of the following:

- (1) All enclosed areas with walls and ceilings in buildings or structures containing smoke-protected assembly seating shall be protected with an approved automatic sprinkler system in accordance with [Section 9.7](#), unless otherwise permitted by one of the following:
  - (a) The requirement of [13.4.2.1\(1\)](#) shall not apply to the floor area used for contest, performance, or entertainment, provided that the roof construction is more than 50 ft (15 m) above the floor level and use is restricted to low fire hazard uses.
  - (b) Sprinklers shall not be required to be located over the floor area used for contest, performance, or entertainment and over the seating areas where an approved engineering analysis substantiates the ineffectiveness of the sprinkler protection due to building height and combustible loading.
- (2) All means of egress serving a smoke-protected assembly seating area shall be provided with smoke-actuated ventilation facilities or natural ventilation designed to maintain the level of smoke at not less than 6 ft (1830 mm) above the floor of the means of egress.

**13.4.2.2** To use the provisions of smoke-protected assembly seating, a facility shall be subject to a life safety evaluation in accordance with [13.4.1](#).

**13.4.2.3** Minimum clear widths of aisles and other means of egress serving smoke-protected assembly seating shall be in accordance with [Table 13.4.2.3](#).

## CHAPTER 12 • New

**Table 12.4.2.3 Capacity Factors for Smoke-Protected Assembly Seating**

No. of Seats	Clear Width per Seat Served			
	Stairs		Passageways, Ramps, and Doorways	
	in.	mm	in.	mm
2,000	0.300 AB	7.6 AB	0.220 C	5.6 C
5,000	0.200 AB	5.1 AB	0.150 C	3.8 C
10,000	0.130 AB	3.3 AB	0.100 C	2.5 C
15,000	0.096 AB	2.4 AB	0.070 C	1.8 C
20,000	0.076 AB	1.9 AB	0.056 C	1.4 C
≥25,000	0.060 AB	1.5 AB	0.044 C	1.1 C

**12.4.2.4 Outdoor Smoke-Protected Assembly Seating.**

**12.4.2.4.1** Where smoke-protected assembly seating and its means of egress are located wholly outdoors, capacity shall be permitted to be provided in accordance with [Table 12.4.2.4.1](#) and the provision of [12.4.2.4.2](#) shall apply.

**Table 12.4.2.4.1 Capacity Factors for Outdoor Smoke-Protected Assembly Seating**

Feature	Clear Width per Seat Served			
	Stairs		Passageways, Ramps, and Doorways	
	in.	mm	in.	mm
Outdoor smoke-protected assembly seating	0.08 AB	2.0 AB	0.06 C	1.5 C

**12.4.2.4.2** Where the number of seats in outdoor smoke-protected assembly seating exceeds 20,000, the capacity factors of [Table 12.4.2.3](#) shall be permitted to be used.

**12.4.2.5** Where using [Table 12.4.2.3](#), the number of seats specified shall be within a single assembly space, and interpolation shall be permitted between the specific values shown. A single seating space shall be permitted to have multiple levels, floors, or mezzanines.

## CHAPTER 13 • Existing

**Table 13.4.2.3 Capacity Factors for Smoke-Protected Assembly Seating**

No. of Seats	Clear Width per Seat Served			
	Stairs		Passageways, Ramps, and Doorways	
	in.	mm	in.	mm
2,000	0.300 AB	7.6 AB	0.220 C	5.6 C
5,000	0.200 AB	5.1 AB	0.150 C	3.8 C
10,000	0.130 AB	3.3 AB	0.100 C	2.5 C
15,000	0.096 AB	2.4 AB	0.070 C	1.8 C
20,000	0.076 AB	1.9 AB	0.056 C	1.4 C
≥25,000	0.060 AB	1.5 AB	0.044 C	1.1 C

**13.4.2.4 Outdoor Smoke-Protected Assembly Seating.**

**13.4.2.4.1** Where smoke-protected assembly seating and its means of egress are located wholly outdoors, capacity shall be permitted to be provided in accordance with [Table 13.4.2.4.1](#) and the provision of [13.4.2.4.2](#) shall apply.

**Table 13.4.2.4.1 Capacity Factors for Outdoor Smoke-Protected Assembly Seating**

Feature	Clear Width per Seat Served			
	Stairs		Passageways, Ramps, and Doorways	
	in.	mm	in.	mm
Outdoor smoke-protected assembly seating	0.08 AB	2.0 AB	0.06 C	1.5 C

**13.4.2.4.2** Where the number of seats in outdoor smoke-protected assembly seating exceeds 20,000, the capacity factors of [Table 13.4.2.3](#) shall be permitted to be used.

**13.4.2.5** Where using [Table 13.4.2.3](#), the number of seats specified shall be within a single assembly space, and interpolation shall be permitted between the specific values shown. A single seating space shall be permitted to have multiple levels, floors, or mezzanines.

## CHAPTER 12 • New

**12.4.2.6** The minimum clear widths shown in [Table 12.4.2.3](#) and [Table 12.4.2.4.1](#) shall be modified in accordance with all of the following:

- (1) If risers exceed 7 in. in height, the stair width in [Table 12.4.2.3](#) and [Table 12.4.2.4.1](#) shall be multiplied by factor *A*, where *A* equals the following:

$$A = 1 + \frac{\text{riser height} - 7}{5} \quad [12.4.2.6(1)]$$

- (2) If risers exceed 178 mm in height, the stair width in [Table 12.4.2.3](#) and shall be multiplied by factor *A*, where *A* equals the following:

$$A = 1 + \frac{\text{riser height} - 178}{125} \quad [12.4.2.6(2)]$$

- (3) Stairs not having a handrail within a 30 in. (760 mm) horizontal distance shall be 25 percent wider than otherwise calculated; that is, their width shall be multiplied by factor *B*, where *B* equals the following:

$$B = 1.25 \quad [12.4.2.6(3)]$$

- (4) Ramps steeper than 1 in 10 slope where used in ascent shall have their width increased by 10 percent; that is, their width shall be multiplied by factor *C*, where *C* equals the following:

$$C = 1.10 \quad [12.4.2.6(4)]$$

**12.4.2.7** Where smoke-protected assembly seating conforms to the requirements of [12.4.2](#), for rows of seats served by aisles or doorways at both ends, the number of seats per row shall not exceed 100, and the clear width of not less than 12 in. (305 mm) for aisle accessways shall be increased by 0.3 in. (7.6 mm) for every additional seat beyond the number stipulated in [Table 12.4.2.7](#); however, the minimum clear width shall not be required to exceed 22 in. (560 mm).

**12.4.2.8** Where smoke-protected assembly seating conforms to the requirements of [12.4.2](#), for rows of seats served by an aisle or doorway at one end only, the aisle accessway clear width of not less than 12 in. (305 mm) shall be increased by 0.6 in. (15 mm) for every additional seat beyond the number stipulated in [Table 12.4.2.7](#); however, the minimum clear width shall not be required to exceed 22 in. (560 mm).

**12.4.2.9** Smoke-protected assembly seating conforming with the requirements of [12.4.2](#) shall be permitted to have a common path of travel of 50 ft (15 m) from any seat to a point where a person has a choice of two directions of egress travel.

**12.4.2.10** Aisle accessways shall be permitted to serve as one or both of the required exit accesses addressed in [12.4.2.9](#),

## CHAPTER 13 • Existing

**13.4.2.6** The minimum clear widths shown in [Table 13.4.2.3](#) and [Table 13.4.2.4.1](#) shall be modified in accordance with all of the following:

- (1) If risers exceed 7 in. in height, the stair width in [Table 13.4.2.3](#) and [Table 13.4.2.4.1](#) shall be multiplied by factor *A*, where *A* equals the following:

$$A = 1 + \frac{\text{riser height} - 7}{5} \quad [13.4.2.6(1)]$$

- (2) If risers exceed 178 mm in height, the stair width in [Table 13.4.2.3](#) and [Table 13.4.2.4.1](#) shall be multiplied by factor *A*, where *A* equals the following:

$$A = 1 + \frac{\text{riser height} - 178}{125} \quad [13.4.2.6(2)]$$

- (3) Stairs not having a handrail within a 30 in. (760 mm) horizontal distance shall be 25 percent wider than otherwise calculated; that is, their width shall be multiplied by factor *B*, where *B* equals the following:

$$B = 1.25 \quad [13.4.2.6(3)]$$

- (4) Ramps steeper than 1 in 10 slope used in ascent shall have their width increased by 10 percent; that is, their width shall be multiplied by factor *C*, where *C* equals the following:

$$C = 1.10 \quad [13.4.2.6(4)]$$

**13.4.2.7** Where smoke-protected assembly seating conforms to the requirements of [13.4.2](#), for rows of seats served by aisles or doorways at both ends, the number of seats per row shall not exceed 100, and the clear width of not less than 12 in. (305 mm) for aisle accessways shall be increased by 0.3 in. (7.6 mm) for every additional seat beyond the number stipulated in [Table 13.4.2.7](#); however, the minimum clear width shall not be required to exceed 22 in. (560 mm).

**13.4.2.8** Where smoke-protected assembly seating conforms to the requirements of [13.4.2](#), for rows of seats served by an aisle or doorway at one end only, the aisle accessway clear width of not less than 12 in. (305 mm) shall be increased by 0.6 in. (15 mm) for every additional seat beyond the number stipulated in [Table 13.4.2.7](#); however, the minimum clear width shall not be required to exceed 22 in. (560 mm).

**13.4.2.9** Smoke-protected assembly seating conforming with the requirements of [13.4.2](#) shall be permitted to have a common path of travel of 50 ft (15 m) from any seat to a point where a person has a choice of two directions of egress travel.

**13.4.2.10** Aisle accessways shall be permitted to serve as one or both of the required exit accesses addressed in [12.4.2.9](#),

## CHAPTER 12 • New

**Table 12.4.2.7 Smoke-Protected Assembly Seating Aisle Accessways**

Total Number of Seats in the Space	Number of Seats per Row Permitted to Have a Clear Width Aisle Accessway of Not Less than 12 in. (305 mm)	
	Aisle or Doorway at Both Ends of Row	Aisle or Doorway at One End of Row
<4,000	14	7
4,000–6,999	15	7
7,000–9,999	16	8
10,000–12,999	17	8
13,000–15,999	18	9
16,000–18,999	19	9
19,000–21,999	20	10
≥22,000	21	11

provided that the aisle accessway has a minimum width of 12 in. (305 mm) plus 0.3 in. (7.6 mm) for every additional seat over a total of 7 in a row.

**12.4.2.11** Where smoke-protected assembly seating conforms to the requirements of 12.4.2, the dead ends in aisle stairs shall not exceed a distance of 21 rows, unless both of the following criteria are met:

- (1) The seats served by the dead-end aisle are not more than 40 seats from another aisle.
- (2) The 40-seat distance is measured along a row of seats having an aisle accessway with a clear width of not less than 12 in. (305 mm) plus 0.3 in. (7.6 mm) for each additional seat above 7 in the row.

**12.4.2.12** Where smoke-protected assembly seating conforms to the requirements of 12.4.2, the travel distance from each seat to the nearest entrance to an egress vomitory or egress concourse shall not exceed 400 ft (122 m).

**12.4.2.13** Where smoke-protected assembly seating conforms to the requirements of 12.4.2, the travel distance from the entrance to the vomitory or from the egress concourse to an approved egress stair, ramp, or walk at the building exterior shall not exceed 200 ft (61 m).

**12.4.2.14** The travel distance requirements of 12.4.2.12 and 12.4.2.13 shall not apply to outdoor assembly seating facilities of Type I or Type II construction where all portions of the means of egress are essentially open to the outside.

## CHAPTER 13 • Existing

**Table 13.4.2.7 Smoke-Protected Assembly Seating Aisle Accessways**

Total Number of Seats in the Space	Number of Seats per Row Permitted to Have a Clear Width Aisle Accessway of Not Less than 12 in. (305 mm)	
	Aisle or Doorway at Both Ends of Row	Aisle or Doorway at One End of Row
<4,000	14	7
4,000–6,999	15	7
7,000–9,999	16	8
10,000–12,999	17	8
13,000–15,999	18	9
16,000–18,999	19	9
19,000–21,999	20	10
≥22,000	21	11

provided that the aisle accessway has a minimum width of 12 in. (305 mm) plus 0.3 in. (7.6 mm) for every additional seat over a total of 7 in a row.

**13.4.2.11** Where smoke-protected assembly seating conforms to the requirements of 13.4.2, the dead ends in aisle stairs shall not exceed a distance of 21 rows, unless both of the following criteria are met:

- (1) The seats served by the dead-end aisle are not more than 40 seats from another aisle.
- (2) The 40-seat distance is measured along a row of seats having an aisle accessway with a clear width of not less than 12 in. (305 mm) plus 0.3 in. (7.6 mm) for each additional seat above 7 in the row.

**13.4.2.12** Where smoke-protected assembly seating conforms to the requirements of 13.4.2, the travel distance from each seat to the nearest entrance to an egress vomitory or egress concourse shall not exceed 400 ft (122 m).

**13.4.2.13** Where smoke-protected assembly seating conforms to the requirements of 13.4.2, the travel distance from the entrance to the vomitory or from the egress concourse to an approved egress stair, ramp, or walk at the building exterior shall not exceed 200 ft (61 m).

**13.4.2.14** The travel distance requirements of 13.4.2.12 and 13.4.2.13 shall not apply to outdoor assembly seating facilities of Type I or Type II construction where all portions of the means of egress are essentially open to the outside.

## CHAPTER 12 • New

The *Code* requires that extra caution be taken before a facility is permitted to use the less stringent egress capacity factors contained in [Table 12/13.4.2.3](#) (versus those in [Table 12/13.2.3.2](#)). The authority having jurisdiction must approve a life safety evaluation, which should not be undertaken lightly or without special competence in a wide range of life safety issues including, but not limited to, fire safety. See [12/13.4.1](#).

When conducting the life safety evaluation, the capabilities of the potential occupants must be taken into account (e.g., will the facilities be used by groups of occupants who are unfamiliar with the facility, or who are unable to move quickly and in dense groups?). The need to consider the capabilities of occupants in relation to circulation facility geometry has led to the application of several correction factors detailed in [12/13.4.2.6](#) for use with the values for clear width in [Table 12/13.4.2.3](#). Maintaining the best possible geometries should be a priority that is heavily emphasized in new facilities. However, the preservation of sight lines often requires stepped aisle riser height to exceed 7 in. (180 mm). Therefore, the correction factor *A* in the table will seldom be 1.0, but correction factors *B* and *C* can often be 1.0. It might not be possible to achieve this level of safety in existing facilities. However, handrails can be retrofitted on aisles and other means of egress to significantly improve occupant safety and comfort. These factors are taken into account here and in other *Code* requirements for means of egress.

The reduction in required egress capacity factors provided by [Table 12/13.4.2.3](#) must be used with caution. The proper balance must be maintained among the relative egress capacities of each part of the means of egress system that occupants encounter as they leave the facility. Otherwise, queuing or waiting at some points other than the point of origin might result.

Attention should be given to the occupants' acceptance of the queue or the wait at their seats before proceeding out of the building; however, if a "downstream" component of the means of egress system is expected to slow the occupant movement, even greater attention should be given to the actual and perceived conditions faced by occupants.

[Exhibit 12/13.79](#) shows occupants of a large stadium queuing to use the vomitory portal to egress the stadium. The egress performance provided is perceived to be acceptable in terms of time and other factors. Occupants' acceptance of the longer egress flow times, permitted by the *Code* for larger assembly facilities, should be taken into account when performing a life safety evaluation for the building.

The provisions of [12/13.4.2.4](#) for outdoor smoke-protected assembly seating were added to the *Code* in 2006, and the provision of [12/13.4.2.4.2](#) was added to the 2012 edition. [Table 12/13.4.2.3](#), which varies the capacity factor based on number of seats, was developed mainly to address indoor arenas. As the number of seats increases in an indoor assembly venue, the area and height of the assembly space increases, so as to increase

## CHAPTER 13 • Existing

**Exhibit 12/13.79**

*Crowd waiting to egress a large assembly facility that might be eligible for egress capacity factor reductions of [Table 12/13.4.2.3](#). (Photo courtesy of Jake Pauls)*

the overall volume of the space. Large-volume spaces are less susceptible to the effects of a developing fire, including smoke filling. The larger-volume spaces act much the same as outdoor spaces without a roof, especially where smoke control, as required by [12/13.4.2.1\(2\)](#), is provided. [Table 12/13.4.2.4.1](#) offers a reduction in the capacity factors for smoke-protected assembly seating venues for which the seating area and its egress system are located wholly outdoors. Such reduction as originally included in the 2006 and 2009 editions of the *Code* was offered independent of the number of seats. The capacity factors specified in [Table 12/13.4.2.4.1](#) for the outdoor smoke-protected assembly seating correlate with those of [Table 12/13.4.2.3](#) for approximately 19,000 seats. Thus, the outdoor smoke-protected assembly seating capacity factors of [Table 12/13.4.2.4.1](#) are not as lenient as some specified in [Table 12/13.4.2.3](#), but they offer great relief from those capacity factors applicable to traditional, non-smoke-protected seating as required by [Table 12/13.2.3.2](#). The addition of [12/13.4.2.4.2](#) permits use of [Table 12/13.4.2.3](#) where the number of outdoor smoke-protected assembly seats exceeds 20,000.

Note that [12/13.4.2.4](#) applies to outdoor assembly seating only if it is smoke-protected assembly seating. Per [12/13.4.2.2](#), the outdoor seating qualifies as smoke-protected assembly seating only if a life safety evaluation in accordance with [12/13.4.1](#) is performed.

The provision of [12/13.4.2.10](#) is based on the concept presented in [12/13.2.5.6.2\(1\)](#), which recognizes that if an aisle accessway is oversized from the standpoint of the egress needs of the occupants of the seating row served by the aisle accessway, the aisle accessway can serve larger numbers of persons, who are outside the seating row, as an egress route.

## CHAPTER 12 • New

## CHAPTER 13 • Existing

**12.4.3 Limited Access or Underground Buildings.**

**12.4.3.1** Limited access or underground buildings shall comply with **12.4.3** and **Section 11.7**.

**12.4.3.2** Underground buildings or portions of buildings having a floor level more than 30 ft (9.1 m) below the level of exit discharge shall comply with the requirements of **12.4.3.3** through **12.4.3.5**, unless otherwise permitted by one of the following:

- (1) This requirement shall not apply to areas within buildings used only for service to the building, such as boiler/heater rooms, cable vaults, and dead storage.
- (2) This requirement shall not apply to auditoriums without intervening occupiable levels.

**12.4.3.3** Each level more than 30 ft (9.1 m) below the level of exit discharge shall be divided into not less than two smoke compartments by a smoke barrier complying with **Section 8.5** and shall have a minimum 1-hour fire resistance rating.

**12.4.3.3.1** Smoke compartments shall comply with both of the following:

- (1) Each smoke compartment shall have access to not less than one exit without passing through the other required compartment.
- (2) Any doors connecting required compartments shall be tight-fitting, minimum 1-hour-rated fire door assemblies designed and installed to minimize smoke leakage and to close and latch automatically upon detection of smoke.

**12.4.3.3.2** Each smoke compartment shall be provided with a mechanical means of moving people vertically, such as an elevator or escalator.

**12.4.3.3.3** Each smoke compartment shall have an independent air supply and exhaust system capable of smoke control or smoke exhaust functions. The system shall be in accordance with NFPA 92, *Standard for Smoke Control Systems*.

**12.4.3.3.4** Throughout each smoke compartment shall be provided an automatic smoke detection system designed such that the activation of any two detectors causes the smoke control system to operate and the building voice alarm to sound.

**12.4.3.4** Any required smoke control or exhaust system shall be provided with a standby power system complying with Article 701 of NFPA 70, *National Electrical Code*.

**12.4.3.5** The building shall be provided with an approved, supervised voice alarm system, in accordance with **Section 9.6**, that complies with **9.6.3.9** and provides a prerecorded evacuation message.

**13.4.3 Limited Access or Underground Buildings.** Limited access or underground buildings shall comply with **Section 11.7**.

## CHAPTER 12 • New

Both new and existing installations must comply with the requirements of [Section 11.7](#) for limited access or underground buildings. Recognizing the potential hazard that limited access or underground buildings pose, the additional provisions of [12.4.3.2](#) through [12.4.3.5](#) apply to new construction if the assembly occupancy is more than 30 ft (9.1 m) below the level of exit discharge.

Exemptions are provided for areas used only for service functions (such as boiler rooms or heater rooms) and for assembly occupancies where there is no occupiable intervening level between the assembly occupancy and the level of exit discharge.

The provisions for underground buildings or portions of assembly buildings with an occupiable floor more than 30 ft (9.1 m) below the level of exit discharge (LED) are designed to

*Escalator and elevator use in assembly occupancy located more than 30 ft (9.1 m) below LED.*

**12.4.4 High-Rise Buildings.** High-rise assembly occupancy buildings and high-rise mixed occupancy buildings that house assembly occupancies in the high-rise portions of the building shall comply with [Section 11.8](#).

High-rise assembly occupancy buildings have the same inherent life safety dangers that are found in other high-rise buildings. Therefore, the protection provided for high-rise buildings in general should be appropriate and applicable to high-rise assembly occupancies and portions of high-rise buildings that are used for assembly occupancy. Note that the sprinkler requirement applies even to existing assembly occupancies located in

**12.4.5 Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers in accordance with [8.7.3.3](#) shall be permitted.

## CHAPTER 13 • Existing

provide protected areas on the subterranean level. This protection, coupled with a smoke control or smoke exhaust system, will provide sufficient time to egress the building. Elevators or escalators are required in each compartment to help rapidly evacuate the area, as shown in [Exhibit 12/13.80](#). It is believed that elevators or escalators will not, themselves, create a life safety threat because of the other requirements of [12.4.3](#), including separate smoke compartments and smoke control or exhaust systems. The elevator or escalator is not considered the required means of egress; normal exits are still required.

The provision of [12.4.3.3](#) was revised for the 2009 edition of the Code. In prior editions, a smoke exhaust rate of not less than six air changes per hour was required. In 2006, NFPA 92A, *Standard for Smoke-Control Systems Utilizing Barriers and Pressure Differences*,<sup>10</sup> was revised and upgraded to the status of a standard. Similarly, in 2005, NFPA 92B, *Standard for Smoke Management Systems in Malls, Atria, and Large Spaces*,<sup>11</sup> was revised and upgraded to the status of a standard. In the same revision cycle that produced the 2012 edition of this Code, NFPA 92A and NFPA 92B were combined into one document, NFPA 92, *Standard for Smoke Control Systems*.<sup>12</sup> As a standard, NFPA 92 is permitted to be mandatorily referenced by other NFPA codes and standards. [Paragraph 12.4.3.3.3](#) makes such mandatory reference.

To provide redundancy in the life safety provisions, standby power, as defined in Article 701 of NFPA 70®, *National Electrical Code*®,<sup>13</sup> is required by [12.4.3.4](#) for the smoke control or exhaust system.

To facilitate orderly evacuation and reduce the possibility of panic, [12.4.3.5](#) requires the use of a supervised voice alarm system that will sound a prerecorded evacuation message.

**13.4.4 High-Rise Buildings.** Existing high-rise buildings that house assembly occupancies in high-rise portions of the building shall have the highest level of the assembly occupancy and all levels below protected by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#). (See also [13.1.6](#).)

the high-rise portion of a building. For new assembly occupancies, the complete high-rise building package of [Section 11.8](#) is required. The high-rise building package includes sprinklers, standpipes, voice alarm/communication, standby power, emergency plans, and an emergency command center in addition to the other non-high-rise-specific features required by [Chapter 12](#).

**13.4.5 Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers in accordance with [8.7.3.3](#) shall be permitted.

## CHAPTER 12 • New

The provision of 12/13.4.5 is new to the 2015 edition of the *Code*. It recognizes the use of alcohol-based hand-rub (ABHR) dis-

**12.4.6 Stages and Platforms.** See 3.3.264 and 3.3.211.**12.4.6.1 Materials and Design.**

**12.4.6.1.1** Materials used in the construction of platforms and stages shall conform to the applicable requirements of the local building code.

**12.4.6.1.2** Stage stairs shall be permitted to be of combustible materials, regardless of building construction type.

**12.4.6.2 Platform Construction.**

**12.4.6.2.1** Temporary platforms shall be permitted to be constructed of any materials.

**12.4.6.2.2** The space between the floor and the temporary platform above shall not be used for any purpose other than the electrical wiring to platform equipment.

**12.4.6.2.3** Permanent platforms shall be of the materials required for the building construction type in which the permanent platform is located, except that the finish floor shall be permitted to be of wood in all types of construction.

**12.4.6.2.4** Where the space beneath the permanent platform is used for storage or any purpose other than equipment wiring or plumbing, the floor construction shall not be less than 1-hour fire resistive.

**12.4.6.3 Stage Construction.**

**12.4.6.3.1** Regular stages shall be of the materials required for the building construction type in which they are located. In all cases, the finish floor shall be permitted to be of wood.

**12.4.6.3.2** Legitimate stages shall be constructed of materials required for Type I buildings, except that the area extending from the proscenium opening to the back wall of the stage, and for a distance of 6 ft (1830 mm) beyond the proscenium opening on each side, shall be permitted to be constructed of steel or heavy timber covered with a wood floor not less than 1½ in. (38 mm) in actual thickness.

**12.4.6.3.3** Openings through stage floors shall be equipped with tight-fitting traps with approved safety locks, and such traps shall comply with one of the following:

- (1) The traps shall be of wood having an actual thickness of not less than 1½ in. (38 mm).
- (2) The traps shall be of a material that provides fire and heat resistance at least equivalent to that provided by wood traps having an actual thickness of not less than 1½ in. (38 mm).

**12.4.6.4 Accessory Rooms.**

## CHAPTER 13 • Existing

pensers in assembly occupancies, provided that the detailed criteria of 8.7.3.3 are met.

**13.4.6 Stages and Platforms.** See 3.3.264 and 3.3.211.**13.4.6.1 Materials and Design.****13.4.6.1.1 Reserved.**

**13.4.6.1.2** Stage stairs shall be permitted to be of combustible materials, regardless of building construction type.

**13.4.6.2 Platform Construction. (Reserved)****13.4.6.3 Stage Construction. (Reserved)****13.4.6.4 Accessory Rooms. (Reserved)**

## CHAPTER 12 • New

**12.4.6.4.1** Workshops, storerooms, permanent dressing rooms, and other accessory spaces contiguous to stages shall be separated from each other and other building areas by 1-hour fire resistance-rated construction and protected openings.

**12.4.6.4.2** The separation requirements of **12.4.6.4.1** shall not be required for stages having a floor area not exceeding 1000 ft<sup>2</sup> (93 m<sup>2</sup>).

**12.4.6.5 Ventilators.** Regular stages in excess of 1000 ft<sup>2</sup> (93 m<sup>2</sup>) and legitimate stages shall be provided with emergency ventilation to provide a means of removing smoke and combustion gases directly to the outside in the event of a fire, and such ventilation shall be achieved by one or a combination of the methods specified in **12.4.6.5.1** through **12.4.6.5.3**.

**12.4.6.5.1 Smoke Control.**

**12.4.6.5.1.1** A means complying with **Section 9.3** shall be provided to maintain the smoke level at not less than 6 ft (1830 mm) above the highest level of assembly seating or above the top of the proscenium opening where a proscenium wall and opening protection are provided.

**12.4.6.5.1.2** Smoke control systems used for compliance with **12.4.6.5.1.1** shall be in accordance with NFPA 92, *Standard for Smoke Control Systems*.

**12.4.6.5.1.3** The smoke control system shall be activated independently by each of the following:

- (1) Activation of the sprinkler system in the stage area
- (2) Activation of smoke detectors over the stage area
- (3) Activation by manually operated switch at an approved location

**12.4.6.5.1.4** The emergency ventilation system shall be supplied by both normal and standby power.

**12.4.6.5.1.5** The fan(s) power wiring and ducts shall be located and properly protected to ensure a minimum of 20 minutes of operation in the event of activation.

**12.4.6.5.2 Roof Vents.**

**12.4.6.5.2.1** Two or more vents shall be located near the center of and above the highest part of the stage area.

**12.4.6.5.2.2** The vents shall be raised above the roof and shall provide a net free vent area equal to 5 percent of the stage area.

**12.4.6.5.2.3** Vents shall be constructed to open automatically by approved heat-activated devices, and supplemental means shall be provided for manual operation and periodic testing of the ventilator from the stage floor.

**12.4.6.5.2.4** Vents shall be labeled.

## CHAPTER 13 • Existing

**13.4.6.5 Ventilators.** Regular stages in excess of 1000 ft<sup>2</sup> (93 m<sup>2</sup>) and legitimate stages shall be provided with emergency ventilation to provide a means of removing smoke and combustion gases directly to the outside in the event of a fire, and such ventilation shall be achieved by one or a combination of the methods specified in **13.4.6.5.1** through **13.4.6.5.3**.

**13.4.6.5.1 Smoke Control.**

**13.4.6.5.1.1** A means complying with **Section 9.3** shall be provided to maintain the smoke level at not less than 6 ft (1830 mm) above the highest level of assembly seating or above the top of the proscenium opening where a proscenium wall and opening protection are provided.

**13.4.6.5.1.2 Reserved.**

**13.4.6.5.1.3** The smoke control system shall be activated independently by each of the following:

- (1) Activation of the sprinkler system in the stage area
- (2) Activation of smoke detectors over the stage area
- (3) Activation by manually operated switch at an approved location

**13.4.6.5.1.4** The emergency ventilation system shall be supplied by both normal and standby power.

**13.4.6.5.1.5** The fan(s) power wiring and ducts shall be located and properly protected to ensure a minimum of 20 minutes of operation in the event of activation.

**13.4.6.5.2 Roof Vents.**

**13.4.6.5.2.1** Two or more vents shall be located near the center of and above the highest part of the stage area.

**13.4.6.5.2.2** The vents shall be raised above the roof and shall provide a net free vent area equal to 5 percent of the stage area.

**13.4.6.5.2.3** Vents shall be constructed to open automatically by approved heat-activated devices, and supplemental means shall be provided for manual operation and periodic testing of the ventilator from the stage floor.

**13.4.6.5.2.4** Vents shall be labeled.

## CHAPTER 12 • New

**12.4.6.5.3 Other Means.** Approved, alternate means of removing smoke and combustion gases shall be permitted.

**12.4.6.6 Proscenium Walls.** Legitimate stages shall be completely separated from the seating area by a proscenium wall of not less than 2-hour fire-resistive, noncombustible construction.

**12.4.6.6.1** The proscenium wall shall extend not less than 48 in. (1220 mm) above the roof of the auditorium in combustible construction.

**12.4.6.6.2** All openings in the proscenium wall of a legitimate stage shall be protected by a fire assembly having a minimum 1½-hour fire protection rating.

## CHAPTER 13 • Existing

**13.4.6.5.2.5** Existing roof vents that are not labeled shall be permitted where they open by spring action or force of gravity sufficient to overcome the effects of neglect, rust, dirt, frost, snow, or expansion by heat or warping of the framework, and the following requirements also shall apply:

- (1) Glass, if used in vents, shall be protected against falling onto the stage.
- (2) A wire screen, if used under the glass, shall be placed so that, if clogged, it does not reduce the required venting area, interfere with the operating mechanism, or obstruct the distribution of water from an automatic sprinkler.
- (3) Vents shall be arranged to open automatically by the use of fusible links.
- (4) The fusible links and operating cable shall hold each door closed against a minimum 30 lb (133 N) counterforce that shall be exerted on each door through its entire arc of travel and for not less than 115 degrees.
- (5) Vents shall be provided with manual control.
- (6) Springs, where employed to actuate vent doors, shall be capable of maintaining full required tension.
- (7) Springs shall not be stressed more than 50 percent of their rated capacity and shall not be located directly in the air-stream nor exposed to the outside.
- (8) A fusible link shall be placed in the cable control system on the underside of the vent at or above the roofline, or as approved by the building official.
- (9) The fusible link shall be located so as not to be affected by the operation of an automatic sprinkler system.
- (10) Remote, manual, or electric controls shall provide for both opening and closing of the vent doors for periodic testing and shall be located at a point on stage designated by the authority having jurisdiction.
- (11) Where remote control vents are electrical, power failure shall not affect instant operation of the vent in the event of fire.
- (12) Hand winches shall be permitted to be employed to facilitate operation of manually controlled vents.

**13.4.6.5.3 Other Means.** Approved, alternate means of removing smoke and combustion gases shall be permitted.

**13.4.6.6 Proscenium Walls. (Reserved)**

## CHAPTER 12 • New

**12.4.6.6.3** The main proscenium opening used for viewing performances shall be provided with proscenium opening protection as described in [12.4.6.7](#).

**12.4.6.6.4** Proscenium walls shall not be required in smoke-protected assembly seating facilities constructed and operated in accordance with [12.4.2](#).

**12.4.6.7 Proscenium Opening Protection.**

**12.4.6.7.1** Where required by [12.4.6.6](#), the proscenium opening shall be protected by a listed, minimum 20-minute opening protective assembly, a fire curtain complying with NFPA 80, *Standard for Fire Doors and Other Opening Protectives*, or an approved water curtain complying with NFPA 13, *Standard for the Installation of Sprinkler Systems*.

**12.4.6.7.2** Proscenium opening protection provided by other than a fire curtain shall activate upon automatic detection of a fire and upon manual activation.

**12.4.6.8 Gridiron, Fly Galleries, and Pinrails.**

## CHAPTER 13 • Existing

**13.4.6.7 Proscenium Opening Protection.**

**13.4.6.7.1** On every legitimate stage, the main proscenium opening used for viewing performances shall be provided with proscenium opening protection as follows:

- (1) The proscenium opening protection shall comply with [12.4.6.7](#).
- (2) Asbestos shall be permitted in lieu of a listed fabric.
- (3) Manual curtains of any size shall be permitted.

**13.4.6.7.2** In lieu of the protection required by [13.4.6.7.1](#)(1), all the following shall be provided:

- (1) A noncombustible opaque fabric curtain shall be arranged so that it closes automatically.
- (2) An automatic, fixed waterspray deluge system shall be located on the auditorium side of the proscenium opening and shall be arranged so that the entire face of the curtain will be wetted, and all of the following requirements also shall apply:
  - (a) The system shall be activated by a combination of rate-of-rise and fixed-temperature detectors located on the ceiling of the stage.
  - (b) Detectors shall be spaced in accordance with their listing.
  - (c) The water supply shall be controlled by a deluge valve and shall be sufficient to keep the curtain completely wet for 30 minutes or until the valve is closed by fire department personnel.
- (3) The curtain shall be automatically operated in case of fire by a combination of rate-of-rise and fixed-temperature detectors that also activates the deluge spray system.
- (4) Stage sprinklers and vents shall be automatically operated by fusible elements in case of fire.
- (5) Operation of the stage sprinkler system or spray deluge valve shall automatically activate the emergency ventilating system and close the curtain.
- (6) The curtain, vents, and spray deluge system valve shall also be capable of manual operation.

**13.4.6.7.3** Proscenium opening protection provided by other than a fire curtain in accordance with [12.4.6.7](#) [*see 13.4.6.7.1(1)*] shall activate upon automatic detection of a fire and upon manual activation.

**13.4.6.8 Gridirons, Fly Galleries, and Pinrails. (Reserved)**

## CHAPTER 12 • New

**12.4.6.8.1** Structural framing designed only for the attachment of portable or fixed theater equipment, gridirons, galleries, and catwalks shall be constructed of materials consistent with the building construction type, and a fire resistance rating shall not be required.

**12.4.6.8.2** Fire-retardant-treated wood shall be permitted for fly galleries and pinrails of all types of construction.

**12.4.6.8.3** Combustible materials shall be permitted to be used for the floors of galleries and catwalks of all construction types.

**12.4.6.9 Catwalks.** The clear width of lighting and access catwalks and the means of egress from galleries and gridirons shall be not less than 22 in. (560 mm).

**12.4.6.10 Fire Protection.** Every stage shall be protected by an approved, supervised automatic sprinkler system in compliance with [Section 9.7](#).

**12.4.6.10.1** Protection shall be provided throughout the stage and in storerooms, workshops, permanent dressing rooms, and other accessory spaces contiguous to stages.

**12.4.6.10.2** Sprinklers shall not be required for stages 1000 ft<sup>2</sup> (93 m<sup>2</sup>) or less in area and 50 ft (15 m) or less in height where both of the following criteria are met:

- (1) Curtains, scenery, or other combustible hangings are not retractable vertically.
- (2) Combustible hangings are limited to borders, legs, a single main curtain, and a single backdrop.

**12.4.6.10.3** Sprinklers shall not be required under stage areas less than 48 in. (1220 mm) in clear height that are used exclusively for chair or table storage and lined on the inside with 5/8 in. (16 mm) Type X gypsum wallboard or the approved equivalent.

**12.4.6.11 Flame-Retardant Requirements.**

**12.4.6.11.1** Combustible scenery of cloth, film, vegetation (dry), and similar materials shall comply with one of the following:

- (1) They shall meet the flame propagation performance criteria contained in Test Method 1 or Test Method 2, as appropriate, of NFPA 701, *Standard Methods of Fire Tests for Flame Propagation of Textiles and Films*.
- (2) They shall exhibit a heat release rate not exceeding 100 kW when tested in accordance with NFPA 289, *Standard Method of Fire Test for Individual Fuel Packages*, using the 20 kW ignition source.

**12.4.6.11.2** Foamed plastics (*see definition of cellular or foamed plastic in 3.3.41*) shall be permitted to be used if they exhibit a heat release rate not exceeding 100 kW when tested in accordance with NFPA 289, *Standard Method of Fire Test for Individual*

## CHAPTER 13 • Existing

**13.4.6.9 Catwalks.** The clear width of lighting and access catwalks and the means of egress from galleries and gridirons shall be not less than 22 in. (560 mm).

**13.4.6.10 Fire Protection.** Every stage shall be protected by an approved automatic sprinkler system in compliance with [Section 9.7](#).

**13.4.6.10.1** Protection shall be provided throughout the stage and in storerooms, workshops, permanent dressing rooms, and other accessory spaces contiguous to stages.

**13.4.6.10.2** Sprinklers shall not be required for stages 1000 ft<sup>2</sup> (93 m<sup>2</sup>) or less in area where both of the following criteria are met:

- (1) Curtains, scenery, or other combustible hangings are not retractable vertically.
- (2) Combustible hangings are limited to borders, legs, a single main curtain, and a single backdrop.

**13.4.6.10.3** Sprinklers shall not be required under stage areas less than 48 in. (1220 mm) in clear height that are used exclusively for chair or table storage and lined on the inside with 5/8 in. (16 mm) Type X gypsum wallboard or the approved equivalent.

**13.4.6.11 Flame-Retardant Requirements.**

**13.4.6.11.1** Combustible scenery of cloth, film, vegetation (dry), and similar materials shall comply with one of the following:

- (1) They shall meet the flame propagation performance criteria contained in Test Method 1 or Test Method 2, as appropriate, of NFPA 701, *Standard Methods of Fire Tests for Flame Propagation of Textiles and Films*.
- (2) They shall exhibit a heat release rate not exceeding 100 kW when tested in accordance with NFPA 289, *Standard Method of Fire Test for Individual Fuel Packages*, using the 20 kW ignition source.

**13.4.6.11.2** Foamed plastics (*see definition of cellular or foamed plastic in 3.3.41*) shall be permitted to be used if they exhibit a heat release rate not exceeding 100 kW when tested in accordance with NFPA 289, *Standard Method of Fire Test for Individual*

## CHAPTER 12 • New

*Fuel Packages*, using the 20 kW ignition source or by specific approval of the authority having jurisdiction.

**12.4.6.11.3** Scenery and stage properties not separated from the audience by proscenium opening protection shall be of non-combustible materials, limited-combustible materials, or fire-retardant-treated wood.

**12.4.6.11.4** In theaters, motion picture theaters, and television stage settings, with or without horizontal projections, and in simulated caves and caverns of foamed plastic, any single fuel package shall have a heat release rate not to exceed 100 kW where tested in accordance with one of the following:

- (1) UL 1975, *Standard for Fire Tests for Foamed Plastics Used for Decorative Purposes*
- (2) NFPA 289, *Standard Method of Fire Test for Individual Fuel Packages*, using the 20 kW ignition source

**12.4.6.12\* Standpipes.**

**A.12.4.6.12** Prior editions of the *Code* required stages to be protected by a Class III standpipe system in accordance with NFPA 14, *Standard for the Installation of Standpipe and Hose Systems*. NFPA 14 requires that Class II and Class III standpipes be automatic — not manual — because they are intended to be used by building occupants. Automatic standpipe systems are required to provide not less than 500 gpm (1890 L/min) at 100 psi (689 kN/m<sup>2</sup>). This requirement often can be met only if a fire pump is installed. Installation of a fire pump presents an unreasonable burden for the system supplying the two hose outlets at the side of the stage. The revised wording of **12.4.6.12** offers some relief by permitting the hose outlets to be in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*.

**12.4.6.12.1** Regular stages over 1000 ft<sup>2</sup> (93 m<sup>2</sup>) in area and all legitimate stages shall be equipped with 1½ in. (38 mm) hose lines for first aid fire fighting at each side of the stage.

**12.4.6.12.2** Hose connections shall be in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*, unless Class II or Class III standpipes in accordance with NFPA 14, *Standard for the Installation of Standpipe and Hose Systems*, are used.

Stages pose a host of life safety protection challenges. Scenery might be shifted horizontally, vertically, or both ways. The use of thrust stages and arena stages introduces new challenges.

The classic stage of the past rose high above the proscenium opening to accommodate the rigid asbestos curtain. The high void was a natural place to house combustible scenery for a performance, along with the rigging necessary for handling scene changes. This vertical storage area represented both a

## CHAPTER 13 • Existing

*Fuel Packages*, using the 20 kW ignition source or by specific approval of the authority having jurisdiction.

**13.4.6.11.3** Scenery and stage properties not separated from the audience by proscenium opening protection shall be of non-combustible materials, limited-combustible materials, or fire-retardant-treated wood.

**13.4.6.11.4** In theaters, motion picture theaters, and television stage settings, with or without horizontal projections, and in simulated caves and caverns of foamed plastic, any single fuel package shall have a heat release rate not to exceed 100 kW where tested in accordance with one of the following:

- (1) UL 1975, *Standard for Fire Tests for Foamed Plastics Used for Decorative Purposes*
- (2) NFPA 289, *Standard Method of Fire Test for Individual Fuel Packages*, using the 20 kW ignition source

**13.4.6.12\* Standpipes.**

**A.13.4.6.12** Prior editions of the *Code* required stages to be protected by a Class III standpipe system in accordance with NFPA 14, *Standard for the Installation of Standpipe and Hose Systems*. NFPA 14 requires that Class II and Class III standpipes be automatic — not manual — because they are intended to be used by building occupants. Automatic standpipe systems are required to provide not less than 500 gpm (1890 L/min) at 100 psi (689 kN/m<sup>2</sup>). This requirement often can be met only if a fire pump is installed. Installation of a fire pump presents an unreasonable burden for the system supplying the two hose outlets at the side of the stage. The revised wording of **13.4.6.12** offers some relief by permitting the hose outlets to be in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*.

**13.4.6.12.1** Stages over 1000 ft<sup>2</sup> (93 m<sup>2</sup>) in area shall be equipped with 1½ in. (38 mm) hose lines for first aid fire fighting at each side of the stage.

**13.4.6.12.2** Hose connections shall be in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*, unless Class II or Class III standpipes in accordance with NFPA 13, *Standard for the Installation of Standpipe and Hose Systems*, are used.

high fuel load and a space difficult to reach in case of fire. Many new theaters use a flexible, noncombustible curtain that does not require much height to accommodate it. Scenery on these stages is moved horizontally, thus reducing the distance necessary for storage between the top of the proscenium opening and the stage ceiling. Most combustible scenery is now stored in areas adjacent to the stage. All rigging and lighting is condensed in less vertical space.

## CHAPTER 12 • New

The use of the provision of 12/13.4.6.1.2 is referenced by 12/13.2.2.3.1(2) as an exemption to the requirement that stairs must meet the provisions of 7.2.2. It permits stage stairs to be of combustible construction, although the egress stairs connecting the floors of the building might have to be of noncombustible materials, based on the construction type of the building.

Ventilators are addressed in 12/13.4.6.5. The venting requirements of 12/13.4.6.5 apply to regular stages larger than 1000 ft<sup>2</sup> (93 m<sup>2</sup>) and to all legitimate stages. Smaller stages, such as those commonly seen in small schools, do not pose the same fire potential as larger stages. See the definitions of *stage* in 3.3.264 and *platform* in 3.3.211.

Paragraph 12/13.4.6.5.1.1 makes use of performance-oriented language to specify the intended function of smoke control, if smoke control is the method used to provide the required ventilation. The performance criterion is to maintain the smoke level at not less than 6 ft (1830 mm) above the highest level of the assembly seating or above the top of a proscenium opening where a proscenium wall and opening protection are provided. For new installations, the provisions of 12.4.6.5.1.2 require that the smoke control system be in accordance with NFPA 92, *Standard for Smoke Control Systems*.

In lieu of a smoke control system, 12/13.4.6.5 permits roof vents, as prescribed by 12/13.4.6.5.2, to provide the required ventilation. For existing vents that are not labeled, 13.4.6.5.2.5 provides prescriptive criteria that help to ensure that the vent will operate as reliably as a vent that is listed.

Paragraph 12/13.4.6.5.3 permits other approved means of removing smoke and combustion gases to fulfill the ventilation requirement of 12/13.4.6.5.

### 12.4.7 Projection Rooms.

**12.4.7.1** Projection rooms shall comply with 12.4.7.2 through 12.4.7.10.

**12.4.7.2** Where cellulose nitrate film is used, the projection room shall comply with NFPA 40, *Standard for the Storage and Handling of Cellulose Nitrate Film*.

**12.4.7.3** Film or video projectors or spotlights utilizing light sources that produce particulate matter or toxic gases, or light sources that produce hazardous radiation, without protective shielding shall be located within a projection room complying with 12.3.2.1.2.

**12.4.7.4** Every projection room shall be of permanent construction consistent with the building construction type in which the projection room is located and shall comply with the following:

- (1) Openings shall not be required to be protected.

## CHAPTER 13 • Existing

The proscenium opening protection provisions of 12.4.6.7 reflect that NFPA 80, *Standard for Fire Doors and Other Opening Protectives*,<sup>14</sup> was revised in 2007 to include provisions for fabric fire safety curtains. Paragraph 12.4.6.7.1 permits the proscenium opening protection to be provided by either a fire curtain complying with NFPA 80, an approved water curtain complying with NFPA 13, *Standard for the Installation of Sprinkler Systems*,<sup>15</sup> or a listed, minimum 20-minute opening protective assembly (such as the special-purpose horizontally-sliding accordion or folding door assemblies detailed in 7.2.1.14). Given that the criteria associated with the fire curtain are detailed in NFPA 80, the prescriptive text on fire curtains that appeared in the *Code* for many editions was deleted. Existing proscenium opening protection, as required by 13.4.6.7, is permitted to meet the criteria applicable to new construction (i.e., 13.4.6.7.1 references 12.4.6.7) or the provisions of 13.4.6.7.2, which have been in the *Code* for many editions.

The provisions of 12/13.4.6.11 impose flame-retardant requirements on combustible scenery. The provision of 13.4.6.11.4 imposes on existing buildings the same requirements as applicable to new buildings for stage settings, including simulated caves and caverns of foamed plastic. Stage settings change in buildings, so the same requirements need to appear in both Chapter 12 and Chapter 13.

Regardless of whether a stage has automatic sprinkler protection, standpipes are required by 12/13.4.6.12 on each side of the stage to provide stagehands and the responding fire department with manual fire-fighting capability in the area of a theater where a fire is most likely to occur.

### 13.4.7 Projection Rooms.

**13.4.7.1** Projection rooms shall comply with 13.4.7.2 through 13.4.7.10.

**13.4.7.2** Where cellulose nitrate film is used, the projection room shall comply with NFPA 40, *Standard for the Storage and Handling of Cellulose Nitrate Film*.

**13.4.7.3** Film or video projectors or spotlights utilizing light sources that produce particulate matter or toxic gases, or light sources that produce hazardous radiation, without protective shielding shall be located within a projection room complying with 13.3.2.1.2.

**13.4.7.4** Every projection room shall be of permanent construction consistent with the building construction type in which the projection room is located and shall comply with the following:

- (1) Openings shall not be required to be protected.

## CHAPTER 12 • New

- (2) The room shall have a floor area of not less than 80 ft<sup>2</sup> (7.4 m<sup>2</sup>) for a single machine and not less than 40 ft<sup>2</sup> (3.7 m<sup>2</sup>) for each additional machine.
- (3) Each motion picture projector, floodlight, spotlight, or similar piece of equipment shall have a clear working space of not less than 30 in. (760 mm) on each side and at its rear, but only one such space shall be required between adjacent projectors.

**12.4.7.5** The projection room and the rooms appurtenant to it shall have a ceiling height of not less than 7 ft 6 in. (2285 mm).

**12.4.7.6** Each projection room for safety film shall have not less than one out-swinging, self-closing door not less than 30 in. (760 mm) wide and 6 ft 8 in. (2030 mm) high.

**12.4.7.7** The aggregate of ports and openings for projection equipment shall not exceed 25 percent of the area of the wall between the projection room and the auditorium, and all openings shall be provided with glass or other approved material so as to completely close the opening.

**12.4.7.8** Projection room ventilation shall comply with [12.4.7.8.1](#) and [12.4.7.8.2](#).

**12.4.7.8.1 Supply Air.**

**12.4.7.8.1.1** Each projection room shall be provided with adequate air supply inlets arranged to provide well-distributed air throughout the room.

**12.4.7.8.1.2** Air inlet ducts shall provide an amount of air equivalent to the amount of air being exhausted by projection equipment.

**12.4.7.8.1.3** Air shall be permitted to be taken from the outside; from adjacent spaces within the building, provided that the volume and infiltration rate is sufficient; or from the building air-conditioning system, provided that it is arranged to supply sufficient air whether or not other systems are in operation.

**12.4.7.8.2 Exhaust Air.**

**12.4.7.8.2.1** Projection booths shall be permitted to be exhausted through the lamp exhaust system.

**12.4.7.8.2.2** The lamp exhaust system shall be positively interconnected with the lamp so that the lamp cannot operate unless there is sufficient airflow required for the lamp.

**12.4.7.8.2.3** Exhaust air ducts shall terminate at the exterior of the building in such a location that the exhaust air cannot be readily recirculated into any air supply system.

**12.4.7.8.2.4** The projection room ventilation system shall be permitted also to serve appurtenant rooms, such as the generator room and the rewind room.

## CHAPTER 13 • Existing

- (2) The room shall have a floor area of not less than 80 ft<sup>2</sup> (7.4 m<sup>2</sup>) for a single machine and not less than 40 ft<sup>2</sup> (3.7 m<sup>2</sup>) for each additional machine.
- (3) Each motion picture projector, floodlight, spotlight, or similar piece of equipment shall have a clear working space of not less than 30 in. (760 mm) on each side and at its rear, but only one such space shall be required between adjacent projectors.

**13.4.7.5** The projection room and the rooms appurtenant to it shall have a ceiling height of not less than 7 ft 6 in. (2285 mm).

**13.4.7.6** Each projection room for safety film shall have not less than one out-swinging, self-closing door not less than 30 in. (760 mm) wide and 6 ft 8 in. (2030 mm) high.

**13.4.7.7** The aggregate of ports and openings for projection equipment shall not exceed 25 percent of the area of the wall between the projection room and the auditorium, and all openings shall be provided with glass or other approved material so as to completely close the opening.

**13.4.7.8** Projection room ventilation shall comply with [13.4.7.8.1](#) and [13.4.7.8.2](#).

**13.4.7.8.1 Supply Air.**

**13.4.7.8.1.1** Each projection room shall be provided with adequate air supply inlets arranged to provide well-distributed air throughout the room.

**13.4.7.8.1.2** Air inlet ducts shall provide an amount of air equivalent to the amount of air being exhausted by projection equipment.

**13.4.7.8.1.3** Air shall be permitted to be taken from the outside; from adjacent spaces within the building, provided that the volume and infiltration rate is sufficient; or from the building air-conditioning system, provided that it is arranged to supply sufficient air whether or not other systems are in operation.

**13.4.7.8.2 Exhaust Air.**

**13.4.7.8.2.1** Projection booths shall be permitted to be exhausted through the lamp exhaust system.

**13.4.7.8.2.2** The lamp exhaust system shall be positively interconnected with the lamp so that the lamp cannot operate unless there is sufficient airflow required for the lamp.

**13.4.7.8.2.3** Exhaust air ducts shall terminate at the exterior of the building in such a location that the exhaust air cannot be readily recirculated into any air supply system.

**13.4.7.8.2.4** The projection room ventilation system shall be permitted also to serve appurtenant rooms, such as the generator room and the rewind room.

## CHAPTER 12 • New

**12.4.7.9** Each projection machine shall be provided with an exhaust duct that draws air from each lamp and exhausts it directly to the outside of the building.

**12.4.7.9.1** The lamp exhaust shall be permitted to exhaust air from the projection room to provide room air circulation.

**12.4.7.9.2** Lamp exhaust ducts shall be of rigid materials, except for a flexible connector approved for the purpose.

**12.4.7.9.3** The projection lamp and projection room exhaust systems shall be permitted to be combined but shall not be interconnected with any other exhaust system or return-air system within the buildings.

**12.4.7.9.4** Specifications for electric arc and xenon projection equipment shall comply with **12.4.7.9.4.1** and **12.4.7.9.4.2**.

**12.4.7.9.4.1 Electric Arc Projection Equipment.** The exhaust capacity shall be 200 ft<sup>3</sup>/min (0.09 m<sup>3</sup>/s) for each lamp connected to the lamp exhaust system, or as recommended by the equipment manufacturer, and auxiliary air shall be permitted to be introduced into the system through a screened opening to stabilize the arc.

**12.4.7.9.4.2 Xenon Projection Equipment.** The lamp exhaust system shall exhaust not less than 300 ft<sup>3</sup>/min (0.14 m<sup>3</sup>/s) per lamp, or not less than the exhaust volume required or recommended by the equipment manufacturer, whichever is greater.

**12.4.7.10** Miscellaneous equipment and storage shall be protected as follows:

- (1) Each projection room shall be provided with rewind and film storage facilities.
- (2) Flammable liquids containers shall be permitted in projection rooms, provided that all of the following criteria are met:
  - (a) There are not more than four containers per projection room.
  - (b) No container has a capacity exceeding 16 oz (0.5 L).
  - (c) The containers are of a nonbreakable type.
- (3) Appurtenant electrical equipment, such as rheostats, transformers, and generators, shall be permitted to be located within the booth or in a separate room of equivalent construction.

The requirements for projection booths were developed jointly with those of NFPA 40, *Standard for the Storage and Handling of Cellulose Nitrate Film*,<sup>16</sup> and the motion picture industry when cellulose nitrate film was still being used. Although only safety film is now used (except at film festivals or revivals), and the risk level has been reduced, the primary function of the requirements of **12/13.4.7.3** is to enclose the projection booth, eliminating it as an exposure threat to the theater audience.

## CHAPTER 13 • Existing

**13.4.7.9** Each projection machine shall be provided with an exhaust duct that draws air from each lamp and exhausts it directly to the outside of the building.

**13.4.7.9.1** The lamp exhaust shall be permitted to exhaust air from the projection room to provide room air circulation.

**13.4.7.9.2** Lamp exhaust ducts shall be of rigid materials, except for a flexible connector approved for the purpose.

**13.4.7.9.3** The projection lamp and projection room exhaust systems shall be permitted to be combined but shall not be interconnected with any other exhaust system or return-air system within the buildings.

**13.4.7.9.4** Specifications for electric arc and xenon projection equipment shall comply with **13.4.7.9.4.1** and **13.4.7.9.4.2**.

**13.4.7.9.4.1 Electric Arc Projection Equipment.** The exhaust capacity shall be 200 ft<sup>3</sup>/min (0.09 m<sup>3</sup>/s) for each lamp connected to the lamp exhaust system or as recommended by the equipment manufacturer, and auxiliary air shall be permitted to be introduced into the system through a screened opening to stabilize the arc.

**13.4.7.9.4.2 Xenon Projection Equipment.** The lamp exhaust system shall exhaust not less than 300 ft<sup>3</sup>/min (0.14 m<sup>3</sup>/s) per lamp, or not less than the exhaust volume required or recommended by the equipment manufacturer, whichever is greater.

**13.4.7.10** Miscellaneous equipment and storage shall be protected as follows:

- (1) Each projection room shall be provided with rewind and film storage facilities.
- (2) Flammable liquids containers shall be permitted in projection rooms, provided that all of the following criteria are met:
  - (a) There are not more than four containers per projection room.
  - (b) No container has a capacity exceeding 16 oz (0.5 L).
  - (c) The containers are of a nonbreakable type.
- (3) Appurtenant electrical equipment, such as rheostats, transformers, and generators, shall be permitted to be located within the booth or in a separate room of equivalent construction.

The intent of **12/13.4.7.3** is to protect the audience from the dangers associated with light sources, such as electric arc or xenon. Where incandescent light is used, projection booths are not required in assembly occupancies. Note that the booth is required based on the light source, not on the use of film.

The provisions of **12/13.4.7.4** apply only to projection booths for the use of cellulose acetate or other safety film. Although openings in the booth do not need to be protected,

## CHAPTER 12 • New

they must be provided with glass or other approved material that will completely close the opening and prevent gas, dust, or radiation from contaminating the audience seating area.

New projection equipment in new theaters has a console that draws air in at the floor and up through the projection machine, thus eliminating the need to provide ducts near the floor.

The requirements of 12/13.4.7.8 for the ventilation of a projection booth are designed to isolate the booth from the theater, so that any products of combustion created by a fire in a projection booth are not circulated into the theater. This isolation is achieved by providing an independent exhaust system for the booth, making certain that the exhaust outlet on the exterior of the building is located at a point where the air intake for the theater cannot recirculate the exhausted air.

If fresh air for the projection booth's ventilation system is supplied from the general system for the building, it is essential

### 12.4.8\* Special Amusement Buildings.

**A.12.4.8** Where a special amusement building is installed inside another building, such as within an Exhibit hall, the special amusement building requirements apply only to the special amusement building. For example, the smoke detectors required by 12.4.8.4 are not required to be connected to the building's system. Where installed in an Exhibit hall, such smoke detectors are also required to comply with the provisions applicable to an exhibit.

**12.4.8.1\* General.** Special amusement buildings, regardless of occupant load, shall meet the requirements for assembly occupancies in addition to the requirements of 12.4.8, unless the special amusement building is a multilevel play structure that is not more than 10 ft (3050 mm) in height and has aggregate horizontal projections not exceeding 160 ft<sup>2</sup> (15 m<sup>2</sup>).

**A.12.4.8.1** The aggregate horizontal projections of a multilevel play structure are indicative of the number of children who might be within the structure and at risk from a fire or similar emergency. The word "aggregate" is used in recognition of the fact that the platforms and tubes that make up the multilevel play structure run above each other at various levels. In calculating the area of the projections, it is important to account for all areas that might be expected to be occupied within, on top of, or beneath the components of the structure when the structure is used for its intended function.

**12.4.8.2\* Automatic Sprinklers.** Every special amusement building, other than buildings or structures not exceeding 10 ft (3050 mm) in height and not exceeding 160 ft<sup>2</sup> (15 m<sup>2</sup>) in aggregate horizontal projection, shall be protected throughout by an approved, supervised automatic sprinkler system installed and maintained in accordance with Section 9.7.

**A.12.4.8.2** See A.12.4.8.1.

## CHAPTER 13 • Existing

that the combined system be arranged to ensure the required air changes in the booth, even when no air is supplied to the general system of the building.

In 12/13.4.7.9.4, the Code specifies the minimum capacity for the exhaust system of a projection machine; however, a greater capacity must be provided where recommended by the manufacturer of the projection equipment. The system must be independent of any other ventilation system in the building housing the theater, but it can be combined with projection room ventilation.

The requirement of 12/13.4.7.10 for the storage and rewinding of film is intended to prevent such operations from taking place outside the projection booth at some less protected location where, if a fire occurred, the exposure to the theater would be significantly greater. All operations that relate to projection activities must be kept within the protected enclosure afforded by the projection booth.

### 13.4.8\* Special Amusement Buildings.

**A.13.4.8** Where a special amusement building is installed inside another building, such as within an Exhibit hall, the special amusement building requirements apply only to the special amusement building. For example, the smoke detectors required by 13.4.8.4 are not required to be connected to the building's system. Where installed in an Exhibit hall, such smoke detectors are also required to comply with the provisions applicable to an exhibit.

**13.4.8.1\* General.** Special amusement buildings, regardless of occupant load, shall meet the requirements for assembly occupancies in addition to the requirements of 13.4.8, unless the special amusement building is a multilevel play structure that is not more than 10 ft (3050 mm) in height and has aggregate horizontal projections not exceeding 160 ft<sup>2</sup> (15 m<sup>2</sup>).

**A.13.4.8.1** The aggregate horizontal projections of a multilevel play structure are indicative of the number of children who might be within the structure and at risk from a fire or similar emergency. The word "aggregate" is used in recognition of the fact that the platforms and tubes that make up the multilevel play structure run above each other at various levels. In calculating the area of the projections, it is important to account for all areas that might be expected to be occupied within, on top of, or beneath the components of the structure when the structure is used for its intended function.

**13.4.8.2\* Automatic Sprinklers.** Every special amusement building, other than buildings or structures not exceeding 10 ft (3050 mm) in height and not exceeding 160 ft<sup>2</sup> (15 m<sup>2</sup>) in aggregate horizontal projection, shall be protected throughout by an approved, supervised automatic sprinkler system installed and maintained in accordance with Section 9.7.

**A.13.4.8.2** See A.13.4.8.1.

## CHAPTER 12 • New

**12.4.8.3 Temporary Water Supply.** Where the special amusement building required to be sprinklered by 12.4.8.2 is movable or portable, the sprinkler water supply shall be permitted to be provided by an approved temporary means.

**12.4.8.4 Smoke Detection.** Where the nature of the special amusement building is such that it operates in reduced lighting levels, the building shall be protected throughout by an approved automatic smoke detection system in accordance with Section 9.6.

**12.4.8.5 Alarm Initiation.** Actuation of any smoke detection system device shall sound an alarm at a constantly attended location on the premises.

**12.4.8.6 Illumination.** Actuation of the automatic sprinkler system, or any other suppression system, or actuation of a smoke detection system having an approved verification or cross-zoning operation capability shall provide for both of the following:

- (1) Increase in illumination in the means of egress to that required by Section 7.8
- (2) Termination of any conflicting or confusing sounds and visuals

**12.4.8.7 Exit Marking.**

**12.4.8.7.1** Exit marking shall be in accordance with Section 7.10.

**12.4.8.7.2** Floor proximity exit signs shall be provided in accordance with 7.10.1.6.

**12.4.8.7.3\*** In special amusement buildings where mazes, mirrors, or other designs are used to confound the egress path, approved directional exit marking that becomes apparent in an emergency shall be provided.

**A.12.4.8.7.3** Consideration should be given to the provision of directional exit marking on or adjacent to the floor.

**12.4.8.8 Interior Finish.** Interior wall and ceiling finish materials complying with Section 10.2 shall be Class A throughout.

Any special amusement building is considered an assembly occupancy, even if the occupant load is not more than 50 persons. However, special amusement buildings do not include theaters, movie houses, and other similar types of assembly occupancies. An example of a special amusement building that typically has an occupant load of not more than 50 persons is a children's play structure, complete with chutes, slides, and ladders, installed as an attraction at a fast-food restaurant.

Paragraph 12/13.4.8.6 addresses the importance of the exits and means of egress being well lighted upon the activation of a smoke detector or suppression system. It is also important that

## CHAPTER 13 • Existing

**13.4.8.3 Temporary Water Supply.** Where the special amusement building required to be sprinklered by 13.4.8.2 is movable or portable, the sprinkler water supply shall be permitted to be provided by an approved temporary means.

**13.4.8.4 Smoke Detection.** Where the nature of the special amusement building is such that it operates in reduced lighting levels, the building shall be protected throughout by an approved automatic smoke detection system in accordance with Section 9.6.

**13.4.8.5 Alarm Initiation.** Actuation of any smoke detection system device shall sound an alarm at a constantly attended location on the premises.

**13.4.8.6 Illumination.** Actuation of the automatic sprinkler system, or any other suppression system, or actuation of a smoke detection system having an approved verification or cross-zoning operation capability shall provide for both of the following:

- (1) Increase in illumination in the means of egress to that required by Section 7.8
- (2) Termination of any conflicting or confusing sounds and visuals

**13.4.8.7 Exit Marking.**

**13.4.8.7.1** Exit marking shall be in accordance with Section 7.10.

**13.4.8.7.2** Floor proximity exit signs shall be provided in accordance with 7.10.1.6.

**13.4.8.7.3\*** In special amusement buildings where mazes, mirrors, or other designs are used to confound the egress path, approved directional exit marking that becomes apparent in an emergency shall be provided.

**A.13.4.8.7.3** Consideration should be given to the provision of directional exit marking on or adjacent to the floor.

**13.4.8.8 Interior Finish.** Interior wall and ceiling finish materials complying with Section 10.2 shall be Class A throughout.

any conflicting or confusing sounds or visuals be stopped and that, where a person's relative position to an exit is changed, additional exit signs be provided.

In special amusement buildings, the provision of directions to an exit is particularly important. Floor proximity exit signs, as required by 12/13.4.8.7.2, should provide patrons an additional tool to assist them in finding their way out under emergency conditions. Exhibit 12/13.81 shows a floor proximity exit sign as well as exit signs mounted above door opening height in a large special amusement attraction in a Florida amusement park.

## CHAPTER 12 • New

Floor proximity EXIT sign in special amusement building.

### 12.4.9 Grandstands.

**12.4.9.1 General.** Grandstands shall comply with the provisions of this chapter as modified by 12.4.9.

The provisions of 12/13.4.9 and 12/13.4.10, concerning bleacher or grandstand seating and folding and telescopic seating, were extracted over several Code-revision cycles from NFPA 102, *Standard for Grandstands, Folding and Telescopic Seating, Tents, and Membrane Structures*.<sup>17</sup> In 2006, NFPA 102 was revised to become a wholly extracted document, with almost all of its content extracted from this Code and NFPA 5000, *Building Construction and Safety Code*.

The provisions of 12/13.4.9 address special requirements that must be followed as additions or modifications to the requirements of other portions of Chapters 12 and 13. This is made clear by 12.4.9.1 and 13.4.9.1.1, which require compliance

#### 12.4.9.2 Seating.

### 13.4.9 Grandstands.

**13.4.9.1 General.**

with the provisions of Chapters 12 and 13, as modified by 12/13.4.9. For example, the requirements for handrails on aisle stairs, as addressed in 12/13.2.5.6.9, apply to bleachers and grandstands but are not repeated in 12/13.4.9. Exhibit 12/13.82 shows an outdoor grandstand/bleachers with no handrails in the aisle stairs. Note how the woman at the right moves cautiously on the stair as the woman at the left offers support.

Exhibit 12/13.83 shows a very large outdoor grandstand/bleachers with handrails in the stepped aisles, a guard at the lower right where grandstand users could otherwise fall over an open side, and guards at the cross aisle at the top of the photo.

**13.4.9.1.1** Grandstands shall comply with the provisions of this chapter as modified by 13.4.9.

**13.4.9.1.2** Approved existing grandstands shall be permitted to be continued to be used.

#### 13.4.9.2 Seating.

## CHAPTER 12 • New

## CHAPTER 13 • Existing

Exhibit 12/13.82

*Cautious movement on grandstand/bleachers aisle stair without handrails. (Photo courtesy of Jake Pauls)*

**12.4.9.2.1** Where grandstand seating without backs is used indoors, rows of seats shall be spaced not less than 22 in. (560 mm) back-to-back.

**12.4.9.2.2** The depth of footboards and seat boards in grandstands shall be not less than 9 in. (230 mm); where the same level is not used for both seat foundations and footrests, footrests independent of seats shall be provided.

**12.4.9.2.3** Seats and footrests of grandstands shall be supported securely and fastened in such a manner that they cannot be displaced inadvertently.

**12.4.9.2.4** Individual seats or chairs shall be permitted only if secured in rows in an approved manner, unless seats do not exceed 16 in number and are located on level floors and within railed-in enclosures, such as boxes.

**12.4.9.2.5** The maximum number of seats permitted between the farthest seat and an aisle in grandstands and bleachers shall not exceed that shown in [Table 12.4.9.2.5](#).

### 12.4.9.3 Special Requirements — Wood Grandstands.

Exhibit 12/13.83

*Handrails and guards on outdoor grandstand/bleachers. (Photo courtesy of Jake Pauls)*

**13.4.9.2.1** Where grandstand seating without backs is used indoors, rows of seats shall be spaced not less than 22 in. (560 mm) back-to-back.

**13.4.9.2.2** The depth of footboards and seat boards in grandstands shall be not less than 9 in. (230 mm); where the same level is not used for both seat foundations and footrests, footrests independent of seats shall be provided.

**13.4.9.2.3** Seats and footrests of grandstands shall be supported securely and fastened in such a manner that they cannot be displaced inadvertently.

**13.4.9.2.4** Individual seats or chairs shall be permitted only if secured firmly in rows in an approved manner, unless seats do not exceed 16 in number and are located on level floors and within railed-in enclosures, such as boxes.

**13.4.9.2.5** The maximum number of seats permitted between the farthest seat and an aisle in grandstands and bleachers shall not exceed that shown in [Table 13.4.9.2.5](#).

### 13.4.9.3 Special Requirements — Wood Grandstands.

## CHAPTER 12 • New

**Table 12.4.9.2.5 Maximum Number of Seats Between Farthest Seat and an Aisle**

Application	Outdoors	Indoors
Grandstands	11	6
Bleachers (See 12.2.5.6.1.2.)	20	9

**12.4.9.3.1** An outdoor wood grandstand shall be erected within not less than two-thirds of its height, and, in no case, within not less than 10 ft (3050 mm), of a building, unless otherwise permitted by one of the following:

- (1) The distance requirement shall not apply to buildings having minimum 1-hour fire resistance-rated construction with openings protected against the fire exposure hazard created by the grandstand.
- (2) The distance requirement shall not apply where a wall having minimum 1-hour fire resistance-rated construction separates the grandstand from the building.

**12.4.9.3.2** An outdoor wood grandstand unit shall not exceed 10,000 ft<sup>2</sup> (929 m<sup>2</sup>) in finished ground level area or 200 ft (61 m) in length, and all of the following requirements also shall apply:

- (1) Grandstand units of the maximum size shall be placed not less than 20 ft (6100 mm) apart or shall be separated by walls having a minimum 1-hour fire resistance rating.
- (2) The number of grandstand units erected in any one group shall not exceed three.
- (3) Each group of grandstand units shall be separated from any other group by a wall having minimum 2-hour fire resistance-rated construction extending 24 in. (610 mm) above the seat platforms or by an open space of not less than 50 ft (15 m).

**12.4.9.3.3** The finished ground level area or length required by 12.4.9.3.2 shall be permitted to be doubled where one of the following criteria is met:

- (1) Where the grandstand is constructed entirely of labeled fire-retardant-treated wood that has passed the standard rain test, ASTM D 2898, *Standard Test Methods for Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing*
- (2) Where the grandstand is constructed of members conforming to dimensions for heavy timber construction [Type IV (2HH)]

**12.4.9.3.4** The highest level of seat platforms above the finished ground level or the surface at the front of any wood grandstand shall not exceed 20 ft (6100 mm).

## CHAPTER 13 • Existing

**Table 13.4.9.2.5 Maximum Number of Seats Between Farthest Seat and an Aisle**

Application	Outdoors	Indoors
Grandstands	11	6
Bleachers (See 13.2.5.6.1.2.)	20	9

**13.4.9.3.1** An outdoor wood grandstand shall be erected within not less than two-thirds of its height, and, in no case, within not less than 10 ft (3050 mm), of a building, unless otherwise permitted by one of the following:

- (1) The distance requirement shall not apply to buildings having minimum 1-hour fire resistance-rated construction with openings protected against the fire exposure hazard created by the grandstand.
- (2) The distance requirement shall not apply where a wall having minimum 1-hour fire resistance-rated construction separates the grandstand from the building.

**13.4.9.3.2** An outdoor wood grandstand unit shall not exceed 10,000 ft<sup>2</sup> (929 m<sup>2</sup>) in finished ground level area or 200 ft (61 m) in length, and all of the following requirements also shall apply:

- (1) Grandstand units of the maximum size shall be placed not less than 20 ft (6100 mm) apart or shall be separated by walls having a minimum 1-hour fire resistance rating.
- (2) The number of grandstand units erected in any one group shall not exceed three.
- (3) Each group of grandstand units shall be separated from any other group by a wall having minimum 2-hour fire resistance-rated construction extending 24 in. (610 mm) above the seat platforms or by an open space of not less than 50 ft (15 m).

**13.4.9.3.3** The finished ground level area or length required by 13.4.9.3.2 shall be permitted to be doubled where one of the following criteria is met:

- (1) Where the grandstand is constructed entirely of labeled fire-retardant-treated wood that has passed the standard rain test, ASTM D 2898, *Standard Test Methods for Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing*
- (2) Where the grandstand is constructed of members conforming to dimensions for heavy timber construction [Type IV (2HH)]

**13.4.9.3.4** The highest level of seat platforms above the finished ground level or the surface at the front of any wood grandstand shall not exceed 20 ft (6100 mm).

## CHAPTER 12 • New

**12.4.9.3.5** The highest level of seat platforms above the finished ground level, or the surface at the front of a portable grandstand within a tent or membrane structure, shall not exceed 12 ft (3660 mm).

**12.4.9.3.6** The height requirements specified in [12.4.9.3.4](#) and [12.4.9.3.5](#) shall be permitted to be doubled where constructed entirely of labeled fire-retardant-treated wood that has passed the standard rain test, ASTM D 2898, *Standard Test Methods for Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing*, or where constructed of members conforming to dimensions for heavy timber construction [Type IV (2HH)].

#### 12.4.9.4 Special Requirements — Portable Grandstands.

**12.4.9.4.1** Portable grandstands shall conform to the requirements of [12.4.9](#) for grandstands and the requirements of [12.4.9.4.2](#) through [12.4.9.4.7](#).

**12.4.9.4.2** Portable grandstands shall be self-contained and shall have within them all necessary parts to withstand and restrain all forces that might be developed during human occupancy.

**12.4.9.4.3** Portable grandstands shall be designed and manufactured so that, if any structural members essential to the strength and stability of the structure have been omitted during erection, the presence of unused connection fittings shall make the omissions self-evident.

**12.4.9.4.4** Portable grandstand construction shall be skillfully accomplished to produce the strength required by the design.

**12.4.9.4.5** Portable grandstands shall be provided with base plates, sills, floor runners, or sleepers of such area that the permitted bearing capacity of the supporting material is not exceeded.

**12.4.9.4.6** Where a portable grandstand rests directly on a base of such character that it is incapable of supporting the load without appreciable settlement, mud sills of suitable material, having sufficient area to prevent undue or dangerous settlement, shall be installed under base plates, runners, or sleepers.

**12.4.9.4.7** All bearing surfaces of portable grandstands shall be in contact with each other.

**12.4.9.5 Spaces Underneath Grandstands.** Spaces underneath a grandstand shall be kept free of flammable or combustible materials, unless protected by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#) or unless otherwise permitted by one of the following:

- (1) This requirement shall not apply to accessory uses of 300 ft<sup>2</sup> (28 m<sup>2</sup>) or less, such as ticket booths, toilet facilities, or concession booths, where constructed of noncombustible or

## CHAPTER 13 • Existing

**13.4.9.3.5** The highest level of seat platforms above the finished ground level, or the surface at the front of a portable grandstand within a tent or membrane structure, shall not exceed 12 ft (3660 mm).

**13.4.9.3.6** The height requirements specified in [13.4.9.3.4](#) and [13.4.9.3.5](#) shall be permitted to be doubled where the grandstand is constructed entirely of labeled fire-retardant-treated wood that has passed the standard rain test, ASTM D 2898, *Standard Test Methods for Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing*, or where constructed of members conforming to dimensions for heavy timber construction [Type IV (2HH)].

#### 13.4.9.4 Special Requirements — Portable Grandstands.

**13.4.9.4.1** Portable grandstands shall conform to the requirements of [13.4.9](#) for grandstands and the requirements of [13.4.9.4.2](#) through [13.4.9.4.7](#).

**13.4.9.4.2** Portable grandstands shall be self-contained and shall have within them all necessary parts to withstand and restrain all forces that might be developed during human occupancy.

**13.4.9.4.3** Portable grandstands shall be designed and manufactured so that, if any structural members essential to the strength and stability of the structure have been omitted during erection, the presence of unused connection fittings shall make the omissions self-evident.

**13.4.9.4.4** Portable grandstand construction shall be skillfully accomplished to produce the strength required by the design.

**13.4.9.4.5** Portable grandstands shall be provided with base plates, sills, floor runners, or sleepers of such area that the permitted bearing capacity of the supporting material is not exceeded.

**13.4.9.4.6** Where a portable grandstand rests directly on a base of such character that it is incapable of supporting the load without appreciable settlement, mud sills of suitable material, having sufficient area to prevent undue or dangerous settlement, shall be installed under base plates, runners, or sleepers.

**13.4.9.4.7** All bearing surfaces shall be in contact with each other.

**13.4.9.5 Spaces Underneath Grandstands.** Spaces underneath a grandstand shall be kept free of flammable or combustible materials, unless protected by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#) or unless otherwise permitted by one of the following:

- (1) This requirement shall not apply to accessory uses of 300 ft<sup>2</sup> (28 m<sup>2</sup>) or less, such as ticket booths, toilet facilities, or concession booths, where constructed of noncombustible or

## CHAPTER 12 • New

fire-resistive construction in otherwise nonsprinklered facilities.

- (2) This requirement shall not apply to rooms that are enclosed in not less than 1-hour fire resistance–rated construction and are less than 1000 ft<sup>2</sup> (93 m<sup>2</sup>) in otherwise nonsprinklered facilities.

**12.4.9.6 Guards and Railings.**

**12.4.9.6.1** Railings or guards not less than 42 in. (1065 mm) above the aisle surface or footrest or not less than 36 in. (915 mm) vertically above the center of the seat or seat board surface, whichever is adjacent, shall be provided along those portions of the backs and ends of all grandstands where the seats are more than 48 in. (1220 mm) above the floor or the finished ground level.

**12.4.9.6.2** The requirement of **12.4.9.6.1** shall not apply where an adjacent wall or fence affords equivalent safeguard.

**12.4.9.6.3** Where the front footrest of any grandstand is more than 24 in. (610 mm) above the floor, railings or guards not less than 33 in. (825 mm) above such footrests shall be provided.

**12.4.9.6.4** The railings required by **12.4.9.6.3** shall be permitted to be not less than 26 in. (660 mm) high in grandstands or where the front row of seats includes backrests.

**12.4.9.6.5** Cross aisles located within the seating area shall be provided with rails not less than 26 in. (660 mm) high along the front edge of the cross aisle.

**12.4.9.6.6** The railings specified by **12.4.9.6.5** shall not be required where the backs of the seats in front of the cross aisle project 24 in. (610 mm) or more above the surface of the cross aisle.

**12.4.9.6.7** Vertical openings between guardrails and footboards or seat boards shall be provided with intermediate construction so that a 4 in. (100 mm) diameter sphere cannot pass through the opening.

**12.4.9.6.8** An opening between the seat board and footboard located more than 30 in. (760 mm) above the finished ground level shall be provided with intermediate construction so that a 4 in. (100 mm) diameter sphere cannot pass through the opening.

**12.4.10 Folding and Telescopic Seating.**

**12.4.10.1 General.** Folding and telescopic seating shall comply with the provisions of this chapter as modified by **12.4.10**.

## CHAPTER 13 • Existing

fire-resistive construction in otherwise nonsprinklered facilities.

- (2) This requirement shall not apply to rooms that are enclosed in not less than 1-hour fire resistance–rated construction and are less than 1000 ft<sup>2</sup> (93 m<sup>2</sup>) in otherwise nonsprinklered facilities.

**13.4.9.6 Guards and Railings.**

**13.4.9.6.1** Railings or guards not less than 42 in. (1065 mm) above the aisle surface or footrest or not less than 36 in. (915 mm) vertically above the center of the seat or seat board surface, whichever is adjacent, shall be provided along those portions of the backs and ends of all grandstands where the seats are in excess of 48 in. (1220 mm) above the floor or the finished ground level.

**13.4.9.6.2** The requirement of **13.4.9.6.1** shall not apply where an adjacent wall or fence affords equivalent safeguard.

**13.4.9.6.3** Where the front footrest of any grandstand is more than 24 in. (610 mm) above the floor, railings or guards not less than 33 in. (825 mm) above such footrests shall be provided.

**13.4.9.6.4** The railings required by **13.4.9.6.3** shall be permitted to be not less than 26 in. (660 mm) high in grandstands or where the front row of seats includes backrests.

**13.4.9.6.5** Cross aisles located within the seating area shall be provided with rails not less than 26 in. (660 mm) high along the front edge of the cross aisle.

**13.4.9.6.6** The railings specified by **13.4.9.6.5** shall not be required where the backs of the seats in front of the cross aisle project 24 in. (610 mm) or more above the surface of the cross aisle.

**13.4.9.6.7** Vertical openings between guardrails and footboards or seat boards shall be provided with intermediate construction so that a 4 in. (100 mm) diameter sphere cannot pass through the opening.

**13.4.9.6.8** An opening between the seat board and footboard located more than 30 in. (760 mm) above the finished ground level shall be provided with intermediate construction so that a 4 in. (100 mm) diameter sphere cannot pass through the opening.

**13.4.10 Folding and Telescopic Seating.**

**13.4.10.1 General.**

**13.4.10.1.1** Folding and telescopic seating shall comply with the provisions of this chapter as modified by **13.4.10**.

**13.4.10.1.2** Approved existing folding and telescopic seating shall be permitted to be continued to be used.

## CHAPTER 12 • New

**12.4.10.2 Seating.**

**12.4.10.2.1** The horizontal distance of seats, measured back-to-back, shall be not less than 22 in. (560 mm) for seats without backs, and all of the following requirements shall also apply:

- (1) There shall be a space of not less than 12 in. (305 mm) between the back of each seat and the front of each seat immediately behind it.
- (2) If seats are of the chair type, the 12 in. (305 mm) dimension shall be measured to the front edge of the rear seat in its normal unoccupied position.
- (3) All measurements shall be taken between plumb lines.

**12.4.10.2.2** The depth of footboards (footrests) and seat boards in folding and telescopic seating shall be not less than 9 in. (230 mm).

**12.4.10.2.3** Where the same level is not used for both seat foundations and footrests, footrests independent of seats shall be provided.

**12.4.10.2.4** Individual chair-type seats shall be permitted in folding and telescopic seating only if firmly secured in groups of not less than three.

**12.4.10.2.5** The maximum number of seats permitted between the farthest seat in an aisle in folding and telescopic seating shall not exceed that shown in [Table 12.4.9.2.5](#).

**12.4.10.3 Guards and Railings.**

**12.4.10.3.1** Railings or guards not less than 42 in. (1065 mm) above the aisle surface or footrest, or not less than 36 in. (915 mm) vertically above the center of the seat or seat board surface, whichever is adjacent, shall be provided along those portions of the backs and ends of all folding and telescopic seating where the seats are more than 48 in. (1220 mm) above the floor or the finished ground level.

**12.4.10.3.2** The requirement of [12.4.10.3.1](#) shall not apply where an adjacent wall or fence affords equivalent safeguard.

**12.4.10.3.3** Where the front footrest of folding or telescopic seating is more than 24 in. (610 mm) above the floor, railings or guards not less than 33 in. (825 mm) above such footrests shall be provided.

**12.4.10.3.4** The railings required by [12.4.10.3.3](#) shall be permitted to be not less than 26 in. (660 mm) high where the front row of seats includes backrests.

**12.4.10.3.5** Cross aisles located within the seating area shall be provided with rails not less than 26 in. (660 mm) high along the front edge of the cross aisle.

## CHAPTER 13 • Existing

**13.4.10.2 Seating.**

**13.4.10.2.1** The horizontal distance of seats, measured back-to-back, shall be not less than 22 in. (560 mm) for seats without backs, and all of the following requirements shall also apply:

- (1) There shall be a space of not less than 12 in. (305 mm) between the back of each seat and the front of each seat immediately behind it.
- (2) If seats are of the chair type, the 12 in. (305 mm) dimension shall be measured to the front edge of the rear seat in its normal unoccupied position.
- (3) All measurements shall be taken between plumb lines.

**13.4.10.2.2** The depth of footboards (footrests) and seat boards in folding and telescopic seating shall be not less than 9 in. (230 mm).

**13.4.10.2.3** Where the same level is not used for both seat foundations and footrests, footrests independent of seats shall be provided.

**13.4.10.2.4** Individual chair-type seats shall be permitted in folding and telescopic seating only if firmly secured in groups of not less than three.

**13.4.10.2.5** The maximum number of seats permitted between the farthest seat in an aisle in folding and telescopic seating shall not exceed that shown in [Table 13.4.9.2.5](#).

**13.4.10.3 Guards and Railings.**

**13.4.10.3.1** Railings or guards not less than 42 in. (1065 mm) above the aisle surface or footrest, or not less than 36 in. (915 mm) vertically above the center of the seat or seat board surface, whichever is adjacent, shall be provided along those portions of the backs and ends of all folding and telescopic seating where the seats are more than 48 in. (1220 mm) above the floor or the finished ground level.

**13.4.10.3.2** The requirement of [13.4.10.3.1](#) shall not apply where an adjacent wall or fence affords equivalent safeguard.

**13.4.10.3.3** Where the front footrest of folding or telescopic seating is more than 24 in. (610 mm) above the floor, railings or guards not less than 33 in. (825 mm) above such footrests shall be provided.

**13.4.10.3.4** The railings required by [13.4.10.3.3](#) shall be permitted to be not less than 26 in. (660 mm) high where the front row of seats includes backrests.

**13.4.10.3.5** Cross aisles located within the seating area shall be provided with rails not less than 26 in. (660 mm) high along the front edge of the cross aisle.

## CHAPTER 12 • New

**12.4.10.3.6** The railings specified by [12.4.10.3.5](#) shall not be required where the backs of the seats in front of the cross aisle project 24 in. (610 mm) or more above the surface of the cross aisle.

**12.4.10.3.7** Vertical openings between guardrails and footboards or seat boards shall be provided with intermediate construction so that a 4 in. (100 mm) diameter sphere cannot pass through the opening.

**12.4.10.3.8** An opening between the seat board and footboard located more than 30 in. (760 mm) above the finished ground level shall be provided with intermediate construction so that a 4 in. (100 mm) diameter sphere cannot pass through the opening.

### 12.4.11 Airport Loading Walkways.

**12.4.11.1** Airport loading walkways shall conform to NFPA 415, *Standard on Airport Terminal Buildings, Fueling Ramp Drainage, and Loading Walkways*, and the provisions of [12.4.11.2](#) and [12.4.11.3](#).

**12.4.11.2** Doors in the egress path from the aircraft through the airport loading walkway into the airport terminal building shall meet both of the following criteria:

- (1) They shall swing in the direction of egress from the aircraft.
- (2)\* They shall not be permitted to have delayed-egress locks.

**A.12.4.11.2(2)** Delayed-egress locks on doors from the airport loading walkway into the airport terminal building might compromise life safety due to the limited period of time the airport loading walkway will provide protection for emergency egress. The requirement of [12.4.11.2\(2\)](#) would not limit the use of access-controlled or delayed-egress hardware from the airport terminal building into the airport loading walkway.

**12.4.11.3** Exit access shall be unimpeded from the airport loading walkway to the nonsecured public areas of the airport terminal building.

**Subsection 12/13.4.11** on airport loading walkways addresses situations unique to airport terminal buildings that present challenges to life safety. Most doors from the airport terminal building to the aircraft loading walkways are not part of the means of egress for occupants of the terminal building, but this does not mean such doors can go unregulated. In most buildings, the egress system functions by getting building occupants to the

---

## 12.5 Building Services

**12.5.1 Utilities.** Utilities shall comply with the provisions of [Section 9.1](#).

## CHAPTER 13 • Existing

**13.4.10.3.6** The railings specified by [13.4.10.3.5](#) shall not be required where the backs of the seats in front of the cross aisle project 24 in. (610 mm) or more above the surface of the cross aisle.

**13.4.10.3.7** Vertical openings between guardrails and footboards or seat boards shall be provided with intermediate construction so that a 4 in. (100 mm) diameter sphere cannot pass through the opening.

**13.4.10.3.8** An opening between the seat board and footboard located more than 30 in. (760 mm) above the finished ground level shall be provided with intermediate construction so that a 4 in. (100 mm) diameter sphere cannot pass through the opening.

### 13.4.11 Airport Loading Walkways.

**13.4.11.1** Airport loading walkways shall conform to NFPA 415, *Standard on Airport Terminal Buildings, Fueling Ramp Drainage, and Loading Walkways*, and the provisions of [13.4.11.2](#) and [13.4.11.3](#).

**13.4.11.2** Doors in the egress path from the aircraft through the airport loading walkway into the airport terminal building shall meet both of the following criteria:

- (1) They shall swing in the direction of egress from the aircraft.
- (2)\* They shall not be permitted to have delayed-egress locks.

**A.13.4.11.2(2)** Delayed-egress locks on doors from the airport loading walkway into the airport terminal building might compromise life safety due to the limited period of time the airport loading walkway will provide protection for emergency egress. The requirement of [13.4.11.2\(2\)](#) would not limit the use of access-controlled or delayed-egress hardware from the airport terminal building into the airport loading walkway.

**13.4.11.3** Exit access shall be unimpeded from the airport loading walkway to the nonsecured public areas of the airport terminal building.

outside at the public way. At airport terminals, occupants of the loading walkways might be ensured safety only if provided with re-entry into the building, since the fire threat might be outside on the tarmac, as in the case of a spilled fuel fire. The criteria specified in [12/13.4.11](#) supplement the other provisions of [Chapters 12 and 13](#) to help provide a complete protection package.

---

## 13.5 Building Services

**13.5.1 Utilities.** Utilities shall comply with the provisions of [Section 9.1](#).

## CHAPTER 12 • New

**12.5.2 Heating, Ventilating, and Air-Conditioning Equipment.** Heating, ventilating, and air-conditioning equipment shall comply with the provisions of [Section 9.2](#).

**12.5.3 Elevators, Escalators, and Conveyors.** Elevators, escalators, and conveyors shall comply with the provisions of [Section 9.4](#).

**12.5.4 Waste Chutes, Incinerators, and Laundry Chutes.** Waste chutes, incinerators, and laundry chutes shall comply with the provisions of [Section 9.5](#).

---

## 12.6 Reserved

---

## 12.7 Operating Features

### 12.7.1 Means of Egress Inspection.

**12.7.1.1** The building owner or agent shall inspect the means of egress to ensure it is maintained free of obstructions, and correct any deficiencies found, prior to each opening of the building to the public.

**12.7.1.2** The building owner or agent shall prepare and maintain records of the date and time of each inspection on approved forms, listing any deficiencies found and actions taken to correct them.

**12.7.1.3 Inspection of Door Openings.** Door openings shall be inspected in accordance with [7.2.1.15](#).

The means of egress features required by [Chapters 12 and 13](#) cannot be ensured to be effective unless maintained. The requirement for inspection and correction of the deficiencies found helps to keep the means of egress features usable. The required record keeping serves as an enforcement tool for the authority having jurisdiction to help ensure such inspection is conducted as specified.

The provision of [12/13.7.1.3](#) for the inspection of door openings is in the form of a requirement that references the provisions of [7.2.1.15](#). The criteria of [7.2.1.15](#) are formatted to apply only where specifically required by another portion of the *Code*. The inspection requirements apply only to specific door categories. This application threshold was chosen to help ensure that the egress doors designed to accommodate larger numbers of occupants under emergency egress or relocation are inspected

## CHAPTER 13 • Existing

**13.5.2 Heating, Ventilating, and Air-Conditioning Equipment.** Heating, ventilating, and air-conditioning equipment shall comply with the provisions of [Section 9.2](#).

**13.5.3 Elevators, Escalators, and Conveyors.** Elevators, escalators, and conveyors shall comply with the provisions of [Section 9.4](#).

**13.5.4 Waste Chutes, Incinerators, and Laundry Chutes.** Waste chutes, incinerators, and laundry chutes shall comply with the provisions of [Section 9.5](#).

---

## 13.6 Reserved

---

## 13.7 Operating Features

### 13.7.1 Means of Egress Inspection.

**13.7.1.1** The building owner or agent shall inspect the means of egress to ensure it is maintained free of obstructions, and correct any deficiencies found, prior to each opening of the building to the public.

**13.7.1.2** The building owner or agent shall prepare and maintain records of the date and time of each inspection on approved forms, listing any deficiencies found and actions taken to correct them.

**13.7.1.3 Inspection of Door Openings.** Door openings shall be inspected in accordance with [7.2.1.15](#).

and tested. Door leaves that are infrequently used, like those into exit stair enclosures in high-rise buildings, might be misaligned within their frames so as to be difficult to open within the operating forces requirements of [7.2.1.4.5](#). The door inspection and testing criteria of [7.2.1.15](#) are intended to help identify problems with door openings and ensure that such problems are remedied. [Exhibit 12/13.84](#) shows double egress doors, other than the main entrance/exit doors, from a hotel multipurpose meeting room. Note that the door on the left is hanging askew and that the left end of the fire exit hardware has broken free from its mounting. The left door is not capable of being pulled into its fully closed position. The provision of [7.2.1.15.1\(1\)](#), which addresses doors with panic hardware or fire exit hardware, as required by [12/13.7.1.3](#), is intended to identify such problems and ensure that they are remedied.

Exhibit 12/13.84

*Damaged egress door subject to inspection.*

### 12.7.2 Special Provisions for Food Service Operations.

**12.7.2.1** All devices in connection with the preparation of food shall be installed and operated to avoid hazard to the safety of occupants.

**12.7.2.2** All devices in connection with the preparation of food shall be of an approved type and shall be installed in an approved manner.

**12.7.2.3** Food preparation facilities shall be protected in accordance with 9.2.3 and shall not be required to have openings protected between food preparation areas and dining areas.

**12.7.2.4** Portable cooking equipment that is not flue-connected shall be permitted only as follows:

- (1) Equipment fueled by small heat sources that can be readily extinguished by water, such as candles or alcohol-burning equipment, including solid alcohol, shall be permitted to be used, provided that precautions satisfactory to the AHJ are taken to prevent ignition of any combustible materials.
- (2) Candles shall be permitted to be used on tables used for food service where securely supported on substantial noncombustible bases located to avoid danger of ignition of combustible materials and only where approved by the AHJ.
- (3) Candle flames shall be protected.
- (4) “Flaming sword” or other equipment involving open flames and flamed dishes, such as cherries jubilee or crêpes suzette,

### 13.7.2 Special Provisions for Food Service Operations.

**13.7.2.1** All devices in connection with the preparation of food shall be installed and operated to avoid hazard to the safety of occupants.

**13.7.2.2** All devices in connection with the preparation of food shall be of an approved type and shall be installed in an approved manner.

**13.7.2.3** Food preparation facilities shall be protected in accordance with 9.2.3 and shall not be required to have openings protected between food preparation areas and dining areas.

**13.7.2.4** Portable cooking equipment that is not flue-connected shall be permitted only as follows:

- (1) Equipment fueled by small heat sources that can be readily extinguished by water, such as candles or alcohol-burning equipment, including solid alcohol, shall be permitted to be used, provided that precautions satisfactory to the AHJ are taken to prevent ignition of any combustible materials.
- (2) Candles shall be permitted to be used on tables used for food service where securely supported on substantial noncombustible bases located to avoid danger of ignition of combustible materials and only where approved by the AHJ.
- (3) Candle flames shall be protected.
- (4) “Flaming sword” or other equipment involving open flames and flamed dishes, such as cherries jubilee or crêpes suzette,

## CHAPTER 12 • New

shall be permitted to be used, provided that precautions subject to the approval of the AHJ are taken.

- (5) Listed and approved LP-Gas commercial food service appliances shall be permitted to be used where in accordance with NFPA 58, *Liquefied Petroleum Gas Code*.

An approved type of device, as required by 12/13.7.2.2, is one that, with regard to potential fire hazards, is acceptable to the authority having jurisdiction. An “approved manner” of installation means installation acceptable to the AHJ. See definition of *approved* in 3.2.1.

The *Code* depends on the automatic extinguishing system mandated by 9.2.3 to control any fire on the cooking surfaces,

**12.7.3 Open Flame Devices and Pyrotechnics.** No open flame devices or pyrotechnic devices shall be used in any assembly occupancy, unless otherwise permitted by one of the following:

- (1) Pyrotechnic special effect devices shall be permitted to be used on stages before proximate audiences for ceremonial or religious purposes, as part of a demonstration in exhibits, or as part of a performance, provided that both of the following criteria are met:
  - (a) Precautions satisfactory to the authority having jurisdiction are taken to prevent ignition of any combustible material.
  - (b) Use of the pyrotechnic device complies with NFPA 1126, *Standard for the Use of Pyrotechnics Before a Proximate Audience*.
- (2) Flame effects before an audience shall be permitted in accordance with NFPA 160, *Standard for the Use of Flame Effects Before an Audience*.
- (3) Open flame devices shall be permitted to be used in the following situations, provided that precautions satisfactory to the authority having jurisdiction are taken to prevent ignition of any combustible material or injury to occupants:
  - (a)\* For ceremonial or religious purposes

**A.12.7.3(3)(a)** Securely supported altar candles in churches that are well separated from any combustible material are permitted. On the other hand, lighted candles carried by children wearing cotton robes present a hazard too great to be permitted. There are many other situations of intermediate hazard where the authority having jurisdiction will have to exercise judgment.

- (b) On stages and platforms where part of a performance
- (c) Where candles on tables are securely supported on substantial noncombustible bases and candle flame is protected
- (4) The requirement of 12.7.3 shall not apply to heat-producing equipment complying with 9.2.2.

## CHAPTER 13 • Existing

shall be permitted to be used, provided that precautions subject to the approval of the AHJ are taken.

- (5) Listed and approved LP-Gas commercial food service appliances shall be permitted to be used where in accordance with NFPA 58, *Liquefied Petroleum Gas Code*.

and, thus, 12/13.7.2.3 does not require enclosure by rated construction.

The list of tragic fires in assembly occupancies caused by “friendly” fires (e.g., alcohol or solid alcohol fires in restaurants, flames used for dramatic effects in theaters) is well documented. The requirements of 12/13.7.2.4 and 12/13.7.3 attempt to prevent a fire by tightly controlling the use of open flame devices.

**13.7.3 Open Flame Devices and Pyrotechnics.** No open flame devices or pyrotechnic devices shall be used in any assembly occupancy, unless otherwise permitted by one of the following:

- (1) Pyrotechnic special effect devices shall be permitted to be used on stages before proximate audiences for ceremonial or religious purposes, as part of a demonstration in exhibits, or as part of a performance, provided that both of the following criteria are met:
  - (a) Precautions satisfactory to the authority having jurisdiction are taken to prevent ignition of any combustible material.
  - (b) Use of the pyrotechnic device complies with NFPA 1126, *Standard for the Use of Pyrotechnics Before a Proximate Audience*.
- (2) Flame effects before an audience shall be permitted in accordance with NFPA 160, *Standard for the Use of Flame Effects Before an Audience*.
- (3) Open flame devices shall be permitted to be used in the following situations, provided that precautions satisfactory to the authority having jurisdiction are taken to prevent ignition of any combustible material or injury to occupants:
  - (a)\* For ceremonial or religious purposes

**A.13.7.3(3)(a)** Securely supported altar candles in churches that are well separated from any combustible material are permitted. On the other hand, lighted candles carried by children wearing cotton robes present a hazard too great to be permitted. There are many other situations of intermediate hazard where the authority having jurisdiction will have to exercise judgment.

- (b) On stages and platforms where part of a performance
- (c) Where candles on tables are securely supported on substantial noncombustible bases and candle flame is protected
- (4) The requirement of 13.7.3 shall not apply to heat-producing equipment complying with 9.2.2.

## CHAPTER 12 • New

- (5) The requirement of 12.7.3 shall not apply to food service operations in accordance with 12.7.2.
- (6) Gas lights shall be permitted to be used, provided that precautions are taken, subject to the approval of the authority having jurisdiction, to prevent ignition of any combustible materials.

**12.7.4 Furnishings, Decorations, and Scenery.**

**12.7.4.1\*** Fabrics and films used for decorative purposes, all draperies and curtains, and similar furnishings shall be in accordance with the provisions of 10.3.1.

**A.12.7.4.1** Fabric applied over unused seating sections should meet the requirements of 12.7.4.

**12.7.4.2** The authority having jurisdiction shall impose controls on the quantity and arrangement of combustible contents in assembly occupancies to provide an adequate level of safety to life from fire.

**12.7.4.3\*** Exposed foamed plastic materials and unprotected materials containing foamed plastic used for decorative purposes or stage scenery shall have a heat release rate not exceeding 100 kW where tested in accordance with one of the following:

- (1) UL 1975, *Standard for Fire Tests for Foamed Plastics Used for Decorative Purposes*
- (2) NFPA 289, *Standard Method of Fire Test for Individual Fuel Packages*, using the 20 kW ignition source

**A.12.7.4.3** The phrase “unprotected materials containing foamed plastic” is meant to include foamed plastic items covered by “thermally thin” combustible fabrics or paint. (See A.10.2.3.4.)

**12.7.4.4** The requirement of 12.7.4.3 shall not apply to individual foamed plastic items and items containing foamed plastic where the foamed plastic does not exceed 1 lb (0.45 kg) in weight.

**12.7.5 Special Provisions for Exposition Facilities.**

**12.7.5.1 General.** No display or exhibit shall be installed or operated to interfere in any way with access to any required exit or with the visibility of any required exit or required exit sign; nor shall any display block access to fire-fighting equipment.

**12.7.5.2 Materials Not On Display.** A storage room having an enclosure consisting of a smoke barrier having a minimum 1-hour fire resistance rating and protected by an automatic extinguishing system shall be provided for combustible materials not on display, including combustible packing crates used to ship exhibitors’ supplies and products.

Exposition facilities have problems that differ from those of theaters, restaurants, or other assembly occupancies. They are generally large, multi-use facilities with high ceilings appropriate to

## CHAPTER 13 • Existing

- (5) The requirement of 13.7.3 shall not apply to food service operations in accordance with 13.7.2.
- (6) Gas lights shall be permitted to be used, provided that precautions are taken, subject to the approval of authority having jurisdiction, to prevent ignition of any combustible materials.

**13.7.4 Furnishings, Decorations, and Scenery.**

**13.7.4.1\*** Fabrics and films used for decorative purposes, all draperies and curtains, and similar furnishings shall be in accordance with the provisions of 10.3.1.

**A.13.7.4.1** Fabric applied over unused seating sections should meet the requirements of 13.7.4.

**13.7.4.2** The authority having jurisdiction shall impose controls on the quantity and arrangement of combustible contents in assembly occupancies to provide an adequate level of safety to life from fire.

**13.7.4.3\*** Exposed foamed plastic materials and unprotected materials containing foamed plastic used for decorative purposes or stage scenery shall have a heat release rate not exceeding 100 kW where tested in accordance with one of the following:

- (1) ANSI/UL 1975, *Standard for Fire Tests for Foamed Plastics Used for Decorative Purposes*
- (2) NFPA 289, *Standard Method of Fire Test for Individual Fuel Packages*, using the 20 kW ignition source

**A.13.7.4.3** The phrase “unprotected materials containing foamed plastic” is meant to include foamed plastic items covered by “thermally thin” combustible fabrics or paint. (See A.10.2.3.4.)

**13.7.4.4** The requirement of 13.7.4.3 shall not apply to individual foamed plastic items and items containing foamed plastic where the foamed plastic does not exceed 1 lb (0.45 kg) in weight.

**13.7.5 Special Provisions for Exposition Facilities.**

**13.7.5.1 General.** No display or exhibit shall be installed or operated to interfere in any way with access to any required exit or with the visibility of any required exit or required exit sign; nor shall any display block access to fire-fighting equipment.

**13.7.5.2 Materials Not on Display.** A storage room having an enclosure consisting of a smoke barrier having a minimum 1-hour fire resistance rating and protected by an automatic extinguishing system shall be provided for combustible materials not on display, including combustible packing crates used to ship exhibitors’ supplies and products.

their size. Combustible materials are frequently displayed, and the containers in which the exhibits are shipped contribute to the fuel load. Due to the size of exhibition halls, most are required

## CHAPTER 12 • New

by 12/13.1.6 and 12/13.3.5.2 to be protected by automatic sprinklers.

The authority having jurisdiction at the local level is often working with organizations that exhibit on a national basis and that are unaware of the local fire safety regulations. It is the intent that this Code provide the more consistent and universal treatment needed in these occupancies and, at the same time, encourage more uniform enforcement practices.

Prior to the inclusion of 12/13.7.5, the trade show and exposition hall regulations used by many jurisdictions were very similar; however, there was no nationally recognized model code that could be referenced. This lack of a model code presented a hardship, as well as confusion between the local AHJ and persons responsible for the various functions of the trade show or exposition.

To meet the intent of 12/13.7.5.1, it is advisable to have prepared plans or diagrams to show the arrangement of displays or exhibits, including any that are to be suspended from the ceiling or housed within an overhead structure. Displays or exhibits must not interfere with access to any required exit, and they must not conceal exit signs. See Exhibit 12/13.85. A display should not block access to fire-fighting equipment or interfere with the normal operation of automatic extinguishing equipment or devices for smoke evacuation.

Aisles serving rows of booths are exit accesses; therefore, booths and other temporary construction should be of minimal

### 12.7.5.3 Exhibits.

**12.7.5.3.1** Exhibits shall comply with 12.7.5.3.2 through 12.7.5.3.11.

**12.7.5.3.2** The travel distance within the exhibit booth or exhibit enclosure to an exit access aisle shall not exceed 50 ft (15 m).

**12.7.5.3.3** The upper deck of multilevel exhibits exceeding 300 ft<sup>2</sup> (28 m<sup>2</sup>) shall have not less than two remote means of egress.

**12.7.5.3.4** Exhibit booth construction materials shall be limited to the following:

- (1) Noncombustible or limited-combustible materials
- (2) Wood exceeding ¼ in. (6.3 mm) nominal thickness
- (3) Wood that is pressure-treated, fire-retardant wood meeting the requirements of NFPA 703, *Standard for Fire Retardant-Treated Wood and Fire-Retardant Coatings for Building Materials*
- (4) Flame-retardant materials complying with one of the following:
  - (a) They shall meet the flame propagation performance criteria contained in Test Method 1 or Test Method 2, as appropriate, of NFPA 701, *Standard Methods of Fire Tests for Flame Propagation of Textiles and Films*.

## CHAPTER 13 • Existing

combustible construction or should be protected to avoid undue hazard of fire that might endanger occupants before they can reach available exits.

Displays or exhibits of combustible material must be limited in quantity to reduce the fuel load to an acceptable level. In accordance with 12/13.7.5.2, excess combustible display material and all other combustible materials that are not in use must be kept in a separate storage room until needed. A separation with a fire resistance rating of 1 hour is required between such a storage room and all other parts of the building, and the room must be protected by an automatic sprinkler system.

Arrangement of displays in an exhibition hall.

### 13.7.5.3 Exhibits.

**13.7.5.3.1** Exhibits shall comply with 13.7.5.3.2 through 13.7.5.3.11.

**13.7.5.3.2** The travel distance within the exhibit booth or exhibit enclosure to an exit access aisle shall not exceed 50 ft (15 m).

**13.7.5.3.3** The upper deck of multilevel exhibits exceeding 300 ft<sup>2</sup> (28 m<sup>2</sup>) shall have not less than two remote means of egress.

**13.7.5.3.4** Exhibit booth construction materials shall be limited to the following:

- (1) Noncombustible or limited-combustible materials
- (2) Wood exceeding ¼ in. (6.3 mm) nominal thickness
- (3) Wood that is pressure-treated, fire-retardant wood meeting the requirements of NFPA 703, *Standard for Fire Retardant-Treated Wood and Fire-Retardant Coatings for Building Materials*
- (4) Flame-retardant materials complying with one of the following:
  - (a) They shall meet the flame propagation performance criteria contained in Test Method 1 or Test Method 2, as appropriate, of NFPA 701, *Standard Methods of Fire Tests for Flame Propagation of Textiles and Films*.

## CHAPTER 12 • New

- (b) They shall exhibit a heat release rate not exceeding 100 kW when tested in accordance with NFPA 289, *Standard Method of Fire Test for Individual Fuel Packages*, using the 20 kW ignition source.
- (5) Textile wall coverings, such as carpeting and similar products used as wall or ceiling finishes, complying with the provisions of 10.2.2 and 10.2.4
- (6) Plastics limited to those that comply with 12.3.3 and Section 10.2
- (7) Foamed plastics and materials containing foamed plastics having a heat release rate for any single fuel package that does not exceed 100 kW where tested in accordance with one of the following:
  - (a) UL 1975, *Standard for Fire Tests for Foamed Plastics Used for Decorative Purposes*
  - (b) NFPA 289, *Standard Method of Fire Test for Individual Fuel Packages*, using the 20 kW ignition source
- (8) Cardboard, honeycombed paper, and other combustible materials having a heat release rate for any single fuel package that does not exceed 150 kW where tested in accordance with one of the following:
  - (a) UL 1975
  - (b) NFPA 289, using the 20 kW ignition source

**12.7.5.3.5** Curtains, drapes, and decorations shall comply with 10.3.1.

**12.7.5.3.6** Acoustical and decorative material including, but not limited to, cotton, hay, paper, straw, moss, split bamboo, and wood chips shall be flame-retardant treated to the satisfaction of the authority having jurisdiction.

**12.7.5.3.6.1** Materials that cannot be treated for flame retardancy shall not be used.

**12.7.5.3.6.2** Foamed plastics, and materials containing foamed plastics and used as decorative objects such as, but not limited to, mannequins, murals, and signs, shall have a heat release rate for any single fuel package that does not exceed 150 kW where tested in accordance with one of the following:

- (1) UL 1975, *Standard for Fire Tests for Foamed Plastics Used for Decorative Purposes*
- (2) NFPA 289, *Standard Method of Fire Test for Individual Fuel Packages*, using the 20 kW ignition source

**12.7.5.3.6.3** Where the aggregate area of acoustical and decorative materials is less than 10 percent of the individual floor or wall area, such materials shall be permitted to be used subject to the approval of the authority having jurisdiction.

**12.7.5.3.7** The following shall be protected by automatic extinguishing systems:

- (1) Single-level exhibit booths exceeding 300 ft<sup>2</sup> (28 m<sup>2</sup>) and covered with a ceiling

## CHAPTER 13 • Existing

- (b) They shall exhibit a heat release rate not exceeding 100 kW when tested in accordance with NFPA 289, *Standard Method of Fire Test for Individual Fuel Packages*, using the 20 kW ignition source.
- (5) Textile wall coverings, such as carpeting and similar products used as wall or ceiling finishes, complying with the provisions of 10.2.2 and 10.2.4
- (6) Plastics limited to those that comply with 13.3.3 and Section 10.2
- (7) Foamed plastics and materials containing foamed plastics having a heat release rate for any single fuel package that does not exceed 100 kW where tested in accordance with one of the following:
  - (a) ANSI/UL 1975, *Standard for Fire Tests for Foamed Plastics Used for Decorative Purposes*
  - (b) NFPA 289, *Standard Method of Fire Test for Individual Fuel Packages*, using the 20 kW ignition source
- (8) Cardboard, honeycombed paper, and other combustible materials having a heat release rate for any single fuel package that does not exceed 150 kW where tested in accordance with one of the following:
  - (a) ANSI/UL 1975
  - (b) NFPA 289, using the 20 kW ignition source

**13.7.5.3.5** Curtains, drapes, and decorations shall comply with 10.3.1.

**13.7.5.3.6** Acoustical and decorative material including, but not limited to, cotton, hay, paper, straw, moss, split bamboo, and wood chips shall be flame-retardant treated to the satisfaction of the authority having jurisdiction.

**13.7.5.3.6.1** Materials that cannot be treated for flame retardancy shall not be used.

**13.7.5.3.6.2** Foamed plastics, and materials containing foamed plastics and used as decorative objects such as, but not limited to, mannequins, murals, and signs shall have a heat release rate for any single fuel package that does not exceed 150 kW where tested in accordance with one of the following:

- (1) ANSI/UL 1975, *Standard for Fire Tests for Foamed Plastics Used for Decorative Purposes*
- (2) NFPA 289, *Standard Method of Fire Test for Individual Fuel Packages*, using the 20 kW ignition source

**13.7.5.3.6.3** Where the aggregate area of acoustical and decorative materials is less than 10 percent of the individual floor or wall area, such materials shall be permitted to be used subject to the approval of the authority having jurisdiction.

**13.7.5.3.7** The following shall be protected by automatic extinguishing systems:

- (1) Single-level exhibit booths exceeding 300 ft<sup>2</sup> (28 m<sup>2</sup>) and covered with a ceiling

## CHAPTER 12 • New

- (2) Each level of multilevel exhibit booths, including the uppermost level where the uppermost level is covered with a ceiling

**12.7.5.3.7.1** The requirements of **12.7.5.3.7** shall not apply where otherwise permitted by the following:

- (1) Ceilings that are constructed of open grate design or listed dropout ceilings in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*, shall not be considered ceilings within the context of **12.7.5.3.7**.
- (2) Vehicles, boats, and similar exhibited products having over 100 ft<sup>2</sup> (9.3 m<sup>2</sup>) of roofed area shall be provided with smoke detectors acceptable to the authority having jurisdiction.
- (3)\* The requirement of **12.7.5.3.7(2)** shall not apply where fire protection of multilevel exhibit booths is consistent with the criteria developed through a life safety evaluation of the exhibition hall in accordance with **12.4.1**, subject to approval of the authority having jurisdiction.

**A.12.7.5.3.7.1(3)** See **A.12.4.1.1**.

**12.7.5.3.7.2** A single exhibit or group of exhibits with ceilings that do not require sprinklers shall be separated by a distance of not less than 10 ft (3050 mm) where the aggregate ceiling exceeds 300 ft<sup>2</sup> (28 m<sup>2</sup>).

**12.7.5.3.7.3** The water supply and piping for the sprinkler system shall be permitted to be of an approved temporary means that is provided by a domestic water supply, a standpipe system, or a sprinkler system.

The requirement of **12/13.7.5.3.2** applies to a standard exhibit booth arrangement, whether constructed of pipe supports and cloth or paper drapes, or whether it is a large exhibit enclosure designed and built from other materials, which could include small booths, open displays, large board displays, or other arrangements. This requirement also includes exhibit enclosures that are created by the arrangement of products such as machinery or vehicles. The intent is that travel distance is not to be more than 50 ft (15 m) for occupants who are inside the enclosure, whether they are employees or patrons. Note that this is not travel distance to an exit, but only to an aisle.

The requirement of **12/13.7.5.3.3** ensures that larger exhibits with a second level will provide at least two means of egress to prevent entrapping occupants on the upper level.

**Paragraph 12/13.7.5.3.4** is intended to provide direction to manufacturers of exhibit booths as well as decorators, exhibitors, and authorities having jurisdiction. This paragraph focuses on the construction components of the ceilings, walls, and floors of an exhibit booth or display area in addition to the finish treatment. The intent is to regulate the materials used for large signs

## CHAPTER 13 • Existing

- (2) Each level of multilevel exhibit booths, including the uppermost level where the uppermost level is covered with a ceiling

**13.7.5.3.7.1** The requirements of **13.7.5.3.7** shall not apply where otherwise permitted by the following:

- (1) Ceilings that are constructed of open grate design or listed dropout ceilings in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*, shall not be considered ceilings within the context of **13.7.5.3.7**.
- (2) Vehicles, boats, and similar exhibited products having over 100 ft<sup>2</sup> (9.3 m<sup>2</sup>) of roofed area shall be provided with smoke detectors acceptable to the authority having jurisdiction.
- (3)\* The requirement of **13.7.5.3.7(2)** shall not apply where fire protection of multilevel exhibit booths is consistent with the criteria developed through a life safety evaluation of the exhibition hall in accordance with **13.4.1**, subject to approval of the authority having jurisdiction.

**A.13.7.5.3.7.1(3)** See **A.13.4.1.1**.

**13.7.5.3.7.2** A single exhibit or group of exhibits with ceilings that do not require sprinklers shall be separated by a distance of not less than 10 ft (3050 mm) where the aggregate ceiling exceeds 300 ft<sup>2</sup> (28 m<sup>2</sup>).

**13.7.5.3.7.3** The water supply and piping for the sprinkler system shall be permitted to be of approved temporary means that is provided by a domestic water supply, a standpipe system, or a sprinkler system.

and display boards; small signs might be considered interior finish materials per the criteria of **10.2.5.3. Paragraph 12/13.7.5.3.4** does not apply to the goods or products that are being displayed.

Plastics are limited to Class A and Class B for wall and ceiling finishes. The intent of **12/13.7.5.3.4(7)** is to prohibit the use of foamed plastics because of their inherent burning characteristics, unless they have been tested for heat release rate in accordance with ANSI/UL 1975, *Standard for Fire Tests for Foamed Plastics Used for Decorative Purposes*,<sup>18</sup> or NFPA 289, *Standard Method of Fire Test for Individual Fuel Packages*,<sup>19</sup> and meet the maximum 100 kW threshold. Foamed plastics are used in sign construction and display boards, and, in some cases, the entire booth is constructed of foamed plastics.

Large booths and multistory booths pose special life safety problems in exhibit halls. A fire in these booths could grow to proportions large enough to have a significant negative impact on the performance of the building's sprinkler system. The intent of **12/13.7.5.3.7** is to provide sprinkler protection in these booths by means of a temporary tap into the existing sprinkler system.

## CHAPTER 12 • New

Sprinklers should provide the protection necessary to extinguish a fire in its incipient stage, thus reducing the life hazard to occupants.

Paragraph 12/13.7.5.3.7.1(1) is not really an exemption to 12/13.7.5.3.7, because the exemption of sprinklers below drop-out ceilings is already permitted by the reference document, NFPA 13, *Standard for the Installation of Sprinkler Systems*. The exemption was added to emphasize that it is not the intent to prohibit this provision of the sprinkler installation standard from being applied.

**12.7.5.3.8** Open flame devices within exhibit booths shall comply with 12.7.3.

**12.7.5.3.9** Cooking and food-warming devices in exhibit booths shall comply with 12.7.2 and all of the following:

- (1) Gas-fired devices shall comply with the following:
  - (a) Natural gas-fired devices shall comply with 9.1.1.
  - (b) The requirement of 12.7.5.3.9(1)(a) shall not apply to compressed natural gas where permitted by the authority having jurisdiction.
  - (c) The use of LP-Gas cylinders shall be prohibited.
  - (d) Nonrefillable LP-Gas cylinders shall be approved for use where permitted by the authority having jurisdiction.
- (2) The devices shall be isolated from the public by not less than 48 in. (1220 mm) or by a barrier between the devices and the public.
- (3) Multi-well cooking equipment using combustible oils or solids shall comply with 9.2.3.
- (4) Single-well cooking equipment using combustible oils or solids shall meet all of the following criteria:
  - (a) The equipment shall have lids available for immediate use.
  - (b) The equipment shall be limited to 2 ft<sup>2</sup> (0.2 m<sup>2</sup>) of cooking surface.
  - (c) The equipment shall be placed on noncombustible surface materials.
  - (d) The equipment shall be separated from each other by a horizontal distance of not less than 24 in. (610 mm).
  - (e) The requirement of 12.7.5.3.9(4)(d) shall not apply to multiple single-well cooking equipment where the aggregate cooking surface area does not exceed 2 ft<sup>2</sup> (0.2 m<sup>2</sup>).
  - (f) The equipment shall be kept at a horizontal distance of not less than 24 in. (610 mm) from any combustible material.
- (5) A portable fire extinguisher in accordance with Section 9.9 shall be provided within the booth for each device, or an approved automatic extinguishing system shall be provided.

## CHAPTER 13 • Existing

Paragraph 12/13.7.5.3.7.1(2) exempts large vehicles (i.e., boats, mobile homes, and recreational vehicles) from the sprinkler requirement but requires a smoke detector if the vehicle is larger than 100 ft<sup>2</sup> (9.3 m<sup>2</sup>) to provide early warning in the immediate area to allow for orderly evacuation. This provision could most probably be met by single-station, battery-operated smoke alarms.

Paragraph 12/13.7.5.3.7.1(3) permits exposition hall operators to work with the AHJ to devise alternate methods of compliance via the life safety evaluation of 12/13.4.1.

**13.7.5.3.8** Open flame devices within exhibit booths shall comply with 13.7.3.

**13.7.5.3.9** Cooking and food-warming devices in exhibit booths shall comply with 13.7.2 and all of the following:

- (1) Gas-fired devices shall comply with all of the following:
  - (a) Natural gas-fired devices shall comply with 9.1.1.
  - (b) The requirement of 13.7.5.3.9(1)(a) shall not apply to compressed natural gas where permitted by the authority having jurisdiction.
  - (c) The use of LP-Gas cylinders shall be prohibited.
  - (d) Nonrefillable LP-Gas cylinders shall be approved for use where permitted by the authority having jurisdiction.
- (2) The devices shall be isolated from the public by not less than 48 in. (1220 mm) or by a barrier between the devices and the public.
- (3) Multi-well cooking equipment using combustible oils or solids shall comply with 9.2.3.
- (4) Single-well cooking equipment using combustible oils or solids shall meet all of the following criteria:
  - (a) The equipment shall have lids available for immediate use.
  - (b) The equipment shall be limited to 2 ft<sup>2</sup> (0.2 m<sup>2</sup>) of cooking surface.
  - (c) The equipment shall be placed on noncombustible surface materials.
  - (d) The equipment shall be separated from each other by a horizontal distance of not less than 24 in. (610 mm).
  - (e) The requirement of 13.7.5.3.9(4)(d) shall not apply to multiple single-well cooking equipment where the aggregate cooking surface area does not exceed 2 ft<sup>2</sup> (0.2 m<sup>2</sup>).
  - (f) The equipment shall be kept at a horizontal distance of not less than 24 in. (610 mm) from any combustible material.
- (5) A portable fire extinguisher in accordance with Section 9.9 shall be provided within the booth for each device, or an approved automatic extinguishing system shall be provided.

## CHAPTER 12 • New

**12.7.5.3.10** Combustible materials within exhibit booths shall be limited to a one-day supply. Storage of combustible materials behind the booth shall be prohibited. (See 12.7.4.2 and 12.7.5.2.)

**12.7.5.3.11** Plans for the exposition, in an acceptable form, shall be submitted to the authority having jurisdiction for approval prior to setting up any exhibit.

**12.7.5.3.11.1** The plan shall show all details of the proposed exposition.

**12.7.5.3.11.2** No exposition shall occupy any exposition facility without approved plans.

Open flame devices, as noted in 12/13.7.5.3.8, need to comply with the provisions of 12/13.7.3. Any use of open flames requires the approval of the authority having jurisdiction.

The provisions of 12/13.7.5.3.9 recognize the inherent dangers in cooking and food-warming devices that are used in an exhibit hall subject to large, transient crowds.

The provisions of 12/13.7.5.3.9(2) require separation distance or a barrier between the public and the device. The purpose is to guard against the dangers of accidental spills of hot greases or foods and to minimize the potential for ignition of combustibles, especially clothing worn by patrons.

Paragraph 12/13.7.5.3.9(3) requires that multi-vat, or multi-well, cooking equipment comply with NFPA 96, *Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations*.<sup>20</sup>

The intent of requiring the lid in 12/13.7.5.3.9(4)(a) is to provide the operator with a ready method of smothering the fire.

The provisions of 12/13.7.5.3.9(4)(c) are important, because the bottom surface of many devices could be subject to heating to temperatures that could ignite combustible surfaces.

The minimum separation distances in 12/13.7.5.3.9(4)(d) are necessary to minimize the danger of a fire in one device extending into another device; the same principle applies to 12/13.7.5.3.9(4)(f), except that the exposure of concern is to combustible decorations or other products, as opposed to another cooking device.

Paragraph 12/13.7.5.3.9(5) requires a portable extinguisher for each cooking device. The intent is to provide an extinguisher

**12.7.5.4 Vehicles.** Vehicles on display within an exposition facility shall comply with 12.7.5.4.1 through 12.7.5.4.5.

**12.7.5.4.1** All fuel tank openings shall be locked and sealed in an approved manner to prevent the escape of vapors; fuel tanks shall not contain in excess of one-half their capacity or contain in excess of 10 gal (38 L) of fuel, whichever is less.

**12.7.5.4.2** At least one battery cable shall be removed from the batteries used to start the vehicle engine, and the disconnected battery cable shall then be taped.

## CHAPTER 13 • Existing

**13.7.5.3.10** Combustible materials within exhibit booths shall be limited to a one-day supply. Storage of combustible materials behind the booth shall be prohibited. (See 13.7.4.2 and 13.7.5.2.)

**13.7.5.3.11** Plans for the exposition, in an acceptable form, shall be submitted to the authority having jurisdiction for approval prior to setting up any exhibit.

**13.7.5.3.11.1** The plan shall show all details of the proposed exposition.

**13.7.5.3.11.2** No exposition shall occupy any exposition facility without approved plans.

near each cooking device, so the operator is able to access the extinguisher readily if a lid does not extinguish the fire or cannot be applied. It is not the intent to permit all extinguishers to be located in one place. The reference to Section 9.9 leads the user to NFPA 10, *Standard for Portable Fire Extinguishers*,<sup>21</sup> which provides the necessary information with regard to the type and size of the appropriate extinguisher.

Paragraph 12/13.7.5.3.10 limits the amount of literature, brochures, boxes, giveaways, and other products that are kept in the exhibit booth. The number of items necessary to constitute a one-day supply obviously varies. However, the AHJ should be able to make a judgment after reviewing the activity anticipated by the exhibitor. Additional supplies and combustible crates (such as those used for shipping) should be kept in a separate storage area having a fire resistance rating of 1 hour and protected by an automatic sprinkler system, as required by 12/13.7.5.2.

The intent of 12/13.7.5.3.11 is to provide the AHJ with a set of plans that shows aisle widths, travel distances, exits, booth locations, display area configurations, types of displays (e.g., cooking, machinery, drapery, arts and crafts), location of fire protection equipment (extinguishers, manual fire alarm boxes, hose cabinets), and lobby and registration area usage. This list is not complete, but it provides some guidance in determining the contents of the plan that should be submitted. The plan should also be drawn to scale. The scale used is not usually critical, provided that it is indicated on the plan.

**13.7.5.4 Vehicles.** Vehicles on display within an exposition facility shall comply with 13.7.5.4.1 through 13.7.5.4.5.

**13.7.5.4.1** All fuel tank openings shall be locked and sealed in an approved manner to prevent the escape of vapors; fuel tanks shall not contain in excess of one-half their capacity or contain in excess of 10 gal (38 L) of fuel, whichever is less.

**13.7.5.4.2** At least one battery cable shall be removed from the batteries used to start the vehicle engine, and the disconnected battery cable shall then be taped.

## CHAPTER 12 • New

**12.7.5.4.3** Batteries used to power auxiliary equipment shall be permitted to be kept in service.

**12.7.5.4.4** Fueling or defueling of vehicles shall be prohibited.

**12.7.5.4.5** Vehicles shall not be moved during exhibit hours.

**Paragraph 12/13.7.5.4** on vehicles is intended to minimize the danger from both fuel and ignition sources.

In accordance with **12/13.7.5.4.1**, it is important that fuel tank openings be locked to prevent tampering and accessibility to fuel. It is also important that the tank openings be taped to prevent the escape of flammable vapors. When these *Code* requirements were written, the issue of the quantity of fuel that is permitted in a tank was studied. Some jurisdictions preferred empty tanks to eliminate fuel, while others preferred full tanks to prevent vapors. It was determined that most exhibitors were unaware of the local regulation until they arrived at the exhibit hall. After learning the specific rule (empty or full), exhibitors proceeded to make their adjustments in the adjacent parking area or some other unsuitable area. It is also difficult for the authority having jurisdiction to determine whether a tank is absolutely full or empty. Fueling and defueling by exhibitors outside the hall presented a greater danger than the level of fuel in the tanks, given that the tanks are locked and sealed, and ignition sources are eliminated from the vehicle. However, to avoid

### 12.7.5.5 Prohibited Materials.

**12.7.5.5.1** The following items shall be prohibited within exhibit halls:

- (1) Compressed flammable gases
- (2) Flammable or combustible liquids
- (3) Hazardous chemicals or materials
- (4) Class II or greater lasers, blasting agents, and explosives

**12.7.5.5.2** The authority having jurisdiction shall be permitted to allow the limited use of any items specified in **12.7.5.5.1** under special circumstances.

**12.7.5.6 Alternatives.** See **Section 1.4**.

Compressed gas containers, as addressed by **12/13.7.5.5.1**, are subject to fire damage that could cause an explosion or create a serious threat to life safety. Flammable and combustible liquids compromise life safety by their inherent capability to contribute to rapid fire spread. Hazardous materials present a variety of hazards to life safety, from their flammability to their toxicity. Class II or greater lasers can cause tissue damage to humans, and blasting agents and explosives can cause a large loss of life or injury if handled improperly.

Exhibitors who wish to display explosives, pesticides, or a type of compressed gas container, among other items, can

## CHAPTER 13 • Existing

**13.7.5.4.3** Batteries used to power auxiliary equipment shall be permitted to be kept in service.

**13.7.5.4.4** Fueling or defueling of vehicles shall be prohibited.

**13.7.5.4.5** Vehicles shall not be moved during exhibit hours.

excessive quantities of fuel in the exhibition hall, the *Code* does limit the quantity of fuel in tanks.

In accordance with **12/13.7.5.4.2**, it is important that at least one of the battery cables be removed from each battery. Many vehicles have more than one battery. The intent is to eliminate the possibility of a spark from the battery that might ignite fuel or surrounding combustibles. Battery cable connectors should be thoroughly taped after they have been removed.

The provision of **12/13.7.5.4.3** permits batteries that cannot be used to start the vehicle to remain in service. These batteries present no more of an ignition hazard than does providing house electrical power to the item on display.

Vehicle movement is addressed in **12/13.7.5.4.5**. The movement of vehicles inside the exhibit hall potentially compromises the means of egress by blocking the exit access; vehicles should, therefore, be positioned before the hall is opened to the public. There is also a concern regarding the effects of carbon monoxide inside an exhibit hall that is occupied.

### 13.7.5.5 Prohibited Materials.

**13.7.5.5.1** The following items shall be prohibited within exhibit halls:

- (1) Compressed flammable gases
- (2) Flammable or combustible liquids
- (3) Hazardous chemicals or materials
- (4) Class II or greater lasers, blasting agents, and explosives

**13.7.5.5.2** The authority having jurisdiction shall be permitted to allow the limited use of any items specified in **13.7.5.5.1** under special circumstances.

**13.7.5.6 Alternatives.** See **Section 1.4**.

effectively do so without bringing the actual product into the hall by using empty containers instead.

**Paragraph 12/13.7.5.5.2** gives the authority having jurisdiction the discretion to permit small amounts of otherwise prohibited materials under special circumstances. For example, an exhibit or trade show for collectors of small arms ammunition or a highly supervised and closed (to the public) vocational trade show using such materials is permitted where special controls and professional supervision are provided.

## CHAPTER 12 • New

**12.7.6 Crowd Managers.**

**12.7.6.1** Assembly occupancies shall be provided with a minimum of one trained crowd manager or crowd manager supervisor. Where the occupant load exceeds 250, additional trained crowd managers or crowd manager supervisors shall be provided at a ratio of one crowd manager or crowd manager supervisor for every 250 occupants, unless otherwise permitted by one of the following:

- (1) This requirement shall not apply to assembly occupancies used exclusively for religious worship with an occupant load not exceeding 500.
- (2) The ratio of trained crowd managers to occupants shall be permitted to be reduced where, in the opinion of the AHJ, the existence of an approved, supervised automatic sprinkler system and the nature of the event warrant.

**12.7.6.2\*** The crowd manager and crowd manager supervisor shall receive approved training in crowd management techniques.

**A.12.7.6.2** Crowd managers and crowd manager supervisors need to clearly understand the required duties and responsibilities specific to the venue's emergency plan. The crowd management training program should include a clear appreciation of crowd dynamics factors including space, energy, time, and information, as well as specific crowd management techniques, such as metering. Training should involve specific actions necessary during normal and emergency operations, and include an assessment of people-handling capabilities of a space prior to its use, the identification of hazards, an evaluation of projected levels of occupancy, the adequacy of means of ingress and egress and identification of ingress and egress barriers, the processing procedures such as ticket collection, and the expected types of human behavior. Training should also involve the different types of emergency evacuations and, where required by the emergency plan, relocation and shelter-in-place operations, and the challenges associated with each.

**12.7.6.3** Duties and responsibilities for the crowd manager and crowd manager supervisor shall be documented within a written emergency plan as required by [12.7.13](#).

**12.7.6.4\*** The training for the duties and responsibilities of crowd managers shall include the following:

- (1) Understanding crowd manager roles and responsibilities
- (2) Understanding safety and security hazards that can endanger public assembly
- (3) Understanding crowd management techniques
- (4) Introduction to fire safety and fire safety equipment
- (5) Understanding methods of evacuation and movement
- (6) Understanding procedures for reporting emergencies
- (7) Understanding crowd management emergency response procedures

## CHAPTER 13 • Existing

**13.7.6 Crowd Managers.**

**13.7.6.1** Assembly occupancies shall be provided with a minimum of one trained crowd manager or crowd manager supervisor. Where the occupant load exceeds 250, additional trained crowd managers or crowd manager supervisors shall be provided at a ratio of one crowd manager or crowd manager supervisor for every 250 occupants, unless otherwise permitted by one of the following:

- (1) This requirement shall not apply to assembly occupancies used exclusively for religious worship with an occupant load not exceeding 500.
- (2) The ratio of trained crowd managers to occupants shall be permitted to be reduced where, in the opinion of the AHJ, the existence of an approved, supervised automatic sprinkler system and the nature of the event warrant.

**13.7.6.2\*** The crowd manager and crowd manager supervisor shall receive approved training in crowd management techniques.

**A.13.7.6.2** Crowd managers and crowd manager supervisors need to clearly understand the required duties and responsibilities specific to the venue's emergency plan. The crowd management training program should include a clear appreciation of crowd dynamics factors including space, energy, time, and information, as well as specific crowd management techniques, such as metering. Training should involve specific actions necessary during normal and emergency operations, and include an assessment of people-handling capabilities of a space prior to its use, the identification of hazards, an evaluation of projected levels of occupancy, the adequacy of means of ingress and egress and identification of ingress and egress barriers, the processing procedures such as ticket collection, and the expected types of human behavior. Training should also involve the different types of emergency evacuations and, where required by the emergency plan, relocation and shelter-in-place operations, and the challenges associated with each.

**13.7.6.3** Duties and responsibilities for the crowd manager and crowd manager supervisor shall be documented within a written emergency plan as required by [13.7.13](#).

**13.7.6.4\*** The training for the duties and responsibilities of crowd managers shall include the following:

- (1) Understanding crowd manager roles and responsibilities
- (2) Understanding safety and security hazards that can endanger public assembly
- (3) Understanding crowd management techniques
- (4) Introduction to fire safety and fire safety equipment
- (5) Understanding methods of evacuation and movement
- (6) Understanding procedures for reporting emergencies
- (7) Understanding crowd management emergency response procedures

## CHAPTER 12 • New

- (8) Understanding the paths of travel and exits, facility evacuation and emergency response procedures and, where provided, facility shelter-in-place procedures
- (9) Familiarization with the venue and guest services training
- (10) Other specific event-warranted training

**A.12.7.6.4** In large facilities, crowd managers typically have a specific area of responsibility. In such facilities, the requirements of 12.7.6.4 might apply only to the crowd managers' area of responsibility.

Since the 2006 edition of the *Code*, a minimum of one crowd manager has been required for each assembly occupancy, regardless of occupant load. Where the occupant load exceeds 250, additional crowd managers are required at the specified ratio. In editions prior to 2006, a crowd manager was required only if the occupant load exceeded 1000. The change was made in reaction to The Station nightclub fire addressed in the commentary following 12.2.3.8.

The provisions of 12/13.7.6 were expanded for the 2015 edition of the *Code* as 12/13.7.6.3 through 12/13.7.6.5 are new. The procedures for providing trained crowd managers must be made part of the written emergency action plan as required by 12/13.7.6.3. The delineation of duties and responsibilities for crowd managers, as listed in 12/13.7.6.4, will lead to standardization in the training that the crowd managers receive and consistency in the services that they provide in the various assembly venues in which they work. The provisions of 12/13.7.6.5 charge the crowd manager supervisors with understanding the workings of the specific venue. The crowd manager supervisors are expected to provide the venue-specific training that elevates a generalist crowd manager to a specialist crowd manager for a particular venue.

The material in Section 3, Chapter 12, of the fourth edition of the *SFPE Handbook of Fire Protection Engineering*,<sup>22</sup> makes a distinction between the required crowd management and the more extreme, but nonmandatory, crowd control. Crowd management meshes the design features of a facility, the established operating features of the facility, and an understanding of the occupants' expected natural behavior in the facility for a specific type of event. Crowd control, on the other hand, is often necessitated when crowd management fails.

**Exhibit 12/13.86** shows the successful exit discharge of occupants from a stadium. Crowd managers need to be prepared for any of many changing conditions within the assembly venue so as to act to help ensure that all occupants can leave the assembly venue as successfully as the persons shown in the photo.

In addition to interacting with assembly venue patrons, crowd managers take note of situations that arise due to faulty

## CHAPTER 13 • Existing

- (8) Understanding the paths of travel and exits, facility evacuation and emergency response procedures and, where provided, facility shelter-in-place procedures
- (9) Familiarization with the venue and guest services training
- (10) Other specific event-warranted training

**A.13.7.6.4** In large facilities, crowd managers typically have a specific area of responsibility. In such facilities, the requirements of 13.7.6.4 might apply only to the crowd managers' area of responsibility.

**Exhibit 12/13.86**

*Crowd successfully discharging from stadium. (Photo courtesy of Jake Pauls)*

layout or equipment and report such issues to management. **Exhibit 12/13.87** shows persons bunching at the bottom of an escalator where a turn must be made to use the next escalator run. **Exhibit 12/13.88** shows a stair where a handrail extension is present to force stair users to move away from the bottom of the stair flight before turning to merge with a crowd that will simultaneously be present on the floor.

The options for training programs for crowd managers increased greatly beginning in 2010 with the introduction of a readily available and affordable, web-based program from the International Association of Venue Managers (formerly the International Association of Assembly Managers), which can be accessed at <http://www.iaamtraining.com/tcm.html>. The web-based program provides 6 hours of training that can be completed in multiple sessions. The enrollee is awarded a certificate upon successful completion of a comprehensive examination. The recipient of the certificate then needs to complete on-site, venue-specific training and receive a certificate from the venue before being officially designated as a trained crowd manager. An individual can complete multiple venue-specific training

## CHAPTER 12 • New

## CHAPTER 13 • Existing

Exhibit 12/13.87

programs so as to qualify to serve as a trained crowd manager at multiple venues.

The IAVM also conducts its annual International Crowd Management Conference (ICMC) each November. The conference in 2013 was its thirty-first such annual training event. The focus of the conference is on large assembly venues such as arenas and stadia.

The Maryland State Fire Marshal's Office provides, at no charge, a web-based 30-minute crowd management primer at <http://www.firemarshal.state.md.us/crowdmanager/bginfo.html>.

**12.7.6.5** The training for the duties and responsibilities of crowd manager supervisors shall include the following:

- (1) The duties described in **12.7.6.4**
- (2) Understanding crowd manager supervisor roles and responsibilities
- (3) Understanding incident management procedures
- (4) Understanding the facility evacuation plan
- (5) Understanding the facility command structure

**12.7.7\* Drills.**

**A.12.7.7** It is important that an adequate number of competent attendants is on duty at all times when the assembly occupancy is occupied.

**12.7.7.1** The employees or attendants of assembly occupancies shall be trained and drilled in the duties they are to perform in case of fire, panic, or other emergency to effect orderly exiting.

**12.7.7.2** Employees or attendants of assembly occupancies shall be instructed in the proper use of portable fire extinguishers and other manual fire suppression equipment where provided.

Exhibit 12/13.88

*Stair with handrail extension at bottom of flight to alleviate user bunching. (Photo courtesy of Jake Pauls)*

**13.7.6.5** The training for the duties and responsibilities of crowd manager supervisors shall include the following:

- (1) The duties described in **13.7.6.4**
- (2) Understanding crowd manager supervisor roles and responsibilities
- (3) Understanding incident management procedures
- (4) Understanding the facility evacuation plan
- (5) Understanding the facility command structure

**13.7.7\* Drills.**

**A.13.7.7** It is important that an adequate number of competent attendants is on duty at all times when the assembly occupancy is occupied.

**13.7.7.1** The employees or attendants of assembly occupancies shall be trained and drilled in the duties they are to perform in case of fire, panic, or other emergency to effect orderly exiting.

**13.7.7.2** Employees or attendants of assembly occupancies shall be instructed in the proper use of portable fire extinguishers and other manual fire suppression equipment where provided.

## CHAPTER 12 • New

**12.7.7.3\*** In the following assembly occupancies, an audible announcement shall be made, or a projected image shall be shown, prior to the start of each program that notifies occupants of the location of the exits to be used in case of a fire or other emergency:

- (1) Theaters
- (2) Motion picture theaters
- (3) Auditoriums
- (4) Other similar assembly occupancies with occupant loads exceeding 300 where there are noncontinuous programs

**A.12.7.7.3** It is not the intent of this provision to require an announcement in bowling alleys, cocktail lounges, restaurants, or places of worship.

**12.7.7.4** The requirement of **12.7.7.3** shall not apply to assembly occupancies in schools where used for nonpublic events.

The provisions of **12/13.7.7.2** do not require fire extinguishers for life safety in an assembly occupancy. They do specify, however, that, if fire extinguishers are provided, the staff must be trained in their use to prevent a false sense of security and possible injury. The authority having jurisdiction determines the extent of this training, whether instruction only or instruction and hands-on use.

The relatively simple requirement of **12/13.7.7.3** for notifying occupants of the location of exits can make a significant difference during an emergency. Note that the requirement does

### 12.7.8 Smoking.

**12.7.8.1** Smoking in assembly occupancies shall be regulated by the authority having jurisdiction.

**12.7.8.2** In rooms or areas where smoking is prohibited, plainly visible signs shall be posted that read as follows:

NO SMOKING

**12.7.8.3** No person shall smoke in prohibited areas that are so posted, unless permitted by the authority having jurisdiction under both of the following conditions:

- (1) Smoking shall be permitted on a stage only where it is a necessary and rehearsed part of a performance.
- (2) Smoking shall be permitted only where the smoker is a regular performing member of the cast.

**12.7.8.4** Where smoking is permitted, suitable ashtrays or receptacles shall be provided in convenient locations.

### 12.7.9 Seating.

#### 12.7.9.1 Secured Seating.

## CHAPTER 13 • Existing

**13.7.7.3\*** In the following assembly occupancies, an audible announcement shall be made, or a projected image shall be shown, prior to the start of each program that notifies occupants of the location of the exits to be used in case of a fire or other emergency:

- (1) Theaters
- (2) Motion picture theaters
- (3) Auditoriums
- (4) Other similar assembly occupancies with occupant loads exceeding 300 where there are noncontinuous programs

**A.13.7.7.3** It is not the intent of this provision to require an announcement in bowling alleys, cocktail lounges, restaurants, or places of worship.

**13.7.7.4** The requirement of **13.7.7.3** shall not apply to assembly occupancies in schools where used for nonpublic events.

not apply to assembly occupancies where the flow of people is constantly changing, such as in a restaurant. Movie theaters commonly meet the provisions of **12/13.7.7.3** through means of sound and screen projection that are presented prior to the main feature, during the same period that notifications of restroom, trash container, and snack bar locations are made and previews are shown. The same complete message is thereby delivered to each audience without the need for human intervention.

### 13.7.8 Smoking.

**13.7.8.1** Smoking in assembly occupancies shall be regulated by the authority having jurisdiction.

**13.7.8.2** In rooms or areas where smoking is prohibited, plainly visible signs shall be posted that read as follows:

NO SMOKING

**13.7.8.3** No person shall smoke in prohibited areas that are so posted, unless permitted by the authority having jurisdiction under both of the following conditions:

- (1) Smoking shall be permitted on a stage only where it is a necessary and rehearsed part of a performance.
- (2) Smoking shall be permitted only where the smoker is a regular performing member of the cast.

**13.7.8.4** Where smoking is permitted, suitable ashtrays or receptacles shall be provided in convenient locations.

### 13.7.9 Seating.

#### 13.7.9.1 Secured Seating.

## CHAPTER 12 • New

**12.7.9.1.1** Seats in assembly occupancies accommodating more than 200 persons shall be securely fastened to the floor, except where fastened together in groups of not less than three and as permitted by **12.7.9.1.2** and **12.7.9.2**.

**12.7.9.1.2** Balcony and box seating areas that are separated from other areas by rails, guards, partial-height walls, or other physical barriers and have a maximum of 14 seats shall be exempt from the requirement of **12.7.9.1.1**.

The function of **12/13.7.9.1** is to prevent the movement of seats so that aisles, rows, and access to the exits do not become blocked in an assembly occupancy during the jostling that occurs when people flee from a fire.

The provision of **12/13.7.9.1.1** for fastening seats together in groups was revised for the 2009 edition of the *Code*. In prior editions, the seats were required to be fastened together in groups of not less than three and not more than seven. The maximum number of seats in a group was deleted, as it served no practical purpose.

### 12.7.9.2 Unsecured Seating.

**12.7.9.2.1** Seats not secured to the floor shall be permitted in restaurants, night clubs, and other occupancies where fastening seats to the floor might be impracticable.

**12.7.9.2.2** Unsecured seats shall be permitted, provided that, in the area used for seating, excluding such areas as dance floors and stages, there is not more than one seat for each 15 ft<sup>2</sup> (1.4 m<sup>2</sup>) of net floor area, and adequate aisles to reach exits are maintained at all times.

**12.7.9.2.3** Seating diagrams shall be submitted for approval by the authority having jurisdiction to permit an increase in occupant load per **7.3.1.3**.

### 12.7.9.3 Occupant Load Posting.

**12.7.9.3.1** Every room constituting an assembly occupancy and not having fixed seats shall have the occupant load of the room posted in a conspicuous place near the main exit from the room.

**12.7.9.3.2** Approved signs shall be maintained in a legible manner by the owner or authorized agent.

**12.7.9.3.3** Signs shall be durable and shall indicate the number of occupants permitted for each room use.

**Paragraph 12/13.7.9.2.3** requires that seating diagrams be provided to the authority having jurisdiction to support a request for an increase in occupant load above that calculated using the occupant load factors of **Table 7.3.1.2** that are characteristic of

## CHAPTER 13 • Existing

**13.7.9.1.1** Seats in assembly occupancies accommodating more than 200 persons shall be securely fastened to the floor, except where fastened together in groups of not less than three and as permitted by **13.7.9.1.2** and **13.7.9.2**.

**13.7.9.1.2** Balcony and box seating areas that are separated from other areas by rails, guards, partial-height walls, or other physical barriers and have a maximum of 14 seats shall be exempt from the requirement of **13.7.9.1.1**.

The provision of **12/13.7.9.1.2** was revised for the 2012 edition of the *Code*. It replaced a requirement for all seats in balconies and galleries to be securely fastened to the floor. Its wording results in the 200-seat criterion of **12/13.7.9.1.1** becoming the threshold for balcony and gallery seat fastening. It also exempts private boxlike seating areas from the requirement for fastening seats to the floor if the box is separated from other boxes and the area has not more than 14 seats.

### 13.7.9.2 Unsecured Seating.

**13.7.9.2.1** Seats not secured to the floor shall be permitted in restaurants, night clubs, and other occupancies where fastening seats to the floor might be impracticable.

**13.7.9.2.2** Unsecured seats shall be permitted, provided that, in the area used for seating, excluding such areas as dance floors and stages, there is not more than one seat for each 15 ft<sup>2</sup> (1.4 m<sup>2</sup>) of net floor area, and adequate aisles to reach exits are maintained at all times.

**13.7.9.2.3** Seating diagrams shall be submitted for approval by the authority having jurisdiction to permit an increase in occupant load per **7.3.1.3**.

### 13.7.9.3 Occupant Load Posting.

**13.7.9.3.1** Every room constituting an assembly occupancy and not having fixed seats shall have the occupant load of the room posted in a conspicuous place near the main exit from the room.

**13.7.9.3.2** Approved signs shall be maintained in a legible manner by the owner or authorized agent.

**13.7.9.3.3** Signs shall be durable and shall indicate the number of occupants permitted for each room use.

the uses of the space. Such increase in occupant load must not exceed the limits imposed by **12/13.1.7.1.1** or **12/13.1.7.1.2**.

The provisions of **12/13.7.9.3** for occupant load posting are unique to assembly occupancies. All occupancies use occupant

## CHAPTER 12 • New

load for capacity calculations to ensure the means of egress system is adequately sized. Assembly occupancies use occupant load for the additional purpose of posting the occupant load as a tool to help avoid overcrowding.

**Exhibit 12/13.89** shows an occupant load posting in an airline membership club at an airport. The maximum occupant load of 825 persons is indicative of the club's singular use as a seating area with many chairs and some tables. **Exhibit 12/13.90**

**Exhibit 12/13.89**

Occupant load posting indicative of one, consistent use of a space.

### 12.7.10 Maintenance of Outdoor Grandstands.

**12.7.10.1** The owner shall provide for not less than annual inspection and required maintenance of each outdoor grandstand to ensure safe conditions.

**12.7.10.2** At least biennially, the inspection shall be performed by a professional engineer, registered architect, or individual certified by the manufacturer.

**12.7.10.3** Where required by the authority having jurisdiction, the owner shall provide a copy of the inspection report and certification that the inspection required by **12.7.10.2** has been performed.

### 12.7.11 Maintenance and Operation of Folding and Telescopic Seating.

**12.7.11.1** Instructions in both maintenance and operation shall be transmitted to the owner by the manufacturer of the seating or his or her representative.

**12.7.11.2** Maintenance and operation of folding and telescopic seating shall be the responsibility of the owner or his or her duly authorized representative and shall include all of the following:

## CHAPTER 13 • Existing

shows two occupant load postings for a ballroom in a hotel. The maximum occupant load of 182 persons is for use of the room with tables and chairs; the maximum occupant load of 391 persons is for use of the room with chairs only.

**Exhibit 12/13.90**

Dual occupant load postings indicative of two common uses of a space.

### 13.7.10 Maintenance of Outdoor Grandstands.

**13.7.10.1** The owner shall provide for not less than annual inspection and required maintenance of each outdoor grandstand to ensure safe conditions.

**13.7.10.2** At least biennially, the inspection shall be performed by a professional engineer, registered architect, or individual certified by the manufacturer.

**13.7.10.3** Where required by the authority having jurisdiction, the owner shall provide a copy of the inspection report and certification that the inspection required by **13.7.10.2** has been performed.

### 13.7.11 Maintenance and Operation of Folding and Telescopic Seating.

**13.7.11.1** Instructions in both maintenance and operation shall be transmitted to the owner by the manufacturer of the seating or his or her representative.

**13.7.11.2** Maintenance and operation of folding and telescopic seating shall be the responsibility of the owner or his or her duly authorized representative and shall include all of the following:

## CHAPTER 12 • New

- (1) During operation of the folding and telescopic seats, the opening and closing shall be supervised by responsible personnel who shall ensure that the operation is in accordance with the manufacturer's instructions.
- (2) Only attachments specifically approved by the manufacturer for the specific installation shall be attached to the seating.
- (3) An annual inspection and required maintenance of each grandstand shall be performed to ensure safe conditions.
- (4) At least biennially, the inspection shall be performed by a professional engineer, registered architect, or individual certified by the manufacturer.

**12.7.12 Clothing.** Clothing and personal effects shall not be stored in corridors, and spaces not separated from corridors, unless otherwise permitted by one of the following:

- (1) This requirement shall not apply to corridors, and spaces not separated from corridors, that are protected by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#).
- (2) This requirement shall not apply to corridors, and spaces not separated from corridors, that are protected by a smoke detection system in accordance with [Section 9.6](#).
- (3) This requirement shall not apply to storage in metal lockers, provided that the required egress width is maintained.

Clothing hung on hooks along corridor walls or on racks in lobbies greatly increases the combustible load and will generally allow flame to spread quickly. Each of the exemptions (control of fire by sprinklers, early warning of incipient stage fire via smoke detection, or isolating fuel packages by locating the clothing in

### 12.7.13 Emergency Action Plans.

**12.7.13.1** Emergency action plans shall be provided in accordance with [Section 4.8](#).

**12.7.13.2** Where assembly occupancies are located in the high-rise portion of a building, the emergency action plan shall include egress procedures, methods, and preferred evacuation routes for each event considered to be a life safety hazard that could impact the building, including the appropriateness of the use of elevators.

# New and Existing Educational Occupancies

Chapters 14 and 15 provide the life safety features necessary to protect students in an educational setting such as a school. These chapters apply to educational settings for students in kindergarten through the twelfth grade; they do not apply to college classrooms. The range of student characteristics and self-preservation abilities found in the educational occupancies regulated by Chapters 14 and 15 requires that student fire safety needs be treated differently from those of adults occupying a college classroom. Exhibit 14/15.1 shows the exterior of an elementary school addressed by the provisions of Chapter 15.

Many of the life safety requirements applicable to educational occupancies are the result of lessons learned from fires

involving schools in which a large loss of life occurred. Fortunately, fatal fires have been extremely rare in educational occupancies for many years. Those fires that do occur tend to involve either employees in accidental fires (e.g., fires caused by cleaning floors with flammable liquids) or, more often, firesetters trapped by their own fires. Children who died in school fires in recent years have been largely limited to juvenile firesetters, acting as individuals or in groups, who are on school grounds after hours without permission.

The protection measures used for educational occupancies recognize the structured environment found in a school. For example, class times, time between classes, and activities during class time are rigidly structured. These factors make it possible to train students to respond to a fire by conducting emergency egress and relocation drills.

Smaller children who might be overwhelmed and pushed aside by older students during a fire emergency evacuation must be housed in classrooms on lower floor levels. Paragraphs 14/15.2.1.2 through 14/15.2.1.4 recognize this problem and establish the criteria to control it. The minimum corridor width requirement (see 14/15.2.3.2) is based on expected student behavior. The wider corridor width accommodates students who are filing out of classrooms and forming parallel lines to proceed down the corridor.

Schools also have one of the more assertive schedules for conducting emergency egress drills (see 14/15.7.2). The drills not only provide a structured fire escape plan, they also help to instill fire-safe behavior for long-term use.

Exhibit 14/15.1

Exterior of an elementary school.

## 14.1 General Requirements

### 14.1.1 Application.

14.1.1.1 The requirements of this chapter shall apply to new buildings or portions thereof used as educational occupancies. (See 1.3.1.)

The provisions for new educational occupancies are addressed in Chapter 14; the provisions for existing educational occupancies (i.e., existing conditions in educational occupancies) are addressed in Chapter 15.

In editions of the Code prior to 2006, renovations, additions, and changes of occupancy were required to comply with the requirements for new construction. For educational

## 15.1 General Requirements

### 15.1.1 Application.

15.1.1.1 The requirements of this chapter shall apply to existing buildings or portions thereof currently occupied as educational occupancies.

occupancies, such renovations, additions, and changes of occupancy were required to meet the provisions of Chapter 14, while existing conditions were subject to the provisions of Chapter 15. Chapter 43, Building Rehabilitation, was added in 2006 to promote the adaptive reuse of existing buildings without sacrificing the needed level of life safety. The provisions of Chapter 43 blend the requirements for new construction with

## CHAPTER 14 • New

those for existing conditions, so as to require additional life safety features as the rehabilitation work category increases in complexity. The rehabilitation work categories are repair,

**14.1.1.2 Administration.** The provisions of [Chapter 1](#), Administration, shall apply.

**14.1.1.3 General.** The provisions of [Chapter 4](#), General, shall apply.

The provisions of [14/15.1.1.2](#) and [14/15.1.1.3](#) remind the user that the administrative provisions of [Chapter 1](#) and the general provisions of [Chapter 4](#) apply.

**14.1.1.4** Educational facilities that do not meet the definition of an educational occupancy shall not be required to comply with this chapter but shall comply with the following requirements:

- (1) Instructional building — business occupancy
- (2) Classrooms under 50 persons — business occupancy
- (3) Classrooms, 50 persons and over — assembly occupancy
- (4) Laboratories, instructional — business occupancy
- (5) Laboratories, noninstructional — industrial occupancy

As defined in [Chapter 6](#) and repeated in [14/15.1.2.1](#), educational occupancies include those buildings, or portions of buildings, used for educating six or more students for 4 or more hours per day or more than 12 hours per week, but only through the twelfth grade. The provisions of [14/15.1.1.4](#) recognize that colleges, universities, and similar educational facilities that do not meet the definition of an educational occupancy do not pose the same life safety concerns as elementary and high schools. Because of the maturity of their occupants, college buildings more closely resemble business occupancies.

[Paragraph 14/15.1.1.4](#) also identifies how to classify an occupancy for other educational uses that do not meet the definition of an educational occupancy. Note that the provisions of [14/15.1.1.4\(1\)](#) through (5) apply only where the educational use

**14.1.2 Classification of Occupancy.** See [6.1.3](#).

**14.1.2.1** Educational occupancies shall include all buildings used for educational purposes through the twelfth grade by six or more persons for 4 or more hours per day or more than 12 hours per week.

**14.1.2.2** Educational occupancies shall include preschools, kindergartens, and other schools meeting both of the following criteria:

- (1) The purpose is primarily educational, even though the children who attend such schools are of preschool age.
- (2) The children are all 24 months of age or older.

## CHAPTER 15 • Existing

renovation, modification, reconstruction, change of use or occupancy classification, and addition. See [4.6.7](#), [4.6.11](#), and [Chapter 43](#).

**15.1.1.2 Administration.** The provisions of [Chapter 1](#), Administration, shall apply.

**15.1.1.3 General.** The provisions of [Chapter 4](#), General, shall apply.

**15.1.1.4** Educational facilities that do not meet the definition of an educational occupancy shall not be required to comply with this chapter but shall comply with the following requirements:

- (1) Instructional building — business occupancy
- (2) Classrooms under 50 persons — business occupancy
- (3) Classrooms, 50 persons and over — assembly occupancy
- (4) Laboratories, instructional — business occupancy
- (5) Laboratories, noninstructional — industrial occupancy

does not meet the definition of an educational occupancy. For example, [14/15.1.1.4\(3\)](#) specifies that a classroom with an occupant load of 50 or more persons be classified as an assembly occupancy only if such classroom is not an educational occupancy. A classroom occupied by 60 eighth-grade students for more than 12 hours per week is an educational occupancy, and not an assembly occupancy, because it meets the definition of an educational occupancy. A classroom occupied by 60 college students is an assembly occupancy in accordance with [14/15.1.1.4\(3\)](#), as the definition of an educational occupancy applies through only the twelfth grade. A classroom occupied by 49 college students is a business occupancy in accordance with [14/15.1.1.4\(2\)](#), as the definition of an educational occupancy applies through only the twelfth grade.

**15.1.2 Classification of Occupancy.** See [6.1.3](#).

**15.1.2.1** Educational occupancies shall include all buildings used for educational purposes through the twelfth grade by six or more persons for 4 or more hours per day or more than 12 hours per week.

**15.1.2.2** Educational occupancies shall include preschools, kindergartens, and other schools meeting both of the following criteria:

- (1) The purpose is primarily educational, even though the children who attend such schools are of preschool age.
- (2) The children are all 24 months of age or older.

## CHAPTER 14 • New

**14.1.2.3** In cases where instruction is incidental to some other occupancy, the section of this *Code* governing such other occupancy shall apply.

**14.1.2.4** Other occupancies associated with educational institutions shall be in accordance with the appropriate parts of this *Code*. (See *Chapters 18, 20, 26, 28, 30, 40, and 42 and 6.1.14*.)

**Paragraph 14/15.1.2.1** has the effect of exempting the following three types of schools from the provisions of **Chapters 14 and 15**:

1. Schools with small numbers of students (fewer than six), such as facilities providing private tutoring or individual lessons
2. Schools with limited operating hours (less than 4 hours per day and not more than 12 hours per week), such as some sports schools or weekend religious instruction schools
3. Schools that educate people above the high school level, as in the case of universities or military training

For purposes of determining occupant load, a classroom area — regardless of whether it is part of an educational occupancy — is still considered an educational use, and the occupant load factors provided for educational uses by **Table 7.3.1.2** are to be used to calculate a realistic, maximum, probable occupant load.

Where instruction is incidental in an occupancy other than educational, the requirements for the occupancy in which the instruction takes place are applicable. Church schools used for instruction for a few hours once or twice a week are generally considered part of the assembly occupancy in which instruction takes place.

### 14.1.3 Multiple Occupancies.

**14.1.3.1 General.** Multiple occupancies shall be in accordance with **6.1.14**.

**Paragraph 14/15.1.3.1** refers to **6.1.14**, within which **6.1.14.3.2** specifies that, where multiple occupancies are to be protected as mixed occupancies, the most stringent requirement applicable to any of the occupancies present is to be applied to all occupancies unless separate safeguards are approved. For example, one of the occupancies present might have a travel distance limitation stricter than that of the other occupancies present; therefore, the stricter limitation is to be applied throughout the building unless separate safeguards are approved. An

**14.1.3.2 Atrium Walls Used in an Occupancy Separation.** Atrium walls in accordance with **6.1.14.4.6** shall be permitted to serve as part of the separation required by **6.1.14.4.1** for creating separated occupancies on a story-by-story basis.

## CHAPTER 15 • Existing

**15.1.2.3** In cases where instruction is incidental to some other occupancy, the section of this *Code* governing such other occupancy shall apply.

**15.1.2.4** Other occupancies associated with educational institutions shall be in accordance with the appropriate parts of this *Code*. (See *Chapters 19, 21, 26, 29, 31, 40, and 42 and 6.1.14*.)

**Paragraph 14/15.1.2.2** classifies part-time day-care facilities as educational occupancies if they primarily provide education in addition to care services and the children are all 24 months of age or older. This classification parallels federal guidelines for subsidizing day-care/educational activities at both the federal and state levels. This classification does not describe a typical day-care facility. **Chapters 16 and 17** contain special requirements for typical, noneducational day-care facilities.

**Paragraph 14/15.1.2.3** could be applied, for example, to an office building or factory in which a few rooms might be used for orientation or instruction in job performance; these rooms are subject to the *Code* requirements for business or industrial occupancies.

The requirement of **14/15.1.2.4** serves as a reminder that other occupancy chapters need to be applied to portions of an educational occupancy campus that do not meet the definition of an educational occupancy. For example, a dormitory where students sleep needs to be classified as a residential occupancy subject to the requirements of **Chapter 28** or **Chapter 29** for new or existing hotels and dormitories. A heating and air-conditioning plant with its boilers and chillers needs to be classified as an industrial occupancy subject to the requirements of **Chapter 40**.

### 15.1.3 Multiple Occupancies.

**15.1.3.1 General.** Multiple occupancies shall be in accordance with **6.1.14**.

occupancy that differs from the occupancy with the strictest travel distance limit might have the strictest requirements for protection of vertical openings, and these provisions also need to be implemented throughout the building. Similarly, for each subject addressed by the *Code*, a comparison must be made among the requirements applicable to each of the occupancies present, and the strictest requirement must be provided throughout the building unless separate safeguards are approved.

**15.1.3.2 Atrium Walls Used in an Occupancy Separation.** Atrium walls in accordance with **6.1.14.4.6** shall be permitted to serve as part of the separation required by **6.1.14.4.1** for creating separated occupancies on a story-by-story basis.

## CHAPTER 14 • New

The provision of 14/15.1.3.2 permits use of the provision of 6.1.14.4.6 relative to atrium walls being part of the separation

### 14.1.3.3 Assembly and Educational.

**14.1.3.3.1** Spaces subject to assembly occupancy shall comply with Chapter 12, including 12.1.3.2, which provides that, where auditorium and gymnasium egress lead through corridors or stairways also serving as egress for other parts of the building, the egress capacity shall be sufficient to allow simultaneous egress from auditorium and classroom sections.

**14.1.3.3.2** In the case of an assembly occupancy of a type suitable for use only by the school occupant load, and therefore not subject to simultaneous occupancy, the same egress capacity shall be permitted to serve both sections.

### 14.1.3.4 Dormitory and Classrooms.

**14.1.3.4.1** Any building used for both classroom and dormitory purposes shall comply with the applicable provisions of Chapter 28 in addition to complying with Chapter 14.

**14.1.3.4.2** Where classroom and dormitory sections are not subject to simultaneous occupancy, the same egress capacity shall be permitted to serve both sections.

The provisions of 14/15.1.3.3 address multiple occupancies that are part assembly and part educational in recognition of the fact that the occupancy that most typically appears within an educational occupancy building to create a multiple occupancy is an assembly occupancy. Note that 6.1.14.1.2 requires that, where exit access from an occupancy traverses another occupancy, the multiple occupancy must be treated as a mixed occupancy (i.e., the option of protecting the multiple occupancy as separated occupancies is prohibited).

Because of the large numbers of occupants characteristic of both assembly and educational occupancies, it is important that their combined occupant loads be used to size the means of egress system if they share common egress components, such as corridors and exit stair enclosures. Exhibit 14/15.2 shows a multipurpose room in an elementary school. The multipurpose room is classified as an assembly occupancy. It shares exit access corridors with classrooms of the educational occupancy.

The requirement of 14/15.1.3.3.1 assumes that the classrooms and assembly areas are likely to be occupied simultaneously. For example, classrooms are often used during the evening for adult or remedial education while a school's gymnasium or auditorium is being used by another group. Where simultaneous occupancy does not occur, 14/15.1.3.3.2 permits the shared means of egress to be sized to handle the larger of the uses, either educational or assembly.

## CHAPTER 15 • Existing

that creates separated occupancies. See the commentary following 6.1.14.4.6.

### 15.1.3.3 Assembly and Educational.

**15.1.3.3.1** Spaces subject to assembly occupancy shall comply with Chapter 13, including 13.1.3.2, which provides that, where auditorium and gymnasium egress lead through corridors or stairways also serving as egress for other parts of the building, the egress capacity shall be sufficient to allow simultaneous egress from auditorium and classroom sections.

**15.1.3.3.2** In the case of an assembly occupancy of a type suitable for use only by the school occupant load, and therefore not subject to simultaneous occupancy, the same egress capacity shall be permitted to serve both sections.

### 15.1.3.4 Dormitory and Classrooms.

**15.1.3.4.1** Any building used for both classroom and dormitory purposes shall comply with the applicable provisions of Chapter 29 in addition to complying with Chapter 15.

**15.1.3.4.2** Where classroom and dormitory sections are not subject to simultaneous occupancy, the same egress capacity shall be permitted to serve both sections.

Exhibit 14/15.2

Multipurpose room classified as an assembly occupancy.

Chapters 12 and 13 contain requirements applicable to assembly occupancies that could have an impact on an educational occupancy contained in a multiple-use building if the building is not designed so the multiple occupancies can be protected as separated occupancies. For example, in new construction where the building is to be sprinklered, if the uses create a

## CHAPTER 14 • New

multiple occupancy that is to be protected as a mixed occupancy, dead-end corridors are not permitted to exceed 20 ft (6100 mm). The 20 ft (6100 mm) dead-end corridor limitation comes from 12.2.5.1.3, applicable to new assembly occupancies, although 14.2.5.2 permits new, sprinklered educational occupancies to have a 50 ft (15 m) dead-end corridor.

It is helpful that the provision of 6.1.14.3.2 permits approved separate safeguards to substitute for the requirement for using the more stringent provision of the two occupancies throughout the building. In the example in the previous paragraph, where the assembly occupancy shares exit access corridors with the educational occupancy, and such shared exit access occurs only on the first floor, the authority having jurisdiction (AHJ) might approve the use of the 50 ft (15 m) dead-end corridor limitation

**14.1.4 Definitions.**

**14.1.4.1 General.** For definitions, see Chapter 3, Definitions.

**14.1.4.2 Special Definitions.** A list of special terms used in this chapter follows:

- (1) **Common Atmosphere.** See 3.3.26.1.
- (2) **Flexible Plan and Open Plan Educational or Day-Care Building.** See 3.3.36.6.
- (3) **Separate Atmosphere.** See 3.3.26.2.

**14.1.5 Classification of Hazard of Contents.** The contents of educational occupancies shall be classified in accordance with the provisions of Section 6.2.

In general, educational occupancies contain ordinary hazard contents. Some laboratories and storage areas might contain

**14.1.6 Minimum Construction Requirements.** (Reserved.)

**14.1.7 Occupant Load.**

**14.1.7.1** The occupant load, in number of persons for whom means of egress and other provisions are required, shall be determined on the basis of the occupant load factors of Table 7.3.1.2 that are characteristic of the use of the space or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

**14.1.7.2** The occupant load of an educational occupancy, or a portion thereof, shall be permitted to be modified from that specified in 14.1.7.1 if the necessary aisles and exits are provided.

**14.1.7.3** An approved aisle or seating diagram shall be required by the authority having jurisdiction to substantiate the modification permitted in 14.1.7.2.

## CHAPTER 15 • Existing

on the second floor if the second floor is used only as an educational occupancy.

The provisions of 14/15.1.3.4 address a situation common to boarding schools where a building is used for both classroom and dormitory purposes. The residential occupancy created by the dormitory is not permitted to be considered incidental to the building being used as an educational occupancy (see 6.1.14.1.3). The occupants of the dormitory have life safety needs that differ from those of the occupants of the classrooms. The provisions of Chapters 28 and 29 need to be applied to the dormitory/classroom building in addition to the educational occupancy provisions of Chapters 14 and 15. For example, smoke alarms are required in the dormitory sleeping rooms to help ensure that the sleeping occupants are awakened upon detection of smoke.

**15.1.4 Definitions.**

**15.1.4.1 General.** For definitions, see Chapter 3, Definitions.

**15.1.4.2 Special Definitions.** A list of special terms used in this chapter follows:

- (1) **Common Atmosphere.** See 3.3.26.1.
- (2) **Flexible Plan and Open Plan Educational or Day-Care Building.** See 3.3.36.6.
- (3) **Separate Atmosphere.** See 3.3.26.2.

**15.1.5 Classification of Hazard of Contents.** The contents of educational occupancies shall be classified in accordance with the provisions of Section 6.2.

high hazard contents. See Section 7.11 for additional egress requirements for areas with high hazard contents.

**15.1.6 Minimum Construction Requirements.** (Reserved.)

**15.1.7 Occupant Load.**

**15.1.7.1** The occupant load, in number of persons for whom means of egress and other provisions are required, shall be determined on the basis of the occupant load factors of Table 7.3.1.2 that are characteristic of the use of the space or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

**15.1.7.2** The occupant load of an educational occupancy, or a portion thereof, shall be permitted to be modified from that specified in 15.1.7.1 if the necessary aisles and exits are provided.

**15.1.7.3** An approved aisle or seating diagram shall be required by the authority having jurisdiction to substantiate the modification permitted in 15.1.7.2.

## CHAPTER 14 • New

Because occupant load is calculated on the basis of the use of a space, regardless of occupancy classification, occupant load factors appear in **Chapter 7**, a general chapter. Occupant load factors for a wide variety of uses are detailed in **Table 7.3.1.2**.

It is not the intent that occupant load factors be applied to require a minimum area per student for functional purposes. Rather, the occupant load factors are used to determine the occupant load for purposes of sizing the means of egress system. The intent is to require adequate egress capacity for those present. Efficient use of classroom space might result in the presence of a greater number of occupants than that determined by calculation using the occupant load factors of **Table 7.3.1.2**. **Paragraph 14/15.1.7.1** permits the occupant load to be established as the maximum probable population if that number exceeds the number determined by calculation using the occupant load factors. However, the means of egress must adequately accommodate all occupants, and all other requirements dependent on the calculated occupant load must be met. **Exhibit 14/15.3** shows a classroom that is occupied, on a regular basis, by more persons than that which results from performing an occupant load calculation using the 20 ft<sup>2</sup> per person (1.9 m<sup>2</sup> per person) occupant load factor characteristic of an educational use classroom as listed in **Table 7.3.1.2**. The maximum probable population of the

## CHAPTER 15 • Existing

**Exhibit 14/15.3**

*Classroom where actual occupant load is the maximum probable population and not the calculated occupant load.*

room, as allowed by **14/15.1.7.1**, becomes the actual occupant load. The means of egress from the room can safely accommodate the actual occupant load.

## 14.2 Means of Egress Requirements

The means of egress provisions of **Chapters 14 and 15** were chosen to serve the occupants under fire and similar emergency. They also work well on a day-to-day basis. **Exhibit 14/15.4** shows elementary school students leaving the building via doors where the number of doors, direction of door swing (in the direction of egress travel), and presence of panic hardware all are based on the occupant load of the space served by the doors.

The general requirements of **Chapter 7** apply, based on the requirement of **14/15.2.1.1**. For example, guards are required by **7.1.8** where there is a drop of more than 30 in. (760 mm) over an open side. **Exhibit 14/15.5** shows guards protecting a two-story opening constructed to take light from above the rooftop to areas on floor 1 of a two-story school.

Another general requirement of **Chapter 7** is that of **7.1.3.2.3**, which prohibits an exit enclosure from being used for any purpose that has the potential to interfere with the enclosure's use as an exit. Authorities having jurisdiction enforce the requirement by prohibiting storage beneath the lowest stair run. Enforcement is difficult, and orders to remove storage located beneath a stair run often are the result of observation during an

## 15.2 Means of Egress Requirements

**Exhibit 14/15.4**

## CHAPTER 14 • New

Exhibit 14/15.5

Guards installed at floor opening.

inspection. Exhibit 14/15.6 shows a physical barricade that prevents unauthorized persons from gaining access to the space beneath the stair run. The barricade is a novel solution to the ongoing problem of inadequate means of preventing the storage of items beneath a stair run.

**14.2.1 General.**

**14.2.1.1** Means of egress shall be in accordance with Chapter 7 and Section 14.2.

**14.2.1.2** Rooms normally occupied by preschool, kindergarten, or first-grade students shall be located on a level of exit discharge, unless otherwise permitted by 14.2.1.4.

**14.2.1.3** Rooms normally occupied by second-grade students shall not be located more than one story above a level of exit discharge, unless otherwise permitted by 14.2.1.4.

**14.2.1.4** Rooms or areas located on floor levels other than as specified in 14.2.1.2 and 14.2.1.3 shall be permitted to be used where provided with independent means of egress dedicated for use by the preschool, kindergarten, first-grade, or second-grade students.

The restrictions on the location of rooms used by preschool, kindergarten, or first- or second-grade pupils were developed to avoid the danger of older — and larger — children overrunning the very young on stairs or ramps during a fire or other incident requiring rapid evacuation. The exemption offered by 14/15.2.1.4

## CHAPTER 15 • Existing

Exhibit 14/15.6

Permanent barricade installed to prevent storage beneath stair run.

**15.2.1 General.**

**15.2.1.1** Means of egress shall be in accordance with Chapter 7 and Section 15.2.

**15.2.1.2** Rooms normally occupied by preschool, kindergarten, or first-grade students shall be located on a level of exit discharge, unless otherwise permitted by 15.2.1.4.

**15.2.1.3** Rooms normally occupied by second-grade students shall not be located more than one story above a level of exit discharge, unless otherwise permitted by 15.2.1.4.

**15.2.1.4** Rooms or areas located on floor levels other than as specified in 15.2.1.2 and 15.2.1.3 shall be permitted to be used where provided with independent means of egress dedicated for use by the preschool, kindergarten, first-grade, or second-grade students.

recognizes that the younger students — often with the help of teachers and staff — can use the stairs and ramps effectively if they don't have to compete with the older, larger, and faster students. For a definition of the term *level of exit discharge*, see 3.3.85.1.

## CHAPTER 14 • New

**14.2.2 Means of Egress Components.**

**14.2.2.1 Components Permitted.** Components of means of egress shall be limited to the types described in 14.2.2.2 through 14.2.2.10.

**14.2.2.2 Doors.**

**14.2.2.2.1** Doors complying with 7.2.1 shall be permitted.

**14.2.2.2.2** Any door in a required means of egress from an area having an occupant load of 100 or more persons shall be permitted to be provided with a latch or lock only if the latch or lock is panic hardware or fire exit hardware complying with 7.2.1.7.

**14.2.2.2.3 Special Locking.**

**14.2.2.2.3.1** Delayed-egress locking systems complying with 7.2.1.6.1 shall be permitted.

**14.2.2.2.3.2** Access-controlled egress door assemblies complying with 7.2.1.6.2 shall be permitted.

**14.2.2.2.3.3** Elevator lobby exit access door assemblies locking in accordance with 7.2.1.6.3 shall be permitted.

**14.2.2.3\* Stairs.** Stairs complying with 7.2.2 shall be permitted.

**A.14.2.2.3** See A.7.2.2.4.5.4 regarding additional handrails on stairs that are used extensively by children 5 years of age or less.

**14.2.2.4 Smokeproof Enclosures.** Smokeproof enclosures complying with 7.2.3 shall be permitted.

**14.2.2.5 Horizontal Exits.** Horizontal exits complying with 7.2.4 shall be permitted.

**14.2.2.6 Ramps.** Ramps complying with 7.2.5 shall be permitted.

**14.2.2.7 Exit Passageways.** Exit passageways complying with 7.2.6 shall be permitted.

**14.2.2.8 Fire Escape Ladders.** Fire escape ladders complying with 7.2.9 shall be permitted.

**14.2.2.9 Alternating Tread Devices.** Alternating tread devices complying with 7.2.11 shall be permitted.

**14.2.2.10 Areas of Refuge.** Areas of refuge complying with 7.2.12 shall be permitted.

Subsection 14/15.2.2 lists those components acceptable for use in the means of egress serving an educational occupancy. Some of the components described in Chapter 7 were judged to be unacceptable for educational occupancy egress system use. Note that slide escapes, escalators, fire escape stairs, and revolving doors are not permitted to be credited as providing any of the required means of egress in an educational occupancy.

## CHAPTER 15 • Existing

**15.2.2 Means of Egress Components.**

**15.2.2.1 Components Permitted.** Components of means of egress shall be limited to the types described in 15.2.2.2 through 15.2.2.10.

**15.2.2.2 Doors.**

**15.2.2.2.1** Doors complying with 7.2.1 shall be permitted.

**15.2.2.2.2** Any required exit door subject to use by 100 or more persons shall be permitted to be provided with a latch or lock only if the latch or lock is panic hardware or fire exit hardware complying with 7.2.1.7.

**15.2.2.2.3 Special Locking.**

**15.2.2.2.3.1** Delayed-egress locking systems complying with 7.2.1.6.1 shall be permitted.

**15.2.2.2.3.2** Access-controlled egress door assemblies complying with 7.2.1.6.2 shall be permitted.

**15.2.2.2.3.3** Elevator lobby exit access door assemblies locking in accordance with 7.2.1.6.3 shall be permitted.

**15.2.2.3\* Stairs.** Stairs complying with 7.2.2 shall be permitted.

**A.15.2.2.3** See A.7.2.2.4.5.4 regarding additional handrails on stairs that are used extensively by children 5 years of age or less.

**15.2.2.4 Smokeproof Enclosures.** Smokeproof enclosures complying with 7.2.3 shall be permitted.

**15.2.2.5 Horizontal Exits.** Horizontal exits complying with 7.2.4 shall be permitted.

**15.2.2.6 Ramps.** Ramps complying with 7.2.5 shall be permitted.

**15.2.2.7 Exit Passageways.** Exit passageways complying with 7.2.6 shall be permitted.

**15.2.2.8 Fire Escape Ladders.** Fire escape ladders complying with 7.2.9 shall be permitted.

**15.2.2.9 Alternating Tread Devices.** Alternating tread devices complying with 7.2.11 shall be permitted.

**15.2.2.10 Areas of Refuge.** Areas of refuge complying with shall be permitted.

The panic hardware and fire exit hardware provisions of 14/15.2.2.2 include application thresholds expressed in terms of occupant load. For new construction, the occupant load addressed by 14.2.2.2 is the total occupant load of the area served and not only the required capacity of the door. For example, if an area of a new educational occupancy has an occupant load of 270 persons and is served by three doors, each door is

## CHAPTER 14 • New

required to have sufficient capacity for 90 persons. However, because the doors serve an overall area with 100 or more persons, any latches on these doors must be arranged to be released by panic hardware or fire exit hardware.

**Exhibit 14/15.7** shows a door equipped with fire exit hardware. The door leaf is one of two door leaves in a single cross-corridor opening in the egress path. The door serves occupants of areas with a combined occupant load far in excess of 100 persons. The door is fire rated, and fire exit hardware is used in lieu of panic hardware, as panic hardware is not listed for use on a fire-rated door.

**Exhibit 14/15.7**

*Fire-rated cross-corridor door with fire exit hardware.*

The requirement for panic hardware or fire exit hardware in existing educational occupancies is slightly less restrictive than for new educational occupancies. In accordance with **15.2.2.2.2**, panic hardware or fire exit hardware is required only on exit doors rather than all egress doors; therefore, the requirement does not apply to exit access doors, such as corridor doors and smoke barrier doors. In addition, **15.2.2.2.2** establishes its criteria on the basis of the number of people using the door for egress. For example, if a single-story existing educational occupancy building with an occupant load of 270 persons has three exit doors, each door can be considered as providing egress capacity for 90 persons. Because no individual exit door is required to have a capacity for 100 or more occupants, panic hardware is not required for the existing doors.

The provisions of **14/15.2.2.3** recognize the use of all three forms of special locking detailed in **7.2.1.6** — delayed egress

## CHAPTER 15 • Existing

locking systems, access-controlled egress door assemblies, and elevator lobby exit access door locking. To use the provisions for delayed-egress locks, the building must be either fully sprinklered or fully protected by an automatic fire detection system. Although many occupancies recognize use of the **Chapter 7** provisions for delayed-egress locks, the original hardware was developed for educational occupancies. Delayed-egress locking provisions were added to **Chapter 7** based on hardware development that addresses security concerns in schools.

The provision of **14/15.2.2.3.3** permits use of the elevator lobby exit access door-locking provisions of **7.2.1.6.3**. **Paragraph 7.2.1.6.3** details 14 criteria that must be met as an alternative to the requirements of **7.4.1.6** that each elevator landing or lobby must have access to at least one exit without the use of a key, a tool, special knowledge, or special effort. See **7.4.1.6** and **7.2.1.6.3**.

Since the 2006 edition of the *Code*, **15.2.2.3**, applicable to existing stairs, references the provisions of **7.2.2** without further modification. In earlier editions, existing stairs for student use were required to be those stairs that were formerly designated as Class A stairs. **Subsection 7.2.2** was revised to eliminate the Class A and Class B designations for existing stairs. The existing stairs provisions in **Table 7.2.2.1.1(b)** permit, via dimensional criteria, those stairs that were formerly designated as Class B to suffice for all existing installations.

**Exhibit 14/15.8** shows a switch-back stair in a two-story school, complete with graspable handrails at both sides, continuity of the handrail at the inside turn, and guards at the open sides.

**Exhibit 14/15.8**

*Stair with handrails and guards.*

## CHAPTER 14 • New

Although 14/15.2.2.8 and 14/15.2.2.9 permit fire escape ladders and alternating tread devices as components of the means of egress, some Chapter 7 provisions limit the use of such ladders and devices. For example, the provisions of 7.2.9 and 7.2.11 restrict the use of fire escape ladders and alternating tread

### 14.2.3 Capacity of Means of Egress.

**14.2.3.1 General.** Capacity of means of egress shall be in accordance with Section 7.3.

**14.2.3.2 Minimum Corridor Width.** Exit access corridors shall have not less than 6 ft (1830 mm) of clear width.

Note that the minimum exit access corridor width requirement of 14/15.2.3.2 applies, regardless of the required capacity of the corridor. Based on egress capacity considerations, larger widths might be necessary for corridors handling large numbers of students; see 14/15.2.3.1 and Section 7.3.

The term *clear width* means a 6 ft (1830 mm) wide clear space with no obstructions other than those permitted by 7.3.2.2 and doors as permitted by 7.2.1.4.3. Subsection 7.3.2 details the required method for measuring the width of a component of the means of egress. Paragraph 7.3.2.2 permits projections of not more than 4½ in. (114 mm) on each side of the corridor. The projections are permitted to be located at or below a handrail height of 38 in. (965 mm), and the maximum 4½ in. (114 mm) encroachment is to be ignored when determining width for use in egress capacity calculations.

Exhibit 14/15.9 shows a corridor in a school where careful design and stringent operating procedures keep encroachments into the required width to a minimum. Note that the classroom

Exhibit 14/15.9

Corridor with minimal encroachment.

## CHAPTER 15 • Existing

devices to normally unoccupied areas, such as rooftops, or to mechanical equipment platforms subject to occupancy by not more than three persons who are all capable of using the ladder or alternating tread device.

### 15.2.3 Capacity of Means of Egress.

**15.2.3.1 General.** Capacity of means of egress shall be in accordance with Section 7.3.

**15.2.3.2 Minimum Corridor Width.** Exit access corridors shall have not less than 6 ft (1830 mm) of clear width.

doors are set into recesses to permit the doors to be in their fully open position without violating the provisions of 7.2.1.4.3.1. See also 14/15.2.5.6. Exhibit 14/15.10 shows a classroom door recess in greater detail. The boxlike protrusion near ceiling level does not violate the clear width requirement, because 7.2.1.2.1.1(6) exempts projections exceeding 6 ft 8 in. (2030 mm) above the floor from being considered as reductions in clear width. Exhibit 14/15.11 shows water fountains set into a recess in the corridor wall, so as not to encroach on required clear width.

The intent of the 6 ft (1830 mm) corridor width requirement is to permit two files of students to move simultaneously, with

Exhibit 14/15.10

Door set into recess in corridor wall.

## CHAPTER 14 • New

sufficient room for teachers or monitors to supervise. Extremely short corridor stubs or sections serving only one or two rooms might warrant consideration for some reduction in required width under the equivalency concept of [Section 1.4](#).

#### 14.2.4 Number of Means of Egress.

**14.2.4.1** The number of means of egress shall be in accordance with [Section 7.4](#).

**14.2.4.2** Not less than two separate exits shall be in accordance with the following criteria:

- (1) They shall be provided on every story.
- (2) They shall be accessible from every part of every story and mezzanine; however, exit access travel shall be permitted to be common for the distance permitted as common path of travel by [14.2.5.3](#).

The provision of [14/15.2.4.1](#) directs that the core requirements of [Section 7.4](#) be used. The provision of [15.2.4.1](#) has the effect of excluding existing egress arrangements from the requirement of [7.4.1.2](#) that might otherwise retroactively require a third (or fourth) means of egress where an existing arrangement with two (or three) means of egress meets all other criteria, such as those related to egress capacity. The provision of [14/15.2.4.2\(2\)](#) clarifies that the requirement for access to two exits from every part of every floor need not occur immediately upon beginning an egress path, because common path of travel, as addressed in [14/15.2.5.3](#), is permitted.

Access must be provided to a minimum of two exits, both of which must be located on the floor or story in question. Contrast

**14.2.5 Arrangement of Means of Egress.** See also [Section 7.5](#).

**14.2.5.1** Means of egress shall be arranged in accordance with [Section 7.5](#).

## CHAPTER 15 • Existing

#### Exhibit 14/15.11

*Water fountains set into recess in corridor wall.*

#### 15.2.4 Number of Means of Egress.

**15.2.4.1** The number of means of egress shall be in accordance with [7.4.1.1](#) and [7.4.1.3](#) through [7.4.1.6](#).

**15.2.4.2** Not less than two separate exits shall be in accordance with the following criteria:

- (1) They shall be provided on every story.
- (2) They shall be accessible from every part of every story and mezzanine; however, exit access travel shall be permitted to be common for the distance permitted as common path of travel by [15.2.5.3](#).

this requirement with a related provision for industrial occupancies that only one of the required exits be located on the floor or story (see [40.2.4.1.1](#)). Thus, in an educational occupancy, an open exit access stair, if it were permitted without violating the provisions applicable to the protection of vertical openings, would be permitted to serve as exit access only if the requirement for two exits on the floor is first satisfied. In a multistory educational occupancy building, the requirements of [14/15.2.4](#) are typically met by providing two properly enclosed exit stairs that can be accessed from all floors above or below the level of exit discharge.

#### 15.2.5 Arrangement of Means of Egress.

**15.2.5.1** Means of egress shall be arranged in accordance with [Section 7.5](#).

## CHAPTER 14 • New

**14.2.5.2** No dead-end corridor shall exceed 20 ft (6100 mm), other than in buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with **Section 9.7**, in which case dead-end corridors shall not exceed 50 ft (15 m).

**14.2.5.3** Limitations on common path of travel shall be in accordance with **14.2.5.3.1** and **14.2.5.3.2**.

**14.2.5.3.1** Common path of travel shall not exceed 100 ft (30 m) in a building protected throughout by an approved, supervised automatic sprinkler system in accordance with **Section 9.7**.

**14.2.5.3.2** Common path of travel shall not exceed 75 ft (23 m) in a building not protected throughout by an approved, supervised automatic sprinkler system in accordance with **Section 9.7**.

**14.2.5.4** Every room or space larger than 1000 ft<sup>2</sup> (93 m<sup>2</sup>) or with an occupant load of more than 50 persons shall comply with the following:

- (1) The room or space shall have a minimum of two exit access doors.
- (2) The doors required by **14.2.5.4(1)** shall provide access to separate exits.
- (3) The doors required by **14.2.5.4(1)** shall be permitted to open onto a common corridor, provided that such corridor leads to separate exits located in opposite directions.

**Paragraph 7.5.1.1.4** permits individual occupancy chapters to allow, and to set limits for, common paths of travel. **Paragraph 14/15.2.5.3** establishes the maximum common path of travel for educational occupancies as 100 ft (30 m), if the building is protected throughout by an approved, supervised automatic sprinkler system, and limits the common path of travel to 75 ft (23 m) where the sprinkler criteria are not met. The 75 ft (23 m) limit is strict enough to help ensure that occupants can safely tolerate traveling in only one direction for a limited distance before reaching a point where travel in independent directions becomes possible. The increase to 100 ft (30 m) recognizes that fire controlled by sprinklers increases the safe travel time along the single available path.

**Paragraph 7.5.1.5** permits individual occupancy chapters to establish limits for dead-end corridors. The standard dead-end corridor limitation for educational occupancies in the past has been 20 ft (6100 mm), as permitted by **14/15.2.5.2**; and this limitation still appears reasonable today. However, **14/15.2.5.2** permits the dead-end corridor to be increased by 30 ft (9.1 m) to a maximum of 50 ft (15 m) in recognition of the fire-controlling capabilities of a sprinkler system.

A floor arrangement with outside doors or stairways at both ends of a central corridor typically creates no dead-end corridors. Dead-end corridor pockets might be created where stairways are not located at the end of corridors but are

## CHAPTER 15 • Existing

**15.2.5.2** No dead-end corridor shall exceed 20 ft (6100 mm), other than in buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with **Section 9.7**, in which case dead-end corridors shall not exceed 50 ft (15 m).

**15.2.5.3** Limitations on common path of travel shall be in accordance with **15.2.5.3.1** and **15.2.5.3.2**.

**15.2.5.3.1** Common path of travel shall not exceed 100 ft (30 m) in a building protected throughout by an approved, supervised automatic sprinkler system in accordance with **Section 9.7**.

**15.2.5.3.2** Common path of travel shall not exceed 75 ft (23 m) in a building not protected throughout by an approved, supervised automatic sprinkler system in accordance with **Section 9.7**.

**15.2.5.4** Every room or space larger than 1000 ft<sup>2</sup> (93 m<sup>2</sup>) or with an occupant load of more than 50 persons shall comply with the following:

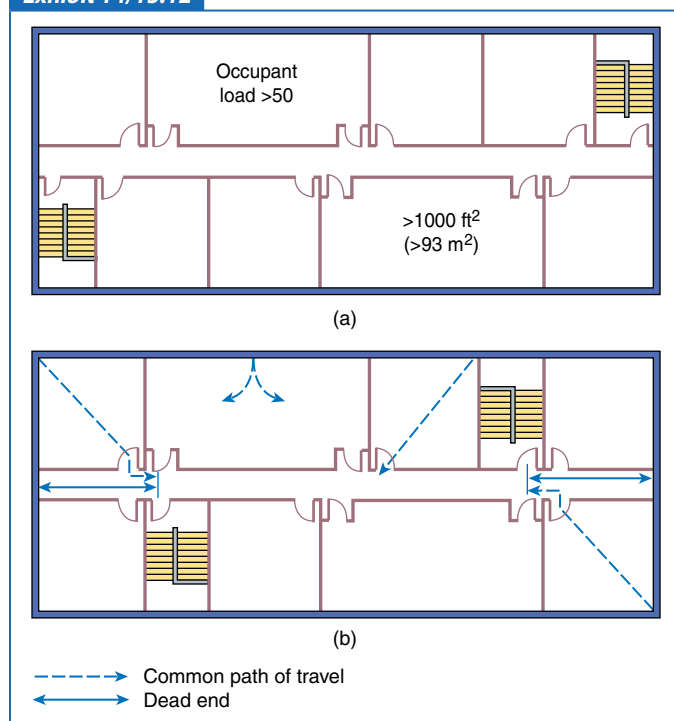

- (1) The room or space shall have a minimum of two exit access doors.
- (2) The doors required by **15.2.5.4(1)** shall provide access to separate exits.
- (3) The doors required by **15.2.5.4(1)** shall be permitted to open onto a common corridor, provided that such corridor leads to separate exits located in opposite directions.

located at intermediate points. See **Exhibit 14/15.12**. Part (a) in **Exhibit 14/15.12** shows no indication of dead-end corridors. This arrangement is preferred but is not always practical in terms of building layout and use. At each end of the corridor in Part (b) of **Exhibit 14/15.12**, dead-end pockets are shown into which occupants might mistakenly travel, only to have to retrace their path to find an exit. Although the scale of the figure is not noted, the length of the dead-end corridor does not exceed the 50 ft (15 m) permitted by **14/15.2.5.2** for sprinklered buildings. All classrooms have been arranged so that the common path of travel does not exceed the 100 ft (30 m) limitation of **14/15.2.5.3.1** for sprinklered buildings. This arrangement is acceptable. In an educational occupancy building that is not protected throughout by an approved, supervised automatic sprinkler system, the dead-end corridor is limited to 20 ft (6100 mm); and the common path of travel is limited to 75 ft (23 m).

**Exhibit 14/15.12** also depicts the provisions of **14/15.2.5.4**. In Part (a), two of the rooms are large enough to require a second exit access door. In one case, the room has an occupant load of more than 50 persons; in the other, the room area exceeds 1000 ft<sup>2</sup> (93 m<sup>2</sup>). The two doors from each of the two rooms open onto a common corridor that provides access to exits in two different directions.

Exhibit 14/15.12

*Dead-end corridors, common path of travel, and second exit access from larger rooms.*

**14.2.5.5** Every room that is normally subject to student occupancy shall have an exit access door leading directly to an exit access corridor or exit, unless otherwise permitted by one of the following:

- (1) This requirement shall not apply where an exit door opens directly to the outside or to an exterior balcony or corridor as described in [14.2.5.9](#).
- (2) One room shall be permitted to intervene between a normally occupied student room and an exit access corridor, provided that all of the following criteria are met:
  - (a) The travel from a room served by an intervening room to the corridor door or exit shall not exceed 75 ft (23 m).
  - (b) Clothing, personal effects, or other materials deemed hazardous by the authority having jurisdiction shall be stored in metal lockers, provided that they do not obstruct the exit access, or the intervening room shall be sprinklered in accordance with [Section 9.7](#).
  - (c) One of the following means of protection shall be provided:
    - i. The intervening room shall have approved fire detection that activates the building alarm.
    - ii. The building shall be protected by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#).

**15.2.5.5** Every room that is normally subject to student occupancy shall have an exit access door leading directly to an exit access corridor or exit, unless otherwise permitted by one of the following:

- (1) This requirement shall not apply where an exit door opens directly to the outside or to an exterior balcony or corridor as described in [15.2.5.9](#).
- (2) One room shall be permitted to intervene between a normally occupied student room and an exit access corridor, provided that all of the following criteria are met:
  - (a) The travel from a room served by an intervening room to the corridor door or exit shall not exceed 75 ft (23 m).
  - (b) Clothing, personal effects, or other materials deemed hazardous by the authority having jurisdiction shall be stored in metal lockers, provided that they do not obstruct the exit access, or the intervening room shall be sprinklered in accordance with [Section 9.7](#).
  - (c) One of the following means of protection shall be provided:
    - i. The intervening room shall have approved fire detection that activates the building alarm.
    - ii. The building shall be protected by an approved automatic sprinkler system in accordance with [Section 9.7](#).
- (3) Approved existing arrangements shall be permitted to continue in use.

CHAPTER 14 • New

To ensure ready access to the exit access corridor — which is intended to be a safer portion of the exit access than an occupied room with furnishings — 14/15.2.5.5 requires most normally occupied rooms to have a door open directly into an exit access corridor. The use of such a door avoids the need for occupants to pass through intervening rooms that might not be arranged or maintained to allow orderly evacuation.

Normally occupied rooms that have doors opening directly to the outside at grade or to an exterior exit access balcony are exempted from the base requirement. Also exempted are normally occupied rooms having only one intervening room that meets the following criteria:

1. Travel distance through the intervening room to the corridor door is limited to 75 ft (23 m).
2. Personal effects — such as coats and other belongings or other contents deemed hazardous by the authority having jurisdiction — must be kept in metal lockers, or the intervening room must be sprinklered.
3. Either the intervening room is supplied with fire detectors connected to the building alarm system, or the entire building is protected throughout by an approved automatic sprinkler system.

It is the Code's intent that, if metal lockers are chosen as the intervening room fire detection option, smoke detectors, rather than heat detectors, should be selected to provide for rapid occupant notification. However, heat detectors are permitted to be used if nuisance alarms are anticipated (e.g., in automotive or woodworking shops with attached classrooms).

Exhibit 14/15.13 and Exhibit 14/15.14 illustrate several possible intervening room configurations that comply with the Code. In Exhibit 14/15.13, Suite A is arranged to comply with 14/15.2.5.5. Each normally occupied room has a door opening either directly to the corridor or to the exterior (opening at grade or to an exterior exit access balcony), as permitted by 14/15.2.5.5(1). The arrangement shown in the lower portion of Exhibit 14/15.13 is permitted, provided that travel distance from the normally occupied rooms to the corridor (from point X to point C) does not exceed 75 ft (23 m), clothing and other personal effects in the intervening room are stored in metal lockers, and occupant notification is provided in the intervening room by a fire detection system (preferably smoke detection for earliest possible notification).

In Exhibit 14/15.14, Part (a) and Part (b) represent acceptable intervening room arrangements in accordance with 14/15.2.5.5(2). Part (a) depicts the limited travel distance from point X to point C, along with the intervening room sprinkler system addressed in 14/15.2.5.5(2)(b) and the intervening room fire detection system addressed in 14/15.2.5.5(2)(c)i. Part (b)

CHAPTER 15 • Existing

Exhibit 14/15.13

Room arrangements complying with 14/15.2.5.5.

Exhibit 14/15.14

Additional room arrangements complying with 14/15.2.5.5.

## CHAPTER 14 • New

represents a building protected throughout by an automatic sprinkler system that satisfies both 14/15.2.5.5(2)(b) and 14/15.2.5.5(2)(c)ii. In effect, even the installation within an intervening room of an automatic sprinkler system that is connected

**14.2.5.6** Doors that swing into an exit access corridor shall be arranged to prevent interference with corridor travel. (See also 7.2.1.4.3.)

**14.2.5.7** Aisles shall be not less than 30 in. (760 mm) wide.

**14.2.5.8** The space between parallel rows of seats shall not be subject to the minimum aisle width, provided that the number of seats that intervenes between any seat and an aisle does not exceed six.

**14.2.5.9\*** Exterior exit access shall comply with 7.5.3.

**A.14.2.5.9** A corridor roofed over and enclosed on its long side and open to the atmosphere at the end is permitted to be considered an exterior corridor if either of the following criteria are met:

- (1) Clear story openings for the corridor are provided on both sides of the corridor and above adjacent roofs or buildings, and such clear openings are not less than one-half the height of the corridor walls.
- (2) The corridor roof has unobstructed openings to the sky not less than 50 percent of the area of the roof.

The openings detailed in A.14.2.5.9(1) and (2) are to be equally distributed, and, if louvers are installed, they are to be fixed open with a clear area based on the actual openings between louver vanes.

Exhibit 14/15.15 illustrates exterior exit access arranged in accordance with 7.5.3. The stairs have been positioned to comply with 7.5.3.3; the arrangement allows an occupant to reach at least one of the stairs without having to travel past an unprotected opening.

Exhibit 14/15.16 and Exhibit 14/15.17 illustrate the use of roofed-over exterior exit access corridors suggested by A.14/A.15.2.5.9. In Exhibit 14/15.16, the openings labeled A, B, C, and D are clear story openings. The building height is 10 ft (3050 mm). For a corridor to be considered an outside corridor, the minimum height for the corridor roof is 5 ft (1525 mm). In this exhibit, the minimum clear story height requirements have been met.

In Exhibit 14/15.17, the alternative to the clear story openings is a roof with unobstructed openings to the sky that are equal to not less than 50 percent of the corridor roof area. The

## CHAPTER 15 • Existing

to the building fire alarm system would satisfy the criteria of 14/15.2.5.5(2)(c)i, because automatic sprinklers are considered heat detectors. Therefore, this approach would satisfy both 14/15.2.5.5(2)(b) and 14/15.2.5.5(2)(c).

**15.2.5.6** Doors that swing into an exit access corridor shall be arranged to prevent interference with corridor travel. (See also 7.2.1.4.3.)

**15.2.5.7** Aisles shall be not less than 30 in. (760 mm) wide.

**15.2.5.8** The space between parallel rows of seats shall not be subject to the minimum aisle width, provided that the number of seats that intervenes between any seat and an aisle does not exceed six.

**15.2.5.9\*** Exterior exit access shall comply with 7.5.3.

**A.15.2.5.9** A corridor roofed over and enclosed on its long side and open to the atmosphere at the end is permitted to be considered an exterior corridor if either of the following criteria are met:

- (1) Clear story openings for the corridor are provided on both sides of the corridor and above adjacent roofs or buildings, and such clear openings are not less than one-half the height of the corridor walls.
- (2) The corridor roof has unobstructed openings to the sky not less than 50 percent of the area of the roof.

The openings detailed in A.15.2.5.9(1) are to be equally distributed, and, if louvers are installed, they are to be fixed open with a clear area based on the actual openings between louver vanes.

Exterior exit access via balcony and stairs.

## CHAPTER 14 • New

Exhibit 14/15.16

Exterior corridor using clear story openings.

example shown has eight openings. Each opening is 4 ft × 16 ft (1220 mm × 4875 mm), or 64 ft<sup>2</sup> (5.9 m<sup>2</sup>). The total corridor roof area is 900 ft<sup>2</sup> (84 m<sup>2</sup>). The total unobstructed opening equals

**14.2.6 Travel Distance to Exits.** Travel distance shall comply with 14.2.6.1 through 14.2.6.3.

**14.2.6.1** Travel distance shall be measured in accordance with Section 7.6.

**14.2.6.2** Travel distance to an exit shall not exceed 150 ft (46 m) from any point in a building, unless otherwise provided in 14.2.6.3. (See also Section 7.6.)

**14.2.6.3** Travel distance shall not exceed 200 ft (61 m) in educational occupancies protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.

**14.2.7 Discharge from Exits.** Discharge from exits shall be arranged in accordance with Section 7.7.

**14.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with Section 7.8.

**14.2.9 Emergency Lighting.** Emergency lighting shall be provided in accordance with Section 7.9.

In earlier editions of the Code, emergency lighting was required in shops, laboratories, assembly use spaces (such as lecture halls, auditoriums, and dining rooms), and interior and windowless portions of educational occupancies. Since the 2003 edition, the Code requires that educational occupancies be provided with

## CHAPTER 15 • Existing

Exhibit 14/15.17

Exterior corridor using roof openings.

512 ft<sup>2</sup> (48 m<sup>2</sup>) — greater than 50 percent of the total roof area. This example is considered an acceptable design.

**15.2.6 Travel Distance to Exits.** Travel distance shall comply with 15.2.6.1 through 15.2.6.4.

**15.2.6.1** Travel distance shall be measured in accordance with Section 7.6.

**15.2.6.2** Travel distance to an exit shall not exceed 150 ft (46 m) from any point in a building, unless otherwise permitted by 15.2.6.3 or 15.2.6.4. (See also Section 7.6.)

**15.2.6.3** Travel distance shall not exceed 200 ft (61 m) in educational occupancies protected throughout by an approved automatic sprinkler system in accordance with Section 9.7.

**15.2.6.4** Approved existing travel distances shall be permitted to continue in use.

**15.2.7 Discharge from Exits.** Discharge from exits shall be arranged in accordance with Section 7.7.

**15.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with Section 7.8.

**15.2.9 Emergency Lighting.**

**15.2.9.1** Emergency lighting shall be provided in accordance with Section 7.9, unless otherwise permitted by 15.2.9.2.

**15.2.9.2** Approved existing emergency lighting installations shall be permitted to be continued in use.

emergency lighting in accordance with Section 7.9. Paragraph 7.9.1.2 clarifies that the portion of the exit access for which the emergency lighting must be provided includes designated stairs, aisles, corridors, ramps, escalators, and passageways — not all portions of the exit access.

## CHAPTER 14 • New

**Exhibit 14/15.18** shows an emergency generator outside a two-story elementary school. The generator supplies power for the emergency lighting as well as for other important equipment.

**14.2.10 Marking of Means of Egress.** Means of egress shall have signs in accordance with **Section 7.10**.

**Exhibit 14/15.19** shows an exit sign with protective cagelike cover installed in a school gymnasium. The cage protects against damage from athletic equipment strikes.

### 14.2.11 Special Means of Egress Features.

#### 14.2.11.1\* Windows for Rescue.

**A.14.2.11.1** It is highly desirable that all windows be of a type that can be readily opened from inside and that they are large

### 15.2.11 Special Means of Egress Features.

#### 15.2.11.1\* Windows for Rescue.

**A.15.2.11.1** It is highly desirable that all windows be of a type that can be readily opened from inside and that they are large

## CHAPTER 14 • New

enough and low enough for use by students, teachers, and fire fighters. Windows are permitted to serve as a supplementary means of emergency escape, particularly where ladders can be raised by fire fighters or others.

**14.2.11.1.1** Every room or space greater than 250 ft<sup>2</sup> (23.2 m<sup>2</sup>) and used for classroom or other educational purposes or normally subject to student occupancy shall have not less than one outside window for emergency rescue that complies with all of the following, unless otherwise permitted by **14.2.11.1.2**:

- (1) Such windows shall be openable from the inside without the use of tools and shall provide a clear opening of not less than 20 in. (510 mm) in width, 24 in. (610 mm) in height, and 5.7 ft<sup>2</sup> (0.5 m<sup>2</sup>) in area.
- (2) The bottom of the opening shall be not more than 44 in. (1120 mm) above the floor, and any latching device shall be capable of being operated from not more than 54 in. (1370 mm) above the finished floor.
- (3) The clear opening shall allow a rectangular solid, with a width and height that provides not less than the required 5.7 ft<sup>2</sup> (0.5 m<sup>2</sup>) opening and a depth of not less than 20 in. (510 mm), to pass fully through the opening.
- (4) Such windows shall be accessible by the fire department and shall open into an area having access to a public way.

**14.2.11.1.2** The requirements of **14.2.11.1.1** shall not apply to any of the following:

- (1) Buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with **Section 9.7**
- (2) Where the room or space has a door leading directly to an exit or directly to the outside of the building
- (3) Reserved
- (4) Rooms located four or more stories above the finished ground level

## CHAPTER 15 • Existing

enough and low enough for use by students, teachers, and fire fighters. Windows are permitted to serve as a supplementary means of emergency escape, particularly where ladders can be raised by fire fighters or others.

**15.2.11.1.1** Every room or space greater than 250 ft<sup>2</sup> (23.2 m<sup>2</sup>) and used for classroom or other educational purposes or normally subject to student occupancy shall have not less than one outside window for emergency rescue that complies with all of the following, unless otherwise permitted by **15.2.11.1.2**:

- (1) Such windows shall be openable from the inside without the use of tools and shall provide a clear opening of not less than 20 in. (510 mm) in width, 24 in. (610 mm) in height, and 5.7 ft<sup>2</sup> (0.5 m<sup>2</sup>) in area.
- (2) The bottom of the opening shall be not more than 44 in. (1120 mm) above the floor, and any latching device shall be capable of being operated from not more than 54 in. (1370 mm) above the finished floor.
- (3) The clear opening shall allow a rectangular solid, with a width and height that provides not less than the required 5.7 ft<sup>2</sup> (0.5 m<sup>2</sup>) opening and a depth of not less than 20 in. (510 mm), to pass fully through the opening.

**15.2.11.1.2** The requirements of **15.2.11.1.1** shall not apply to any of the following:

- (1) Buildings protected throughout by an approved automatic sprinkler system in accordance with **Section 9.7**
- (2) Where the room or space has a door leading directly to an exit or directly to the outside of the building
- (3) Where the room has a door, in addition to the door that leads to the exit access corridor as required by **15.2.5.5**, and such door leads directly to another corridor located in a compartment separated from the compartment housing the corridor addressed in **15.2.5.5** by smoke partitions in accordance with **Section 8.4**
- (4) Rooms located four or more stories above the finished ground level
- (5) Where awning-type or hopper-type windows that are hinged or subdivided to provide a clear opening of not less than 4 ft<sup>2</sup> (0.38 m<sup>2</sup>) or any dimension of not less than 22 in. (560 mm) meet the following criteria:
  - (a) Such windows shall be permitted to continue in use.
  - (b) Screen walls or devices located in front of required windows shall not interfere with rescue requirements.
- (6) Where the room or space complies with all of the following:
  - (a) One door providing direct access to an adjacent classroom and a second door providing direct access to another adjacent classroom shall be provided.
  - (b) The two classrooms to which exit access travel is made in accordance with **15.2.11.1.2(6)(a)** shall each provide

## CHAPTER 14 • New

## CHAPTER 15 • Existing

Small rooms of 250 ft<sup>2</sup> (23.2 m<sup>2</sup>) or less, such as those used for music instruction or student counseling, and subject to occupancy by very few students, are exempt from the rescue window requirement.

The dimensions specified for windows used for emergency rescue are based on simulations of emergency rescue conducted by the San Diego Fire Department. Windows providing clear openings of identical dimensions are also required for rescue in dwellings. Exhibit 14/15.20 illustrates two configurations that provide the required area of 5.7 ft<sup>2</sup> (0.5 m<sup>2</sup>) and the minimum opening height and width.

Awning-type and hopper-type windows might provide the required opening within the plane of the building exterior wall. However, when the window is open, the sash and glazing are outside that plane and might prevent occupants from passing through the opening. Therefore, the criterion of 14/15.2.11.1.1(3) for providing an opening through which a minimum-size rectangular solid can pass is intended to ensure that occupants can pass through the opening. For existing awning-type windows, 15.2.11.1.2(5) offers some relief from the rectangular solid and minimum-size opening requirements. The exemption in 15.2.11.1.2(5) is provided in acknowledgment of a feature that was formerly recognized by the Code. Although the exemption is no longer permitted in new construction, it is still permitted in existing facilities. Exhibit 14/15.21 illustrates the use of 15.2.11.1.2(5).

The Code intends that the fire department or others are to assist students, especially over ladders, once students have moved through the window opening. Emergency rescue windows used as a supplementary means of escape need to allow small children to utilize the window unaided. Therefore, storm sashes, screens, or devices in front of the windows must be easy to open or remove, and the sills must be low enough for children to reach.

The Code also requires that new rescue windows be accessible to the fire department and that occupants, once they escape through the window to the outside, have access to a public way.

exit access in accordance with 15.2.11.1.2(2) or 15.2.11.1.2(3).

- (c) The corridor required by 15.2.5.5, and the corridor addressed by 15.2.11.1.2(3), if provided, shall be separated from the classrooms by a wall that resists the passage of smoke, and all doors between the classrooms and the corridor shall be self-closing or automatic-closing in accordance with 7.2.1.8.
- (d) The length of travel to exits along such paths shall not exceed 150 ft (46 m).
- (e) Each communicating door shall be marked in accordance with Section 7.10.
- (f) No locking device shall be permitted on the communicating doors.

Exhibit 14/15.20

Windows for rescue — minimum required dimensions.

## CHAPTER 14 • New

Exhibit 14/15.21

Existing awning window — minimum dimensions permitted by 15.2.11.1.2(5).

Emergency rescue windows are not required if a classroom has a door leading directly to an exit or leading directly to the outside, or if the building is totally sprinklered. Note that 14/15.2.11.1.2(1) requires that the building be protected throughout by an automatic sprinkler system. The purpose of the window is to provide means of escape when the interior corridor is blocked by smoke from a fire in another part of the building. Installing sprinklers in only some rooms does not provide protection from smoke that is emanating from other areas.

Exhibit 14/15.22 shows an operable classroom window whose opening complies with 14/15.2.11.1.1. The building is protected throughout by an approved automatic sprinkler system, so the provision of 14/15.2.11.1.2(1) exempts the window. The classroom items placed in front of the window are permitted as the window is not required for rescue purposes.

The provisions of 14/15.2.11.1.2(2) recognize a directly accessible exit as the equivalent of a door to the outside for purposes of exempting the rescue window. Exhibit 14/15.23 illustrates the use of the provisions of 14/15.2.11.1.2(2) in order to exempt the window. Room A has a door directly to the outside. Room B has direct access to an exit stair enclosure.

The provision of 15.2.11.1.2(3) applies only in existing buildings. Exhibit 14/15.24 illustrates its use. All classrooms other than room A have their requisite rescue window. Room A has no rescue window but is provided with two doors to separated corridors. The door in the smoke partition leads directly to a corridor that is separated from the corridor entered through the second door opening in room A. The

## CHAPTER 15 • Existing

Exhibit 14/15.22

Rescue window that is not required because building is sprinklered.

Exhibit 14/15.23

Exemptions to provision of a rescue window as permitted by 14/15.2.11.1.2(2).

corridor at the right of the exhibit is separated from the corridor at the left by a smoke partition.

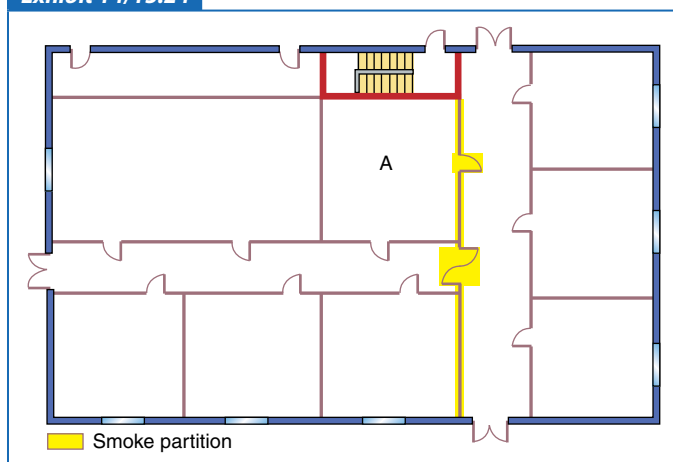

The provisions of 15.2.11.1.2(6) apply only to existing buildings. Exhibit 14/15.25 and Exhibit 14/15.26 illustrate its use. In Exhibit 14/15.25, room B has no rescue window and uses one of the options of 15.2.11.1.2(6) for exemption from the requirement for a rescue window. Room B is provided with doors, not subject to locking, to room A and room C. Room A and room C use the provision of 15.2.11.1.2(2), as permitted by 15.2.11.1.2(6)(b), related to having a door directly to the outside or directly to an exit, so as to be exempted from the requirement for a rescue window. Maximum length of travel from room B, as required by

## CHAPTER 14 • New

## CHAPTER 15 • Existing

Exhibit 14/15.24

Existing room A exempted from rescue window requirement by 15.2.11.1.2(3).

Exhibit 14/15.25

Existing room B exempted from rescue window requirement by 15.2.11.1.2(6) — Example 1.

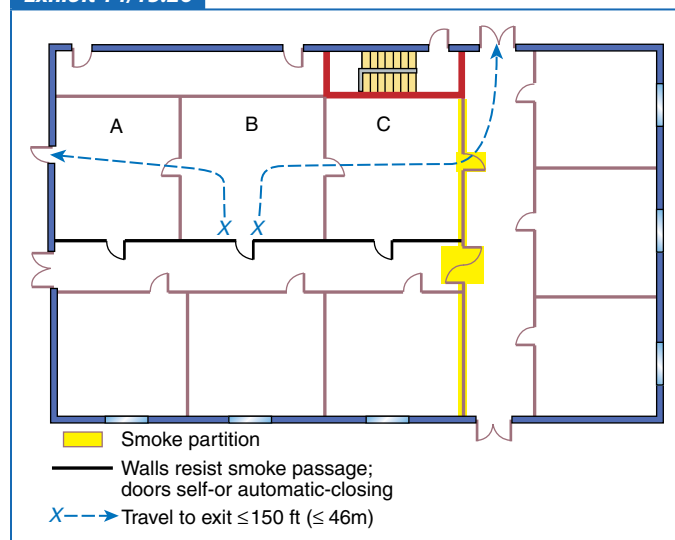

**14.2.11.2 Lockups.** Lockups in educational occupancies shall comply with the requirements of 22.4.5.

The term *lockup* is defined in 3.3.166 as “an incidental use area in other than a detention and correctional occupancy where occupants are restrained and such occupants are mostly incapable of self-preservation because of security measures not under the occupants’ control.” For example, a lockup in an educational occupancy is a room for holding unruly students until police can

15.2.11.1.2(6)(d), by way of the paths of travel through room A and room C is met. The corridor walls, shaded in black in Exhibit 14/15.25, resist the passage of smoke, and the doors are self-closing.

In Exhibit 14/15.26, room B has no rescue window and uses one of the options of 15.2.11.1.2(6) for exemption from the requirement for a rescue window. Room B is provided with doors, not subject to locking, to room A and room C. Room A uses the exemption of 15.2.11.1.2(2), as permitted by 15.2.11.1.2(6)(b), by having a door directly to the outside, so as to be exempted from the requirement for a rescue window. Room C uses the provision of 15.2.11.1.2(3), as permitted by 15.2.11.1.2(6)(b), by traveling through a smoke partition into a separate corridor compartment, so as to be exempted from the requirement for a rescue window. Maximum length of travel from room B, as required by 15.2.11.1.2(6)(d), by way of the paths of travel through room A and room C is met. The corridor walls of rooms A through C, as shaded in black in Exhibit 14/15.26, resist the passage of smoke, and the doors are self-closing.

Exhibit 14/15.26

Existing room B exempted from rescue window requirement by 15.2.11.1.2(6) — Example 2.

**15.2.11.2 Lockups.** Lockups in educational occupancies, other than approved existing lockups, shall comply with the requirements of 23.4.5.

transport such students to the police station. The provisions of Chapters 14 and 15 alone are not adequate to ensure life safety for those who are detained by security measures not under their control. Lockups in educational occupancies are required to meet the provisions of 22/23.4.5, which complete the needed package of protection features.

## CHAPTER 14 • New

## 14.3 Protection

### 14.3.1 Protection of Vertical Openings.

**14.3.1.1** Any vertical opening, other than unprotected vertical openings in accordance with 8.6.9.1, shall be enclosed or protected in accordance with Section 8.6.

**14.3.1.2** Where the provisions of 8.6.6 are used, the requirements of 14.3.5.4 shall be met.

Chapters 14 and 15 require all vertical openings — with the exception of an open and unobstructed communicating space connecting three floors or less (see 8.6.6, which often is referred to as the mini-atrium provision), an atrium (see 8.6.7), a partially-enclosed two-story opening (see 8.6.8), and a two-story convenience opening (see 8.6.9.1) — to be enclosed in accordance with Section 8.6. Although not specified by the communicating space provisions of 8.6.6, 14/15.3.1.2 and 14/15.3.5.4 require a building to be fully sprinklered to permit the maximum three-story unenclosed vertical opening. The convenience opening addressed by 8.6.9.2 might be useful, especially for two-story libraries or offices within schools.

Exhibit 14/15.27 shows a two-story vertical opening as might be addressed by 8.6.6. Use of 8.6.6 in educational occupancies is limited to buildings protected throughout by automatic sprinklers as required by 14/15.3.1.2 and 14/15.3.5.4. The building pictured is protected throughout by automatic sprinklers. The two-story opening is capable of being isolated, from one of the two building wings that the opening abuts, by an automatic-sliding fire door whose operation is initiated by smoke detection in the vicinity of the opening. Exhibit 14/15.28 shows a portion of the ceiling-mounted track system and wall-mounted door stop associated with the sliding door. The two-story opening is capable of being isolated from the other wing by a pair of automatic-closing doors in a single door opening.

The two-story stair permitted by 15.3.1.3 differs from the convenience opening detailed in 8.6.9.1; paragraph 15.3.1.3 permits an existing two-story school building to have open egress stairs between the first-floor corridor and second-floor corridor. Open egress stairs are not permitted in new construction.

## CHAPTER 15 • Existing

## 15.3 Protection

### 15.3.1 Protection of Vertical Openings.

**15.3.1.1** Any vertical opening, other than unprotected vertical openings in accordance with 8.6.9.1, shall be enclosed or protected in accordance with Section 8.6.

**15.3.1.2** Where the provisions of are used, the requirements of 15.3.5.4 shall be met.

**15.3.1.3** Stairway enclosures shall not be required where all of the following conditions are met:

- (1) The stairway serves only one adjacent floor, other than a basement.
- (2) The stairway is not connected with stairways serving other floors.
- (3) The stairway is not connected with corridors serving other than the two floors involved.

Basements are excluded from use of the exemption in 15.3.1.3, because basements usually contain hazardous contents areas with high fuel loads, such as storage rooms, boiler rooms, or workshops.

Exhibit 14/15.27

Two-story vertical opening.

Exhibit 14/15.28

Track system and door stop for sliding door to isolate vertical opening.

### 14.3.2 Protection from Hazards.

**14.3.2.1** Rooms or spaces for the storage, processing, or use of materials shall be protected in accordance with the following:

- (1) Such rooms or spaces shall be separated from the remainder of the building by fire barriers having a minimum 1-hour fire resistance rating or protected by automatic extinguishing systems as specified in **Section 8.7** in the following areas:
  - (a) Boiler and furnace rooms, unless such rooms enclose only air-handling equipment
  - (b) Rooms or spaces used for the storage of combustible supplies in quantities deemed hazardous by the authority having jurisdiction
  - (c) Rooms or spaces used for the storage of hazardous materials or flammable or combustible liquids in quantities deemed hazardous by recognized standards
  - (d) Janitor closets [see also **14.3.2.1(4)**]
- (2) Such rooms or spaces shall be separated from the remainder of the building by fire barriers having a minimum 1-hour fire resistance rating and protected by automatic extinguishing systems as specified in **Section 8.7** in the following areas:
  - (a) Laundries
  - (b) Maintenance shops, including woodworking and painting areas
  - (c) Rooms or spaces used for processing or use of combustible supplies deemed hazardous by the authority having jurisdiction
  - (d) Rooms or spaces used for processing or use of hazardous materials or flammable or combustible liquids in quantities deemed hazardous by recognized standards

### 15.3.2 Protection from Hazards.

**15.3.2.1** Rooms or spaces for the storage, processing, or use of materials shall be protected in accordance with the following:

- (1) Such rooms or spaces shall be separated from the remainder of the building by fire barriers having a minimum 1-hour fire resistance rating or protected by automatic extinguishing systems as specified in **Section 8.7** in the following areas:
  - (a) Boiler and furnace rooms, unless such rooms enclose only air-handling equipment
  - (b) Rooms or spaces used for the storage of combustible supplies in quantities deemed hazardous by the authority having jurisdiction
  - (c) Rooms or spaces used for the storage of hazardous materials or flammable or combustible liquids in quantities deemed hazardous by recognized standards
  - (d) Janitor closets [see also **15.3.2.1(4)**]
- (2) Such rooms or spaces shall be separated from the remainder of the building by fire barriers having a minimum 1-hour fire resistance rating and protected by automatic extinguishing systems as specified in **Section 8.7** in the following areas:
  - (a) Laundries
  - (b) Maintenance shops, including woodworking and painting areas
  - (c) Rooms or spaces used for processing or use of combustible supplies deemed hazardous by the authority having jurisdiction
  - (d) Rooms or spaces used for processing or use of hazardous materials or flammable or combustible liquids in quantities deemed hazardous by recognized standards

## CHAPTER 14 • New

- (3) Where automatic extinguishing is used to meet the requirements of 14.3.2.1(1) or (2), the protection shall be permitted in accordance with 9.7.1.2.
- (4) Where janitor closets addressed in 14.3.2.1(1)(d) are protected in accordance with the sprinkler option of 14.3.2.1(1), the janitor closet doors shall be permitted to have ventilating louvers.

**14.3.2.2** Cooking facilities shall be protected in accordance with 9.2.3. Openings shall not be required to be protected between food preparation areas and dining areas.

**14.3.2.3** Stages and platforms shall be protected in accordance with Chapter 12.

**14.3.2.4** Educational occupancy laboratories using chemicals shall be in accordance with 8.7.4.

The intent of 14/15.3.2.1 is to specify the degree of protection necessary for certain hazardous contents areas. The hazards noted in 14/15.3.2.1(1) are required to be enclosed in 1-hour fire resistance-rated construction or protected by automatic sprinklers. If the sprinkler option is chosen for new construction, an enclosure is still required by 8.7.1.2. However, the enclosure is not required to be rated; it is required to be a smoke partition in accordance with the provisions of Section 8.4. Exhibit 14/15.29 shows a boiler room as addressed in 14/15.3.2.1(1)(a). Exhibit 14/15.30 shows a janitor closet as addressed in 14/15.3.2.1(1)(d).

Where janitor closets abut and are entered from a corridor, a louvered door is often provided for ventilation. Where louvered doors are used, it is necessary to provide these spaces with automatic sprinkler protection, because a fire in the janitor closet might directly affect the usability of the corridor for exit access.

Exhibit 14/15.29

Boiler room requiring protection.

## CHAPTER 15 • Existing

- (3) Where automatic extinguishing is used to meet the requirements of 15.3.2.1(1) or (2), the protection shall be permitted in accordance with 9.7.1.2.
- (4) Where janitor closets addressed in 15.3.2.1(1)(d) are protected in accordance with the sprinkler option of 15.3.2.1(1), the janitor closet doors shall be permitted to have ventilating louvers.

**15.3.2.2** Cooking facilities shall be protected in accordance with 9.2.3. Openings shall not be required to be protected between food preparation areas and dining areas.

**15.3.2.3** Stages and platforms shall be protected in accordance with Chapter 13.

**15.3.2.4** Educational occupancy laboratories using chemicals shall be in accordance with 8.7.4.

See 14/15.3.2.1(4). Paragraph 9.7.1.2 describes an economical method of providing sprinkler protection for such closets by using the normal building water supply. To achieve this protection at reasonable cost, these sprinklers (not more than six for a given room or space) are permitted to be supplied from the building water supply, if the supply is capable of providing the required flow of water. It is advisable to provide a waterflow switch to initiate an alarm when a sprinkler is opened.

Exhibit 14/15.30

Janitor closet requiring protection.

## CHAPTER 14 • New

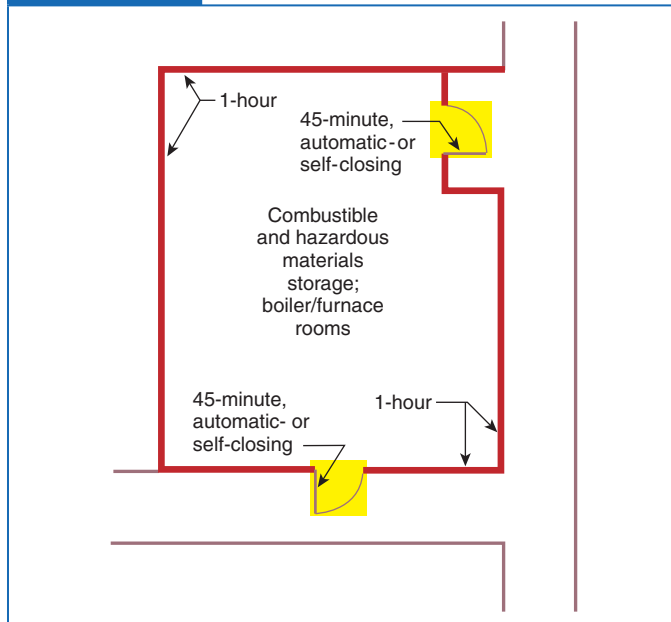

Exhibit 14/15.31, Exhibit 14/15.32, and Exhibit 14/15.33 illustrate the various protection requirements of 14/15.3.2.1.

In accordance with 14/15.3.2.2, openings in the wall between kitchens and dining areas are not restricted and do not need to be protected. The Code relies on the specialized automatic extinguishing system required by 9.2.3 to control any fire on the cooking surfaces and, thus, does not require openings between the kitchen and dining areas to be protected.

The provision of 14/15.3.2.3 requires that platforms, and not just stages, be protected in accordance with the criteria of the assembly occupancies chapters. See 12/13.4.5.

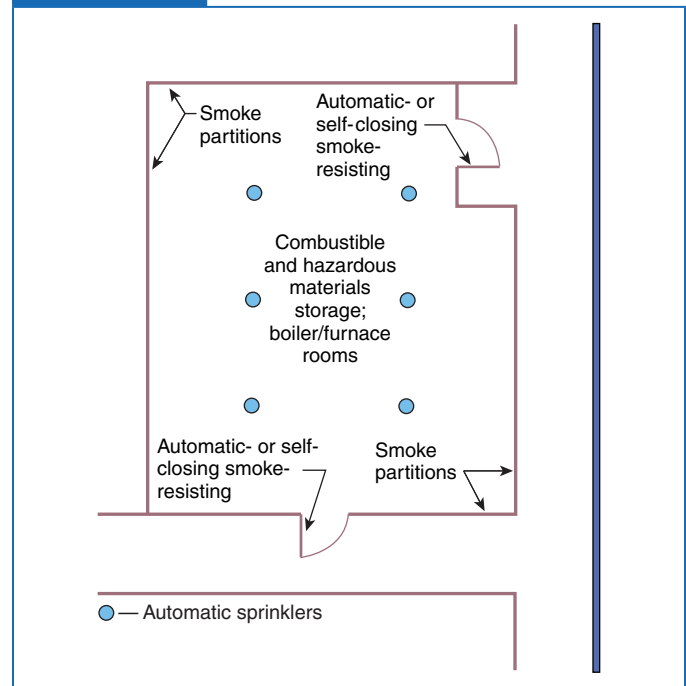

The provision of 14/15.3.2.4 recognizes that educational occupancies often have laboratories using chemicals. Laboratories using chemicals need protection in accordance with 8.7.4.

Exhibit 14/15.31

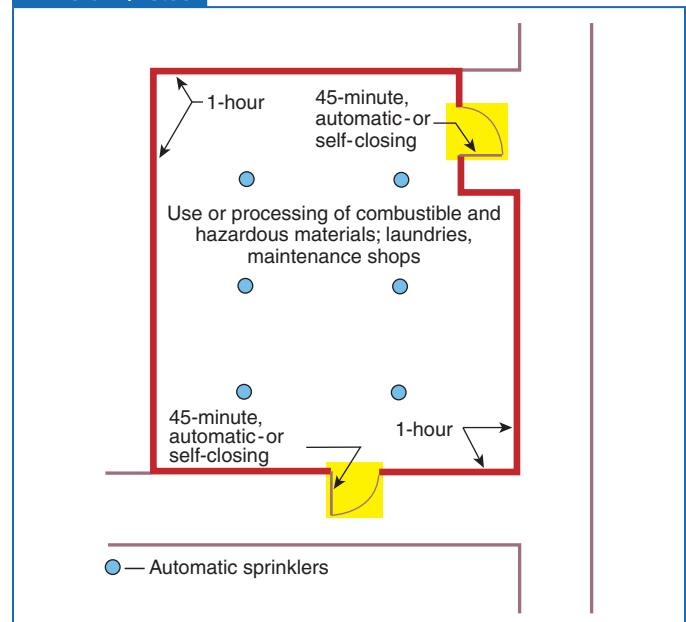

Protection of hazardous contents areas — rated enclosure complying with 14/15.3.2.1(1).

Exhibit 14/15.32

Protection of new hazardous contents areas — sprinkler protection and smoke partition enclosure complying with 14.3.2.1(1).

Exhibit 14/15.33

Protection of hazardous contents areas — separation by 1-hour-rated enclosure and automatic sprinkler protection complying with 14/15.3.2.1(2).

## CHAPTER 14 • New

**14.3.3 Interior Finish.**

**14.3.3.1 General.** Interior finish shall be in accordance with [Section 10.2](#).

**14.3.3.2\* Interior Wall and Ceiling Finish.** Interior wall and ceiling finish materials complying with [Section 10.2](#) shall be permitted as follows:

- (1) Exits — Class A
- (2) Other than exits — Class A or Class B
- (3) Low-height partitions not exceeding 60 in. (1525 mm) and used in locations other than exits — Class A, Class B, or Class C

**A.14.3.3.2** The definition of interior wall finish is meant to include washroom water closet partitions.

**14.3.3.3 Interior Floor Finish.**

**14.3.3.3.1** Interior floor finish shall comply with [Section 10.2](#).

**14.3.3.3.2** Interior floor finish in exit enclosures and exit access corridors and spaces not separated from them by walls complying with [14.3.6](#) shall be not less than Class II.

**14.3.3.3.3** Interior floor finish shall comply with [10.2.7.1](#) or [10.2.7.2](#), as applicable.

[Exhibit 14/15.34](#) shows acoustical panels and wood surround mounted to the wall in the corridor of a school. The panels do not serve as bulletin boards and are used only to attenuate sound. The panels and the associated wood surround constitute interior wall finish.

**Exhibit 14/15.34**

*Acoustical panels constituting interior wall finish.*

## CHAPTER 15 • Existing

**15.3.3 Interior Finish.**

**15.3.3.1 General.** Interior finish shall be in accordance with [Section 10.2](#).

**15.3.3.2 Interior Wall and Ceiling Finish.** Interior wall and ceiling finish materials complying with [Section 10.2](#) shall be permitted as follows:

- (1) Exits — Class A
- (2) Corridors and lobbies — Class A or Class B
- (3) Low-height partitions not exceeding 60 in. (1525 mm) and used in locations other than exits — Class A, Class B, or Class C

**15.3.3.3 Interior Floor Finish. (Reserved)**

[Exhibit 14/15.35](#) shows protective padding mounted to the lower portion of the walls in a school gymnasium. The photo also shows acoustical panels mounted in the upper height of the walls. The padding and panels constitute interior wall finish.

**Exhibit 14/15.35**

*Protective padding and acoustical panels constituting interior wall finish.*

## CHAPTER 14 • New

Note that the exit door at the far end of the wall has no padding, so as to be more readily identified as an exit.

New interior floor finish is regulated by 14.3.3.3. Floor finish in corridors is susceptible to ignition and flame spread when exposed to a well-developed fire, such as might occur if a room

### 14.3.4 Detection, Alarm, and Communications Systems.

#### 14.3.4.1 General.

**14.3.4.1.1** Educational occupancies shall be provided with a fire alarm system in accordance with Section 9.6.

**14.3.4.1.2** The requirement of 14.3.4.1.1 shall not apply to buildings meeting all of the following criteria:

- (1) Buildings having an area not exceeding 1000 ft<sup>2</sup> (93 m<sup>2</sup>)
- (2) Buildings containing a single classroom
- (3) Buildings located not less than 30 ft (9.1 m) from another building

The limited-size, single-classroom building addressed by 14/15.3.4.1.2 does not need an alarm system, because the fire will be immediately obvious to the occupants. Emergency egress can begin upon first notice of fire. A fire within a building located

#### 14.3.4.2 Initiation.

**14.3.4.2.1 General.** Initiation of the required fire alarm system, other than as permitted by 14.3.4.2.3, shall be by manual means in accordance with 9.6.2.1(1).

**14.3.4.2.2 Automatic Initiation.** In buildings provided with automatic sprinkler protection, the operation of the sprinkler system shall automatically activate the fire alarm system in addition to the initiation means required in 14.3.4.2.1.

**14.3.4.2.3 Alternative Protection System.** Manual fire alarm boxes shall be permitted to be eliminated in accordance with 14.3.4.2.3.1 or 14.3.4.2.3.2.

**14.3.4.2.3.1\*** Manual fire alarm boxes shall be permitted to be eliminated where all of the following conditions apply:

## CHAPTER 15 • Existing

fire were to grow to flashover and the room door remained open. Paragraph 14.3.3.3.2 addresses this concern. Paragraph 14.3.3.3.3 references the generalized criteria of 10.2.7.1 and 10.2.7.2, which are intended to identify and prohibit the use of floor finish materials that have little or no resistance to ignition.

### 15.3.4 Detection, Alarm, and Communications Systems.

#### 15.3.4.1 General.

**15.3.4.1.1** Educational occupancies shall be provided with a fire alarm system in accordance with Section 9.6.

**15.3.4.1.2** The requirement of 15.3.4.1.1 shall not apply to buildings meeting all of the following criteria:

- (1) Buildings having an area not exceeding 1000 ft<sup>2</sup> (93 m<sup>2</sup>)
- (2) Buildings containing a single classroom
- (3) Buildings located not less than 30 ft (9.1 m) from another building

at least 30 ft (9.1 m) from another building should not prove to be detrimental to the occupants of the other building if egress is delayed because no alarm system is provided.

#### 15.3.4.2 Initiation.

**15.3.4.2.1 General.** Initiation of the required fire alarm system shall be by manual means in accordance with 9.6.2.1(1), unless otherwise permitted by one of the following:

- (1) Manual fire alarm boxes shall not be required where permitted by 15.3.4.2.3.
- (2) In buildings where all normally occupied spaces are provided with a two-way communication system between such spaces and a constantly attended receiving station from where a general evacuation alarm can be sounded, the manual fire alarm boxes shall not be required, except in locations specifically designated by the authority having jurisdiction.

**15.3.4.2.2 Automatic Initiation.** In buildings provided with automatic sprinkler protection, the operation of the sprinkler system shall automatically activate the fire alarm system in addition to the initiation means required in 15.3.4.2.1.

**15.3.4.2.3 Alternative Protection System.** Manual fire alarm boxes shall be permitted to be eliminated in accordance with 15.3.4.2.3.1 or 15.3.4.2.3.2.

**15.3.4.2.3.1\*** Manual fire alarm boxes shall be permitted to be eliminated where all of the following conditions apply:

## CHAPTER 14 • New

- (1) Interior corridors are protected by smoke detectors in accordance with [Section 9.6](#).
- (2) Auditoriums, cafeterias, and gymnasiums are protected by heat-detection devices or other approved detection devices.
- (3) Shops and laboratories involving dusts or vapors are protected by heat-detection devices or other approved detection devices.
- (4) Provision is made at a central point to manually activate the evacuation signal or to evacuate only affected areas.

**A.14.3.4.2.3.1** Occupied portions of the building should have access to a central point for manual activation of the evacuation signal.

**14.3.4.2.3.2\*** Manual fire alarm boxes shall be permitted to be eliminated where both of the following conditions apply:

- (1) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#).
- (2) Provision is made at a central point to manually activate the evacuation signal or to evacuate only affected areas.

**A.14.3.4.2.3.2** Occupied portions of the building should have access to a central point for manual activation of the evacuation signal.

[Exhibit 14/15.36](#) shows a manual fire alarm box for initiation of the building fire alarm system. The cover is intended to help avoid accidental initiations due to unintended contact with the box. Where additional means of preventing unintended or nuisance alarms is needed, the provisions of [14/15.3.4.2.3](#) offer alternatives.

[Paragraph 14/15.3.4.2.3](#) provides alternatives to the manual fire alarm boxes required by [14/15.3.4.2.1](#). These alternatives are offered as a means to avoid the nuisance alarms initiated through unauthorized use of the building manual fire alarm boxes. By relying on the automatic initiation that is provided by the detection systems addressed in [14/15.3.4.2.3.1](#)(1) through (3), equivalent protection is provided. By relying on the fire control that is provided by the automatic sprinkler system addressed in [14/15.3.4.2.3.2](#), equivalent protection is provided.

[Paragraph 15.3.4.2.1](#)(2) — which applies only to existing educational occupancies — recognizes an alternative to a dedicated fire alarm system. Where there is a two-way communication system between classrooms and a constantly attended location where a general alarm can be sounded, the requirement for an alarm system — and its requisite manual fire alarm boxes — is exempted. To use this exemption, the authority having jurisdiction must designate those manual fire alarm boxes that are not required. For the purposes of this provision, a “constantly attended” location is a location that is attended

## CHAPTER 15 • Existing

- (1) Interior corridors are protected by smoke detectors using an alarm verification system as described in *NFPA 72, National Fire Alarm and Signaling Code*.
- (2) Auditoriums, cafeterias, and gymnasiums are protected by heat-detection devices or other approved detection devices.
- (3) Shops and laboratories involving dusts or vapors are protected by heat-detection devices or other approved detection devices.
- (4) Provision is made at a central point to manually activate the evacuation signal or to evacuate only affected areas.

**A.15.3.4.2.3.1** Occupied portions of the building should have access to a central point for manual activation of the evacuation signal.

**15.3.4.2.3.2\*** Manual fire alarm boxes shall be permitted to be eliminated where both of the following conditions apply:

- (1) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#).
- (2) Provision is made at a central point to manually activate the evacuation signal or to evacuate only affected areas.

**A.15.3.4.2.3.2** Occupied portions of the building should have access to a central point for manual activation of the evacuation signal.

**Exhibit 14/15.36**

Manual fire alarm box with protective cover.

## CHAPTER 14 • New

while the school building is in use as a school. Compliance might involve providing personnel at this location during night classes, when the regular school office staff is not present. The

**14.3.4.3 Notification.****14.3.4.3.1 Occupant Notification.**

**14.3.4.3.1.1** Occupant notification shall be accomplished automatically in accordance with 9.6.3.

**14.3.4.3.1.2** The occupant notification required by 14.3.4.3.1.1 shall utilize an emergency voice/alarm communication system in accordance with 9.6.3 where the building has an occupant load of more than 100.

The provision of 14.3.4.3.1.2 is new to the 2015 edition of the Code. New fire alarm systems in educational occupancy buildings with an occupant load of more than 100 are required to provide occupant notification via an emergency voice/alarm communication system. See 9.6.3.9.1, 9.6.3.10.2, and 14.3.4.3.1.4.

**14.3.4.3.1.3** Positive alarm sequence shall be permitted in accordance with 9.6.3.4.

**14.3.4.3.1.4** In accordance with 9.6.3.10.2 the emergency voice/alarm communication system shall be permitted to be used for other emergency signaling or for class changes.

**14.3.4.3.1.5** To prevent students from being returned to a building that is burning, the recall signal shall be separate and distinct from any other signals, and such signal shall be permitted to be given by use of distinctively colored flags or banners.

**14.3.4.3.1.6** If the recall signal required by 14.3.4.3.1.5 is electric, the push buttons or other controls shall be kept under lock, the key for which shall be in the possession of the principal or another designated person in order to prevent a recall at a time when there is an actual fire.

**14.3.4.3.1.7** Regardless of the method of recall signal, the means of giving the recall signal shall be kept under lock.

**14.3.4.3.2 Emergency Forces Notification.** Emergency forces notification shall be accomplished in accordance with 9.6.4.

## CHAPTER 15 • Existing

exemption is not permitted for new construction due to reliability concerns.

**15.3.4.3 Notification.****15.3.4.3.1 Occupant Notification.**

**15.3.4.3.1.1\*** Occupant notification shall be accomplished automatically in accordance with 9.6.3.

**A.15.3.4.3.1.1** The audible occupant notification signal for evacuation of an educational occupancy building should be the distinctive three-pulse temporal pattern fire alarm evacuation signal that is required of new systems by *NFPA 72, National Fire Alarm and Signaling Code*. The temporal pattern will help educate students to recognize the need to evacuate when they are in other occupancies. Existing fire alarm systems should be modified, as feasible, to sound the three-pulse temporal pattern.

**15.3.4.3.1.2 Reserved.**

The provision of 14.3.4.3.1.2 applies to new construction or to rehabilitation projects where the provisions of Chapter 43 require the alarm system to meet the requirements of Chapter 14, as might occur for the rehabilitation work categories of modification, reconstruction, change of occupancy, or addition.

**15.3.4.3.1.3** Positive alarm sequence shall be permitted in accordance with 9.6.3.4.

**15.3.4.3.1.4** Where acceptable to the authority having jurisdiction, the fire alarm system shall be permitted to be used for other emergency signaling or for class changes, provided that the fire alarm is distinctive in signal and overrides all other use.

**15.3.4.3.1.5** To prevent students from being returned to a building that is burning, the recall signal shall be separate and distinct from any other signals, and such signal shall be permitted to be given by use of distinctively colored flags or banners.

**15.3.4.3.1.6** If the recall signal required by 15.3.4.3.1.5 is electric, the push buttons or other controls shall be kept under lock, the key for which shall be in the possession of the principal or another designated person in order to prevent a recall at a time when there is an actual fire.

**15.3.4.3.1.7** Regardless of the method of recall signal, the means of giving the recall signal shall be kept under lock.

**15.3.4.3.2 Emergency Forces Notification.**

## CHAPTER 14 • New

## CHAPTER 15 • Existing

The provision of 15.3.4.3.2.2 imposes a requirement for emergency forces notification in accordance with 9.6.4 in existing buildings only where the fire alarm system is replaced.

#### 14.3.4.4 Carbon Monoxide Alarms and Carbon Monoxide Detection Systems.

14.3.4.4.1 Carbon monoxide alarms or carbon monoxide detectors in accordance with Section 9.12 shall be provided in new educational occupancies in the locations specified as follows:

- (1) On the ceilings of rooms containing permanently installed fuel-burning appliances
- (2) Centrally located within occupiable spaces served by the first supply air register from a permanently installed, fuel-burning HVAC system
- (3) Centrally located within occupiable spaces adjacent to a communicating attached garage

14.3.4.4.2 Carbon monoxide alarms and carbon monoxide detectors as specified in 14.3.4.4.1 shall not be required in the following locations:

- (1) Garages
- (2) Occupiable spaces with communicating attached garages that are open parking structures as defined in 3.3.272.7.4
- (3) Occupiable spaces with communicating attached garages that are mechanically ventilated in accordance with the applicable mechanical code

The provisions of 14.3.4.4 are new to the 2015 edition of the Code. They impose a requirement for carbon monoxide detec-

#### 14.3.5 Extinguishment Requirements.

14.3.5.1\* Educational occupancy buildings exceeding 12,000 ft<sup>2</sup> (1120 m<sup>2</sup>) shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.

15.3.4.3.2.1 Wherever any of the school authorities determine that an actual fire exists, they shall immediately call the local fire department using the public fire alarm system or other available facilities.

15.3.4.3.2.2 Emergency forces notification shall be accomplished in accordance with 9.6.4 where the existing fire alarm system is replaced.

tion and alarms but only for new construction and only if a source of carbon monoxide generation is present.

#### 15.3.5 Extinguishment Requirements.

15.3.5.1 Where student occupancy exists below the level of exit discharge, every portion of such floor shall be protected throughout by an approved automatic sprinkler system in accordance with Section 9.7.

## CHAPTER 14 • New

**A.14.3.5.1** It is the intent to permit use of the criteria of **8.2.1.3(1)** to create separate buildings for purposes of limiting educational occupancy building area to not more than 12,000 ft<sup>2</sup> (1120 m<sup>2</sup>).

**14.3.5.2** Educational occupancy buildings four or more stories in height shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with **Section 9.7**.

**14.3.5.3** Every portion of educational buildings below the level of exit discharge shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with **Section 9.7**.

**14.3.5.4** Buildings with unprotected openings in accordance with **8.6.6** shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with **Section 9.7**.

**14.3.5.5** Where another provision of this chapter requires an automatic sprinkler system, the sprinkler system shall be installed in accordance with **9.7.1.1(1)**.

The provision of **14.3.5.1** requires new educational occupancy buildings exceeding 12,000 ft<sup>2</sup> (1120 m<sup>2</sup>) to be sprinklered, as the occupant load characteristic of a building of that size has the potential to place a large number of persons at risk from a single fire. Note that **A.14.3.5.1** recognizes the placement of 2-hour or greater vertically aligned fire barriers, in accordance with **8.2.1.3(1)**, to create separate fire compartments that might be considered the equivalent of separate buildings. Provided that no such fire compartment exceeds the 12,000 ft<sup>2</sup> (1120 m<sup>2</sup>) criterion of **14.3.5.1**, sprinklers are not required in a structure that appears from the outside to be a single building with an aggregate area in excess of 12,000 ft<sup>2</sup> (1120 m<sup>2</sup>). The text of **A.14.3.5.1** is based on the belief that a single fire (see **4.3.2**) has the potential to affect only the occupants of the fire compartment in which the fire originates, especially early in the fire, before the building is evacuated.

**Paragraph 14.3.5.2** requires new educational occupancy buildings four or more stories in height (see **4.6.3**) to be sprinklered, as large numbers of occupants are expected to have to travel vertically on stairs to egress the building. Stair travel is

## CHAPTER 15 • Existing

**15.3.5.2** Where student occupancy does not exist on floors below the level of exit discharge, such floors shall be separated from the rest of the building by 1-hour fire resistance-rated construction or shall be protected throughout by an approved automatic sprinkler system in accordance with **Section 9.7**.

**15.3.5.3** Automatic sprinkler protection shall not be required where student occupancy exists below the level of exit discharge, provided that both of the following criteria are met:

- (1) The approval of the authority having jurisdiction shall be required.
- (2) Windows for rescue and ventilation shall be provided in accordance with **15.2.11.1**.

**15.3.5.4** Buildings with unprotected openings in accordance with **8.6.6** shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with **Section 9.7**.

**15.3.5.5** Where another provision of this chapter requires an automatic sprinkler system, the sprinkler system shall be installed in accordance with **9.7.1.1(1)**.

slower and more complicated than level travel across a floor. Sprinklers control fires so as to provide additional safe egress time.

The provision of **14.3.5.3** and the provisions of **15.3.5.1** through **15.3.5.3** address the need for sprinklers based on whether there are levels or floors below the level of exit discharge. For new construction, this provision will normally require basements of schools to be sprinklered; for existing educational occupancies, the basement will need to be sprinklered if it is used for student occupancy.

The provisions of **8.6.6**, applicable to the communicating space exemption to the requirements for vertical opening protection, are permitted to be used unless prohibited by the applicable occupancy chapter. The provisions of **14/15.3.1**, related to vertical opening protection for educational occupancies, do not prohibit the use of **8.6.6** but add one extra requirement for situations where the communicating space exemption of **8.6.6** is used. The requirement is for the educational occupancy building to be protected throughout by an approved, supervised automatic sprinkler system as detailed in **14/15.3.5.4**.

## CHAPTER 14 • New

**14.3.6 Corridors.** Corridors shall be separated from other parts of the story by walls having a 1-hour fire resistance rating in accordance with [Section 8.3](#), unless otherwise permitted by one of the following:

- (1) Corridor protection shall not be required where all spaces normally subject to student occupancy have not less than one door opening directly to the outside or to an exterior exit access balcony or corridor in accordance with [7.5.3](#).
- (2) The following shall apply to buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#):
  - (a) Corridor walls shall not be required to be rated, provided that such walls form smoke partitions in accordance with [Section 8.4](#).
  - (b) The provisions of [8.4.3.5](#) shall not apply to normally occupied classrooms.
- (3) Where the corridor ceiling is an assembly having a 1-hour fire resistance rating where tested as a wall, the corridor walls shall be permitted to terminate at the corridor ceiling.
- (4) Lavatories shall not be required to be separated from corridors, provided that they are separated from all other spaces by walls having not less than a 1-hour fire resistance rating in accordance with [Section 8.3](#).
- (5) Lavatories shall not be required to be separated from corridors, provided that both of the following criteria are met:
  - (a) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#).
  - (b) The walls separating the lavatory from other rooms form smoke partitions in accordance with [Section 8.4](#).

Given the protection provided by an automatic sprinkler system installed throughout the building, [14/15.3.6\(2\)\(a\)](#) permits the corridor walls to be unrated, provided that they form smoke partitions. See [Section 8.4](#) for applicable criteria. In addition, [14/15.3.6\(2\)\(b\)](#) permits the door closer to be omitted from corridor doors to normally occupied classrooms. The emergency plan required by [14/15.7.1](#) and the emergency egress drills required by [14/15.7.2](#) help to ensure that staff and students, working together as a team, close corridor doors as part of the emergency egress procedure.

## CHAPTER 15 • Existing

**15.3.6 Corridors.** Corridors shall be separated from other parts of the story by walls having a minimum ½-hour fire resistance rating in accordance with [Section 8.3](#), unless otherwise permitted by one of the following:

- (1) Corridor protection shall not be required where all spaces normally subject to student occupancy have not less than one door opening directly to the outside or to an exterior exit access balcony or corridor in accordance with [7.5.3](#).
- (2)\* The following shall apply to buildings protected throughout by an approved automatic sprinkler system with valve supervision in accordance with [Section 9.7](#):
  - (a) Corridor walls shall not be required to be rated, provided that such walls form smoke partitions in accordance with [Section 8.4](#).
  - (b) The provisions of [8.4.3.5](#) shall not apply to normally occupied classrooms.
- (3) Where the corridor ceiling is an assembly having a minimum ½-hour fire resistance rating where tested as a wall, the corridor wall shall be permitted to terminate at the corridor ceiling.
- (4) Lavatories shall not be required to be separated from corridors, provided that they are separated from all other spaces by walls having a minimum ½-hour fire resistance rating in accordance with [Section 8.3](#).
- (5) Lavatories shall not be required to be separated from corridors, provided that both of the following criteria are met:
  - (a) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#).
  - (b) The walls separating the lavatory from other rooms form smoke partitions in accordance with [Section 8.4](#).

**A.15.3.6(2)** This provision permits valve supervision in accordance with [Section 9.7](#), rather than requiring that the entire automatic sprinkler system be electrically supervised. It is intended that the valve supervision be performed electrically, not by chaining and locking the valves in the open position.

**Paragraph 14/15.3.6(3)** legitimizes the practice of designing a corridor protection system by building a tunnel with walls and ceilings constructed to meet the requirements of a 1-hour-rated wall assembly for new construction and by providing a ½-hour rating for existing assemblies.

The walls and doors that typically separate a school lavatory from the corridor often serve to isolate the lavatory, making incidents of violence or illegal drug use difficult to monitor by staff. In recognition of this problem, and given the typically low fuel loads associated with lavatories, [14/15.3.6\(4\)](#) exempts the wall

## CHAPTER 14 • New

separating the lavatory from the corridor from the rated construction requirement, provided that the rated corridor wall continuously separates the lavatory from adjacent rooms. This separation method permits lavatory doors to be omitted from the doorways. **Exhibit 14/15.37** illustrates this arrangement.

The provision of **14/15.3.6(5)** makes clear that, in addition to sprinkler protection, the wall separating the lavatory from its abutting neighbors needs to be a smoke partition, as is required of the corridor walls. The intent of **14/15.3.6(5)** is to combine parts of the concepts addressed in **14/15.3.6(2)** and (4). Where the entire building is protected by automatic sprinklers, the lavatory is permitted to be open to the corridor, and the walls

**Exhibit 14/15.37**

*Lavatory open to corridor but separated from adjacent rooms by continuous, rated corridor walls extending to building exterior walls.*

### 14.3.7 Subdivision of Building Spaces.

**14.3.7.1** Educational occupancies shall be subdivided into compartments by smoke partitions having not less than a 1-hour fire resistance rating and complying with **Section 8.4** where one or both of the following conditions exist:

- (1) The maximum floor area, including the aggregate area of all floors having a common atmosphere, exceeds 30,000 ft<sup>2</sup> (2800 m<sup>2</sup>).
- (2) The length or width of the building exceeds 300 ft (91 m).

**14.3.7.2** The requirement of **14.3.7.1** shall not apply to either of the following:

- (1) Where all spaces normally subject to student occupancy have not less than one door opening directly to the outside or to an exterior or exit access balcony or corridor in accordance with **7.5.3**
- (2) Buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with **Section 9.7**

## CHAPTER 15 • Existing

separating the lavatory from other rooms do not need to be fire rated but do need to form smoke partitions. **Exhibit 14/15.38** shows the opening to a lavatory where no doors separate the lavatory from the corridor.

**Exhibit 14/15.38**

*Lavatory opening without doors to corridor.*

### 15.3.7 Subdivision of Building Spaces.

**15.3.7.1** Educational occupancies shall be subdivided into compartments by smoke partitions having not less than a 1-hour fire resistance rating and complying with **Section 8.4** where one or both of the following conditions exist:

- (1) The maximum area of a compartment, including the aggregate area of all floors having a common atmosphere, exceeds 30,000 ft<sup>2</sup> (2800 m<sup>2</sup>).
- (2) The length or width of the building exceeds 300 ft (91 m).

**15.3.7.2** The requirement of **15.3.7.1** shall not apply to either of the following:

- (1) Where all classrooms have exterior exit access in accordance with **7.5.3**
- (2) Buildings protected throughout by an approved automatic sprinkler system in accordance with **Section 9.7**

## CHAPTER 14 • New

**14.3.7.3** The area of any smoke compartment required by **14.3.7.1** shall not exceed 30,000 ft<sup>2</sup> (2800 m<sup>2</sup>), with no dimension exceeding 300 ft (91 m).

The Code requires smoke barriers at maximum intervals of 300 ft (91 m) so that the products of combustion will not affect large numbers of occupants and their exits simultaneously. A primary concern is a situation in which a corridor becomes clogged with smoke, resulting in the loss of the exit access. Rooms with exterior exit access provide the occupants with a readily available, alternate means of escape in the event that a corridor fills with smoke.

**Exhibit 14/15.39** shows cross-corridor doors arranged to close in a fire emergency to complete the integrity of the smoke barrier that divides the floor into two smoke compartments.

The excellent record of automatic fire sprinkler systems permits the compartmentation requirements to be exempted in buildings with such systems.

The provision of **14/15.3.7.3** limits the area of a smoke compartment only if such compartmentation is required by **14/15.3.7.1** and not exempted by **14/15.3.7.2**.

## 14.4 Special Provisions

**14.4.1 Limited Access Buildings and Underground Buildings.** Limited access buildings and underground buildings shall comply with **Section 11.7**.

**14.4.2 High-Rise Buildings.** High-rise buildings shall comply with **Section 11.8**.

An educational occupancy high-rise building poses many of the same problems for occupants and fire-fighting forces that are posed by other occupancies located in high-rise buildings. Thus, the package of protection addressed by **Section 11.8** (i.e., automatic sprinkler, standpipe, alarm and communications, standby

### 14.4.3 Flexible Plan and Open Plan Buildings.

**14.4.3.1** Flexible plan and open plan buildings shall comply with the requirements of this chapter as modified by **14.4.3.2** through **14.4.3.5**.

## CHAPTER 15 • Existing

**15.3.7.3** The area of any smoke compartment required by **15.3.7.1** shall not exceed 30,000 ft<sup>2</sup> (2800 m<sup>2</sup>), with no dimension exceeding 300 ft (91 m).

**Exhibit 14/15.39**

*Cross-corridor doors in smoke barrier.*

## 15.4 Special Provisions

**15.4.1 Limited Access Buildings and Underground Buildings** Limited access buildings and underground buildings shall comply with **Section 11.7**.

**15.4.2 High-Rise Buildings.** High-rise buildings shall comply with **11.8.3.1**.

power, and emergency command center requirements) is mandatorily referenced for new construction; the sprinkler provisions of **11.8.3.1** are mandatorily referenced for existing educational occupancy high-rise buildings.

### 15.4.3 Flexible Plan and Open Plan Buildings.

**15.4.3.1** Flexible plan and open plan buildings shall comply with the requirements of this chapter as modified by **15.4.3.2** through **15.4.3.5**.

## CHAPTER 14 • New

**14.4.3.2** Each room occupied by more than 300 persons shall have two or more means of egress entering into separate atmospheres.

**14.4.3.3** Where three or more means of egress are required, the number of means of egress permitted to enter into the same atmosphere shall not exceed two.

**14.4.3.4** Flexible plan buildings shall be permitted to have walls and partitions rearranged periodically only if revised plans or diagrams have been approved by the authority having jurisdiction.

**14.4.3.5** Flexible plan buildings shall be evaluated while all folding walls are extended and in use as well as when they are in the retracted position.

Flexible plan and open plan buildings are addressed in 14/15.4.3. Rooms occupied by more than 300 persons require special treatment in flexible plan and open plan schools. To ensure the safety of this large number of persons occupying one room, means of egress must be arranged so that each of the egress paths traverses atmospheres that are separate from each other. If more than two separate means of egress paths are required, not more than two are permitted to pass through the same atmosphere. See the definition of *separate atmosphere* in 3.3.26.2. Using this arrangement should prevent a single fire from contaminating or blocking all egress routes in an open plan or flexible plan building.

Exhibit 14/15.40 illustrates a room in an open plan building that requires two or more means of egress into separate atmospheres.

In accordance with 14/15.4.3.4, approval of revised plans or diagrams is necessary to avoid the possibility of circuitous egress paths or other arrangements that do not comply with the intent of the Code. Also, flexible plan buildings are required to meet the provisions for corridor protection, as well as those for the subdivision of building spaces, using smoke barriers.

**14.4.4 Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers shall be protected in accordance with 8.7.3.1, unless all of the following requirements are met:

- (1) Dispensers shall be installed in rooms or spaces separated from corridors and exits.
- (2) The maximum individual dispenser fluid capacity shall be as follows:
  - (a) 0.32 gal (1.2 L) for dispensers in rooms
  - (b) 0.53 gal (2.0 L) for dispensers in suites of rooms
- (3) The dispensers shall be separated from each other by horizontal spacing of not less than 48 in. (1220 mm).
- (4) Storage of quantities greater than 5 gal (18.9 L) in a single fire compartment shall meet the requirements of NFPA 30, *Flammable and Combustible Liquids Code*.

## CHAPTER 15 • Existing

**15.4.3.2** Each room occupied by more than 300 persons shall have two or more means of egress entering into separate atmospheres.

**15.4.3.3** Where three or more means of egress are required, the number of means of egress permitted to enter into the same atmosphere shall not exceed two.

**15.4.3.4** Flexible plan buildings shall be permitted to have walls and partitions rearranged periodically only if revised plans or diagrams have been approved by the authority having jurisdiction.

**15.4.3.5** Flexible plan buildings shall be evaluated while all folding walls are extended and in use as well as when they are in the retracted position.

Exhibit 14/15.40

Room in open plan building requiring two or more means of egress into separate atmospheres.

**15.4.4 Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers shall be protected in accordance with 8.7.3.1, unless all of the following requirements are met:

- (1) Dispensers shall be installed in rooms or spaces separated from corridors and exits.
- (2) The maximum individual dispenser fluid capacity shall be as follows:
  - (a) 0.32 gal (1.2 L) for dispensers in rooms
  - (b) 0.53 gal (2.0 L) for dispensers in suites of rooms
- (3) The dispensers shall be separated from each other by horizontal spacing of not less than 48 in. (1220 mm).
- (4) Storage of quantities greater than 5 gal (18.9 L) in a single fire compartment shall meet the requirements of NFPA 30, *Flammable and Combustible Liquids Code*.

## CHAPTER 14 • New

- (5) The dispensers shall not be installed over or directly adjacent to an ignition source.
- (6) Dispensers installed directly over carpeted floors shall be permitted only in sprinklered rooms or spaces.

The provisions of 14/15.4.4 draw from material developed for the health care occupancies chapters to permit alcohol-based hand-rub (ABHR) dispensers. Although health care occupancies have a functional need to position such dispensers in corridors

Exhibit 14/15.41

Alcohol-based hand-rub (ABHR) dispenser mounted on wall.

## 14.5 Building Services

**14.5.1 Utilities.** Utilities shall comply with the provisions of Section 9.1.

The utilities referenced in 14/15.5.1 include the electrical system as addressed in 9.1.2. As more electronic equipment, such as computer stations, is utilized in classrooms, the electrical system might need upgrading to accommodate the electrical needs. Exhibit 14/15.42 shows a modern classroom with an electrical system that was planned at the time of construction to support many computer stations.

## CHAPTER 15 • Existing

- (5) The dispensers shall not be installed over or directly adjacent to an ignition source.
- (6) Dispensers installed directly over carpeted floors shall be permitted only in sprinklered rooms or spaces.

to permit hand sanitizing prior to entering a patient room and again upon leaving, no such need exists for educational occupancies. For educational occupancies, the ABHR dispensers are permitted only in rooms or spaces separated from the corridor. Exhibit 14/15.41 shows an ABHR dispenser mounted on a wall in a room.

Prior to the inclusion of the provisions for ABHR dispensers, the only option available to educational occupancies was to treat the alcohol solutions as flammable liquids subject to the provisions of 8.7.3, which meant the dispensers were prohibited from being placed in student-occupied areas. Dispensers not meeting all the criteria of 14/15.3.2.4(1) through (6) are subject to regulation as flammable liquids in accordance with 8.7.3.

The provisions of 8.7.3.3 for ABHR dispensers are new to the 2015 edition of the Code. The criteria of 8.7.3.3 are similar to those of 14/15.4.4 and require occupancy chapter permission for their use. The technical committee responsible for Chapters 14 and 15 on educational occupancies chose not to reference the use of 8.7.3.3 but to retain the criteria of 14/15.4.4(1) through (6), as the text of 8.7.3.3 had not been finalized. The technical committee intends to evaluate the criteria of 8.7.3.3 for purposes of referencing it for the next edition of the Code.

## 15.5 Building Services

**15.5.1 Utilities.** Utilities shall comply with the provisions of Section 9.1.

Exhibit 14/15.42

Modern classroom equipped with electrical system to support multiple computer stations.

## CHAPTER 14 • New

**14.5.2 Heating, Ventilating, and Air-Conditioning Equipment.**

**14.5.2.1** Heating, ventilating, and air-conditioning equipment shall comply with the provisions of [Section 9.2](#).

**14.5.2.2** Unvented fuel-fired heating equipment, other than gas space heaters in compliance with NFPA 54/ANSI Z223.1, *National Fuel Gas Code*, shall be prohibited.

It is not in the interest of reasonable life safety to permit unvented fuel-fired equipment in a school building occupied by children; the typical use of such equipment might jeopardize the life safety of the students. Improper venting and potential misuse by

**14.5.3 Elevators, Escalators, and Conveyors.** Elevators, escalators, and conveyors shall comply with the provisions of [Section 9.4](#).

Elevator machine rooms must be kept clear of any items other than elevator equipment. Such spaces become inviting for use as storage rooms. Elevator machine room doors are kept locked, and keys are usually restricted to those who have a functional need to access the room. [Exhibit 14/15.43](#) shows signage reminding occupants that storage is prohibited in the elevator machine room.

**14.5.4 Waste Chutes, Incinerators, and Laundry Chutes.** Waste chutes, incinerators, and laundry chutes shall comply with the provisions of [Section 9.5](#).

## CHAPTER 15 • Existing

**15.5.2 Heating, Ventilating, and Air-Conditioning Equipment.**

**15.5.2.1** Heating, ventilating, and air-conditioning equipment shall comply with the provisions of [Section 9.2](#).

**15.5.2.2** Unvented fuel-fired heating equipment, other than gas space heaters in compliance with NFPA 54/ANSI Z223.1, *National Fuel Gas Code*, shall be prohibited.

students might result in injury to students, especially younger children. [Paragraph 14/15.5.2.2](#) recognizes a special form of gas space heater that — although not vented in the conventional way — can be used safely.

**15.5.3 Elevators, Escalators, and Conveyors.** Elevators, escalators, and conveyors shall comply with the provisions of [Section 9.4](#).

**Exhibit 14/15.43**

*Sign warning that elevator machine room must not be used for storage.*

**15.5.4 Waste Chutes, Incinerators, and Laundry Chutes.** Waste chutes, incinerators, and laundry chutes shall comply with the provisions of [Section 9.5](#).

## CHAPTER 14 • New

**14.6 Reserved****14.7 Operating Features**

**14.7.1 Emergency Action Plan.** Emergency action plans shall be provided in accordance with [Section 4.8](#).

**14.7.2 Emergency Egress Drills.**

**14.7.2.1\*** Emergency egress drills shall be conducted in accordance with [Section 4.7](#) and the applicable provisions of [14.7.2.3](#) as otherwise provided in [14.7.2.2](#).

**A.14.7.2.1** The requirements are, of necessity, general in scope, as it is recognized that they apply to all types of educational occupancies as well as conditions of occupancies, such as truant schools; schools for the mentally handicapped, vision impaired, hearing impaired, and speech impaired; and public schools. It is fully recognized that no one code can meet all the conditions of the various buildings involved, and it will be necessary for site administrators to issue supplements to these requirements, but all supplements should be consistent with these requirements.

**14.7.2.2** Approved training programs designed for education and training and for the practice of emergency egress to familiarize occupants with the drill procedure, and to establish conduct of the emergency egress as a matter of routine, shall be permitted to receive credit on a one-for-one basis for not more than four of the emergency egress drills required by [14.7.2.3](#), provided that a minimum of four emergency egress drills are completed prior to the conduct of the first such training and practice program.

**14.7.2.3** Emergency egress drills shall be conducted as follows:

- (1) Not less than one emergency egress drill shall be conducted every month the facility is in session, unless both of the following criteria are met:
  - (a) In climates where the weather is severe, the monthly emergency egress drills shall be permitted to be deferred.
  - (b) The required number of emergency egress drills shall be conducted, and not less than four shall be conducted before the drills are deferred.
- (2) All occupants of the building shall participate in the drill.
- (3) One additional emergency egress drill, other than for educational occupancies that are open on a year-round basis, shall be required within the first 30 days of operation.

**14.7.2.4** All emergency drill alarms shall be sounded on the fire alarm system.

## CHAPTER 15 • Existing

**15.6 Reserved****15.7 Operating Features**

**15.7.1 Emergency Action Plans.** Emergency action plans shall be provided in accordance with [Section 4.8](#).

**15.7.2 Emergency Egress Drills.**

**15.7.2.1\*** Emergency egress drills shall be conducted in accordance with [Section 4.7](#) and the applicable provisions of [15.7.2.3](#) as otherwise provided by [15.7.2.2](#).

**A.15.7.2.1** The requirements are, of necessity, general in scope, as it is recognized that they apply to all types of educational occupancies as well as conditions of occupancies, such as truant schools; schools for the mentally handicapped, vision impaired, hearing impaired, and speech impaired; and public schools. It is fully recognized that no one code can meet all the conditions of the various buildings involved, and it will be necessary for site administrators to issue supplements to these requirements, but all supplements should be consistent with these requirements.

**15.7.2.2** Approved training programs designed for education and training and for the practice of emergency egress to familiarize occupants with the drill procedure, and to establish conduct of the emergency egress as a matter of routine, shall be permitted to receive credit on a one-for-one basis for not more than four of the emergency egress drills required by [15.7.2.3](#), provided that a minimum of four emergency egress drills are completed prior to the conduct of the first such training and practice program.

**15.7.2.3** Emergency egress drills shall be conducted as follows:

- (1) Not less than one emergency egress drill shall be conducted every month the facility is in session, unless both of the following criteria are met:
  - (a) In climates where the weather is severe, the monthly emergency egress drills shall be permitted to be deferred.
  - (b) The required number of emergency egress drills shall be conducted, and not less than four shall be conducted before the drills are deferred.
- (2) All occupants of the building shall participate in the drill.
- (3) One additional emergency egress drill, other than for educational occupancies that are open on a year-round basis, shall be required within the first 30 days of operation.

**15.7.2.4** All emergency drill alarms shall be sounded on the fire alarm system.

## CHAPTER 14 • New

Emergency egress drills for educational occupancies, particularly those at the grade school level, are essential to ensure an orderly response during a fire. Unfortunately, the predictability of such drills often leads to their ineffectiveness. When an alarm bell sounds and a fire department monitor appears in a corridor, some teachers ignore the bell, assuming that it is a false alarm. If the bell sounds and a fire department monitor is not seen, teachers opt either to evacuate or to remain in the building. This decision is made in the hallway. While the bell continues to ring, the students remain in their classrooms. Therefore, when a bell sounds, the primary emphasis should be placed on evacuation, regardless of who is or is not present in the hallways and regardless of whether fire equipment is parked in front of the school. Essentially, the fire department and the school should vary the timing and arrangement of the drills but not the required response, which is orderly evacuation. See also [Section 4.7](#).

**14.7.3 Inspection.**

**14.7.3.1\*** It shall be the duty of principals, teachers, or staff to inspect all exit facilities daily to ensure that all stairways, doors, and other exits are in proper condition.

**A.14.7.3.1** Particular attention should be given to keeping all doors unlocked; keeping doors that serve to protect the safety of paths of egress closed and under no conditions blocked open, such as doors on stairway enclosures; keeping outside stairs and fire escape stairs free from all obstructions and clear of snow and ice; and allowing no accumulation of snow or ice or materials of any kind outside exit doors that might prevent the opening of the door or interfere with rapid escape from the building.

Any condition likely to interfere with safe egress should be corrected immediately, if possible, or otherwise should be reported at once to the appropriate authorities.

**14.7.3.2** Open plan buildings shall require extra surveillance to ensure that exit paths are maintained clear of obstruction and are obvious.

**14.7.3.3 Inspection of Door Openings.** Door openings shall be inspected in accordance with [7.2.1.15](#).

Compliance with the requirement of [14/15.7.3.1](#) for daily inspection of the egress system has benefits that far outweigh the time and resources required to conduct such inspections. The provision permits staff, other than principals and teachers, to make such inspections. The inspection function is often better performed by maintenance personnel who have responsibility for, and intimate working knowledge of, the many building features and systems.

## CHAPTER 15 • Existing

The provisions of [14/15.7.2.2](#) permit emergency egress training programs to substitute for as many as four of the required monthly emergency egress drills. The mixture of training programs and emergency egress drills might elicit student egress behavior that is superior to that instilled by drills alone. However, at least four egress drills need to be conducted prior to the first training program to ensure that the students have walked the egress route and demonstrated other behavior addressed by the emergency plan. The concept behind the requirement that emergency drills be conducted at the start of the school year is that training without the hands-on instruction accomplished by drilling does not guarantee that students will be familiar with the egress routes and able to interact with others during an emergency evacuation or relocation.

**15.7.3 Inspection.**

**15.7.3.1\*** It shall be the duty of principals, teachers, or staff to inspect all exit facilities daily to ensure that all stairways, doors, and other exits are in proper condition.

**A.15.7.3.1** Particular attention should be given to keeping all doors unlocked; keeping doors that serve to protect the safety of paths of egress closed and under no conditions blocked open, such as doors on stairway enclosures; keeping outside stairs and fire escape stairs free from all obstructions and clear of snow and ice; and allowing no accumulation of snow or ice or materials of any kind outside exit doors that might prevent the opening of the door or interfere with rapid escape from the building.

Any condition likely to interfere with safe egress should be corrected immediately, if possible, or otherwise should be reported at once to the appropriate authorities.

**15.7.3.2** Open plan buildings shall require extra surveillance to ensure that exit paths are maintained clear of obstruction and are obvious.

**15.7.3.3 Inspection of Door Openings.** Door openings shall be inspected in accordance with [7.2.1.15](#).

The provision of [14/15.7.3.3](#) requires the inspection of door openings in accordance with [7.2.1.15](#). The criteria of [7.2.1.15](#) are formatted to apply only where specifically required by another portion of the *Code*. The inspection requirements apply only to specific doors. This application threshold was chosen to help ensure that the egress doors used under emergency egress or relocation are inspected and tested. Door leaves that are infrequently used, such as those that open into exit stair enclosures in

## CHAPTER 14 • New

high-rise buildings, might be misaligned within their frames so as to be difficult to open within the operating forces requirements of 7.2.1.4.5. The door inspection and testing criteria of

#### 14.7.4 Furnishings and Decorations.

**14.7.4.1** Draperies, curtains, and other similar furnishings and decorations in educational occupancies shall be in accordance with the provisions of 10.3.1.

**14.7.4.2** Clothing and personal effects shall not be stored in corridors, unless otherwise permitted by one of the following:

- (1) This requirement shall not apply to corridors protected by an automatic sprinkler system in accordance with Section 9.7.
- (2) This requirement shall not apply to corridor areas protected by a smoke detection system in accordance with Section 9.6.
- (3) This requirement shall not apply to storage in metal lockers, provided that the required egress width is maintained.

Clothing hung on hooks along corridor walls or on racks in school lobbies greatly increases the combustible load and will generally allow flame to spread quickly. Because Chapters 14 and 15 regulate the interior wall finish for corridors and lobbies, surfaces covered by combustible clothing that would allow flame to spread more quickly than is permitted by wall surfaces should not be created. The three provisions of 14/15.7.4.2 (control of fire by sprinklers, early warning of incipient-stage fire via smoke detection, or isolating fuel packages by locating the clothing in metal lockers) help to mitigate the potential for a clothing fire to render the exit access unusable. Exhibit 14/15.44 shows metal lockers in a corridor.

**14.7.4.3** Artwork and teaching materials shall be permitted to be attached directly to the walls in accordance with the following:

- (1) The artwork and teaching materials shall not exceed 20 percent of the wall area in a building that is not protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.
- (2) The artwork and teaching materials shall not exceed 50 percent of the wall area in a building that is protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.

## CHAPTER 15 • Existing

7.2.1.15 are intended to help identify problems with door openings and ensure that such problems are remedied. See 7.2.1.15.

#### 15.7.4 Furnishings and Decorations.

**15.7.4.1** Draperies, curtains, and other similar furnishings and decorations in educational occupancies shall be in accordance with the provisions of 10.3.1.

**15.7.4.2** Clothing and personal effects shall not be stored in corridors, unless otherwise permitted by one of the following:

- (1) This requirement shall not apply to corridors protected by an automatic sprinkler system in accordance with Section 9.7.
- (2) This requirement shall not apply to corridor areas protected by a smoke detection system in accordance with Section 9.6.
- (3) This requirement shall not apply to storage in metal lockers, provided that the required egress width is maintained.

Exhibit 14/15.44

Metal lockers in corridor.

**15.7.4.3** Artwork and teaching materials shall be permitted to be attached directly to the walls in accordance with the following:

- (1) The artwork and teaching materials shall not exceed 20 percent of the wall area in a building that is not protected throughout by an approved automatic sprinkler system in accordance with Section 9.7.
- (2) The artwork and teaching materials shall not exceed 50 percent of the wall area in a building that is protected throughout by an approved automatic sprinkler system in accordance with Section 9.7.

## CHAPTER 14 • New

It is advantageous not only to limit the quantity of artwork displayed but also to avoid placing such materials near a room's exit access doors. Because the combustibility of the artwork cannot be effectively controlled, the quantity, in terms of the percentage of wall area covered, is regulated to avoid creating a continuous combustible surface that will spread flame across the room. If the building is protected throughout by automatic sprinklers, the percentage of wall area permitted to be covered with artwork and teaching materials is increased to 50 percent. Exhibit 14/15.45 shows artwork and teaching materials affixed to walls in a classroom in a sprinklered school building.

NFPA technical staff often hears the criticism that the *Code* is overly restrictive and hampers day-to-day function by limiting the percentage of wall area that can be covered by artwork and teaching materials in educational occupancies. The commenters fail to realize that the wall artwork provision is a relaxation of earlier *Code* provisions, not a more stringent requirement. Prior to the recognition of artwork and teaching materials on up to 20 percent of wall area, such materials were treated like any other interior wall finish material. AHJs routinely prohibited all wall artwork unless there was proof the material met the requisite Class A, B, C interior finish classification requirements based on testing — something that paper and fiberboard cannot meet. The 20 percent criterion was established in accordance with the

**14.7.5 Open Flames.** Approved open flames shall be permitted in laboratories and vocational/technical areas.

## CHAPTER 15 • Existing

technical committee's judgment as to a quantity of material that would not spread flame continuously. The 50 percent allowance for sprinklered areas is a further relaxation that the technical committee offered when the educators said that 20 percent did not meet their educational needs.

Exhibit 14/15.45

*Sprinklered building classroom with artwork and teaching materials attached to walls.*

**15.7.5 Open Flames.** Approved open flames shall be permitted in laboratories and vocational/technical areas.

# New and Existing Day-Care Occupancies

Chapters 16 and 17 address not only traditional child day care, but also the growing field of adult day care. In both cases, these chapters recognize that many of the individuals who occupy these facilities are not totally capable of self-preservation. Very young children will require a certain amount of assistance from the day-care staff to help with relocation or evacuation. Likewise, some adults in adult day care will also require staff assistance during a fire emergency. For these reasons, Chapters 16 and 17 mandate select features that anticipate that these occupants will respond to a fire more slowly than is average. The requirements address a range of protection features, including the physical location of the day-care facility as it relates to the building construction type and the presence of automatic sprinklers.

The photographs used as exhibits in the commentary associated with Sections 16/17.1 through 16/17.5 and 16/17.7 were

shot at a day-care occupancy located in an inner city, multiple occupancy building that is predominantly a health care occupancy. Clients range from infants who are at least two months old through children 12 years of age. Exhibit 16/17.1 shows the main entrance to the day-care facility, which fronts onto a corridor shared with the health care areas of the building. Security is of paramount importance, and it can be achieved in concert with compliance with the requirements of this Code. Exhibit 16/17.2 is a close up of the equipment mounted to the left of the door, which is locked from the corridor side, including a security camera for video monitoring of the door area from within the day-care facility, a button for requesting staff attention, and electronic card reader for credentialed staff entry. The sign reads: *We are a secure site. You must be buzzed in. Please press the buzzer, located to your left, for assistance.*

Exhibit 16/17.1

Day-care occupancy main entrance in multiple occupancy building.

Exhibit 16/17.2

Security equipment associated with restricted entrance to day-care occupancy.

## 16.1 General Requirements

### 16.1.1\* Application.

**A.16.1.1** Day-care occupancies do not provide for the full-time maintenance of a client. Occupancies that provide a primary place of residence are addressed in other occupancy chapters. (See Chapters 24 through 33.)

## 17.1 General Requirements

### 17.1.1\* Application.

**A.17.1.1** Day-care occupancies do not provide for the full-time maintenance of a client. Occupancies that provide a primary place of residence are addressed in other occupancies. (See Chapters 24 through 33.)

## CHAPTER 16 • New

Table A.16.1.1 Staffing

Staff-to-Client Ratio	Age (mo.)
1:3	0–24
1:4	25–36
1:7	37–60
1:10	61–96
1:12	≥97
1:3	Clients incapable of self-preservation

The requirements of Chapter 16 are based on the need to adequately protect the occupants in case of fire. The requirements assume that adequate staffing will be available and are based on staffing similar to that outlined in Table A.16.1.1.

If staff-to-client ratios fall below those suggested by Table A.16.1.1, it is the responsibility of the authority having jurisdiction to determine the additional safeguards beyond the requirements of Chapter 16 that are necessary. Typical additional provisions might include restricting the day-care occupancy to the level of exit discharge, requiring additional smoke detection, requiring automatic sprinkler protection, requiring better or additional means of egress, and requiring similar types of provisions, depending on the situation.

Note that the last line of Table A16/A17.1.1 uses the term *clients incapable of self-preservation*. Client incapability of self-preservation is an important concept that recurs within numerous provisions of Chapter 16/17. See 16/17.1.1.6, 16.1.6.2, Table 17.1.6.1 Note d, 17.3.4.5, 16/17.6.1.1.3, 16/17.6.1.7.1, and 16/17.6.1.7.2. To better understand the term *incapable of self-preservation* as it relates to day-care occupancies, begin with the definition of the term *self-preservation* and its annex text as presented below.

**3.3.242\* Self-Preservation (Day-Care Occupancy).**

The ability of a client to evacuate a day-care occupancy without direct intervention by a staff member.

**A.3.3.242 Self-Preservation (Day-Care Occupancy).**

Examples of clients who are incapable of self-preservation include infants, clients who are unable to use stairs because of confinement to a wheelchair or other physical disability, and clients who cannot follow directions or a group to the outside of a facility due to mental or

## CHAPTER 17 • Existing

Table A.17.1.1 Staffing

Staff-to-Client Ratio	Age (mo.)
1:3	0–24
1:4	25–36
1:7	37–60
1:10	61–96
1:12	≥97
1:3	Clients incapable of self-preservation

The requirements of Chapter 17 are based on the need to adequately protect the occupants in case of fire. The requirements assume that adequate staffing will be available and are based on staffing similar to that outlined in Table A.17.1.1.

If staff-to-client ratios fall below those suggested by Table A.17.1.1, it is the responsibility of the authority having jurisdiction to determine the additional safeguards beyond the requirements of Chapter 17 that are necessary. Typical additional provisions might include restricting the day-care occupancy to the level of exit discharge, requiring additional smoke detection, requiring automatic sprinkler protection, requiring better or additional means of egress, and requiring similar types of items, depending on the situation.

behavioral disorders. It is the intent of this Code to classify children under the age of 24 months as incapable of self-preservation. Examples of direct intervention by staff members include carrying a client, pushing a client outside in a wheelchair, and guiding a client by direct hand-holding or continued bodily contact. If clients cannot exit the building by themselves with minimal intervention from staff members, such as verbal orders, classification as incapable of self-preservation should be considered.

Exhibit 16/17.3 shows an evacuation crib that permits one staff member to evacuate multiple clients who are incapable of self-preservation in one trip to the outside. As shown in Exhibit 16/17.4, the crib is on casters and its width passes through the door opening to the corridor/lobby within the day-care facility. Similarly, the crib will fit through the door opening from the day-care facility to the common corridor of the multiple occupancy building, and then to the outside where a ramped driveway provides access to the public way.

## CHAPTER 16 • New

## CHAPTER 17 • Existing

Exhibit 16/17.3

Evacuation crib for moving multiple clients incapable of self-preservation.

**16.1.1.1** The requirements of this chapter shall apply to new buildings or portions thereof used as day-care occupancies. (See 1.3.1.)

The provisions for new day-care occupancies are addressed in Chapter 16; the provisions for existing day-care occupancies (i.e., existing conditions in day-care occupancies) are addressed in Chapter 17.

In editions of the Code prior to 2006, renovations, additions, and changes of occupancy were required to comply with the requirements for new construction. For day-care occupancies, such renovations, additions, and changes of occupancy were required to meet the provisions of Chapter 16, while existing

Exhibit 16/17.4

Crib sized to pass through door openings along the egress route.

**17.1.1.1** The requirements of this chapter shall apply to existing buildings or portions thereof currently occupied as day-care occupancies.

conditions were subject to the provisions of Chapter 17. Since the 2006 edition of the Code, Chapter 43, Building Rehabilitation, has addressed the subject. Chapter 43 was written to promote the adaptive reuse of existing buildings without sacrificing the needed level of life safety. The provisions of Chapter 43 blend the requirements for new construction with those for existing conditions, so as to require additional life safety features as the rehabilitation work category increases in complexity. The rehabilitation work categories are repair, renovation, modification,

## CHAPTER 16 • New

reconstruction, change of use or change of occupancy classification, and addition. See 4.6.7, 4.6.11, 4.6.12.2, and Chapter 43.

Exhibit 16/17.5 shows a portion of a room in an existing day-care facility that has features in excess of those required by Chapter 17 for an existing day-care occupancy, such as emergency forces notification via an auxiliary fire alarm connection to the city fire department. Per the requirement of 4.6.12.2, no existing life safety feature is permitted to be reduced where such feature is a requirement for new construction. The provision of 16.3.4.4, applicable to new day-care occupancies, requires that the fire alarm system provide emergency forces notification in accordance with 9.6.4. The existing auxiliary fire alarm connection must be maintained.

**16.1.1.2 Administration.** The provisions of Chapter 1, Administration, shall apply.

**16.1.1.3 General.** The provisions of Chapter 4, General, shall apply.

The provisions of 16/17.1.1.2 and 16/17.1.1.3 remind the user that the administrative provisions of Chapter 1 and the general provisions of Chapter 4 apply.

**16.1.1.4** The requirements of Sections 16.1 through 16.5 and Section 16.7 shall apply to day-care occupancies in which more than 12 clients receive care, maintenance, and supervision by other than their relative(s) or legal guardian(s) for less than 24 hours per day.

## CHAPTER 17 • Existing

Exhibit 16/17.5

Existing day-care facility with features in excess of that required for existing day-care facilities.

**17.1.1.2 Administration.** The provisions of Chapter 1, Administration, shall apply.

**17.1.1.3 General.** The provisions of Chapter 4, General, shall apply.

**17.1.1.4** The requirements of Sections 17.1 through 17.5 and Section 17.7 shall apply to existing day-care occupancies in which more than 12 clients receive care, maintenance, and supervision by other than their relative(s) or legal guardian(s) for less than 24 hours per day. An existing day-care occupancy shall be

## CHAPTER 16 • New

**16.1.1.5** The requirements of [Section 16.1](#) and [Sections 16.4](#) through [16.7](#) shall apply to day-care homes as defined in [16.1.4](#).

**16.1.1.6** Where a facility houses more than one age group or self-preservation capability, the strictest requirements applicable to any group present shall apply throughout the day-care occupancy or building, as appropriate to a given area, unless the area housing such a group is maintained as a separate fire area.

**16.1.1.7** Places of religious worship shall not be required to meet the provisions of this chapter where providing day care while services are being held in the building.

The intent of [16/17.1.1.4](#) is to differentiate between institutions where clients are in residence 24 hours a day (such as orphanages) and day-care facilities where clients who normally reside at another location are provided care. A facility supplying “total care” for each client would provide laundries, dormitories, cafeterias, and other ancillary services not found in a day-care center. Other occupancy provisions of the *Code* would govern the life safety requirements of such a facility.

Note that, per [17.1.1.4](#) and [17.1.1.5](#), an existing day-care center or an existing day-care home meeting the requirements of [Chapter 16](#) is to be judged as meeting the requirements of [Chapter 17](#). Thus, if a new day-care center or day-care home is built in accordance with the requirements of [Chapter 16](#), it later becomes an existing facility. Because the requirements of [Chapters 16](#) and [17](#) differ, it would be unfair to re-examine the existing facility under the requirements of [Chapter 17](#), because the protection package provided in accordance with [Chapter 16](#) is as good as, if not better than, the package provided by compliance with the requirements of [Chapter 17](#).

The provisions of [16/17.1.1.6](#) tailor the protection package to the client group with the greatest needs. This concept is similar to that applied by [6.1.14.3](#) to a multiple occupancy protected as a mixed occupancy. [Paragraph 6.1.14.3.2](#) requires that the most stringent *Code* provisions applicable to any of the

**16.1.1.8 Multiple-Level Buildings.** For purposes of applying requirements of this chapter that utilize the term *level of exit discharge*, including determination of stories in height as addressed in [4.6.3](#), the level of exit discharge shall be permitted

## CHAPTER 17 • Existing

permitted the option of meeting the requirements of [Chapter 16](#) in lieu of [Chapter 17](#). An existing day-care occupancy that meets the requirements of [Chapter 16](#) shall be judged as meeting the requirements of [Chapter 17](#).

**17.1.1.5** The requirements of [Section 17.1](#) and [Sections 17.4](#) through [17.7](#) shall apply to existing day-care homes as defined in [17.1.4](#). An existing day-care home shall be permitted the option of meeting the requirements of [Chapter 16](#) in lieu of [Chapter 17](#). An existing day-care home that meets the requirements of [Chapter 16](#) shall be judged as meeting the requirements of [Chapter 17](#).

**17.1.1.6** Where a facility houses clients of more than one self-preservation capability, the strictest requirements applicable to any group present shall apply throughout the day-care occupancy or building, as appropriate to a given area, unless the area housing such a group is maintained as a separate fire area.

**17.1.1.7** Places of religious worship shall not be required to meet the provisions of this chapter where providing day care while services are being held in the building.

occupancies present must be applied throughout the facility, unless separate safeguards are approved.

For example, [16.1.6.2](#) requires smoke partitions in new day-care centers if clients are 2 years old or younger. If any client in a facility is 2 years old or younger, the floors of the building occupied by that client must be provided with smoke partitions. A portion of the facility separated from that occupied by a client who is 2 years old or younger is not required to have smoke partitions. A separated fire area is usually constructed with walls that have a fire resistance rating of 2 hours, as required by [Table 6.1.14.4.1\(a\)](#) or [Table 6.1.14.4.1\(b\)](#), or 1 hour where sprinklers are provided.

[Paragraph 16/17.1.1.7](#) addresses day care provided within a place of worship while religious services are being held. The parents of the clients of the day-care center would be among those attending a worship service; they and others assembled for the worship service would be expected to assist the day-care staff with any necessary evacuation. The requirements of [Chapters 16](#) and [17](#), therefore, do not apply under such circumstances. On the other hand, if day-care operations are conducted in the same building while religious services are not being conducted — such as during the work week — the day-care provisions of [Chapters 16](#) and [17](#) would apply.

**17.1.1.8 Multiple-Level Buildings.** For purposes of applying requirements of this chapter that utilize the term *level of exit discharge*, including determination of stories in height as addressed in [4.6.3](#), the level of exit discharge shall be permitted

CHAPTER 16 • New

to be the combination of floor levels as addressed in 16.1.1.8.1, 16.1.1.8.2, or 16.1.1.8.3.

**16.1.1.8.1** One floor level located not more than eight stair risers above the level of exit discharge shall be permitted to be considered part of the level of exit discharge.

**16.1.1.8.2** One floor level located not more than eight stair risers below the level of exit discharge shall be permitted to be considered part of the level of exit discharge.

**16.1.1.8.3** Where one floor level is located above the level of exit discharge, another floor level is located below the level of exit discharge, and not more than a total of eight stair risers separate the upper level from the lower level, the two floor levels shall be permitted to be considered part of the level of exit discharge.

**16.1.1.8.4** The provisions of 16.1.1.8.1, 16.1.1.8.2, and 16.1.1.8.3 shall not be used in combination with each other.

The provisions of 16/17.1.1.8 are new to the 2015 edition of the Code. Day-care homes, as addressed in 16/17.6, are often housed in residential structures such as dwellings. Split-level floor arrangements are common. The provisions of 16/17.1.1.8 permit one or more levels that are not the level of exit discharge

CHAPTER 17 • Existing

to be the combination of floor levels as addressed in 17.1.1.8.1, 17.1.1.8.2, or 17.1.1.8.3.

**17.1.1.8.1** One floor level located not more than eight stair risers above the level of exit discharge shall be permitted to be considered part of the level of exit discharge.

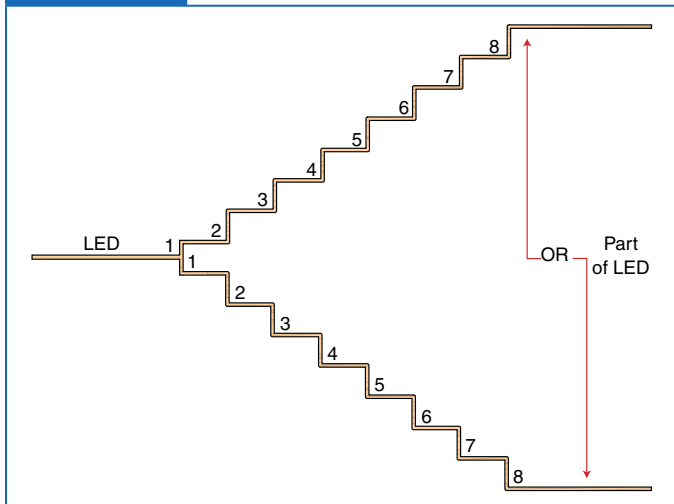

**17.1.1.8.2** One floor level located not more than eight stair risers below the level of exit discharge shall be permitted to be considered part of the level of exit discharge.

**17.1.1.8.3** Where one floor level is located above the level of exit discharge, another floor level is located below the level of exit discharge, and not more than a total of eight stair risers separate the upper level from the lower level, the two floor levels shall be permitted to be considered part of the level of exit discharge.

**17.1.1.8.4** The provisions of 17.1.1.8.1, 17.1.1.8.2, and 17.1.1.8.3 shall not be used in combination with each other.

(LED) to be considered part of the level of exit discharge. The same allowance is permitted for day-care facilities of any size. The application of 16/17.1.1.8 is depicted in Exhibit 16/17.6 and Exhibit 16/17.7.

Exhibit 16/17.6

One of the two levels located within 8 risers of the LED is permitted to be considered part of the LED.

**16.1.2 Classification of Occupancy.** See 6.1.4.

**16.1.2.1 General.** Occupancies that include preschools, kindergartens, and other schools whose purpose is primarily educational for children 24 months of age or older, even though the

Exhibit 16/17.7

Both of the levels located within 4 risers of the LED are permitted to be considered part of the LED.

**17.1.2 Classification of Occupancy.** See 6.1.4.

**17.1.2.1 General.** Occupancies that include preschools, kindergartens, and other schools whose purpose is primarily educational for children 24 months of age or older, even though the

## CHAPTER 16 • New

children who attend such schools are of preschool age, shall comply with the provisions of [Chapter 14](#).

### 16.1.2.2 Adult Day-Care Occupancies.

**16.1.2.2.1** Adult day-care occupancies shall include any building or portion thereof used for less than 24 hours per day to house more than three adults requiring care, maintenance, and supervision by other than their relative(s).

**16.1.2.2.2** Clients in adult day-care occupancies shall be ambulatory or semiambulatory and shall not be bedridden.

**16.1.2.2.3** Clients in adult day-care occupancies shall not exhibit behavior that is harmful to themselves or to others.

**16.1.2.3\* Conversions.** A conversion from a day-care home to a day-care occupancy with more than 12 clients shall be permitted only if the day-care occupancy conforms to the requirements of this chapter for new day-care occupancies with more than 12 clients.

**A.16.1.2.3** A conversion from a day-care occupancy with more than 12 clients to a day-care home is not considered a change of occupancy. The resulting day-care home should be permitted to meet the requirements of [Chapter 17](#) for existing day-care homes.

The specific reference to an adult day-care occupancy in [16/17.1.2.2](#) acknowledges that more and more senior citizens are being cared for in day-care centers similar to centers that have traditionally functioned as child day-care centers. The definition of an adult day-care occupancy includes the characteristics of clients who might be cared for in this type of occupancy. Essentially, the capabilities of adult day-care clients clarify that these occupancies are not nursing homes or old age homes but occupancies used by adults who are capable of self-preservation but who are in need of limited attendance, supervision, or observation.

Earlier editions of the *Code* included several cues for identifying adults who meet the criteria of adult day-care clients as described in the previous paragraph. However, to avoid the implication that medical training is necessary for assessing such adults, these cues were removed from the *Code*. It might be appropriate, however, to use some of the following guidelines from previous editions to determine the acceptability of a client for adult day care:

### 16.1.3 Multiple Occupancies.

**16.1.3.1 General.** Multiple occupancies shall be in accordance with [6.1.14](#).

**16.1.3.2 Atrium Walls Used in an Occupancy Separation.** Atrium walls in accordance with [6.1.14.4.6](#) shall be

## CHAPTER 17 • Existing

children who attend such schools are of preschool age, shall comply with the provisions of [Chapter 15](#).

### 17.1.2.2 Adult Day-Care Occupancies.

**17.1.2.2.1** Adult day-care occupancies shall include any building or portion thereof used for less than 24 hours per day to house more than three adults requiring care, maintenance, and supervision by other than their relative(s).

**17.1.2.2.2** Clients in adult day-care occupancies shall be ambulatory or semiambulatory and shall not be bedridden.

**17.1.2.2.3** Clients in adult day-care occupancies shall not exhibit behavior that is harmful to themselves or to others.

**17.1.2.3\* Conversions.** A conversion from a day-care home to a day-care occupancy with more than 12 clients shall be permitted only if the day-care occupancy conforms to the requirements of [Chapter 16](#) for new day-care occupancies with more than 12 clients.

**A.17.1.2.3** A conversion from a day-care occupancy with more than 12 clients to a day-care home is not considered a change of occupancy. The resulting day-care home should be permitted to meet the requirements of [Chapter 17](#) for existing day-care homes.

1. The client does not require medical injections from staff but might require the administration of oral medication by staff when and as prescribed by a licensed medical examiner.
2. The client might require limited supervision, attendance, or observation.
3. The client exhibits acceptable behavior (not harmful to self or others).

[Paragraph 16/17.1.2.3](#) addresses conversions that result in an increase in the number of clients to a number greater than 12. The conversion from a day-care home to a day-care center places a sufficiently greater number of clients at risk so as to justify imposing the requirements for new construction. If the conversion is made in reverse (i.e., from an existing day-care center to a day-care home), fewer clients are placed at risk. The existing protection package for the day-care center would be considered adequate to permit treating the post-conversion day-care home as an existing occupancy.

### 17.1.3 Multiple Occupancies.

**17.1.3.1 General.** Multiple occupancies shall be in accordance with [6.1.14](#).

**17.1.3.2 Atrium Walls Used in an Occupancy Separation.** Atrium walls in accordance with [6.1.14.4.6](#) shall be

## CHAPTER 16 • New

permitted to serve as part of the separation required by 6.1.14.4.1 for creating separated occupancies on a story-by-story basis in other than high-hazard industrial and high-hazard storage occupancies.

**16.1.3.3 Day-Care Occupancies in Apartment Buildings.** If the two exit accesses from a day-care occupancy enter the same corridor as an apartment occupancy, the exit accesses shall be separated in the corridor by a smoke partition complying with both of the following:

- (1) It shall have not less than a 1-hour fire resistance rating and shall be constructed in accordance with Section 8.4.
- (2) It shall be located so that it has an exit on each side.

Where a day-care occupancy is located in a building housing another occupancy, the operators of the day-care facility often have limited control over the safety procedures and precautions practiced by that occupancy. Subsection 16/17.1.3 requires additional protection to minimize the clients' exposure to potential hazards outside the day-care occupancy.

A day-care use with more than three clients is not permitted to be considered incidental to a predominant occupancy within the same building, except for a specialized case involving places of religious worship as specified in 16/17.1.1.7. See 6.1.14.1.3(2). Thus, the presence of a day-care use for more than three clients in a building with some other occupancy creates a multiple occupancy. As required by 16/17.1.3.1, the multiple occupancy must be protected in accordance with 6.1.14. Two protection options are offered: the multiple occupancy can be protected as a mixed occupancy, or it can be protected as separated occupancies.

Exhibit 16/17.8 depicts a corridor wall separating a day-care facility from the common corridor of a multiple occupancy building that is predominantly a hospital. One of the two means of egress for the day-care facility uses the shared corridor as exit access. Per the provision of 6.1.14.1.2, the shared exit access corridor arrangement imposes the requirement that the multiple occupancy be protected as a mixed occupancy — not as separated occupancies. The provision of 6.1.14.3.2 for mixed occupancies requires that the overall building comply with the most restrictive requirements of the occupancies involved — in this case, health care and day-care — unless separate safeguards are approved. It is this last condition, related to approved separate safeguards, that is used so as not to require the health care portions of the building to be provided with the full complement of smoke detection required of the day-care facility by the provisions of 16/17.3.4.5.

The provision of 16/17.1.3.2 permits use of the provision of 6.1.14.4.6 relative to atrium walls being part of the separation

## CHAPTER 17 • Existing

permitted to serve as part of the separation required by 6.1.14.4.1 for creating separated occupancies on a story-by-story basis in other than high-hazard industrial and high-hazard storage occupancies.

**17.1.3.3 Day-Care Occupancies in Apartment Buildings.** If the two exit accesses from a day-care occupancy enter the same corridor as an apartment occupancy, the exit accesses shall be separated in the corridor by a smoke partition complying with both of the following:

- (1) It shall have not less than a 1-hour fire resistance rating and shall be constructed in accordance with Section 8.4.
- (2) It shall be located so that it has an exit on each side.

Exhibit 16/17.8

Shared exit access corridor in multiple occupancy building protected as mixed occupancies.

that creates separated occupancies. However, 16/17.1.3.2 adds one criterion not found in 6.1.14.4.6 — the occupancies being separated from the day-care occupancy by the atrium walls must not be high-hazard industrial or high-hazard storage occupancies. See the commentary following 6.1.14.4.6.

The reason for the requirement of 16/17.1.3.3(1) for corridor subdivision by smoke partitions in accordance with Section 8.4 where day-care centers are located in an apartment building, and where the multiple occupancy is protected as a mixed occupancy, is the same as that used in Chapters 18 and 19 for health care facilities. This minimum construction will provide sufficient protection against flame and smoke spread to the other portion of the corridor. If use of one portion of the corridor is compromised by fire conditions, the day-care occupants can use the non-compromised portion of the corridor for exit access.

## CHAPTER 16 • New

**16.1.4 Definitions.**

**16.1.4.1 General.** For definitions, see [Chapter 3](#), Definitions.

**16.1.4.2 Special Definitions.** A list of special terms used in this chapter follows:

- (1) **Day-Care Home.** See [3.3.142.1](#).
- (2) **Flexible Plan and Open Plan Educational or Day-Care Building.** See [3.3.36.6](#).
- (3) **Self-Preservation (Day-Care Occupancy).** See [3.3.242](#).
- (4) **Separate Atmosphere.** See [3.3.26.2](#).

**16.1.5 Classification of Hazard of Contents.** The contents of day-care occupancies shall be classified as ordinary hazard in accordance with [Section 6.2](#).

**16.1.6 Location and Minimum Construction Requirements.**

**16.1.6.1** Day-care occupancies, other than day-care homes, shall be limited to the building construction types specified in [Table 16.1.6.1](#) based on the number of stories in height as defined in [4.6.3](#). (See [8.2.1](#).)

**16.1.6.2** Where day-care occupancies, other than day-care homes, with clients who are 24 months or less in age or who are incapable of self-preservation, are located one or more stories above the level of exit discharge, or where day-care occupancies are located two or more stories above the level of exit discharge, smoke partitions shall be provided to divide such stories into not less than two compartments. The smoke partitions shall be constructed in accordance with [Section 8.4](#) but shall not be required to have a fire resistance rating.

[Table 16.1.6.1](#) and [Table 17.1.6.1](#) coordinate the building construction type, the automatic sprinkler protection, and the highest story occupied as they relate to a day-care center. See [4.6.3](#), which explains that the number of stories in height is counted starting with the level of exit discharge and ending with the highest occupiable story containing the occupancy considered, which, in this case, is a day-care occupancy. For example, a new or existing day-care center is permitted to be located on the first story (i.e., the level of exit discharge) in any building, regardless of construction type or automatic sprinkler protection. For a new day-care center located on the second story (i.e., one story above the level of exit discharge) in a nonsprinklered building, the building must be of Type I(442), Type I(332), or Type II(222) construction. In the case of an existing day-care center where the clients are capable of self-preservation, Type II(111), Type III(211), and Type V(111) construction are permitted in addition to Type I(442), Type I(332), Type II(222), or Type II(000) construction.

## CHAPTER 17 • Existing

**17.1.4 Definitions.**

**17.1.4.1 General.** For definitions, see [Chapter 3](#), Definitions.

**17.1.4.2 Special Definitions.** A list of special terms used in this chapter follows:

- (1) **Day-Care Home.** See [3.3.142.1](#).
- (2) **Flexible Plan and Open Plan Educational or Day-Care Building.** See [3.3.36.6](#).
- (3) **Self-Preservation (Day-Care Occupancy).** See [3.3.242](#).
- (4) **Separate Atmosphere.** See [3.3.26.2](#).

**17.1.5 Classification of Hazard of Contents.** The contents of day-care occupancies shall be classified as ordinary hazard in accordance with [Section 6.2](#).

**17.1.6 Location and Minimum Construction Requirements.**

**17.1.6.1** Day-care occupancies, other than day-care homes, shall be limited to the building construction types specified in [Table 17.1.6.1](#) based on the number of stories in height as defined in [4.6.3](#). (See [8.2.1](#).)

**17.1.6.2 Reserved.**

If the building is of any other construction type, the day-care center is permitted to be located one story above the level of exit discharge only if the building is protected by automatic sprinklers. For other possible combinations of story height, building construction type, and building sprinklering, see [Table 16.1.6.1](#) and [Table 17.1.6.1](#).

Although [Table 16.1.6.1](#) permits new day-care occupancies on floors above the first story if the building is of the required construction type and is sprinklered, the *Code* recognizes that rapid vertical movement to the level of exit discharge might be difficult. Therefore, per [16.1.6.2](#), where clients who are 24 months old or younger, or who are incapable of self-preservation, are located above the level of exit discharge, the floor must be subdivided into two compartments using smoke partitions. The intent is that at least one of the two compartments on the floor is expected to be unaffected by any fire for the time necessary to summon assistance and evacuate, or for the time necessary to

Table 16.1.6.1 Construction Type Limitations

<sup>c</sup>One story below the level of exit discharge.

control the fire, so that evacuation is unnecessary. This requirement was added to the Code in 1994 for new day-care occupancies, but the provision was not applied to existing day-care centers, as there was not sufficient justification to impose the requirement retroactively.

Exhibit 16/17.9 shows a building housing an existing day-care occupancy and an abutting building. Note the support columns embedded in concrete. The buildings are of Type II(222) construction as they are part of a multistory hospital complex. The buildings are protected throughout by approved, supervised automatic sprinkler systems. The day-care occupancy is on the level of exit discharge and is, therefore, one story in height for purposes of applying Table 17.1.6.1. Table 17.1.6.1 permits an existing day-care occupancy to be located on the first story (i.e., the level of exit discharge) in any building, regardless of construction type or automatic sprinkler protection. Similarly,

Exhibit 16/17.9

Building construction type adequate for housing a day-care occupancy.

<sup>b</sup>Sprinklered throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7. (See 17.3.5.)

<sup>c</sup>One story below the level of exit discharge.

<sup>d</sup>Permitted only if clients capable of self-preservation.

Table 16.1.6.1 permits a new day-care occupancy to be located on the first story in any building, regardless of construction type or automatic sprinkler protection. The choice of building construction type, in this case, was influenced by the health care

occupancy provisions of 18/19.1.6, as the day-care facility occupies a small part of the multiple-story buildings comprising the hospital complex.

### 16.1.7 Occupant Load.

**16.1.7.1** The occupant load, in number of persons for whom means of egress and other provisions are required, either shall be determined on the basis of the occupant load factors of Table 7.3.1.2 that are characteristic of the use of the space or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

### 17.1.7 Occupant Load.

**17.1.7.1** The occupant load, in number of persons for whom means of egress and other provisions are required, either shall be determined on the basis of the occupant load factors of Table 7.3.1.2 that are characteristic of the use of the space or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

## CHAPTER 16 • New

**16.1.7.2** Where the occupant load is determined as the maximum probable population of the space in accordance with 16.1.7.1, an approved aisle, seating, and exiting diagram shall be required by the authority having jurisdiction to substantiate such a modification.

Many jurisdictions that license day-care centers require such facilities to provide a net area of 35 ft<sup>2</sup> (3.3 m<sup>2</sup>) per client for functional reasons other than life safety. In Table 7.3.1.2, the Code establishes the 35 ft<sup>2</sup> (3.3 m<sup>2</sup>) net area occupant load factor solely for the purpose of calculating occupant load and associated egress capacity. The occupant load is required to be the maximum number of persons expected to occupy the floor but not less than the number calculated using the occupant load factor.

Exhibit 16/17.10 shows an existing day-care facility space with potential for heavy client use. The occupant load of the overall facility is 40, as calculated using the 35 ft<sup>2</sup> (3.3 m<sup>2</sup>) net area occupant load factor of Table 7.3.1.2 for a day-care use. The day-care providers do not use the facility for more than 29 clients. The occupant load is the larger of the two values — 40 persons. The facility is required to have two means of egress in accordance with 17.2.4.2. Each 32 in. (810 mm) clear width door opening from the facility provides egress capacity for 160 persons (see 7.3.3.1). The two doors, together, accommodate 320 persons, which far exceeds the occupant load. Yet, in analyzing the egress capacity of the floor of this multiple occupancy building, it is important to determine occupant load carefully, as the day-care facility shares common exit access with other use spaces. The common exit access, exit, and exit discharge must be sized to accommodate the aggregated occupant loads.

## 16.2 Means of Egress Requirements

**16.2.1 General.** Means of egress shall be in accordance with Chapter 7 and Section 16.2.

### 16.2.2 Means of Egress Components.

**16.2.2.1 Components Permitted.** Components of means of egress shall be limited to the types described in 16.2.2.2 through 16.2.2.10.

#### 16.2.2.2 Doors.

**16.2.2.2.1 General.** Doors complying with 7.2.1 shall be permitted.

**16.2.2.2.2 Panic Hardware or Fire Exit Hardware.** Any door in a required means of egress from an area having an occupant load of 100 or more persons shall be permitted to be provided with a latch or lock only if the latch or lock is panic hardware or fire exit hardware complying with 7.2.1.7.

## CHAPTER 17 • Existing

**17.1.7.2** Where the occupant load is determined as the maximum probable population of the space in accordance with 17.1.7.1, an approved aisle, seating, and exiting diagram shall be required by the authority having jurisdiction to substantiate such a modification.

Exhibit 16/17.10

*Day-care facility subject to occupant load determination.*

## 17.2 Means of Egress Requirements

**17.2.1 General.** Means of egress shall be in accordance with Chapter 7 and Section 17.2.

### 17.2.2 Means of Egress Components.

**17.2.2.1 Components Permitted.** Components of means of egress shall be limited to the types described in 17.2.2.2 through 17.2.2.10.

#### 17.2.2.2 Doors.

**17.2.2.2.1 General.** Doors complying with 7.2.1 shall be permitted.

**17.2.2.2.2 Panic Hardware or Fire Exit Hardware.** Any door in a required means of egress from an area having an occupant load of 100 or more persons shall be permitted to be provided with a latch or lock only if the latch or lock is panic hardware or fire exit hardware complying with 7.2.1.7.

## CHAPTER 16 • New

**16.2.2.2.3 Special Locking Arrangements.**

**16.2.2.2.3.1** Delayed-egress locking systems complying with 7.2.1.6.1 shall be permitted.

**16.2.2.2.3.2** Access-controlled egress door assemblies complying with 7.2.1.6.2 shall be permitted.

**16.2.2.2.3.3** Elevator lobby exit access door assemblies locking in accordance with 7.2.1.6.3 shall be permitted.

**16.2.2.2.4\* Door Latches.** Every door latch to closets, storage areas, kitchens, and other similar spaces or areas shall be such that clients can open the door from inside the space or area.

**A.16.2.2.2.4** The purpose of this requirement is to prevent arrangements whereby a client can be trapped in a space or area. It is intended that this provision be broadly interpreted by the authority having jurisdiction to include equipment such as refrigerators and freezers.

**16.2.2.2.5 Bathroom Doors.** Every bathroom door lock shall be designed to allow opening of the locked door from the outside by an opening device that shall be readily accessible to the staff.

The requirement of 16/17.2.2.2.2 for panic hardware or fire exit hardware is based on the total occupant load of the area served, not on the required capacity of the door. For example, if an area has an occupant load of 120 persons and is served by three doors, each door is required only to have a capacity for 40 persons. However, since each of these doors serves the common area with 100 or more persons, any latches on these doors must be arranged to be released by panic hardware or fire exit hardware. The concept employed recognizes that it is not possible to predict how many occupants will move to any one of the doors serving the area. The number of persons from the assembled group of 100 or more who travel to any one of the doors might be sufficiently large to cause crowding and shoving. Panic hardware and fire exit hardware are designed to release the door latch when building occupants push up against the actuating mechanism (typically a push pad or bar that must extend across at least one-half the width of the door in accordance with 7.2.1.7).

The provisions of 7.2.1.6.1 for delayed-egress locks, as permitted by 16/17.2.2.2.3.1, were developed for educational occupancies. Delayed-egress locking provisions were added to Chapter 7 based on hardware development that addressed school security concerns related to students admitting unauthorized persons, such as drug dealers, at perimeter doors that could not be visually monitored. Day-care occupancies might employ delayed egress locks to prevent clients from leaving the facility prior to the time that staff can react. Exhibit 16/17.11 depicts such use for the day-care facility outdoor courtyard featured in Exhibit 16/17.9. The second means of egress for the

## CHAPTER 17 • Existing

**17.2.2.2.3 Special Locking Arrangements.**

**17.2.2.2.3.1** Delayed-egress locking systems complying with 7.2.1.6.1 shall be permitted.

**17.2.2.2.3.2** Access-controlled egress door assemblies complying with 7.2.1.6.2 shall be permitted.

**17.2.2.2.3.3** Elevator lobby exit access door assemblies locking in accordance with 7.2.1.6.3 shall be permitted.

**17.2.2.2.4\* Door Latches.** Every door latch to closets, storage areas, kitchens, and other similar spaces or areas shall be such that clients can open the door from inside the space or area.

**A.17.2.2.2.4** The purpose of this requirement is to prevent arrangements where a client can be trapped in a space or area. It is intended that this provision be broadly interpreted by the authority having jurisdiction to include equipment such as refrigerators and freezers.

**17.2.2.2.5 Bathroom Doors.** Every bathroom door lock shall be designed to allow opening of the locked door from the outside by an opening device that shall be readily accessible to the staff.

day-care facility uses a door that takes clients from the exterior courtyard into and through an abutting building. The door is equipped with delayed egress hardware. The sign required for delayed-egress hardware use is shown in Exhibit 16/17.12.

The provision of 16/17.2.2.2.4 applies not only to closets but to storage areas, kitchens, and other similar spaces. Day-care clients might otherwise be trapped as explained in A.16/A.17.2.2.2.4.

Exhibit 16/17.11

Door with delayed-egress hardware in second means of egress route.

## CHAPTER 16 • New

## CHAPTER 17 • Existing

## Exhibit 16/17.12

Signage on door with delayed-egress hardware.

**16.2.2.3\* Stairs.** Stairs complying with 7.2.2 shall be permitted.

**A.16.2.2.3** See A.7.2.2.4.5.4 regarding additional handrails on stairs that are used extensively by children 5 years of age or less.

Since the 2006 edition of the Code, 17.2.2.3, applicable to existing stairs, references the provisions of 7.2.2 without further modification. In earlier editions, existing stairs for client use were required to be those stairs that were formerly designated as Class A stairs. Subsection 7.2.2 was revised for the 2006 edition

**16.2.2.4 Smokeproof Enclosures.** Smokeproof enclosures complying with 7.2.3 shall be permitted.

**16.2.2.5 Horizontal Exits.** Horizontal exits complying with 7.2.4 shall be permitted.

Paragraph 17.2.2.5.2 requires an existing nonsprinklered building with a day-care occupancy located above the fifth story to have horizontal exits or smokeproof enclosures to help ensure that

**17.2.2.3\* Stairs.** Stairs complying with 7.2.2 shall be permitted.

**A.17.2.2.3** See A.7.2.2.4.5.4 regarding additional handrails on stairs that are used extensively by children 5 years of age and under.

to eliminate the Class A and Class B designations for existing stairs. The existing stairs provisions in Table 7.2.2.1.1(b) permit the stair features formerly designated for Class B stairs to suffice for all existing installations.

**17.2.2.4 Smokeproof Enclosures.** Smokeproof enclosures complying with 7.2.3 shall be permitted.

**17.2.2.5 Horizontal Exits.**

**17.2.2.5.1** Horizontal exits complying with 7.2.4 shall be permitted.

**17.2.2.5.2** Day-care occupancies located six or more stories above the level of exit discharge shall have horizontal exits to provide areas of refuge, unless the building meets one of the following criteria:

- (1) The building is provided with smokeproof enclosures.
- (2) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.

clients will survive a fire. The smokeproof enclosures or the areas of refuge created by the horizontal exit provide the occupant with the protection needed where no sprinklers are provided to

## CHAPTER 16 • New

control or extinguish the fire. A similar provision does not apply to new day-care centers, because [Table 16.1.6.1](#) requires sprinklers in buildings that house day-care centers above the fourth story.

[Table 17.1.6.1](#) would permit the continued use of an existing day-care center located above the fourth story of a non-sprinklered building if the building were of minimum 2-hour fire resistance-rated construction. However, such continued use would not be permitted within the high-rise portion of that

**16.2.2.6 Ramps.** Ramps complying with [7.2.5](#) shall be permitted.

**16.2.2.7 Exit Passageways.** Exit passageways complying with [7.2.6](#) shall be permitted.

**16.2.2.8 Fire Escape Ladders.** Fire escape ladders complying with [7.2.9](#) shall be permitted.

**16.2.2.9 Alternating Tread Devices.** Alternating tread devices complying with [7.2.11](#) shall be permitted.

Fire escape ladders and alternating tread devices are permitted egress components for day-care occupancies, but only within the constraints detailed in [7.2.9](#) and [7.2.11](#). The provisions of [7.2.9](#) and [7.2.11](#) restrict the use of fire escape ladders and alternating tread devices to normally unoccupied areas, such as rooftops, or to mechanical equipment platforms subject to occupancy by not more than three persons who are all capable of using the ladder or alternating tread device. This means that fire escape ladders and alternating tread devices are not egress components permitted within the required means of egress for day-care clients.

[Exhibit 16/17.13](#) shows a fire escape ladder at the roof level of a building that houses a day-care occupancy. The ladder is used for accessing a normally unoccupied roof space. The ladder is not within the egress path used by the day-care occupancy clients.

**16.2.2.10 Areas of Refuge.** Areas of refuge complying with [7.2.12](#) shall be permitted.

**16.2.3 Capacity of Means of Egress.** Capacity of means of egress shall be in accordance with [Section 7.3](#).

**16.2.4 Number of Means of Egress.**

**16.2.4.1** The number of means of egress shall be in accordance with [Section 7.4](#).

## CHAPTER 17 • Existing

building. If an existing day-care center is located in the high-rise portion of a building [i.e., on a floor more than 75 ft (23 m) above the lowest level of fire department vehicle access — see [3.3.36.7](#)], [Table 17.1.6.1](#) requires sprinkler protection for the entire building and further requires that the building be of minimum 2-hour fire resistance-rated construction. Thus, the provision of [17.2.2.5.2](#) would apply only where day-care clients occupy floors above the fifth story and not a floor in the high-rise portion of a nonsprinklered building.

**17.2.2.6 Ramps.** Ramps complying with [7.2.5](#) shall be permitted.

**17.2.2.7 Exit Passageways.** Exit passageways complying with [7.2.6](#) shall be permitted.

**17.2.2.8 Fire Escape Ladders.** Fire escape ladders complying with [7.2.9](#) shall be permitted.

**17.2.2.9 Alternating Tread Devices.** Alternating tread devices complying with [7.2.11](#) shall be permitted.

**Exhibit 16/17.13**

*Fire escape ladder for accessing rooftop, not within day-care occupancy egress path.*

**17.2.2.10 Areas of Refuge.** Areas of refuge complying with [7.2.12](#) shall be permitted.

**17.2.3 Capacity of Means of Egress.** Capacity of means of egress shall be in accordance with [Section 7.3](#).

**17.2.4 Number of Means of Egress.**

**17.2.4.1** The number of means of egress shall be in accordance with [7.4.1.1](#) and [7.4.1.3](#) through [7.4.1.6](#).

## CHAPTER 16 • New

**16.2.4.2** Not less than two separate exits shall be in accordance with both of the following criteria:

- (1) They shall be provided on every story.
- (2) They shall be accessible from every part of every story and mezzanine; however, exit access travel shall be permitted to be common for the distance permitted as common path of travel by [16.2.5.3](#).

**16.2.4.3 Reserved.**

The provision of [16/17.2.4.1](#) provides the needed roadmap to the requirements of [Section 7.4](#). The provision of [16/17.2.4.2\(2\)](#) clarifies that the required access to two separate exits need not occur immediately upon beginning the egress path, because common path of travel is permitted as detailed in [16/17.2.5.3](#).

Access must be provided to a minimum of two exits, both of which must be located on the floor or story in question. Contrast this requirement with a related provision for industrial occupancies that requires access to two exits but mandates that only one of those required exits be located on the floor or story (see [40.2.4.1.1](#)). Thus, in a day-care occupancy, an open exit access stair, if it were permitted without violating the provisions applicable to the protection of vertical openings, would be permitted to serve as exit access only if the requirement for two exits on the floor is first satisfied. In a multistory day-care occupancy building, the requirements of [16/17.2.4.2](#) are typically met by providing two properly enclosed exit stairs that can be accessed from all floors.

## CHAPTER 17 • Existing

**17.2.4.2** Not less than two separate exits shall be in accordance with both of the following criteria:

- (1) They shall be provided on every story.
- (2) They shall be accessible from every part of every story and mezzanine; however, exit access travel shall be permitted to be common for the distance permitted as common path of travel by [17.2.5.3](#).

**17.2.4.3** Where the story below the level of exit discharge is occupied as a day-care occupancy, [17.2.4.3.1](#) and [17.2.4.3.2](#) shall apply.

**17.2.4.3.1** One means of egress shall be an outside or interior stair in accordance with [7.2.2](#). An interior stair, if used, shall serve only the story below the level of exit discharge. The interior stair shall be permitted to communicate with the level of exit discharge; however, the exit route from the level of exit discharge shall not pass through the stair enclosure.

**17.2.4.3.2** The second means of egress shall be permitted to be via an unenclosed stairway separated from the level of exit discharge in accordance with [8.6.5](#).

**17.2.4.3.3** The path of egress travel on the level of exit discharge shall be protected in accordance with [7.1.3.1](#), unless one of the following criteria is met:

- (1) The path of egress on the level of exit discharge shall be permitted to be unprotected if the level of exit discharge and the level below the level of exit discharge are protected throughout by a smoke detection system.
- (2) The path of egress on the level of exit discharge shall be permitted to be unprotected if the level of exit discharge and the level below the level of exit discharge are protected throughout by an approved automatic sprinkler system.

The provisions of [17.2.4.3](#) contain requirements for existing day-care centers located below the level of exit discharge. (Similar provisions do not appear in [Chapter 16](#), because [Table 16.1.6.1](#) requires complete sprinkling of the building if a new day-care center is located below the first story.) This requirement helps to ensure that the occupants of the lower level have a protected egress path that doesn't force them to traverse the street floor. The requirement does help but doesn't guarantee safe egress, because a convenience door is permitted from the street floor into the lower level's stair enclosure. If a fire were to occur on the street floor, and if someone were to wedge the door open, smoke and other effects of fire could enter the stair designated for use by the occupants of the lower level. Diligent enforcement is needed to ensure that the self-closing door will not be improperly held open. The intent of [17.2.4.3](#) is illustrated in [Exhibit 16/17.14](#).

Exhibit 16/17.14

*Egress for levels below level of exit discharge — existing day-care occupancies.*

### 16.2.5 Arrangement of Means of Egress. See also 16.1.6.2.

**16.2.5.1** Means of egress shall be arranged in accordance with Section 7.5.

**16.2.5.2** No dead-end corridor shall exceed 20 ft (6100 mm), other than in buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7, in which case dead-end corridors shall not exceed 50 ft (15 m).

**16.2.5.3** Limitations on common path of travel shall be in accordance with 16.2.5.3.1 and 16.2.5.3.2.

**16.2.5.3.1** Common path of travel shall not exceed 100 ft (30 m) in a building protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.

**16.2.5.3.2** Common path of travel shall not exceed 75 ft (23 m) in a building not protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.

### 17.2.5 Arrangement of Means of Egress.

**17.2.5.1** Means of egress shall be arranged in accordance with Section 7.5.

**17.2.5.2** No dead-end corridor shall exceed 20 ft (6100 mm), other than in buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7, in which case dead-end corridors shall not exceed 50 ft (15 m).

**17.2.5.3** Limitations on common path of travel shall be in accordance with 17.2.5.3.1 and 17.2.5.3.2.

**17.2.5.3.1** Common path of travel shall not exceed 100 ft (30 m) in a building protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.

**17.2.5.3.2** Common path of travel shall not exceed 75 ft (23 m) in a building not protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.

**17.2.5.4** The story used below the level of exit discharge shall be in accordance with 17.2.4.3.

## CHAPTER 16 • New

Paragraph 7.5.1.1.4 permits individual occupancy chapters to set limits for common paths of travel. Paragraph 16/17.2.5.3 establishes the maximum common path of travel for day-care occupancies as 100 ft (30 m), if the building is protected throughout by an approved, supervised automatic sprinkler system, and limits the common path of travel to 75 ft (23 m) where the sprinkler criteria are not met. The 75 ft (23 m) limit is strict enough to help ensure that occupants can safely tolerate traveling in only one direction for a limited distance before reaching a point where travel in independent directions becomes possible. The increase to 100 ft (30 m) recognizes that fire control by sprinklers increases the safe travel time along the single available path.

### 16.2.6 Travel Distance to Exits.

**16.2.6.1** Travel distance shall be measured in accordance with Section 7.6.

**16.2.6.2** Travel distance shall meet all of the following criteria, unless otherwise permitted by 16.2.6.3:

- (1) The travel distance between any room door intended as an exit access and an exit shall not exceed 100 ft (30 m).
- (2) The travel distance between any point in a room and an exit shall not exceed 150 ft (46 m).
- (3) The travel distance between any point in a sleeping room and an exit access door in that room shall not exceed 50 ft (15 m).

**16.2.6.3** The travel distance required by 16.2.6.2(1) and (2) shall be permitted to be increased by 50 ft (15 m) in buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.

Exhibit 16/17.15 illustrates the travel distance limitations of 16/17.2.6.

The maximum permitted travel distance from a room door to the nearest exit (e.g., the path from the exit access door to the corridor shown as C1 to E1 or C2 to E2 in Exhibit 16/17.15) is 100 ft (30 m); if the building is sprinklered, the maximum is extended to 150 ft (46 m) in accordance with 16/17.2.6.3. Note that, for new construction, the Code requires that the sprinkler system be supervised to permit the 50 ft (15 m) increase in allowable travel distance.

The maximum travel distance from a point in a sleeping room to an exit access door from that room (path X1 to C1) is 50 ft (15 m). This travel distance limit within a sleeping room is not permitted to be increased, even if the building is sprinklered.

The total travel distance permitted from any point in a sleeping room to an exit (path X1 to E1) is 150 ft (46 m), unless the building is sprinklered, as explained in 16/17.2.6.3. In a

## CHAPTER 17 • Existing

Paragraph 7.5.1.5 permits individual occupancy chapters to establish limits for dead-end corridors. The dead-end corridor limitation for day-care occupancies is 20 ft (6100 mm), as permitted by 16/17.2.5.2 — and the limitation appears reasonable. However, 16/17.2.5.2 permits the dead-end corridor to be increased by 30 ft (9.1 m) to a maximum of 50 ft (15 m) in recognition of the fire-controlling capabilities of a sprinkler system. A floor arrangement with outside doors or stairways at both ends of a central corridor typically creates no dead-end corridors. Dead-end corridor pockets might be created where stairways are not located at the end of corridors but are located at intermediate points.

### 17.2.6 Travel Distance to Exits.

**17.2.6.1** Travel distance shall be measured in accordance with Section 7.6.

**17.2.6.2** Travel distance shall meet all of the following criteria, unless otherwise permitted by 17.2.6.3:

- (1) The travel distance between any room door intended as an exit access and an exit shall not exceed 100 ft (30 m).
- (2) The travel distance between any point in a room and an exit shall not exceed 150 ft (46 m).
- (3) The travel distance between any point in a sleeping room and an exit access door in that room shall not exceed 50 ft (15 m).

**17.2.6.3** The travel distance required by 17.2.6.2(1) and (2) shall be permitted to be increased by 50 ft (15 m) in buildings protected throughout by an approved automatic sprinkler system in accordance with Section 9.7.

Maximum travel distance in a day-care occupancy.

## CHAPTER 16 • New

sprinklered building, the total permitted travel distance associated with a sleeping room is 200 ft (61 m) only if the full 50 ft (15 m) of within-room exit access and the full 150 ft (46 m) of corridor exit access are used.

For rooms other than sleeping rooms, the total travel distance permitted from any point in a nonsleeping room to an exit

**16.2.7 Discharge from Exits.** Discharge from exits shall be arranged in accordance with [Section 7.7](#).

**16.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with [Section 7.8](#).

**16.2.9 Emergency Lighting.** Emergency lighting shall be provided in accordance with [Section 7.9](#) in the following areas:

- (1) Interior stairs and corridors
- (2) Assembly use spaces
- (3) Flexible and open plan buildings
- (4) Interior or limited access portions of buildings
- (5) Shops and laboratories

**16.2.10 Marking of Means of Egress.** Means of egress shall have signs in accordance with [Section 7.10](#).

The requirements of [16/17.2.8](#) for illumination of means of egress, [16/17.2.9](#) for emergency lighting, and [16/17.2.10](#) for marking of means of egress work together to increase occupant awareness of the means of egress paths and make more effective use of the egress system.

[Exhibit 16/17.16](#) shows ceiling lighting fixtures in an existing day-care occupancy. No unit lighting packs (i.e., lamps and batteries) are present for purposes of providing emergency lighting, as the building is part of a hospital complex that relies on generators to provide emergency power. Select lighting

Exhibit 16/17.16

Emergency lighting provided using normal lighting fixtures.

## CHAPTER 17 • Existing

(path X2 to E2) is 150 ft (46 m), unless the building is sprinklered, as explained in [16/17.2.6.3](#). In a sprinklered building, the total permitted travel distance associated with a nonsleeping room is 200 ft (61 m), but not more than 150 ft (46 m) of that total can occur outside the room (path C2 to E2).

**17.2.7 Discharge from Exits.** Discharge from exits shall be arranged in accordance with [Section 7.7](#), unless otherwise provided in [17.2.4.3](#).

**17.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with [Section 7.8](#).

**17.2.9 Emergency Lighting.** Emergency lighting shall be provided in accordance with [Section 7.9](#) in the following areas:

- (1) Interior stairs and corridors
- (2) Assembly use spaces
- (3) Flexible and open plan buildings
- (4) Interior or limited access portions of buildings
- (5) Shops and laboratories

**17.2.10 Marking of Means of Egress.** Means of egress shall have signs in accordance with [Section 7.10](#).

fixtures in the day-care facility are provided with emergency electrical power within 10 seconds of loss of normal power. [Exhibit 16/17.17](#) shows a directional exit sign within the same existing day-care occupancy. The sign directs occupants to the facility's corridor and lobby area that leads to a common exit access corridor shared with the hospital. Attached to the left side panel of the exit sign housing are identifying markings that can be read by a bar code scanner used as part of an inspection, testing, and maintenance program. See [7.10.9](#).

Exhibit 16/17.17

Directional exit sign.

## CHAPTER 16 • New

**16.2.11 Special Means of Egress Features.****16.2.11.1 Windows for Rescue.**

**16.2.11.1.1** Every room or space normally subject to client occupancy, other than bathrooms, shall have not less than one outside window for emergency rescue that complies with all of the following, unless otherwise permitted by **16.2.11.1.2**:

- (1) Such windows shall be openable from the inside without the use of tools and shall provide a clear opening of not less than 20 in. (510 mm) in width, 24 in. (610 mm) in height, and 5.7 ft<sup>2</sup> (0.5 m<sup>2</sup>) in area.
- (2) The bottom of the opening shall be not more than 44 in. (1120 mm) above the floor.
- (3) The clear opening shall allow a rectangular solid, with a width and height that provides not less than the required 5.7 ft<sup>2</sup> (0.5 m<sup>2</sup>) opening and a depth of not less than 20 in. (510 mm), to pass fully through the opening.

**16.2.11.1.2** The requirements of **16.2.11.1.1** shall not apply to either of the following:

- (1) Buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with **Section 9.7**
- (2) Where the room or space has a door leading directly to an exit or directly to the outside of the building

## CHAPTER 17 • Existing

**17.2.11 Special Means of Egress Features.****17.2.11.1 Windows for Rescue.**

**17.2.11.1.1** Every room or space greater than 250 ft<sup>2</sup> (23.2 m<sup>2</sup>) and normally subject to client occupancy shall have not less than one outside window for emergency rescue that complies with all of the following, unless otherwise permitted by **17.2.11.1.2**:

- (1) Such windows shall be openable from the inside without the use of tools and shall provide a clear opening of not less than 20 in. (510 mm) in width, 24 in. (610 mm) in height, and 5.7 ft<sup>2</sup> (0.5 m<sup>2</sup>) in area.
- (2) The bottom of the opening shall be not more than 44 in. (1120 mm) above the floor
- (3) The clear opening shall allow a rectangular solid, with a width and height that provides not less than the required 5.7 ft<sup>2</sup> (0.5 m<sup>2</sup>) opening and a depth of not less than 20 in. (510 mm), to pass fully through the opening.

**17.2.11.1.2** The requirements of **17.2.11.1.1** shall not apply to any of the following:

- (1) Buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with **Section 9.7**
- (2) Where the room or space has a door leading directly to an exit or directly to the outside of the building
- (3) Where the room has a door, in addition to the door that leads to the exit access corridor and such door leads directly to an exit or directly to another corridor located in a compartment separated from the compartment housing the initial corridor by smoke partitions in accordance with **Section 8.4**
- (4) Rooms located four or more stories above the finished ground level
- (5) Where awning-type or hopper-type windows that are hinged or subdivided to provide a clear opening of not less than 4 ft<sup>2</sup> (0.38 m<sup>2</sup>) or any dimension of not less than 22 in. (560 mm) meet the following criteria:
  - (a) Such windows shall be permitted to continue in use.
  - (b) Screen walls or devices in front of required windows shall not interfere with normal rescue requirements.
- (6) Where the room or space complies with all of the following:
  - (a) One door providing direct access to an adjacent room and a second door providing direct access to another adjacent room shall be provided.
  - (b) The two rooms to which exit access travel is made in accordance with **17.2.11.1.2(6)(a)** shall each provide exit access in accordance with **17.2.11.1.2(2)** or (3).
  - (c) The corridor addressed by **17.2.11.1.2(3)**, if provided shall be separated from the rooms by a wall that resists the passage of smoke, and all doors between the rooms and the corridor shall be self-closing in accordance with **7.2.1.8**.

## CHAPTER 16 • New

## CHAPTER 17 • Existing

The dimensions specified for windows used for emergency rescue in day-care occupancies, which are identical to those required for secondary escape from dwelling units, are based on simulations of emergency rescue conducted by the San Diego Fire Department. Exhibit 16/17.18 illustrates two configurations that achieve the required area of 5.7 ft<sup>2</sup> (0.5 m<sup>2</sup>), as well as the minimum width and minimum height.

The Code assumes that the fire department or others will assist day-care occupancy clients, especially over ladders. If these emergency rescue windows must be used as a supplementary means of escape, the windows should allow younger children to escape unaided. Therefore, storm sashes, screens, or devices in front of the windows must be easy to open or remove, and the sills must be low enough for children to reach.

According to 16/17.2.11.1.2(1) and (2), emergency rescue windows are not required if a room has a door leading directly to the outside, the room has a door leading directly to an exit, or if the building is totally sprinklered.

It might not be practical to use a window above the fourth story as an escape window. Therefore, 17.2.11.1.2(4) exempts windows above the fourth story in existing day-care centers. This exemption will have limited application, because Table 17.1.6.1 requires most day-care centers located above the fourth story to be sprinklered, and, per 17.2.11.1.2(1), sprinklers negate the need for the rescue window. Similarly, the exemption is not needed for new construction, because Table 16.1.6.1 requires day-care centers located above the fourth story to be sprinklered.

Awning-type and hopper-type windows might provide the required opening within the plane of the building's exterior wall. However, when the window is open, the sash and glazing are located outside that plane and might prevent occupants from passing through the opening. Therefore, the criterion of 16/17.2.11.1.1(3) for providing an opening through which a minimum-size rectangular solid can pass is intended to ensure that occupants can pass through the opening. For existing awning-type windows, 17.2.11.1.2(5) offers some relief from the rectangular solid and minimum-size opening requirements. Exhibit 16/17.19 illustrates the use of 17.2.11.1.2(5).

The provisions of 17.2.11.1.2(3) and 17.2.11.1.2(6) provide alternatives to rescue windows that are identical to those offered in 15.2.11.1.2(6) for existing educational occupancies. See the commentary and accompanying exhibits that follow 14/15.2.11.1.2.

- (d) The length of travel to exits along such paths shall not exceed 150 ft (46 m).
- (e) Each communicating door shall be marked in accordance with Section 7.10.
- (f) No locking device shall be permitted on the communicating doors.

Exhibit 16/17.18

Windows for rescue or ventilation — minimum dimensions.

Exhibit 16/17.19

Existing awning window — minimum dimensions.

**16.2.11.2 Lockups.** Lockups in day-care occupancies shall comply with the requirements of 22.4.5.

The term *lockup* is defined in 3.3.166 as “an incidental use area in other than a detention and correctional occupancy where occupants are restrained and such occupants are mostly incapable of self-preservation because of security measures not under the occupants’ control.” It is difficult to provide an example of a lockup in a day-care occupancy, but that does not mean that there will not be a lockup in a day-care occupancy. An example

**17.2.11.2 Lockups.** Lockups in day-care occupancies, other than approved existing lockups, shall comply with the requirements of 23.4.5.

of a lockup in an educational occupancy is a room for holding unruly students until police can transport such students to the police station. The provisions of Chapters 16 and 17 alone are not adequate to ensure life safety for those who are detained by security measures not under their control. Lockups in day-care occupancies are required to meet the provisions of 22/23.4.5, which complete the needed package of protection features.

## 16.3 Protection

**16.3.1 Protection of Vertical Openings.** Any vertical opening, other than unprotected vertical openings in accordance with 8.6.9.1, shall be enclosed or protected in accordance with Section 8.6.

### 16.3.2 Protection from Hazards.

**16.3.2.1** Rooms or spaces for the storage, processing, or use of materials specified in 16.3.2.1(1) through (3) shall be protected in accordance with the following:

- (1) Separation from the remainder of the building by fire barriers having a minimum 1-hour fire resistance rating, or protection of such rooms by automatic extinguishing systems as specified in Section 8.7, in the following areas:

## 17.3 Protection

**17.3.1 Protection of Vertical Openings.** Any vertical opening, other than unprotected vertical openings in accordance with 8.6.9.1, shall be enclosed or protected in accordance with Section 8.6.

### 17.3.2 Protection from Hazards.

**17.3.2.1** Rooms or spaces for the storage, processing, or use of materials specified in 17.3.2.1(1) through (3) shall be protected in accordance with the following:

- (1) Separation from the remainder of the building by fire barriers having a minimum 1-hour fire resistance rating, or protection of such rooms by automatic extinguishing systems as specified in Section 8.7, in the following areas:

## CHAPTER 16 • New

- (a) Boiler and furnace rooms, unless such rooms enclose only air-handling equipment
  - (b) Rooms or spaces used for the storage of combustible supplies in quantities deemed hazardous by the authority having jurisdiction
  - (c) Rooms or spaces used for the storage of hazardous materials or flammable or combustible liquids in quantities deemed hazardous by recognized standards
  - (d) Janitor closets
- (2) Separation from the remainder of the building by fire barriers having a minimum 1-hour fire resistance rating and protection of such rooms by automatic extinguishing systems as specified in [Section 8.7](#) in the following areas:
- (a)\* Laundries
  - (b) Maintenance shops, including woodworking and painting areas
  - (c) Rooms or spaces used for processing or use of combustible supplies deemed hazardous by the authority having jurisdiction
  - (d) Rooms or spaces used for processing or use of hazardous materials or flammable or combustible liquids in quantities deemed hazardous by recognized standards
- (3) Where automatic extinguishing is used to meet the requirements of [16.3.2.1\(1\)](#) and (2), protection as permitted in accordance with [9.7.1.2](#)

**A.16.3.2.1(2)(a)** It is not the intent to classify a room with a domestic-type clothes washer and a domestic-type clothes dryer as a laundry.

**16.3.2.2** Janitor closets protected in accordance with [16.3.2.1\(1\)\(d\)](#) shall be permitted to have doors fitted with ventilating louvers where the space is protected by automatic sprinklers.

**16.3.2.3** Cooking facilities shall be protected in accordance with [9.2.3](#), unless otherwise permitted by [16.3.2.4](#) or [16.3.2.5](#).

**16.3.2.4** Openings shall not be required to be protected between food preparation areas and dining areas.

**16.3.2.5** Approved domestic cooking equipment used for food warming or limited cooking shall not be required to be protected.

The intent of [16/17.3.2.1](#) is to specify the degree of protection necessary for certain hazardous contents areas. The hazards noted in [16/17.3.2.1\(1\)](#) are required to be enclosed in 1-hour fire resistance-rated construction or protected by automatic sprinklers. In new construction, if the sprinkler option were chosen, [8.7.1.2](#) would still require an enclosure comprised of smoke partitions.

[Exhibit 16/17.20](#), [Exhibit 16/17.21](#), and [Exhibit 16/17.22](#) illustrate the various protection requirements of [16/17.3.2.1](#).

## CHAPTER 17 • Existing

- (a) Boiler and furnace rooms, unless such rooms enclose only air-handling equipment
  - (b) Rooms or spaces used for the storage of combustible supplies in quantities deemed hazardous by the authority having jurisdiction
  - (c) Rooms or spaces used for the storage of hazardous materials or flammable or combustible liquids in quantities deemed hazardous by recognized standards
  - (d) Janitor closets
- (2) Separation from the remainder of the building by fire barriers having a minimum 1-hour fire resistance rating and protection of such rooms by automatic extinguishing systems as specified in [Section 8.7](#) in the following areas:
- (a)\* Laundries
  - (b) Maintenance shops, including woodworking and painting areas
  - (c) Rooms or spaces used for processing or use of combustible supplies deemed hazardous by the authority having jurisdiction
  - (d) Rooms or spaces used for processing or use of hazardous materials or flammable or combustible liquids in quantities deemed hazardous by recognized standards
- (3) Where automatic extinguishing is used to meet the requirements of [17.3.2.1\(1\)](#) and (2), protection as permitted in accordance with [9.7.1.2](#)

**A.17.3.2.1(2)(a)** It is not the intent to classify a room with a domestic-type clothes washer and a domestic-type clothes dryer as a laundry.

**17.3.2.2** Janitor closets protected in accordance with [17.3.2.1\(1\)\(d\)](#) shall be permitted to have doors fitted with ventilating louvers where the space is protected by automatic sprinklers.

**17.3.2.3** Cooking facilities shall be protected in accordance with [9.2.3](#), unless otherwise permitted by [17.3.2.4](#) or [17.3.2.5](#).

**17.3.2.4** Openings shall not be required to be protected between food preparation areas and dining areas.

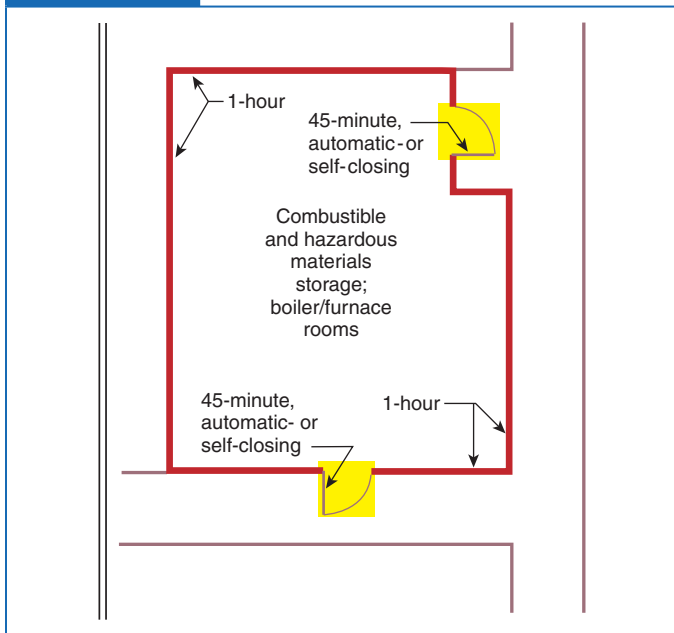

**17.3.2.5** Approved domestic cooking equipment used for food warming or limited cooking shall not be required to be protected.

The provision of [16/17.3.2.5](#) exempts approved domestic cooking equipment used for food warming or limited cooking from the protection requirements of [9.2.3](#). [Exhibit 16/17.23](#) shows domestic cooking equipment used for food warming in a day-care occupancy. The equipment is not required to be protected in accordance with [9.2.3](#), nor does the presence of the cooking equipment require that it be protected as a hazardous area. Yet, the room is protected as a hazardous area — perhaps due to the presence of its other contents.

CHAPTER 16 • New

## CHAPTER 16 • New

**16.3.3 Interior Finish.**

**16.3.3.1 General.** Interior finish shall be in accordance with [Section 10.2](#).

**16.3.3.2 Interior Wall and Ceiling Finish.** Interior wall and ceiling finish materials complying with [Section 10.2](#) shall be Class A in stairways, corridors, and lobbies; in all other occupied areas, interior wall and ceiling finish shall be Class A or Class B.

**16.3.3.3 Interior Floor Finish.**

**16.3.3.3.1** Interior floor finish shall comply with [Section 10.2](#).

**16.3.3.3.2** Interior floor finish in exit enclosures and exit access corridors and spaces not separated from them by walls complying with [14.3.6](#) shall be not less than Class II.

**16.3.3.3.3** Interior floor finish shall comply with [10.2.7.1](#) or [10.2.7.2](#), as applicable.

[Exhibit 16/17.24](#) shows a mural painted on the wall of the corridor/lobby of an existing day-care occupancy. The requirement of [17.3.3.2](#) limits the interior wall and ceiling finish materials to being Class A or Class B throughout the facility. The facility pictured is sprinklered, meaning that use of the provision of [10.2.8.1](#) leads to permission to use a Class C interior wall and ceiling finish. The mural consists of paint on gypsum wallboard and the

**Exhibit 16/17.24**

**16.3.4 Detection, Alarm, and Communications Systems.**

**16.3.4.1 General.** Day-care occupancies, other than day-care occupancies housed in one room having at least one door opening directly to the outside at grade plane or to an exterior exit access

## CHAPTER 17 • Existing

**17.3.3 Interior Finish.**

**17.3.3.1 General.** Interior finish shall be in accordance with [Section 10.2](#).

**17.3.3.2 Interior Wall and Ceiling Finish.** Interior wall and ceiling finish materials complying with [Section 10.2](#) shall be Class A or Class B throughout.

**17.3.3.3 Interior Floor Finish. (Reserved)**

combination of the two materials typically qualifies as being a Class A — or at worse, a Class B — interior wall finish material.

[Exhibit 16/17.25](#) shows a climbing wall associated with a play area in an existing day-care occupancy. The effect of [17.3.3.3](#), [10.2.8.1](#), and the presence of sprinklers permits the use of Class C interior wall finish. The wood backing board used to support the climbing elements typically qualifies as being a Class C material.

**Exhibit 16/17.25**

*Climbing wall with wood backing board.*

**17.3.4 Detection, Alarm, and Communications Systems.**

**17.3.4.1 General.** Day-care occupancies, other than day-care occupancies housed in one room, shall be provided with a fire alarm system in accordance with [Section 9.6](#).

## CHAPTER 16 • New

balcony in accordance with 7.5.3, shall be provided with a fire alarm system in accordance with Section 9.6.

**16.3.4.2 Initiation.** Initiation of the required fire alarm system shall be by manual means and by operation of any required smoke detectors and required sprinkler systems. (See 16.3.4.5.)

**16.3.4.3 Occupant Notification.**

**16.3.4.3.1** Occupant notification shall be in accordance with 9.6.3.

**16.3.4.3.2** Positive alarm sequence shall be permitted in accordance with 9.6.3.4.

**16.3.4.3.3** Private operating mode in accordance with 9.6.3.6.3 shall be permitted.

**16.3.4.4 Emergency Forces Notification.** Emergency forces notification shall be accomplished in accordance with 9.6.4.

**16.3.4.5 Detection.** A smoke detection system in accordance with Section 9.6 shall be installed in day-care occupancies, other than those housed in one room having at least one door opening directly to the outside at grade plane or to an exterior exit access balcony in accordance with 7.5.3, and such system shall comply with both of the following:

- (1) Detectors shall be installed on each story in front of the doors to the stairways and in the corridors of all floors occupied by the day-care occupancy.
- (2) Detectors shall be installed in lounges, recreation areas, and sleeping rooms in the day-care occupancy.

New day-care centers, other than those housed in a single room having a door opening directly to the outside at grade plane or to an exterior exit access balcony, are required to have a fire alarm system. Existing day-care centers, other than those housed in a single room, are required to have a fire alarm system. Exhibit 16/17.26 and Exhibit 16/17.27 show three forms of equipment for initiating the fire alarm system in an existing day-care occupancy in accordance with 17.3.4.2 — manual fire alarm box, automatic smoke detector, and automatic sprinkler (see 9.6.2.1). The manual fire alarm box has a protective cover to dissuade day-care clients from playing with it.

The alarm system is for purposes of occupant notification and fire department notification. Existing day-care centers are exempt from the fire department notification requirement if

## CHAPTER 17 • Existing

**17.3.4.2 Initiation.** Initiation of the required fire alarm system shall be by manual means and by operation of any required smoke detectors and required sprinkler systems. (See 17.3.4.5.)

**17.3.4.3 Occupant Notification.**

**17.3.4.3.1** Occupant notification shall be in accordance with 9.6.3.

**17.3.4.3.2** Positive alarm sequence shall be permitted in accordance with 9.6.3.4.

**17.3.4.3.3** Private operating mode in accordance with 9.6.3.6.3 shall be permitted.

**17.3.4.4 Emergency Forces Notification.**

**17.3.4.4.1** Emergency forces notification, other than for day-care occupancies with not more than 100 clients, shall be accomplished in accordance with 9.6.4.

**17.3.4.4.2** Emergency forces notification shall be accomplished in accordance with 9.6.4 where the existing fire alarm system is replaced.

**17.3.4.5 Detection.** A smoke detection system in accordance with Section 9.6 shall be installed in day-care occupancies, other than those housed in one room or those housing clients capable of self-preservation where no sleeping facilities are provided, and such system shall comply with both of the following:

- (1) Detectors shall be installed on each story in front of the doors to the stairways and in the corridors of all floors occupied by the day-care occupancy.
- (2) Detectors shall be installed in lounges, recreation areas, and sleeping rooms in the day-care occupancy.

there are 100 or fewer clients. Exhibit 16/17.28 shows an alarm notification appliance for occupant notification. It provides both audible and visual notification as it was installed to meet the requirements for new construction (see 16/17.3.4.3.1, 9.6.3.5, and 9.6.3.5.3). Exhibit 16/17.29 shows an auxiliary fire alarm box for automatic transmission of an alarm to the city fire department. The associated fire alarm control panel and annunciator are of a larger scale than would be expected for the day-care center shown in the photo exhibits of this chapter. Note that the day-care center is part of a multiple occupancy building that is predominantly a hospital. The multiple occupancy building is protected as mixed occupancies, and the hospital and day-care share a common fire alarm system. See the commentary that follows 16/17.1.3.3(2).

## CHAPTER 16 • New

## CHAPTER 17 • Existing

Exhibit 16/17.26

Manual fire alarm box with protective cover.

Exhibit 16/17.27

Smoke detector and sprinkler for alarm system initiation.

Exhibit 16/17.28

Horn and strobe for occupant notification.

Exhibit 16/17.29

Auxiliary fire alarm box for emergency forces notification.

Neither new nor existing day-care centers are permitted to use a presignal system (see 9.6.3.3). A delay in occupant notification is permitted only if positive alarm sequence in accordance with 9.6.3.4 is provided. Positive alarm sequence includes some fail-safe features not found in presignal systems. For example, if the person staffing the control panel does not acknowledge the signal, general occupant notification occurs automatically. Also, if a second initiation device reports a fire

## CHAPTER 16 • New

condition to the control panel, the delay ends, and general occupant notification occurs immediately.

Some day-care centers make provisions for clients to nap. Also, parents who work at night might place their children in day-care centers for the purpose of sleeping through the night. Regardless of whether occupants sleep in the center, the smoke detectors required by 16/17.3.4.5 will provide critical extra time to evacuate clients. The requirement for smoke detection does

### 16.3.5 Extinguishment Requirements.

**16.3.5.1** Any required sprinkler systems shall be in accordance with Section 9.7.

**16.3.5.2** Required sprinkler systems shall be installed in accordance with 9.7.1.1(1).

**16.3.5.3** Buildings with unprotected openings in accordance with 8.6.6 shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.

**16.3.6 Corridors.** Every interior corridor shall be constructed of walls having not less than a 1-hour fire resistance rating in accordance with Section 8.3, unless otherwise permitted by any of the following:

- (1) Corridor protection shall not be required where all spaces normally subject to client occupancy have not less than one door opening directly to the outside or to an exterior exit access balcony or corridor in accordance with 7.5.3.
- (2) In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7, corridor walls shall not be required to be rated, provided that such walls form smoke partitions in accordance with Section 8.4.
- (3) Where the corridor ceiling is an assembly having a 1-hour fire resistance rating where tested as a wall, the corridor walls shall be permitted to terminate at the corridor ceiling.
- (4) Lavatories shall not be required to be separated from corridors, provided that they are separated from all other spaces by walls having not less than a 1-hour fire resistance rating in accordance with Section 8.3.
- (5) Lavatories shall not be required to be separated from corridors, provided that both of the following criteria are met:
  - (a) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.
  - (b) The walls separating the lavatory from other rooms form smoke partitions in accordance with Section 8.4.

## CHAPTER 17 • Existing

not apply to new day-care centers housed in a single room having a door opening directly to the outside at grade plane or to an exterior exit access balcony, where a fire will be obvious simultaneously to all occupants. Similarly, the requirement for smoke detection does not apply to existing day-care centers housed in a single room or where the clients are capable of self-preservation and there are no sleeping facilities.

### 17.3.5 Extinguishment Requirements.

**17.3.5.1** Any required sprinkler system shall be in accordance with Section 9.7.

**17.3.5.2** Required sprinkler systems, other than approved existing systems, shall be installed in accordance with 9.7.1.1(1).

**17.3.5.3** Buildings with unprotected openings in accordance with 8.6.6 shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.

**17.3.6 Corridors.** Every interior corridor shall be constructed of walls having a minimum ½-hour fire resistance rating in accordance with Section 8.3, unless otherwise permitted by any of the following:

- (1) Corridor protection shall not be required where all spaces normally subject to student occupancy have not less than one door opening directly to the outside or to an exterior exit access balcony or corridor in accordance with 7.5.3.
- (2) In buildings protected throughout by an approved automatic sprinkler system with valve supervision in accordance with Section 9.7, corridor walls shall not be required to be rated, provided that such walls form smoke partitions in accordance with Section 8.4.
- (3) Where the corridor ceiling is an assembly having a minimum ½-hour fire resistance rating where tested as a wall, the corridor walls shall be permitted to terminate at the corridor ceiling.
- (4) Lavatories shall not be required to be separated from corridors, provided that they are separated from all other spaces by walls having a minimum ½-hour fire resistance rating in accordance with Section 8.3.
- (5) Lavatories shall not be required to be separated from corridors, provided that both of the following criteria are met:
  - (a) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.
  - (b) The walls separating the lavatory from other rooms form smoke partitions in accordance with Section 8.4.

## CHAPTER 16 • New

Given the protection provided by an automatic sprinkler system installed throughout the building, 16/17.3.6(2) permits the corridor walls to be unrated, provided that they form smoke partitions. See Section 8.4 for applicable criteria.

Paragraph 16/17.3.6(3) legitimizes the practice of designing a corridor protection system by building a tunnel with walls and ceilings constructed to meet the requirements of a 1-hour-rated wall assembly for new construction and by providing a 1/2-hour rating for existing assemblies.

The walls and doors that typically separate a lavatory from the corridor often serve to isolate the lavatory, making it difficult for staff to monitor the lavatory. In recognition of this problem, and given the typically low fuel loads associated with lavatories, 16/17.3.6(4) exempts the wall separating the lavatory from the corridor from the rated construction requirement, provided that the rated corridor wall continuously separates the lavatory from adjacent rooms.

## 16.4 Special Provisions

**16.4.1 Limited Access Buildings and Underground Buildings.** Limited access buildings and underground buildings shall comply with Section 11.7.

**16.4.2 High-Rise Buildings.** High-rise buildings that house day-care occupancies on floors more than 75 ft (23 m) above the lowest level of fire department vehicle access shall comply with Section 11.8.

Subsection 16/17.4.2 requires compliance with Section 11.8 (i.e., automatic sprinkler, standpipe, alarm and communications, standby power, emergency plan, and emergency command center requirements) where a day-care center is located on a floor above 75 ft (23 m), regardless of whether the center is new or existing.

### 16.4.3 Flexible Plan and Open Plan Buildings.

**16.4.3.1** Flexible plan and open plan buildings shall comply with the requirements of this chapter as modified by 16.4.3.2 through 16.4.3.5.

**16.4.3.2** Flexible plan buildings shall be permitted to have walls and partitions rearranged periodically only if revised plans or diagrams have been approved by the authority having jurisdiction.

**16.4.3.3** Flexible plan buildings shall be evaluated while all folding walls are extended and in use as well as when they are in the retracted position.

## CHAPTER 17 • Existing

The provision of 16/17.3.6(5) combines parts of the concepts addressed in 16/17.3.6(2) and (4). Where the entire building is protected by automatic sprinklers, the lavatory is permitted to be open to the corridor, and the walls separating the lavatory from other rooms do not need to be fire rated but do need to form smoke partitions. The revision made to 16/17.3.6(5) for the 2012 edition of the Code clearly explains this. Earlier editions failed to require the walls to form smoke partitions.

In the 2003 and earlier editions of the Code, the provisions of 17.3.6, applicable to existing corridors, permitted existing doors in 1/2-hour fire resistance-rated corridor walls to be 1 3/4 in. (44 mm) thick solid-bonded wood-core doors or equivalent in lieu of 20-minute fire protection-rated doors. The text was deleted for the 2006 edition because the subject is adequately addressed as a core chapter provision in 8.3.4.4.

## 17.4 Special Provisions

**17.4.1 Limited Access Buildings and Underground Buildings.** Limited access buildings and underground buildings shall comply with Section 11.7.

**17.4.2 High-Rise Buildings.** High-rise buildings that house day-care occupancies on floors more than 75 ft (23 m) above the lowest level of fire department vehicle access shall comply with Section 11.8.

The requirement of 16/17.4.2 will force careful review when considering the placement of a new day-care center above 75 ft (23 m) in an existing high-rise building. If the building does not already comply with the requirements of Section 11.8, it will need to be brought into compliance.

### 17.4.3 Flexible Plan and Open Plan Buildings.

**17.4.3.1** Flexible plan and open plan buildings shall comply with the requirements of this chapter as modified by 17.4.3.2 and 17.4.3.3.

**17.4.3.2** Flexible plan buildings shall be permitted to have walls and partitions rearranged periodically only if revised plans or diagrams have been approved by the authority having jurisdiction.

**17.4.3.3** Flexible plan buildings shall be evaluated while all folding walls are extended and in use as well as when they are in the retracted position.

## CHAPTER 16 • New

**16.4.3.4** Each room occupied by more than 300 persons shall have two or more means of egress entering into separate atmospheres.

**16.4.3.5** Where three or more means of egress are required from a single room, the number of means of egress permitted to enter into a common atmosphere shall not exceed two.

**16.4.4 Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers shall be protected in accordance with **8.7.3.1**, unless all of the following requirements are met:

- (1) Dispensers shall be installed in rooms or spaces separated from corridors and exits.
- (2) The maximum individual dispenser fluid capacity shall be as follows:
  - (a) 0.32 gal (1.2 L) for dispensers in rooms
  - (b) 0.53 gal (2.0 L) for dispensers in suites of rooms
- (3) The dispensers shall be separated from each other by horizontal spacing of not less than 48 in. (1220 mm).
- (4) Storage of quantities greater than 5 gal (18.9 L) in a single fire compartment shall meet the requirements of NFPA 30, *Flammable and Combustible Liquids Code*.
- (5) The dispensers shall not be installed over or directly adjacent to an ignition source.
- (6) Dispensers installed directly over carpeted floors shall be permitted only in sprinklered rooms or spaces.

The provisions of **16/17.4.4** draw from material developed for the health care occupancies chapters to permit alcohol-based hand-rub (ABHR) dispensers. Although health care occupancies have a functional need to position such dispensers in corridors to permit hand sanitizing prior to entering a patient room and again upon leaving, no such need exists for day-care occupancies. For day-care occupancies, the ABHR dispensers are permitted only in rooms or spaces separated from the corridor. Prior to the inclusion of the provisions for ABHR dispensers, the only option available to day-care occupancies was to treat the alcohol solutions as flammable liquids subject to the provisions of **8.7.3.1** and **8.7.3.2**, which meant the dispensers were prohibited from being placed in client-occupied areas. Dispensers not meeting all the criteria of **16/17.4.4(1)** through **(6)** are subject to regulation as flammable liquids in accordance with **8.7.3.1** and **8.7.3.2**. **Exhibit 16/17.30** shows an ABHR dispenser, something that has become ubiquitous in day-care occupancies.

The provisions of **8.7.3.3** for ABHR dispensers are new to the 2015 edition of the *Code*. The criteria of **8.7.3.3** are similar to those of **16/17.4.4** and require occupancy chapter permission for their use. The technical committee responsible for **Chapters 16** and **17** on day-care occupancies chose not to reference the use of **8.7.3.3** but to retain the criteria of **16/17.4.4(1)** through **(6)**, as the text of **8.7.3.3** had not been finalized. The technical committee intends to evaluate the criteria of **8.7.3.3** for purposes of referencing it for the next edition of the *Code*.

## CHAPTER 17 • Existing

**17.4.4 Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers shall be protected in accordance with **8.7.3.1**, unless all of the following requirements are met:

- (1) Dispensers shall be installed in rooms or spaces separated from corridors and exits.
- (2) The maximum individual dispenser fluid capacity shall be as follows:
  - (a) 0.32 gal (1.2 L) for dispensers in rooms
  - (b) 0.53 gal (2.0 L) for dispensers in suites of rooms
- (3) The dispensers shall be separated from each other by horizontal spacing of not less than 48 in. (1220 mm).
- (4) Storage of quantities greater than 5 gal (18.9 L) in a single fire compartment shall meet the requirements of NFPA 30, *Flammable and Combustible Liquids Code*.
- (5) The dispensers shall not be installed over or directly adjacent to an ignition source.
- (6) Dispensers installed directly over carpeted floors shall be permitted only in sprinklered rooms or spaces.

Exhibit 16/17.30

Alcohol-based hand-rub (ABHR) dispenser in a day-care occupancy.

## CHAPTER 16 • New

---

## 16.5 Building Services

### 16.5.1 Utilities.

**16.5.1.1** Utilities shall comply with the provisions of [Section 9.1](#).

**16.5.1.2** Special protective covers for all electrical receptacles shall be installed in all areas occupied by clients.

### 16.5.2 Heating, Ventilating, and Air-Conditioning Equipment.

**16.5.2.1** Heating, ventilating, and air-conditioning equipment shall be in accordance with [Section 9.2](#).

**16.5.2.2** Unvented fuel-fired heating equipment, other than gas space heaters in compliance with NFPA 54/ANSI Z223.1, *National Fuel Gas Code*, shall be prohibited.

**16.5.2.3** Any heating equipment in spaces occupied by clients shall be provided with partitions, screens, or other means to protect clients from hot surfaces and open flames; if solid partitions are used to provide such protection, provisions shall be made to ensure adequate air for combustion and ventilation for the heating equipment.

**16.5.3 Elevators, Escalators, and Conveyors.** Elevators, escalators, and conveyors, other than those in day-care homes, shall comply with the provisions of [Section 9.4](#).

**16.5.4 Waste Chutes, Incinerators, and Laundry Chutes.** Waste chutes, incinerators, and laundry chutes, other than those in day-care homes, shall comply with the provisions of [Section 9.5](#).

[Paragraph 16/17.5.1.2](#) requires that protective covers be provided and maintained on all electrical receptacles to avoid serious injuries resulting from clients inserting objects into such receptacles.

The interest of reasonable life safety is not served by permitting the use of unvented fuel-fired equipment in buildings occupied by day-care center clients. Thus, [16/17.5.2.2](#) prohibits such equipment, with the exception of a special form of gas space heater that can be used safely.

---

## 16.6 Day-Care Homes

### 16.6.1 General Requirements.

#### 16.6.1.1 Application.

**16.6.1.1.1** The requirements of [Section 16.6](#) shall apply to new buildings or portions thereof used as day-care homes. (*See 1.3.1.*)

## CHAPTER 17 • Existing

---

## 17.5 Building Services

### 17.5.1 Utilities.

**17.5.1.1** Utilities shall comply with the provisions of [Section 9.1](#).

**17.5.1.2** Special protective covers for all electrical receptacles shall be installed in all areas occupied by clients.

### 17.5.2 Heating, Ventilating, and Air-Conditioning Equipment.

**17.5.2.1** Heating, ventilating, and air-conditioning equipment shall be in accordance with [Section 9.2](#).

**17.5.2.2** Unvented fuel-fired heating equipment, other than gas space heaters in compliance with NFPA 54/ANSI Z 223.1, *National Fuel Gas Code*, shall be prohibited.

**17.5.2.3** Any heating equipment in spaces occupied by clients shall be provided with partitions, screens, or other means to protect clients from hot surfaces and open flames; if solid partitions are used to provide such protection, provisions shall be made to ensure adequate air for combustion and ventilation for the heating equipment.

**17.5.3 Elevators, Escalators, and Conveyors.** Elevators, escalators, and conveyors, other than those in day-care homes, shall comply with the provisions of [Section 9.4](#).

**17.5.4 Waste Chutes, Incinerators, and Laundry Chutes.** Waste chutes, incinerators, and laundry chutes, other than those in day-care homes, shall comply with the provisions of [Section 9.5](#).

Day-care center clients do not always understand the dangers of hot surfaces; [16/17.5.2.3](#) recognizes the importance of providing safeguards to protect clients from the hot surfaces of heating equipment. It is important that such safeguards allow adequate air for combustion, as incomplete or inadequate combustion could cause serious injury or death.

---

## 17.6 Day-Care Homes

### 17.6.1 General Requirements.

#### 17.6.1.1 Application.

**17.6.1.1.1** Reserved.

## CHAPTER 16 • New

**16.6.1.1.2** The requirements of **Section 16.6** shall apply to day-care homes in which more than 3, but not more than 12, clients receive care, maintenance, and supervision by other than their relative(s) or legal guardian(s) for less than 24 hours per day, generally within a dwelling unit. (See also **16.6.1.4**.)

**16.6.1.1.3** Where a facility houses more than one age group or one self-preservation capability, the strictest requirements applicable to any group present shall apply throughout the day-care home or building, as appropriate to a given area, unless the area housing such a group is maintained as a separate fire area.

**16.6.1.1.4** Facilities that supervise clients on a temporary basis with a parent or guardian in close proximity shall not be required to meet the provisions of **Section 16.6**.

**16.6.1.1.5** Places of religious worship shall not be required to meet the provisions of **Section 16.6** where operating a day-care home while services are being held in the building.

**16.6.1.2 Multiple Occupancies.** See **16.1.3**.

**16.6.1.3 Definitions.** See **16.1.4**.

**16.6.1.4 Classification of Occupancy.**

**16.6.1.4.1 Subclassification of Day-Care Homes.** Subclassification of day-care homes shall comply with **16.6.1.4.1.1** and **16.6.1.4.1.2**.

**16.6.1.4.1.1 Family Day-Care Home.** A family day-care home shall be a day-care home in which more than three, but fewer than seven, clients receive care, maintenance, and supervision by other than their relative(s) or legal guardian(s) for less than 24 hours per day, generally within a dwelling unit.

**16.6.1.4.1.2 Group Day-Care Home.** A group day-care home shall be a day-care home in which not less than 7, but not more than 12, clients receive care, maintenance, and supervision by other than their relative(s) or legal guardian(s) for less than 24 hours per day, generally within a dwelling unit.

**16.6.1.4.2\* Conversions.** A conversion from a day-care home to a day-care occupancy with more than 12 clients shall be permitted only if the day-care occupancy conforms to the requirements of **Chapter 16** for new day-care occupancies with more than 12 clients.

## CHAPTER 17 • Existing

**17.6.1.1.2\*** The requirements of **Section 17.6** shall apply to existing day-care homes in which more than 3, but not more than 12, clients receive care, maintenance, and supervision by other than their relative(s) or legal guardian(s) for less than 24 hours per day, generally within a dwelling unit. An existing day-care home shall be permitted the option of meeting the requirements of **Section 16.6** in lieu of **Section 17.6**. Any existing day-care home that meets the requirements of **Chapter 16** shall be judged as meeting the requirements of this chapter. (See also **17.6.1.4**.)

**A.17.6.1.1.2** Day-care homes do not provide for the full-time maintenance of a client. Day-care occupancies that provide a primary place of residence are addressed in other occupancy chapters. (See **Chapters 24 through 33**.)

**17.6.1.1.3** Where a facility houses clients of more than one self-preservation capability, the strictest requirements applicable to any group present shall apply throughout the day-care home or building, as appropriate to a given area, unless the area housing such a group is maintained as a separate fire area.

**17.6.1.1.4** Facilities that supervise clients on a temporary basis with a parent or guardian in close proximity shall not be required to meet the provisions of **Section 17.6**.

**17.6.1.1.5** Places of religious worship shall not be required to meet the provisions of **Section 17.6** where operating a day-care home while services are being held in the building.

**17.6.1.2 Multiple Occupancies.** See **17.1.3**.

**17.6.1.3 Definitions.** See **17.1.4**.

**17.6.1.4 Classification of Occupancy.**

**17.6.1.4.1 Subclassification of Day-Care Homes.** Subclassification of day-care homes shall comply with **17.6.1.4.1.1** and **17.6.1.4.1.2**.

**17.6.1.4.1.1 Family Day-Care Home.** A family day-care home shall be a day-care home in which more than three, but fewer than seven, clients receive care, maintenance, and supervision by other than their relative(s) or legal guardian(s) for less than 24 hours per day, generally within a dwelling unit.

**17.6.1.4.1.2 Group Day-Care Home.** A group day-care home shall be a day-care home in which not less than 7, but not more than 12, clients receive care, maintenance, and supervision by other than their relative(s) or legal guardian(s) for less than 24 hours per day, generally within a dwelling unit.

**17.6.1.4.2\* Conversions.** A conversion from a day-care home to a day-care occupancy with more than 12 clients shall be permitted only if the day-care occupancy conforms to the requirements of **Chapter 16** for new day-care occupancies with more than 12 clients.

## CHAPTER 16 • New

**A.16.6.1.4.2** A conversion from a day-care occupancy with more than 12 clients to a day-care home is not considered a change of occupancy. The resulting day-care home should be permitted to meet the requirements of **Chapter 17** for existing day-care homes.

**Section 16/17.6** addresses both family day-care homes (4 to 6 clients) and group day-care homes (7 to 12 clients). Where the requirements vary between the two sizes of day-care homes, **Section 16/17.6** references the applicable size.

The provisions of **Section 16/17.6** recognize that day-care homes are typically located in residential settings. However, a day-care home, whether a family day-care home or a group day-care home, is to be treated via the day-care home requirements of **Section 16/17.6**, even if it is located in a nonresidential setting, such as an office building.

Day-care homes and group day-care homes are often found in buildings primarily composed of apartment, mercantile,

**16.6.1.5 Classification of Hazard of Contents.** See **16.1.5**.

**16.6.1.6 Location and Construction.** No day-care home shall be located more than one story below the level of exit discharge.

**16.6.1.7 Occupant Load.**

**16.6.1.7.1** In family day-care homes, both of the following shall apply:

- (1) The minimum staff-to-client ratio shall be not less than one staff for up to six clients, including the caretaker's own children under age six.
- (2) There shall be not more than two clients incapable of self-preservation.

**16.6.1.7.2** In group day-care homes, all of the following shall apply:

- (1) The minimum staff-to-client ratio shall be not less than two staff for up to 12 clients.
- (2) There shall be not more than 3 clients incapable of self-preservation.
- (3) The staff-to-client ratio shall be permitted to be modified by the authority having jurisdiction where safeguards in addition to those specified by **Section 16.6** are provided.

**16.6.2 Means of Escape Requirements.**

**16.6.2.1 General.** Means of escape shall comply with **Section 24.2**.

**16.6.2.2 Reserved.**

**16.6.2.3 Reserved.**

## CHAPTER 17 • Existing

**A.17.6.1.4.2** A conversion from a day-care occupancy with more than 12 clients to a day-care home is not considered a change of occupancy. The resulting day-care home should be permitted to meet the requirements of **Chapter 17** for existing day-care homes.

business, or assembly occupancies. Where a day-care home is located in a building housing another occupancy, the operators of the day-care home usually have no control over the safety procedures and precautions practiced outside the day-care home. Thus, **6.1.14.1.3** does not permit a day-care home with four or more clients to be considered incidental to another occupancy. This means that the day-care home provisions of the *Code* must be followed, because the provisions applicable to the predominant occupancy might not be adequate to protect the day-care home clients.

**17.6.1.5 Classification of Hazard of Contents.** See **17.1.5**.

**17.6.1.6 Location and Construction.** No day-care home shall be located more than one story below the level of exit discharge.

**17.6.1.7 Occupant Load.**

**17.6.1.7.1** In family day-care homes, both of the following shall apply:

- (1) The minimum staff-to-client ratio shall be not less than one staff for up to six clients, including the caretaker's own children under age six.
- (2) There shall be not more than two clients incapable of self-preservation.

**17.6.1.7.2** In group day-care homes, all of the following shall apply:

- (1) The minimum staff-to-client ratio shall be not less than two staff for up to 12 clients.
- (2) There shall be not more than 3 clients incapable of self-preservation.
- (3) The staff-to-client ratio shall be permitted to be modified by the authority having jurisdiction where safeguards in addition to those specified by **Section 17.6** are provided.

**17.6.2 Means of Escape Requirements.**

**17.6.2.1 General.** Means of escape shall comply with **Section 24.2**.

**17.6.2.2 Reserved.**

**17.6.2.3 Reserved.**

## CHAPTER 16 • New

**16.6.2.4 Number and Type of Means of Escape.**

**16.6.2.4.1** The number and type of means of escape shall comply with [Section 24.2](#) and [16.6.2.4.2](#) through [16.6.2.4.4](#).

**16.6.2.4.2** Every room used for sleeping, living, recreation, education, or dining purposes shall have the number and type of means of escape in accordance with [Section 24.2](#).

**16.6.2.4.3** No room or space that is accessible only by a ladder or folding stairs or through a trap door shall be occupied by clients.

**16.6.2.4.4** In group day-care homes where spaces on the story above the level of exit discharge are used by clients, that story shall have not less than one means of escape complying with one of the following:

- (1) Door leading directly to the outside with access to finished ground level
- (2) Door leading directly to an outside stair to finished ground level
- (3) Interior stair leading directly to the outside with access to finished ground level separated from other stories by a ½-hour fire barrier in accordance with [Section 8.3](#)

**16.6.2.4.5** Where clients occupy a story below the level of exit discharge, that story shall have not less than one means of escape complying with one of the following:

- (1) Door leading directly to the outside with access to finished ground level
- (2) Door leading directly to an outside stair going to finished ground level
- (3) Bulkhead enclosure complying with [24.2.7](#)
- (4) Interior stair leading directly to the outside with access to finished ground level, separated from other stories by a ½-hour fire barrier in accordance with [Section 8.3](#)

The concept of means of escape is well developed in [Chapter 24](#) for one- and two-family dwellings. However, [16/17.6.2.4.4](#) and [16/17.6.2.4.5](#) require one of the means of escape to discharge directly to the outside or provide protected interior travel if day-care home clients occupy the second story or basement.

If an open stair serves the second story of a typical single-family dwelling used as a day-care home, the requirement of

## CHAPTER 17 • Existing

**17.6.2.4 Number and Type of Means of Escape.**

**17.6.2.4.1** The number and type of means of escape shall comply with [Section 24.2](#) and [17.6.2.4.1](#) through [17.6.2.4.4](#).

**17.6.2.4.2** Every room used for sleeping, living, recreation, education, or dining purposes shall have the number and type of means of escape in accordance with [Section 24.2](#).

**17.6.2.4.3** No room or space that is accessible only by a ladder or folding stairs or through a trap door shall be occupied by clients.

**17.6.2.4.4** In group day-care homes where spaces on the story above the level of exit discharge are used by clients, that story shall have not less than one means of escape complying with one of the following:

- (1) Door leading directly to the outside with access to finished ground level
- (2) Door leading directly to an outside stair to finished ground level
- (3) Interior stair leading directly to the outside with access to finished ground level separated from other stories by a ½-hour fire barrier in accordance with [Section 8.3](#)
- (4) Interior stair leading directly to the outside with access to finished ground level separated from other stories by a barrier that has been previously approved for use in a group day-care home

**17.6.2.4.5** Where clients occupy a story below the level of exit discharge, that story shall have not less than one means of escape complying with one of the following:

- (1) Door leading directly to the outside with access to finished ground level
- (2) Door leading directly to an outside stair to finished ground level
- (3) Bulkhead enclosure complying with [24.2.7](#)
- (4) Interior stair leading directly to the outside with access to finished ground level separated from other stories by a ½-hour fire barrier in accordance with [Section 8.3](#)
- (5) Interior stair leading directly to the outside with access to finished ground level separated from other stories by a barrier that has been previously approved for use in a group day-care home

[16/17.6.2.4.4](#) mandates that the second story be served by an enclosed interior stair or an exterior stair (not a fire escape) if clients are occupying the second story. See also [16/17.6.3.1](#).

The requirement of [16/17.6.2.4.5](#) is similar to that of [16/17.6.2.4.4](#) for a second story and mandates that, where clients are below the level of exit discharge, at least one protected or direct means of escape to the outside be provided.

## CHAPTER 16 • New

As illustrated in [Exhibit 16/17.31](#), where a group day-care home is located in a basement, a means of escape is required that opens directly to the outside. If a stairway to the story above were provided, it would have to be cut off from the basement by fire barriers with a minimum 1/2-hour fire resistance rating.

### 16.6.2.5 Arrangement of Means of Escape.

**16.6.2.5.1** A story used above or below the level of exit discharge shall be in accordance with [16.6.2.4.3](#) and [16.6.2.4.4](#).

**16.6.2.5.2** For group day-care homes, means of escape shall be arranged in accordance with [Section 7.5](#).

**16.6.2.5.3** No dead-end corridors shall exceed 20 ft (6100 mm).

**16.6.2.5.4** Doors in means of escape shall be protected from obstructions, including snow and ice.

Since the 2006 edition of the *Code*, the title of [16/17.6.2.5](#) and its provisions have reflected that day-care homes are required to be provided with means of escape, not means of egress. The provision of [16/17.6.2.5.4](#) is presented for completeness, because the

**16.6.2.6 Travel Distance.** Travel distance shall comply with [16.6.2.6.1](#) through [16.6.2.6.3](#).

**16.6.2.6.1** Travel distance shall be measured in accordance with [Section 7.6](#).

**16.6.2.6.2** Travel distance shall meet all of the following criteria, unless otherwise permitted by [16.6.2.6.3](#):

- (1) The travel distance between any point in a room and a door leading directly to the outside with access to finished ground level shall not exceed 150 ft (46 m).
- (2) The travel distance between any point in a sleeping room and access to a means of escape from that room shall not exceed 50 ft (15 m).

**16.6.2.6.3** The travel distance required by [16.6.2.6.2](#)(1) shall be permitted to be increased by 50 ft (15 m) in buildings protected

## CHAPTER 17 • Existing

### Exhibit 16/17.31

*Egress requirements for group day-care home occupying a basement.*

### 17.6.2.5 Arrangement of Means of Escape.

**17.6.2.5.1** A story used above or below the level of exit discharge shall be in accordance with [17.6.2.4.3](#) or [17.6.2.4.4](#).

**17.6.2.5.2** For group day-care homes, means of escape shall be arranged in accordance with [Section 7.5](#).

**17.6.2.5.3** No dead-end corridor shall exceed 20 ft (6100 mm), other than in buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#), in which case dead-end corridors shall not exceed 50 ft (15 m).

**17.6.2.5.4** Doors in means of escape shall be protected from obstructions, including snow and ice.

means of egress provisions of [Chapter 7](#) related to maintaining the egress path free of obstructions, including snow and ice, do not automatically apply to means of escape.

**17.6.2.6 Travel Distance.** Travel distance shall comply with [17.6.2.6.1](#) through [17.6.2.6.3](#).

**17.6.2.6.1** Travel distance shall be measured in accordance with [Section 7.6](#).

**17.6.2.6.2** Travel distance shall meet all of the following criteria, unless otherwise permitted by [17.6.2.6.3](#):

- (1) The travel distance between any point in a room and a door leading directly to the outside with access to finished ground level shall not exceed 150 ft (46 m).
- (2) The travel distance between any point in a sleeping room and access to a means of escape from that room shall not exceed 50 ft (15 m).

**17.6.2.6.3** The travel distance required by [17.6.2.6.2](#)(1) shall be permitted to be increased by 50 ft (15 m) in buildings protected

## CHAPTER 16 • New

throughout by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#).

**16.6.2.7 Discharge from Exits.** See [16.6.2.4](#).

**16.6.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with [Section 7.8](#).

**16.6.2.9 Emergency Lighting.** (Reserved)

**16.6.2.10 Marking of Means of Egress.** (Reserved)

### 16.6.3 Protection.

#### 16.6.3.1 Protection of Vertical Openings.

**16.6.3.1.1** For group day-care homes, the doorway between the level of exit discharge and any story below shall be equipped with a fire door assembly having a 20-minute fire protection rating.

**16.6.3.1.2** For group day-care homes where the story above the level of exit discharge is used for sleeping purposes, there shall be a fire door assembly having a 20-minute fire protection rating at the top or bottom of each stairway.

The provisions of [16/17.6.3.1](#) apply only to group day-care homes (not family day-care homes), and [16/17.6.3.1.2](#) clarifies the same applicability. The provisions apply regardless of

#### 16.6.3.2 Protection from Hazards.

**16.6.3.2.1** Reserved.

#### 16.6.3.3 Interior Finish.

**16.6.3.3.1 General.** Interior finish shall be in accordance with [Section 10.2](#).

##### 16.6.3.3.2 Interior Wall and Ceiling Finish.

**16.6.3.3.2.1** In group day-care homes, interior wall and ceiling finish materials complying with [Section 10.2](#) shall be Class A or Class B in corridors, hallways, stairways, foyers, and lobbies.

**16.6.3.3.2.2** In family day-care homes, the interior wall and ceiling finish materials complying with [Section 10.2](#) shall be Class A or Class B in stairways.

**16.6.3.3.2.3** Interior wall and ceiling finish materials complying with [Section 10.2](#) shall be Class A, Class B, or Class C in occupied spaces.

##### 16.6.3.3.3 Interior Floor Finish.

## CHAPTER 17 • Existing

throughout by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#).

**17.6.2.7 Discharge from Exits.** See [17.6.2.4](#).

**17.6.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with [Section 7.8](#).

**17.6.2.9 Emergency Lighting.** (Reserved)

**17.6.2.10 Marking of Means of Egress.** (Reserved)

### 17.6.3 Protection.

#### 17.6.3.1 Protection of Vertical Openings.

**17.6.3.1.1** For group day-care homes, the doorway between the level of exit discharge and any story below shall be equipped with a fire door assembly having a 20-minute fire protection rating.

**17.6.3.1.2** For group day-care homes where the story above the level of exit discharge is used for sleeping purposes, there shall be a fire door assembly having a 20-minute fire protection rating at the top or bottom of each stairway, unless otherwise permitted by [17.6.3.1.3](#).

**17.6.3.1.3** Approved, existing, self-closing, 1¾ in. (44 mm) thick, solid-bonded wood doors without rated frames shall be permitted to continue in use.

whether means of escape is provided directly to the outside from levels above or below the level of exit discharge in accordance with [16/17.6.2.4](#).

#### 17.6.3.2 Protection from Hazards.

**17.6.3.2.1** Reserved.

#### 17.6.3.3 Interior Finish.

**17.6.3.3.1 General.** Interior finish shall be in accordance with [Section 10.2](#).

##### 17.6.3.3.2 Interior Wall and Ceiling Finish.

**17.6.3.3.2.1** Interior wall and ceiling finish materials complying with [Section 10.2](#) shall be Class A or Class B in stairways.

**17.6.3.3.2.2** Interior wall and ceiling finish materials complying with [Section 10.2](#) shall be Class A, Class B, or Class C in occupied spaces.

##### 17.6.3.3.3 Interior Floor Finish. (Reserved)

## CHAPTER 16 • New

**16.6.3.3.3.1** Interior floor finish shall comply with [Section 10.2](#).

**16.6.3.3.3.2** Interior floor finish in stairways shall be not less than Class II.

**16.6.3.3.3.3** Interior floor finish shall comply with [10.2.7.1](#) or [10.2.7.2](#), as applicable.

**16.6.3.4 Detection, Alarm, and Communications Systems.**

**16.6.3.4.1** Smoke alarms shall be installed within day-care homes in accordance with [9.6.2.10](#).

**16.6.3.4.2** Where a day-care home is located within a building of another occupancy, such as in an apartment building or office building, any corridors serving the day-care home shall be provided with a smoke detection system in accordance with [Section 9.6](#).

**16.6.3.4.3** Single-station or multiple-station smoke alarms or smoke detectors shall be provided in all rooms used for sleeping in accordance with [9.6.2.10](#).

**16.6.3.4.4 Reserved.**

**16.6.3.4.5** Single-station or multiple-station carbon monoxide alarms or detectors shall be provided in accordance with [Section 9.12](#) in day-care homes where client sleeping occurs and one or both of the following conditions exist:

- (1) Fuel-fired equipment is present.
- (2) An enclosed parking structure is attached to the day-care home.

The provisions of [16/17.6.3.4](#) are as follows:

1. To provide smoke alarms within the day-care home
2. To provide a smoke detection system in the corridor serving the day-care home in a multiple occupancy building
3. To require that smoke alarms or smoke detectors be installed in each sleeping room
4. To require carbon monoxide alarms of detectors where certain conditions are present

**16.6.3.5 Extinguishment Requirements.** Any required sprinkler systems shall be in accordance with [Section 9.7](#) and shall be installed in accordance with [9.7.1.1](#)(1), (2), or (3), as appropriate with respect to the scope of the installation standard.

## CHAPTER 17 • Existing

**17.6.3.4 Detection, Alarm, and Communications Systems.**

**17.6.3.4.1** Smoke alarms shall be installed within day-care homes in accordance with [9.6.2.10](#).

**17.6.3.4.2** Where a day-care home is located within a building of another occupancy, such as in an apartment building or office building, any corridors serving the day-care home shall be provided with a smoke detection system in accordance with [Section 9.6](#).

**17.6.3.4.3** Single-station or multiple-station smoke alarms or smoke detectors shall be provided in all rooms used for sleeping in accordance with [9.6.2.10](#), other than as permitted by [17.6.3.4.4](#).

**17.6.3.4.4** Approved existing battery-powered smoke alarms, rather than house electrical service-powered smoke alarms required by [17.6.3.4.3](#), shall be permitted where the facility has testing, maintenance, and battery replacement programs that ensure reliability of power to the smoke alarms.

The provision of [16.6.3.4.5](#), requiring carbon monoxide alarms or detectors, was added for the 2012 edition of the *Code*. The requirement is not applicable to existing day-care homes. The requirement applies where both of the following conditions exist:

1. Clients sleep in the day-care home.
2. Clients are within proximity of a combustion source.

**17.6.3.5 Extinguishment Requirements.** Any required sprinkler systems shall be in accordance with [Section 9.7](#) and, other than approved existing systems, shall be installed in accordance with [9.7.1.1](#)(1), (2), or (3), as appropriate with respect to the scope of the installation standard.

## CHAPTER 16 • New

**16.6.4 Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers shall be protected in accordance with [8.7.3.1](#), unless all of the following requirements are met:

- (1) Dispensers shall be installed in rooms or spaces separated from corridors, stairways, and exterior doors.
- (2) The maximum individual dispenser fluid capacity shall be as follows:
  - (a) 0.32 gal (1.2 L) for dispensers in rooms
  - (b) 0.53 gal (2.0 L) for dispensers in suites of rooms
- (3) The dispensers shall be separated from each other by horizontal spacing of not less than 48 in. (1220 mm).
- (4) Storage of quantities greater than 5 gal (18.9 L) in a single fire compartment shall meet the requirements of NFPA 30, *Flammable and Combustible Liquids Code*.
- (5) The dispensers shall not be installed over or directly adjacent to an ignition source.
- (6) Dispensers installed directly over carpeted floors shall be permitted only in sprinklered rooms or spaces.

See the last paragraph of the commentary following [16/17.4.4\(6\)](#).

---

## 16.7 Operating Features

[Section 16/17.7](#) is positioned to follow the provisions of [Section 16/17.6](#), applicable to day-care homes, but has applicability both to day-care occupancies and day-care homes, unless otherwise specified. For example, the provisions of [16/17.7.4.1](#), applicable to limiting the flame propagation of draperies and curtains,

**16.7.1\* Emergency Action Plans.** Emergency action plans shall be provided in accordance with [Section 4.8](#).

**A.16.7.1** The requirements are, of necessity, general in scope, because it is recognized that they apply to all types of day-care occupancies as well as conditions of occupancies, such as truant day-care occupancies; occupancies for the mentally handicapped, vision impaired, hearing impaired, and speech impaired; adult day-care; care of infants; and day-care occupancies. It is fully recognized that no one code can meet all the conditions of the various buildings involved, and it will be necessary for site administrators, through the written fire emergency response plan, to issue supplements to these requirements; however, all supplements should be consistent with these requirements. Additionally, it is recommended that fire safety be a part of the educational programs of the occupancy for clients.

Fire emergency response plans need to be written and made available to all employees, including temporary or substitute staff, so that all employees know what is expected of them during

## CHAPTER 17 • Existing

**17.6.4 Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers shall be protected in accordance with [8.7.3.1](#), unless all of the following requirements are met:

- (1) Dispensers shall be installed in rooms or spaces separated from corridors, stairways, and exterior doors.
- (2) The maximum individual dispenser fluid capacity shall be as follows:
  - (a) 0.32 gal (1.2 L) for dispensers in rooms
  - (b) 0.53 gal (2.0 L) for dispensers in suites of rooms
- (3) The dispensers shall be separated from each other by horizontal spacing of not less than 48 in. (1220 mm).
- (4) Storage of quantities greater than 5 gal (18.9 L) in a single fire compartment shall meet the requirements of NFPA 30, *Flammable and Combustible Liquids Code*.
- (5) The dispensers shall not be installed over or directly adjacent to an ignition source.
- (6) Dispensers installed directly over carpeted floors shall be permitted only in sprinklered rooms or spaces.

---

## 17.7 Operating Features

is a requirement for day-care occupancies only, not day-care homes. The text of [16/17.7.4.1](#) was revised for the 2012 edition of the *Code* to clarify the issue by changing “in day-care occupancies” to “in day-care occupancies, other than in day-care homes.” See [16/17.1.1.4](#) and [16/17.1.1.5](#).

**17.7.1\* Emergency Action Plans.** Emergency action plans shall be provided in accordance with [Section 4.8](#).

**A.17.7.1** The requirements are, of necessity, general in scope, because it is recognized that they apply to all types of day-care occupancies as well as conditions of occupancies, such as truant day-care occupancies; occupancies for the mentally handicapped, vision impaired, hearing impaired, and speech impaired; adult day-care; care of infants; and day-care occupancies. It is fully recognized that no one code can meet all the conditions of the various buildings involved, and it will be necessary for site administrators, through the written fire emergency response plan, to issue supplements to these requirements; however, all supplements should be consistent with these requirements. Additionally, it is recommended that fire safety be a part of the educational programs of the occupancy for clients.

Fire emergency response plans need to be written and made available to all employees, including temporary or substitute staff, so that all employees know what is expected of them during

## CHAPTER 16 • New

a fire emergency. The elements needed in the written plan should be identified in coordination with the authority having jurisdiction.

The facility fire emergency response plan might be a module of a facility disaster plan that covers other emergencies.

The proper safeguarding of clients during a fire emergency requires prompt and effective response by the facility employees in accordance with the fire emergency response plan. Duties covered under the plan should be assigned by position rather than by employee name. Such assignment ensures that, in the absence of an employee, the duties of the position will be performed by a substitute or temporary employee assigned to the position. Temporary or substitute employees should be instructed in advance regarding their duties under the plan for the position to which they are assigned.

Written fire emergency response plans should include, but should not be limited to, information for employees regarding methods and devices available for alerting occupants of a fire emergency. Employees should know how the fire department is to be alerted. Even where automatic systems are expected to alert the fire department, the written plan should provide for backup alerting procedures by staff. Other responses of employees to a fire emergency should include the following:

- (1) Removal of clients in immediate danger to areas of safety, as set forth in the plan
- (2) Methods of using building features to confine the fire and its byproducts to the room or area of origin
- (3) Control of actions and behaviors of clients during removal or evacuation activities and at predetermined safe assembly areas

The written plan should state clearly the facility policy regarding the actions staff are to take or not take to extinguish a fire. It should also incorporate the emergency egress and relocation drill procedures set forth in [16.7.2](#).

For additional guidance on emergency action plans, see *NFPA 1600, Standard on Disaster/Emergency Management and Business Continuity Programs*. This standard establishes a common set of criteria for disaster management, emergency management, and business continuity programs.

The provision of [16/17.7.1](#) requires emergency action plans in accordance with [Section 4.8](#). [Paragraphs A.4.8.2.1, A.4.8.2.1\(3\), and A.4.8.2.3](#) provide helpful guidance on emergency action plan components, evacuation strategies, and evaluation of current plans. [Exhibit 16/17.32](#) shows a posted evacuation route placard and associated directions for a day-care occupancy. The evacuation plan takes advantage of the presence of other buildings in the large hospital complex in which the day-care occupancy is located. After exiting the building, clients are taken into

## CHAPTER 17 • Existing

a fire emergency. The elements needed in the written plan should be identified in coordination with the authority having jurisdiction.

The facility fire emergency response plan might be a module of a facility disaster plan that covers other emergencies.

The proper safeguarding of clients during a fire emergency requires prompt and effective response by the facility employees in accordance with the fire emergency response plan. Duties covered under the plan should be assigned by position rather than by employee name. Such assignment ensures that, in the absence of an employee, the duties of the position will be performed by a substitute or temporary employee assigned to the position. Temporary or substitute employees should be instructed in advance regarding their duties under the plan for the position to which they are assigned.

Written fire emergency response plans should include, but should not be limited to, information for employees about methods and devices available for alerting occupants of a fire emergency. Employees should know how the fire department is to be alerted. Even where automatic systems are expected to alert the fire department, the written plan should provide for backup alerting procedures by staff. Other responses of employees to a fire emergency should include the following:

- (1) Removal of clients in immediate danger to areas of safety, as set forth in the plan
- (2) Methods of using building features to confine the fire and its byproducts to the room or area of origin
- (3) Control of actions and behaviors of clients during removal or evacuation activities and at predetermined safe assembly areas

The written plan should state clearly the facility policy regarding the actions staff are to take or not take to extinguish a fire. It should also incorporate the emergency egress and relocation drill procedures set forth in [17.7.2](#).

For additional guidance on emergency action plans, see *NFPA 1600, Standard on Disaster/Emergency Management and Business Continuity Programs*. This standard establishes a common set of criteria for disaster management, emergency management, and business continuity programs.

another — but physically distant — building so as not to be on a busy city street or exposed to harsh weather conditions. The directions posted with the evacuation route plan read as follows:

Exit 1. Remove attendance sheet for roll call. Proceed through single door of Classroom B. Exit through the main Center doorway. Proceed left through the xxx [name, as well as others below, redacted to protect

## CHAPTER 16 • New

*identity of the facility*] Lobby then right to exit to the street area. Take a right turn and proceed to sidewalk area at bottom of ramp.

**Exit 2.** Remove attendance sheet for roll call. In case of fire in front entrance or Lobby Unit, exit directly through back double doors in Classroom B to the outdoor play yard space. Continue through Exit Door at back end of play yard (on left side of yard). Once through exit door continue straight across hall to xxx Court Yard. Proceed left through courtyard and down brick stair to sidewalk area.

Exhibit 16/17.32

Evacuation route plan.

## 16.7.2 Emergency Egress and Relocation Drills.

**16.7.2.1\*** Emergency egress and relocation drills shall be conducted in accordance with **Section 4.7** and the applicable provisions of **16.7.2.2**.

**A.16.7.2.1** The requirements are, of necessity, general in scope, because it is recognized that they apply to all types of day-care occupancies as well as conditions of occupancies, such as truant day-care occupancies; and day-care occupancies for the mentally handicapped, vision impaired, hearing impaired, and speech impaired. It is fully recognized that no one code can meet all the conditions of the various buildings involved, and it will be necessary for site administrators to issue supplements to these requirements, but all supplements should be consistent with these requirements.

**16.7.2.2** Emergency egress and relocation drills shall be conducted as follows:

- (1) Not less than one emergency egress and relocation drill shall be conducted every month the facility is in session, unless both of the following criteria are met:

## CHAPTER 17 • Existing

**Once Outside.** Once outside from either exit take an initial roll call to ensure everyone is present. Proceed down sidewalk toward xxx Street. Take a right on xxx Street until you reach xxx Building. Enter building and gather in lobby area.

The emergency action plan needs to reflect the client population of the facility, including whether clients might be asleep. The daily schedule posted to the right of the evacuation plan in **Exhibit 16/17.32** calls for naps and quiet play from 12:30 to 2:30 p.m. **Exhibit 16/17.33** shows some of the sleeping mats located in each of the client rooms of the day-care facility.

Exhibit 16/17.33

Mats for client sleeping (naps).

## 17.7.2 Emergency Egress and Relocation Drills.

**17.7.2.1\*** Emergency egress and relocation drills shall be conducted in accordance with **Section 4.7** and the applicable provisions of **17.7.2.2**.

**A.17.7.2.1** The requirements are, of necessity, general in scope, because it is recognized that they apply to all types of day-care occupancies as well as conditions of occupancies, such as truant day-care occupancies; and day-care occupancies for the mentally handicapped, vision impaired, hearing impaired, and speech impaired. It is fully recognized that no one code can meet all the conditions of the various buildings involved, and it will be necessary for site administrators to issue supplements to these requirements, but all supplements should be consistent with these requirements.

**17.7.2.2** Emergency egress and relocation drills shall be conducted as follows:

- (1) Not less than one emergency egress and relocation drill shall be conducted every month the facility is in session, unless both of the following criteria are met:

## CHAPTER 16 • New

- (a) In climates where the weather is severe, the monthly emergency egress and relocation drills shall be permitted to be deferred.
  - (b) The required number of emergency egress and relocation drills shall be conducted, and not less than four shall be conducted before the drills are deferred.
- (2) All occupants of the building shall participate in the drill.
  - (3) One additional emergency egress and relocation drill, other than for day-care occupancies that are open on a year-round basis, shall be required within the first 30 days of operation.

Emergency egress drills for day-care occupancies are essential to ensure an orderly response of staff and clients during a fire. The day-care facility should vary the timing and arrangement of the

**16.7.3 Inspections.**

**16.7.3.1** Fire prevention inspections shall be conducted monthly by a trained senior member of the staff, after which a copy of the latest inspection report shall be posted in a conspicuous place in the day-care facility.

**16.7.3.2\*** It shall be the duty of site administrators and staff members to inspect all exit facilities daily to ensure that all stairways, doors, and other exits are in proper condition.

**A.16.7.3.2** Particular attention should be given to keeping all doors unlocked; keeping doors that serve to protect the safety of paths of egress closed and under no conditions blocked open, such as doors on stairway enclosures; keeping outside stairs and fire escape stairs free from all obstructions and clear of snow and ice; and allowing no accumulation of snow or ice or materials of any kind outside exit doors that might prevent the opening of the door or interfere with rapid escape from the building.

**16.7.3.3** Open plan buildings shall require extra surveillance to ensure that exit paths are maintained clear of obstruction and are obvious.

**16.7.3.4 Inspection of Door Openings.** Door openings shall be inspected in accordance with [7.2.1.15](#).

Compliance with the requirement of [16/17.7.3.2](#) for daily inspection of the egress system has benefits that far outweigh the time and resources required to conduct such inspections. Staff members are permitted to conduct such inspections. Staff members typically are well acquainted with the building features and operations of the facility.

The door inspection requirements of [16/17.7.3.4](#) apply to specific doors as detailed in [7.2.1.15](#). Door leaves that get used

## CHAPTER 17 • Existing

- (a) In climates where the weather is severe, the monthly emergency egress and relocation drills shall be permitted to be deferred.
  - (b) The required number of emergency egress and relocation drills shall be conducted, and not less than four shall be conducted before the drills are deferred.
- (2) All occupants of the building shall participate in the drill.
  - (3) One additional emergency egress and relocation drill, other than for day-care occupancies that are open on a year-round basis, shall be required within the first 30 days of operation.

drills but not the required response, which is orderly evacuation. See also [Section 4.7](#).

**17.7.3 Inspections.**

**17.7.3.1** Fire prevention inspections shall be conducted monthly by a trained senior member of the staff, after which a copy of the latest inspection report shall be posted in a conspicuous place in the day-care facility.

**17.7.3.2\*** It shall be the duty of site administrators and staff members to inspect all exit facilities daily to ensure that all stairways, doors, and other exits are in proper condition.

**A.17.7.3.2** Particular attention should be given to keeping all doors unlocked; keeping doors that serve to protect the safety of paths of egress closed and under no conditions blocked open, such as doors on stairway enclosures; keeping outside stairs and fire escape stairs free from all obstructions and clear of snow and ice; and allowing no accumulation of snow or ice or materials of any kind outside exit doors that might prevent the opening of the door or interfere with rapid escape from the building.

**17.7.3.3** Open plan buildings shall require extra surveillance to ensure that exit paths are maintained clear of obstruction and are obvious.

**17.7.3.4 Inspection of Door Openings.** Door openings shall be inspected in accordance with [7.2.1.15](#).

frequently are more apt to experience wear that adversely affects operability and leads to failure. Door leaves that are infrequently used might be misaligned within their frames so as to be difficult to open within the operating forces requirements of [7.2.1.4.5](#). The door inspection and testing criteria of [7.2.1.15](#) are intended to help identify problems with door openings and ensure that such problems are remedied. See [7.2.1.15](#).

## CHAPTER 16 • New

**16.7.4 Furnishings and Decorations.**

Day-care facilities have many furnishings that are needed for client activities. The provisions of 16/17.7.4.1 and 16/16.7.4.3 address furnishings that might spread flame to the ceiling, such as draperies/curtains or expanses of artwork applied to walls. The provisions of 16/17.7.4.2 address clothing in corridors but not within the client care areas. Exhibit 16/17.34 shows typical furnishings that are not regulated by 16/17.7.4. Exhibit 16/17.35 shows cubbies that are not directly addressed by 16/17.7.4 but might be considered to be wood lockers as addressed by 10.3.8.2. If the cubbies were to be regulated as wood lockers, they would be permitted based on the presence of automatic sprinklers and the combined effect of 10.3.8.2, 17.3.3.2, and 10.2.8.1. See the commentary that follows 16.3.3.3.3.

Exhibit 16/17.34

*Contents typical of a day-care occupancy.*

**16.7.4.1** Draperies, curtains, and other similar furnishings and decorations in day-care occupancies, other than in day-care homes, shall be in accordance with the provisions of 10.3.1.

**16.7.4.2** Clothing and personal effects shall not be stored in corridors, unless otherwise permitted by one of the following:

- (1) This requirement shall not apply to corridors protected by an automatic sprinkler system in accordance with Section 9.7.
- (2) This requirement shall not apply to corridor areas protected by a smoke detection system in accordance with Section 9.6.
- (3) This requirement shall not apply to storage in metal lockers, provided that the required egress width is maintained.

## CHAPTER 17 • Existing

**17.7.4 Furnishings and Decorations.**

Clothing hung on hooks along corridor walls greatly increases the combustible load and will generally allow flame to spread quickly. Because Chapters 16 and 17 regulate the interior wall finish for corridors and lobbies, surfaces covered by combustible clothing that would allow flame to spread more quickly than is permitted by wall surfaces should not be created. The three provisions of 16/17.7.4.2 (control of fire by sprinklers, early warning of incipient-stage fire via smoke detection, or isolating fuel packages by locating the clothing in metal lockers) help to mitigate the potential for a clothing fire to render the exit access unusable.

Exhibit 16/17.35

*Cubbies that might be considered wood lockers.*

**17.7.4.1** Draperies, curtains, and other similar furnishings and decorations in day-care occupancies, other than in day-care homes, shall be in accordance with the provisions of 10.3.1.

**17.7.4.2** Clothing and personal effects shall not be stored in corridors, unless otherwise permitted by one of the following:

- (1) This requirement shall not apply to corridors protected by an automatic sprinkler system in accordance with Section 9.7.
- (2) This requirement shall not apply to corridor areas protected by a smoke detection system in accordance with Section 9.6.
- (3) This requirement shall not apply to storage in metal lockers, provided that the required egress width is maintained.

## CHAPTER 16 • New

**16.7.4.3** Artwork and teaching materials shall be permitted to be attached directly to the walls in accordance with the following:

- (1) The artwork and teaching materials shall not exceed 20 percent of the wall area in a building that is not protected throughout by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#).
- (2) The artwork and teaching materials shall not exceed 50 percent of the wall area in a building that is protected throughout by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#).

It is advantageous not only to limit the quantity of artwork displayed but also to avoid placing such materials near a room's exit access doors. Because the combustibility of the artwork cannot be effectively controlled, the quantity, in terms of the percentage of wall area covered, is regulated to avoid creating a

**16.7.4.4** The provision of [10.3.2](#) for cigarette ignition resistance of newly introduced upholstered furniture and mattresses shall not apply to day-care homes.

The format of [10.3.2](#) was changed for the 2006 edition of the *Code* from a menu-like item requiring adoption by an occupancy chapter to an outright mandate. [Subsection 10.3.2](#) requires smoldering ignition resistance for newly introduced upholstered furniture and mattresses, unless otherwise modified by an

**16.7.5\* Day-Care Staff.** Adequate adult staff shall be on duty in the facility and alert at all times where clients are present.

**A.16.7.5** It is the intent that the requirement for adequate adult staff to be awake at all times when clients are present be applied to family day-care and group day-care homes that are operated at night, as well as day-care occupancies.

It is beyond the scope of the *Code* to specify a minimum staff-to-client ratio, but [16/17.7.5](#) clearly requires that adequate adult staff be on duty and alert in the facility at all times when clients are present. The mandatory language of [16/17.7.5](#) mandates that staff be on duty and alert; the text of [A.16/A.17.7.5](#) clarifies

## CHAPTER 17 • Existing

**17.7.4.3** Artwork and teaching materials shall be permitted to be attached directly to the walls in accordance with the following:

- (1) The artwork and teaching materials shall not exceed 20 percent of the wall area in a building that is not protected throughout by an approved automatic sprinkler system in accordance with [Section 9.7](#).
- (2) The artwork and teaching materials shall not exceed 50 percent of the wall area in a building that is protected throughout by an approved automatic sprinkler system in accordance with [Section 9.7](#).

continuous combustible surface that will spread flame across the room. If the building is protected throughout by automatic sprinklers, the percentage of wall area permitted to be covered with artwork and teaching materials is increased to 50 percent.

**17.7.4.4** The provision of [10.3.2](#) for cigarette ignition resistance of newly introduced upholstered furniture and mattresses shall not apply to day-care homes.

occupancy chapter. [Paragraph 16/17.7.4.4](#) clarifies that furniture and mattresses in day-care homes (i.e., 4 to 12 clients), but not day-care occupancies (i.e., more than 12 clients), are exempted from fire testing for smoldering ignition resistance.

**17.7.5\* Day-Care Staff.** Adequate adult staff shall be on duty in the facility and alert at all times where clients are present.

**A.17.7.5** It is the intent that the requirement for adequate adult staff to be awake at all times when clients are present be applied to family day-care and group day-care homes that are operated at night, as well as day-care occupancies.

that, in order to be alert, staff must be awake. The overall protection package of [Chapters 16 and 17](#) relies heavily on staff action. The staff-to-client ratios on which the other provisions of the chapter were developed are summarized in [A.16/A.17.1.1](#).

# New and Existing Health Care Occupancies

Life safety in health care occupancies is so encompassing that it includes nearly the entire gamut of systems, options, and features addressed in the core chapters. Unlike most other buildings and use groups addressed by the *Code*, the least desirable emergency action in a health care occupancy is the wholesale relocation or evacuation of patients. For this reason, a “defend-in-place” strategy is used.

The defend-in-place strategy is implemented using a “total concept” approach. As detailed in 18/19.1.1.3, the total concept approach provides an assortment of features that are deemed necessary to avoid the movement of patients to the outside during a fire. Of course, those patients or residents who might be perilously close to the effects of the fire are given a range of protection features, such as being moved to an adjacent smoke compartment on the same floor. Exhibit 18/19.1 shows cross-corridor smoke barrier doors that, when closed, complete the continuity of the smoke barrier, separating one smoke compartment from the adjacent smoke compartment.

Requirements for allowable building construction types, sprinklers, alarm and detection systems, and staff training work in harmony to help ensure that a patient can be safely and adequately protected, regardless of where a fire starts.

Exhibit 18/19.1

Cross-corridor smoke barrier doors, which are part of the “defend-in-place” protection strategy.

Chapters 18 and 19 also address provisions under which doors are permitted to be locked. Examples of conditions that might justify door locking for the protection of patients or the public are provided in A.18/A.19.1.1.7. The criteria of the exemptions are detailed within the door provisions of 18/19.2.2.2.

Staff action is an integral part of the life safety features required in a health care facility. The proper response from staff in terms of availability, actions, and management of a fire can readily influence the outcome of a fire. Health care facility staff are charged with the responsibility of preserving the safety of their charges, whether that involves informing patients who are not in jeopardy from the fire or helping to relocate those who are. Exhibit 18/19.2 shows a nursing home staff member on duty at a nurses’ station. The staff member’s duties are many, but staff are at the ready and available to transition, as needed, into fire emergency mode.

Exhibit 18/19.2

Staffing levels provided for day-to-day functional purposes as well as for fire and similar emergency.

## CHAPTER 18 • New

Staff training, coupled with the traditional built-in systems and features (e.g., construction; compartmentation; interior finish; alarm, detection, and sprinkler systems; and control of contents and furnishings), provides one of the safest environments for one of the most vulnerable population groups addressed by the Code.

The health care occupancy environment continues to change as new technology is implemented, especially in hospitals where

Exhibit 18/19.3

Computer on wheels.

## 18.1 General Requirements

Chapters 18 and 19 cover the requirements for health care occupancies. Prior to the 1976 edition of the Code, these occupancies were grouped with penal facilities (currently addressed by Chapters 22 and 23) and were known as “institutional occupancies.”

Health care occupancies are those facilities used on an inpatient basis for the medical care or treatment of four or more persons suffering from physical or mental illness, disease, or infirmity, and for the care of infants, convalescents, or infirm aged persons.

The health care occupancies addressed in Chapters 18 and 19 include the following:

## CHAPTER 19 • Existing

patient information privacy requirements have made computer screens, mounted on corridor walls and visible to passersby, obsolete. Computers on wheels accompany staff on most interactions with patients. The computers on wheels, when not in use, present challenges to maintaining the corridor clear width required by 18/19.2.3. Exhibit 18/19.3 shows the ubiquitous computer on wheels.

Health concerns have led to a ban on smoking in health care occupancy buildings and in proximate outdoor areas. Fires caused by smoldering cigarettes trapped in dirty linen were common in years past. Similar incidents are rare today. Exhibit 18/19.4 shows an outdoor sign, at the main entrance of a hospital, reminding visitors of the smoking ban.

Exhibit 18/19.4

Outdoor sign at main entrance of a hospital declaring area to be smoke free.

## 19.1 General Requirements

1. Hospitals
2. Nursing homes
3. Limited care facilities

Exhibit 18/19.5 and Exhibit 18/19.6 show, respectively, the main entrance of a hospital and the main entrance of a nursing home.

The occupants who receive medical care in a hospital are called *patients*. The occupants who receive nursing care in a nursing home are called *residents*. Throughout the handbook commentary for Chapters 18/19, the term *patient* is also meant

## CHAPTER 18 • New

to include the term *resident*, and the term *resident* is also meant to include the term *patient*. In other cases, both the term *patient* and the term *resident* are used in a commentary sentence.

Hospitals, nursing homes, and limited care facilities provide sleeping facilities for occupants incapable of self-preservation

Exhibit 18/19.5

Main entrance of a hospital.

**18.1.1 Application.****18.1.1.1 General.**

**18.1.1.1.1\*** The requirements of this chapter shall apply to new buildings or portions thereof used as health care occupancies. (See 1.3.1.)

**A.18.1.1.1.1** In determining equivalency for conversions, modernizations, renovations, or unusual design concepts of hospitals or nursing homes, the authority having jurisdiction is permitted to accept evaluations based on the health care occupancies fire safety evaluation system (FSSES) of NFPA 101A, *Guide on Alternative Approaches to Life Safety*, utilizing the parameters for new construction.

The provisions for new health care occupancies are addressed in Chapter 18; the provisions for existing health care occupancies (i.e., existing conditions in health care occupancies) are addressed in Chapter 19.

In editions of the *Code* prior to 2006, renovations, additions, and change of occupancy were required to comply with the requirements for new construction. For health care occupancies, such renovations, additions, and changes of occupancy

## CHAPTER 19 • Existing

due to age, physical or mental disabilities, or security measures not under their control.

Ambulatory health care facilities differ from health care occupancies in that they provide health care services on an outpatient basis; they are addressed separately in Chapters 20 and 21.

Exhibit 18/19.6

Main entrance of a nursing home.

**19.1.1 Application.****19.1.1.1 General.**

**19.1.1.1.1\*** The requirements of this chapter shall apply to existing buildings or portions thereof currently occupied as health care occupancies, unless the authority having jurisdiction has determined equivalent safety has been provided in accordance with Section 1.4.

**A.19.1.1.1.1** In determining equivalency for existing hospitals or nursing homes, the authority having jurisdiction is permitted to accept evaluations based on the health care occupancies fire safety evaluation system (FSSES) of NFPA 101A, *Guide on Alternative Approaches to Life Safety*, utilizing the parameters for existing buildings.

were required to meet the provisions of Chapter 18, while existing conditions were subject to the provisions of Chapter 19. With the 2006 edition of the *Code*, Chapter 43, Building Rehabilitation, was added. The chapter was written to promote the adaptive reuse of existing buildings without sacrificing the needed level of life safety. The provisions of Chapter 43 blend the requirements for new construction with those for existing conditions, so as to require additional life safety features as the

## CHAPTER 18 • New

rehabilitation work category increases in complexity. The rehabilitation work categories are repair, renovation, modification, reconstruction, change of use or occupancy classification, and addition. See 4.6.7, 4.6.11, and Chapter 43.

Exhibit 18/19.7 shows a room in a hospital that has been converted from a patient sleeping room to a storage room. The room is larger than 50 ft<sup>2</sup> (4.6 m<sup>2</sup>), and the presence of the combustible storage creates a hazardous area requiring protection in accordance with 18/19.3.2.1. The change from a patient sleeping room to a hazardous area storage room constitutes a *change of use* as defined by 43.2.2.1.5 and addressed by the requirements of 43.7.1.

Exhibit 18/19.7

Patient sleeping room converted to a storage room.

**18.1.1.1.2 Administration.** The provisions of Chapter 1, Administration, shall apply.

**18.1.1.1.3 General.** The provisions of Chapter 4, General, shall apply.

The provisions of 18/19.1.1.1.2 and 18/19.1.1.1.3 remind the user that the administrative provisions of Chapter 1 and the general provisions of Chapter 4 apply.

**18.1.1.1.4** The requirements established by this chapter shall apply to the design of all new hospitals, nursing homes, and limited care facilities. The term *hospital*, wherever used in this Code, shall include general hospitals, psychiatric hospitals, and

## CHAPTER 19 • Existing

Chapters 18 and 19 are not intended to limit the methods that an authority having jurisdiction (AHJ) might use to determine equivalency. However, as noted in A.18/A.19.1.1.1.1, NFPA 101A, *Guide on Alternative Approaches to Life Safety*,<sup>1</sup> provides an equivalency system that uses numerical values to analyze the fire safety effectiveness of a building design and arrangement. This system, known as the fire safety evaluation system (FSES), provides a method for evaluating alternative designs as options to literal Code compliance. It is not the intent of the Code to limit equivalency evaluations solely to this system. The AHJ does retain the power to evaluate and approve alternative designs on the basis of appropriate supporting data, whether or not the FSES is used to aid in that evaluation. Paragraph A.18/A.19.1.1.1.1 in no way mandates the use of the FSES, nor does it require the AHJ to accept the results of an evaluation using the system.

The FSES is a tool to help determine equivalency — it should not be used to circumvent Code requirements. Code requirements must be met, or equivalent safety must be provided by alternative means approved by the AHJ. Although the FSES was developed primarily to evaluate alternative designs in existing buildings, it is particularly useful in determining equivalency for unusual design concepts, as it has applicability to new construction as well.

The 2013 edition of NFPA 101A was calibrated so that its measurement tools would compare alternative designs against the requirements of the 2012 edition of the *Life Safety Code*. It does not measure equivalency against the requirements of the 2015 edition of the Code and, therefore, must not be used to measure such equivalency. At the time this handbook went to press, the 2016 edition of NFPA 101A was being processed via the NFPA consensus-based standards-making process. The 2016 edition, to be published late in 2015, will include the proper calibration of the health care occupancies FSES for measuring equivalency against the requirements of Chapters 18 and 19 of the 2015 edition of the Code.

**19.1.1.1.2 Administration.** The provisions of Chapter 1, Administration, shall apply.

**19.1.1.1.3 General.** The provisions of Chapter 4, General, shall apply.

**19.1.1.1.4** The requirements established by this chapter shall apply to all existing hospitals, nursing homes, and limited care facilities. The term *hospital*, wherever used in this Code, shall include general hospitals, psychiatric hospitals, and specialty

## CHAPTER 18 • New

specialty hospitals. The term *nursing home*, wherever used in this *Code*, shall include nursing and convalescent homes, skilled nursing facilities, intermediate care facilities, and infirmaries in homes for the aged. Where requirements vary, the specific subclass of health care occupancy that shall apply is named in the paragraph pertaining thereto. The requirements established by **Chapter 20** shall apply to all new ambulatory health care facilities. The operating feature requirements established by **Section 18.7** shall apply to all health care occupancies.

**18.1.1.1.5** The health care facilities regulated by this chapter shall be those that provide sleeping accommodations for their occupants and are occupied by persons who are mostly incapable of self-preservation because of age, because of physical or mental disability, or because of security measures not under the occupants' control.

**18.1.1.1.6** Buildings, or sections of buildings, that primarily house patients who, in the opinion of the governing body of the facility and the governmental agency having jurisdiction, are capable of exercising judgment and appropriate physical action for self-preservation under emergency conditions shall be permitted to comply with chapters of this *Code* other than **Chapter 18**.

**18.1.1.1.7\*** It shall be recognized that, in buildings housing certain patients, it might be necessary to lock doors and bar windows to confine and protect building inhabitants.

**A.18.1.1.1.7** There are many reasons why doors in the means of egress in health care occupancies might need to be locked for the protection of the patients or the public. Examples of conditions that might justify door locking include dementia, mental health, infant care, pediatric care, or patients under court detention order requiring medical treatment in a health care facility. See **18.2.2.2.5** for details on door locking.

**18.1.1.1.8** Buildings, or sections of buildings, that house older persons and that provide activities that foster continued independence but that do not include services distinctive to health care occupancies (*see 18.1.4.2*), as defined in **3.3.190.7**, shall be permitted to comply with the requirements of other chapters of this *Code*, such as **Chapters 30** or **32**.

**18.1.1.1.9** Facilities that do not provide housing on a 24-hour basis for their occupants shall be classified as other occupancies and shall be covered by other chapters of this *Code*.

**18.1.1.1.10\*** The requirements of this chapter shall apply based on the assumption that staff is available in all patient-occupied areas to perform certain fire safety functions as required in other paragraphs of this chapter.

**A.18.1.1.1.10** The *Code* recognizes that certain functions necessary for the life safety of building occupants — such as the detection of fire and associated products of combustion, the closing of corridor doors, the operation of manual fire alarm devices,

## CHAPTER 19 • Existing

hospitals. The term *nursing home*, wherever used in this *Code*, shall include nursing and convalescent homes, skilled nursing facilities, intermediate care facilities, and infirmaries in homes for the aged. Where requirements vary, the specific subclass of health care occupancy that shall apply is named in the paragraph pertaining thereto. The requirements established by **Chapter 21** shall apply to all existing ambulatory health care facilities. The operating features requirements established by **Section 19.7** shall apply to all health care occupancies.

**19.1.1.1.5** The health care facilities regulated by this chapter shall be those that provide sleeping accommodations for their occupants and are occupied by persons who are mostly incapable of self-preservation because of age, because of physical or mental disability, or because of security measures not under the occupants' control.

**19.1.1.1.6** Buildings, or sections of buildings, that primarily house patients who, in the opinion of the governing body of the facility and the governmental agency having jurisdiction, are capable of exercising judgment and appropriate physical action for self-preservation under emergency conditions shall be permitted to comply with chapters of the *Code* other than **Chapter 19**.

**19.1.1.1.7\*** It shall be recognized that, in buildings housing certain patients, it might be necessary to lock doors and bar windows to confine and protect building inhabitants.

**A.19.1.1.1.7** There are many reasons why doors in the means of egress in health care occupancies might need to be locked for the protection of the patients or the public. Examples of conditions that might justify door locking include dementia, mental health, infant care, pediatric care, or patients under court detention order requiring medical treatment in a health care facility. See **19.2.2.2.5** for details on door locking.

**19.1.1.1.8** Buildings, or sections of buildings, that house older persons and that provide activities that foster continued independence but do not include services distinctive to health care occupancies (*see 19.1.4.2*), as defined in **3.3.190.7**, shall be permitted to comply with the requirements of other chapters of this *Code*, such as **Chapters 31** or **33**.

**19.1.1.1.9** Facilities that do not provide housing on a 24-hour basis for their occupants shall be classified as other occupancies and shall be covered by other chapters of this *Code*.

**19.1.1.1.10\*** The requirements of this chapter shall apply based on the assumption that staff is available in all patient-occupied areas to perform certain fire safety functions as required in other paragraphs of this chapter.

**A.19.1.1.1.10** The *Code* recognizes that certain functions necessary for the life safety of building occupants — such as the detection of fire and associated products of combustion, the closing of corridor doors, the operation of manual fire alarm devices,

## CHAPTER 18 • New

and the removal of patients from the room of fire origin — require the intervention of facility staff. It is not the intent of 18.1.1.1.10 to specify the levels or locations of staff necessary to meet this requirement.

Paragraphs 18/19.1.1.1.4 through 18/19.1.1.1.10 contain general material applicable to health care occupancies. Occupants in a health care facility are housed primarily for treatment of mental or physical infirmities, though they might be restrained. If occupants are restrained for penal or correctional purposes, the building would be classified as a detention and correctional occupancy, and the provisions of Chapters 22 and 23 would apply. However, see A.18/A.19.1.1.1.7, which recognizes that patients under court detention order might receive medical treatment in a health care occupancy where doors are locked.

If a building is used for the treatment or housing of patients, including those with mental disabilities or older persons (see 18/19.1.1.1.6 and 18/19.1.1.1.7), the building can be classified as an occupancy other than health care under the following conditions:

1. Occupants are not restrained by locked doors or other devices.
2. Patients are ambulatory.
3. Occupants are capable of perceiving threats and taking appropriate action for self-preservation.

Occupants of health care facilities are considered to be incapable of self-preservation (see 18/19.1.1.1.5) due to age, physical or mental disabilities, or security measures not under their control. A significant number of occupants in health care facilities are assumed to be nonambulatory or bedridden. Other occupants, while capable of self-movement, might have impaired judgment.

Although locked exit doors and barred windows are undesirable in terms of life safety, the Code recognizes that, in some cases, such measures are necessary for the protection of the

**18.1.1.2\* Goals and Objectives.** The goals and objectives of Sections 4.1 and 4.2 shall be met with due consideration for functional requirements, which are accomplished by limiting the development and spread of a fire emergency to the room of fire origin and reducing the need for occupant evacuation, except from the room of fire origin.

**A.18.1.1.2** This objective is accomplished in the context of the physical facilities, the type of activities undertaken, the provisions for the capabilities of staff, and the needs of all occupants through requirements directed at the following:

- (1) Prevention of ignition
- (2) Detection of fire

## CHAPTER 19 • Existing

and the removal of patients from the room of fire origin — require the intervention of facility staff. It is not the intent of 19.1.1.1.10 to specify the levels or locations of staff necessary to meet this requirement.

patients or the public. In these instances, provisions need to be made for the continuous supervision and prompt release of those restrained (see 18/19.1.1.1.7). Release of occupants should be achieved by a system capable of automatically unlocking doors in the means of egress or by continuously available attendants equipped with keys. In either case, continuous supervision is considered essential. Also see 18/19.2.2.2.5, which permit locked doors for the following conditions:

1. Door locking for the clinical needs of patients who require specialized security measures
2. Door locking where patients pose a security threat
3. Door locking where patient needs require specialized protective measures for their safety

The Code assumes that staff will be in continuous attendance in all health care facilities. In fact, staff are assigned certain critical functions during a fire emergency, such as rescuing patients from the room of origin, closing the door to the room, and activating the fire alarm system. The Code does not specify minimum staff/patient ratios, because such provisions are included in licensing criteria, and compliance with licensing criteria will normally satisfy the Code. Paragraph 18/19.1.1.1.10, in effect, mandates that staff be present. A staff person should be situated to supervise each smoke compartment housing patients. A nursing station located to allow visual supervision of two or more smoke compartments is considered adequate. If, because of some unusual arrangement, staff is not available 24 hours a day to provide supervision, alternative means should be provided to ensure an adequate level of fire safety that is in compliance with the Code.

**19.1.1.2\* Goals and Objectives.** The goals and objectives of Sections 4.1 and 4.2 shall be met with due consideration for functional requirements, which are accomplished by limiting the development and spread of a fire emergency to the room of fire origin and reducing the need for occupant evacuation, except from the room of fire origin.

**A.19.1.1.2** This objective is accomplished in the context of the physical facilities, the type of activities undertaken, the provisions for the capabilities of staff, and the needs of all occupants through requirements directed at the following:

- (1) Prevention of ignition
- (2) Detection of fire

## CHAPTER 18 • New

- (3) Control of fire development
- (4) Confinement of the effects of fire
- (5) Extinguishment of fire
- (6) Provision of refuge or evacuation facilities, or both
- (7) Staff reaction

**18.1.1.3 Total Concept.**

**18.1.1.3.1** All health care facilities shall be designed, constructed, maintained, and operated to minimize the possibility of a fire emergency requiring the evacuation of occupants.

**18.1.1.3.2** Because the safety of health care occupants cannot be ensured adequately by dependence on evacuation of the building, their protection from fire shall be provided by appropriate arrangement of facilities; adequate, trained staff; and development of operating and maintenance procedures composed of the following:

- (1) Design, construction, and compartmentation
- (2) Provision for detection, alarm, and extinguishment
- (3) Fire prevention procedures and planning, training, and drilling programs for the isolation of fire, transfer of occupants to areas of refuge, or evacuation of the building

The well-being of an individual located in the room of fire origin can be reasonably ensured only through complete control of that environment, including construction materials, wall and ceiling finishes, furnishings, decorations, clothing, linens, bedding, and the like. However, no code can prevent injury resulting from a person's careless actions.

Although an effort should be made to protect the individual through fire prevention, the primary goal of the requirements of **Chapters 18 and 19**, as stated in **4.1.1(1)**, is to limit fire size so as to protect individuals not intimate with the initial fire development. In accordance with the goal of **4.1.1(2)**, the same protection scheme should have the benefit of additionally improving the survivability of those occupants who are intimate with the initial fire development.

**18.1.1.4 Additions, Conversions, Modernization, Renovation, and Construction Operations.**

The provisions of **4.6.7.3** through **4.6.7.5** and **4.6.12.2** explain the effect rehabilitation is permitted to have on existing features. The rehabilitation must not reduce existing life safety features that do not meet the requirements for new construction but that exceed the requirements for existing buildings. The rehabilitation is permitted to decrease existing life safety features only if such features are in excess of those required for new construction. For example, a portion of an existing hospital with a 6 ft (1830 mm) wide corridor is to be renovated. Although the hospital is an

## CHAPTER 19 • Existing

- (3) Control of fire development
- (4) Confinement of the effects of fire
- (5) Extinguishment of fire
- (6) Provision of refuge or evacuation facilities, or both
- (7) Staff reaction

**19.1.1.3 Total Concept.**

**19.1.1.3.1** All health care facilities shall be designed, constructed, maintained, and operated to minimize the possibility of a fire emergency requiring the evacuation of occupants.

**19.1.1.3.2** Because the safety of health care occupants cannot be ensured adequately by dependence on evacuation of the building, their protection from fire shall be provided by appropriate arrangement of facilities; adequate, trained staff; and development of operating and maintenance procedures composed of the following:

- (1) Design, construction, and compartmentation
- (2) Provision for detection, alarm, and extinguishment
- (3) Fire prevention procedures and planning, training, and drilling programs for the isolation of fire, transfer of occupants to areas of refuge, or evacuation of the building

Vertical movement of patients within a health care facility is an inefficient, time-consuming process. In particular, patients in critical care areas might be connected to life-support equipment, making movement difficult and, in some cases, impossible. The provisions of **Chapters 18 and 19**, therefore, are based on a defend-in-place strategy, which minimizes the probability of a fire dictating vertical movement of occupants. Barriers are required to provide for the horizontal movement of patients to safe areas on a single floor level and to maintain a manageable limit on the number of occupants exposed to any single fire. Vertical means of egress (stairs, in particular) should be considered as egress routes for visitors and staff who are not directly involved with patient relocation and as a "last line of defense" for the movement of patients.

**19.1.1.4 Additions, Conversions, Modernization, Renovation, and Construction Operations.**

existing building and existing health care occupancies require minimum 4 ft (1220 mm) wide corridors in accordance with **19.2.3.4**, the 6 ft (1830 mm) wide corridor must be maintained, since **18.2.3.4**, applicable to new construction, requires a minimum 8 ft (2440 mm) corridor width. Conversely, if a portion of an existing hospital with a 10 ft (3050 mm) wide corridor is to be altered, the corridor width is permitted to be reduced to 8 ft (2440 mm), which is the minimum requirement for new construction in accordance with **18.2.3.4**.

## CHAPTER 18 • New

**18.1.1.4.1 Additions.** Additions shall be separated from any existing structure not conforming to the provisions within **Chapter 19** by a fire barrier having not less than a 2-hour fire resistance rating and constructed of materials as required for the addition. (See 4.6.7 and 4.6.11.)

**18.1.1.4.1.1** Communicating openings in dividing fire barriers required by 18.1.1.4.1 shall be permitted only in corridors and shall be protected by approved self-closing fire door assemblies. (See also **Section 8.3**.)

**18.1.1.4.1.2** Doors in barriers required by 18.1.1.4.1 shall normally be kept closed, unless otherwise permitted by 18.1.1.4.1.3.

**18.1.1.4.1.3** Doors shall be permitted to be held open if they meet the requirements of 18.2.2.2.7.

**Paragraph 18/19.1.1.4.1** establishes separation criteria for additions to existing structures where those structures do not conform to the provisions of **Chapter 19**. However, if the existing building does meet the provisions of **Chapter 19**, a new addition complying with **Chapter 18** would not be required to be separated from the existing structure.

If additions are required to be separated from existing portions of buildings, barriers must be constructed of assemblies that provide not less than a 2-hour fire resistance rating. If the structural framing of the addition or the existing buildings consists of assemblies that provide less than 2-hour fire resistance, special provision must be made to ensure that the necessary separation will be maintained for a 2-hour period.

**Exhibit 18/19.8** illustrates the provisions of 18/19.1.1.4.1. In Part (a), the new addition that complies with **Chapter 18** must be separated from the existing portion of the building that does not comply with the requirements of **Chapter 19** for existing health care occupancies. In Part (b), the new addition that complies with **Chapter 18** is permitted to be open to the existing portion of the building that complies with the requirements of **Chapter 19**.

Materials used in the construction of the separation barrier required by 18/19.1.1.4.1 should meet the standards applicable to the addition under construction. That is, if the addition is required to be constructed of noncombustible or limited-combustible materials (construction Type I or Type II), the materials used in the barrier should be noncombustible or limited-combustible as addressed in 4.6.13 and 4.6.14 of this Code in lieu of the definitions in NFPA 220, *Standard on Types of Building Construction*.<sup>2</sup> Conversely, if the addition is permitted to be constructed of combustible materials, combustible materials are permitted to be used in the fire-rated barrier.

Openings in fire barriers separating additions that comply with **Chapter 18** from portions of the building not in compliance

## CHAPTER 19 • Existing

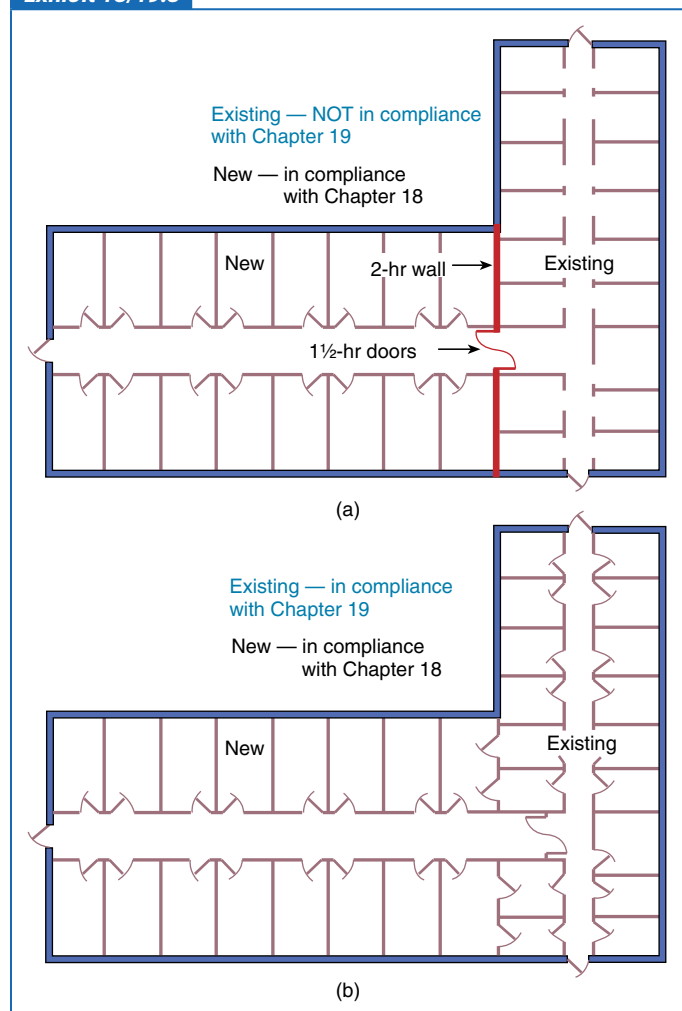

**19.1.1.4.1 Additions.** Additions shall be separated from any existing structure not conforming to the provisions within **Chapter 19** by a fire barrier having not less than a 2-hour fire resistance rating and constructed of materials as required for the addition. (See 4.6.7 and 4.6.11.)

**19.1.1.4.1.1** Communicating openings in dividing fire barriers required by 19.1.1.4.1 shall be permitted only in corridors and shall be protected by approved self-closing fire door assemblies. (See also **Section 8.3**.)

**19.1.1.4.1.2** Doors in barriers required by 19.1.1.4.1 shall normally be kept closed, unless otherwise permitted by 19.1.1.4.1.3.

**19.1.1.4.1.3** Doors shall be permitted to be held open if they meet the requirements of 19.2.2.2.7.

Exhibit 18/19.8

Separation of new construction from existing building.

## CHAPTER 18 • New

with the requirements of [Chapter 19](#) are limited to those that are absolutely necessary — that is, cross-corridor doors (see [18/19.1.1.4.1.1](#)). Openings are required to be protected by 1½-hour fire protection-rated door assemblies. The fire doors are required to be self-closing and to remain closed; they are permitted, however, to be held open by an automatic release device in accordance with [18/19.2.2.2.7](#). In Part (a) of [Exhibit 18/19.8](#), no openings, other than the cross-corridor doors, would be permitted in the separating barrier. This means

**18.1.1.4.2 Changes of Use or Occupancy Classification.** Changes of use or occupancy classification shall comply with [4.6.11](#), unless otherwise permitted by one of the following:

- (1) A change from a hospital to a nursing home or from a nursing home to a hospital shall not be considered a change in occupancy classification or a change in use.
- (2) A change from a hospital or nursing home to a limited care facility shall not be considered a change in occupancy classification or a change in use.
- (3) A change from a hospital or nursing home to an ambulatory health care facility shall not be considered a change in occupancy classification or a change in use.

[Paragraph 18/19.1.1.4.2](#) provides exemptions to the provisions of [4.6.11](#) related to change of occupancy classification or change of use. Exemptions offered by [18/19.1.1.4.2\(1\)](#) through (3) address changes from one health care occupancy subclassification to another health care occupancy subclassification. The exemptions state that the specific changes addressed are not meant to invoke the provisions for change of occupancy or change of use. Provided that the change in subclassification is from a subclassification that is heavily regulated by the *Code* to a subclassification that is either less regulated or at least as

#### 18.1.1.4.3 Rehabilitation.

**18.1.1.4.3.1** For purposes of the provisions of this chapter, the following shall apply:

- (1) A major rehabilitation shall involve the modification of more than 50 percent, or more than 4500 ft<sup>2</sup> (420 m<sup>2</sup>), of the area of the smoke compartment.
- (2) A minor rehabilitation shall involve the modification of not more than 50 percent, and not more than 4500 ft<sup>2</sup> (420 m<sup>2</sup>), of the area of the smoke compartment.

**18.1.1.4.3.2** Work that is exclusively plumbing, mechanical, fire protection system, electrical, medical gas, or medical equipment work shall not be included in the computation of the modification area within the smoke compartment.

## CHAPTER 19 • Existing

there can be no penetrations by ductwork. A convenience door between two rooms on opposite sides of the barrier also would be prohibited. However, as shown in Part (b) of [Exhibit 18/19.8](#), if the existing section of the building is in compliance with the requirements of [Chapter 19](#), no fire-rated separating barrier is required. Therefore, unlimited openings are permitted, as depicted in Part (b) of [Exhibit 18/19.8](#) by the four doors in the room walls between the new and existing portions of the building.

**19.1.1.4.2 Changes of Use or Occupancy Classification.** Changes of use or occupancy classification shall comply with [4.6.11](#), unless otherwise permitted by one of the following:

- (1) A change from a hospital to a nursing home or from a nursing home to a hospital shall not be considered a change in occupancy classification or a change in use.
- (2) A change from a hospital or nursing home to a limited care facility shall not be considered a change in occupancy classification or a change in use.
- (3) A change from a hospital or nursing home to an ambulatory health care facility shall not be considered a change in occupancy classification or a change in use.

regulated (e.g., hospital to ambulatory health care, or hospital to nursing home, respectively), the resulting facility is not subject to the change of occupancy or change of use provisions of [4.6.11](#). However, if the change is in the opposite direction — for example, from an ambulatory health care facility, which the *Code* regulates with a modest package of requirements, to a hospital or nursing home, which the *Code* regulates via an extensive package of requirements — then the resulting facility is subject to the change of occupancy or change of use provisions of [4.6.11](#).

#### 19.1.1.4.3 Rehabilitation.

**19.1.1.4.3.1** For purposes of the provisions of this chapter, the following shall apply:

- (1) A major rehabilitation shall involve the modification of more than 50 percent, or more than 4500 ft<sup>2</sup> (420 m<sup>2</sup>), of the area of the smoke compartment.
- (2) A minor rehabilitation shall involve the modification of not more than 50 percent, and not more than 4500 ft<sup>2</sup> (420 m<sup>2</sup>), of the area of the smoke compartment.

**19.1.1.4.3.2** Work that is exclusively plumbing, mechanical, fire protection system, electrical, medical gas, or medical equipment work shall not be included in the computation of the modification area within the smoke compartment.

## CHAPTER 18 • New

**18.1.1.4.3.3\*** Where major rehabilitation is done in a nonsprinklered smoke compartment, the automatic sprinkler requirements of 18.3.5 shall apply to the smoke compartment undergoing the rehabilitation, and, in cases where the building is not protected throughout by an approved automatic sprinkler system, the requirements of 18.4.4.2, 18.4.4.3, and 18.4.4.8 shall also apply.

**A.18.1.1.4.3.3** For the purpose of this requirement, a floor that is not divided by a smoke barrier is considered one smoke compartment. Where automatic sprinklers are retrofitted into existing nonsprinklered buildings, the construction alternatives for sprinklers provided in this *Code* are intended to apply to the renovated area.

**18.1.1.4.3.4\*** Where minor rehabilitation is done in a nonsprinklered smoke compartment, the requirements of 18.3.5.1 shall not apply, but, in such cases, the rehabilitation shall not reduce life safety below the level required for new buildings or below the level of the requirements of 18.4.3 for nonsprinklered smoke compartment rehabilitation. (See 4.6.7.)

**A.18.1.1.4.3.4** In minor rehabilitation, only the rehabilitation itself — not the entire smoke compartment or building — is required to be brought up to the requirements for new nonsprinklered facilities.

The provisions of 18/19.1.1.4.3 supplement, but do not replace, those of 4.6.7. See 4.6.7.2.

Automatic sprinkler protection is required for all new health care facilities (see 18.3.5.1) and existing nursing homes (see 19.3.5.1). Existing hospitals might be nonsprinklered. Where major rehabilitation is made in a nonsprinklered existing facility, in addition to performing those planned renovations in accordance with the requirements for new construction, 18/19.1.1.4.3.3 requires that the smoke compartment in which the major rehabilitation occurs be sprinklered. Therefore, although the rehabilitation was not originally planned to include the installation of sprinklers, such installation is required within the smoke compartment being rehabilitated.

Paragraph 18/19.1.1.4.3.1 defines major and minor rehabilitation with reference to the term *modification*. The definition of the term *modification* in 3.3.180 and 43.2.2.1.3 originated in Chapter 15, Building Rehabilitation, of NFPA 5000®, *Building Construction and Safety Code*®,<sup>3</sup> which served as the basis for Chapter 43, Building Rehabilitation, that was added to NFPA 101 in 2006. The Chapter 43 hierarchy of rehabilitation methods includes repair, renovation, modification, reconstruction, change of use, change of occupancy classification, and addition. Repair and renovation do not require classification as major rehabilitation. Change of use or change of occupancy classification is addressed in the commentary following 18/19.1.1.4.2(3) with respect to 18/19.1.1.4.2.

Modification and reconstruction can require major rehabilitation classification, depending on the floor area involved, as

## CHAPTER 19 • Existing

**19.1.1.4.3.3\*** Where major rehabilitation is done in a nonsprinklered smoke compartment, the automatic sprinkler requirements of 18.3.5 shall apply to the smoke compartment undergoing the rehabilitation, and, in cases where the building is not protected throughout by an approved automatic sprinkler system, the requirements of 18.4.4.2, 18.4.4.3, and 18.4.4.8 shall also apply.

**A.19.1.1.4.3.3** For the purpose of this requirement, a floor that is not divided by a smoke barrier is considered one smoke compartment. Where automatic sprinklers are retrofitted into existing nonsprinklered buildings, the construction alternatives for sprinklers provided in this *Code* are intended to apply to the renovated area.

**19.1.1.4.3.4\*** Where minor rehabilitation is done in a nonsprinklered smoke compartment, the requirements of 18.3.5.1 shall not apply, but, in such cases, the rehabilitation shall not reduce life safety below the level required for new buildings or below the level of the requirements of 18.4.3 for nonsprinklered smoke compartment rehabilitation. (See 4.6.7.)

**A.19.1.1.4.3.4** In minor rehabilitation, only the rehabilitation itself is required to be brought up to the requirements for new nonsprinklered facilities, not the entire smoke compartment or building.

detailed in 18/19.1.1.4.3.1(1). Note that, per 18/19.1.1.4.3.2, work that is exclusively plumbing, mechanical, fire protection system, electrical, medical gas, or medical equipment work is not included in the computation of the modification area within the smoke compartment undergoing the rehabilitation.

Minor rehabilitation — as defined by 18/19.1.1.4.3.1(2) — does not mandate the requirement for installing sprinklers. Only that smoke compartment undergoing major rehabilitation is required to be sprinklered at the time of rehabilitation. Therefore, if a floor of a hospital is subdivided into three smoke compartments and only one smoke compartment is undergoing major rehabilitation, only that particular smoke compartment would require sprinkler installation. Over the course of a few years of undergoing multiple major rehabilitation projects, the entire building would eventually be fully sprinklered. Because the building undergoing major rehabilitation in only one smoke compartment would then be only partially protected with sprinklers, the construction requirements of 18.4.4.2 for nonsprinklered buildings must be met, egress capacity must be based on the nonsprinklered criteria of 18.4.4.3 in the nonsprinklered portions of the building, and smoke dampers are required where ducts penetrate required smoke barriers per 18.4.4.8. [For example, stair capacity is calculated at 0.6 in. (15 mm) per person, rather than the typical 0.3 in. (7.6 mm) per person.] Smoke dampers are permitted to be omitted for ducted penetrations of smoke barriers only where the smoke compartments on both sides of the smoke barrier are fully sprinklered as specified in 18.4.4.8.

## CHAPTER 18 • New

**18.1.1.4.4 Construction, Repair, and Improvement Operations.** See 4.6.10.

The introduction of workers, other than regular employees, and activities associated with rehabilitation creates unusual risks for fire in health care occupancies. Special precautions should be taken to guard against the potential exposure created by the introduction of flammable substances or by other hazardous practices that could pose a threat to occupants. See 4.6.10.3.

Temporary fire-resistant barriers should be erected to separate rehabilitation areas and associated activity from the functioning areas of the existing buildings. Care should be taken to

**18.1.2 Classification of Occupancy.** See 6.1.5 and 18.1.4.2.**18.1.3 Multiple Occupancies.**

**18.1.3.1** Multiple occupancies shall be in accordance with 6.1.14.

**18.1.3.2** Atrium walls in accordance with 6.1.14.4.6 shall be permitted to serve as part of the separation required by 6.1.14.4.1 for creating separated occupancies on a story-by-story basis, provided both of the following are met:

- (1) The provision is not used for occupancy separations involving industrial and storage occupancies.
- (2) Smoke partitions serving as atrium walls are not permitted to serve as enclosures for hazardous areas.

**18.1.3.3** Sections of health care facilities shall be permitted to be classified as other occupancies in accordance with the separated occupancies provisions of 6.1.14.4 and either 18.1.3.4 or 18.1.3.5.

**18.1.3.4\*** Sections of health care facilities shall be permitted to be classified as other occupancies, provided that they meet both of the following conditions:

- (1) They are not intended to provide services simultaneously for four or more inpatients for purposes of housing, treatment, or customary access by inpatients incapable of self-preservation.
- (2) They are separated from areas of health care occupancies by construction having a minimum 2-hour fire resistance rating in accordance with Chapter 8.

**A.18.1.3.4** Doctors' offices and treatment and diagnostic facilities that are intended solely for outpatient care and are physically separated from facilities for the treatment or care of inpatients,

## CHAPTER 19 • Existing

**19.1.1.4.4 Construction, Repair, and Improvement Operations.** See 4.6.10.

ensure that these temporary barriers do not block means of egress for the existing building and that all existing equipment for fire protection and all portions of the required means of egress are maintained in full working order. See 4.6.10.1.

Adequate escape facilities should be provided and continuously maintained for the use of construction workers. See 4.6.10.2, A.4.6.10.2, and NFPA 241, *Standard for Safeguarding Construction, Alteration, and Demolition Operations*.<sup>4</sup>

**19.1.2 Classification of Occupancy.** See 6.1.5 and 19.1.4.2.**19.1.3 Multiple Occupancies.**

**19.1.3.1** Multiple occupancies shall be in accordance with 6.1.14.

**19.1.3.2** Atrium walls in accordance with 6.1.14.4.6 shall be permitted to serve as part of the separation required by 6.1.14.4.1 for creating separated occupancies on a story-by-story basis, provided both of the following are met:

- (1) The provision is not used for occupancy separations involving industrial and storage occupancies.
- (2) Smoke partitions serving as atrium walls are not permitted to serve as enclosures for hazardous areas.

**19.1.3.3** Sections of health care facilities shall be permitted to be classified as other occupancies in accordance with the separated occupancies provisions of 6.1.14.4 and either 19.1.3.4 or 19.1.3.5.

**19.1.3.4\*** Sections of health care facilities shall be permitted to be classified as other occupancies, provided that they meet all of the following conditions:

- (1) They are not intended to provide services simultaneously for four or more inpatients for purposes of housing, treatment, or customary access by inpatients incapable of self-preservation.
- (2) They are separated from areas of health care occupancies by construction having a minimum 2-hour fire resistance rating in accordance with Chapter 8.
- (3) For other than previously approved occupancy separation arrangements, the entire building is protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.

**A.19.1.3.4** Doctors' offices and treatment and diagnostic facilities that are intended solely for outpatient care and are physically separated from facilities for the treatment or care of inpatients,

## CHAPTER 18 • New

but that are otherwise associated with the management of an institution, might be classified as business occupancies rather than health care occupancies. Facilities that do not provide housing for patients on a 24-hour basis are required to be classified as other than health care occupancies per 18.1.1.1.9, except where services are provided routinely to four or more inpatients who are incapable of self-preservation.

### 18.1.3.5 Contiguous Non-Health Care Occupancies.

**18.1.3.5.1\*** Ambulatory care facilities, medical clinics, and similar facilities that are contiguous to health care occupancies, but are primarily intended to provide outpatient services, shall be permitted to be classified as business occupancies or ambulatory health care facilities, provided that the facilities are separated from the health care occupancy by construction having a minimum 2-hour fire resistance rating, and the facility is not intended to provide services simultaneously for four or more inpatients who are incapable of self preservation.

**A.18.1.3.5.1** It is the intent that these requirements apply to mobile, transportable, and relocatable structures (in accordance with 1.3.2) where such structures are used to provide shared medical services on an extended or a temporary basis. Where properly separated from the health care occupancy and intended to provide services simultaneously for three or fewer health care patients who are litterborne, the level of protection for such structures should be based on the appropriate occupancy classification of other chapters of this *Code*. Mobile, transportable, or relocatable structures that are not separated from a contiguous health care occupancy, or that are intended to provide services simultaneously for four or more health care patients who are litterborne, should be classified and designed as health care occupancies.

**18.1.3.5.2** Ambulatory care facilities, medical clinics, and similar facilities that are contiguous to health care occupancies shall be permitted to be used for diagnostic and treatment services of inpatients who are capable of self-preservation.

**18.1.3.6** Where separated occupancies provisions are used in accordance with either 18.1.3.4 or 18.1.3.5, the most stringent construction type shall be provided throughout the building, unless a 2-hour separation is provided in accordance with 8.2.1.3, in which case the construction type shall be determined as follows:

- (1) The construction type and supporting construction of the health care occupancy shall be based on the story on which it is located in the building in accordance with the provisions of 18.1.6 and Table 18.1.6.1.
- (2) The construction type of the areas of the building enclosing the other occupancies shall be based on the applicable occupancy chapters of this *Code*.

## CHAPTER 19 • Existing

but that are otherwise associated with the management of an institution, might be classified as business occupancies rather than health care occupancies. Facilities that do not provide housing for patients on a 24-hour basis are required to be classified as other than health care occupancies per 19.1.1.1.9, except where services are provided routinely to four or more inpatients who are incapable of self-preservation.

### 19.1.3.5 Contiguous Non-Health Care Occupancies.

**19.1.3.5.1\*** Ambulatory care facilities, medical clinics, and similar facilities that are contiguous to health care occupancies, but are primarily intended to provide outpatient services, shall be permitted to be classified as business occupancies or ambulatory health care facilities, provided that the facilities are separated from the health care occupancy by not less than 2-hour fire resistance-rated construction, and the facility is not intended to provide services simultaneously for four or more inpatients who are litterborne.

**A.19.1.3.5.1** It is the intent of the *Code* that these requirements apply to mobile, transportable, and relocatable structures (in accordance with 1.3.2) when such structures are used to provide shared medical services on an extended or a temporary basis. Where properly separated from the health care occupancy and intended to provide services simultaneously for three or fewer health care patients who are litterborne, the level of protection for such structures should be based on the appropriate occupancy classification of other chapters of this *Code*. Mobile, transportable, or relocatable structures that are not separated from a contiguous health care occupancy, or that are intended to provide services simultaneously for four or more health care patients who are litterborne, should be classified and designed as health care occupancies.

**19.1.3.5.2** Ambulatory care facilities, medical clinics, and similar facilities that are contiguous to health care occupancies shall be permitted to be used for diagnostic and treatment services of inpatients who are capable of self-preservation.

**19.1.3.6** Where separated occupancies provisions are used in accordance with either 19.1.3.4 or 19.1.3.5, the most stringent construction type shall be provided throughout the building, unless a 2-hour separation is provided in accordance with 8.2.1.3, in which case the construction type shall be determined as follows:

- (1) The construction type and supporting construction of the health care occupancy shall be based on the story on which it is located in the building in accordance with the provisions of 19.1.6 and Table 19.1.6.1.
- (2) The construction type of the areas of the building enclosing the other occupancies shall be based on the applicable occupancy chapters of this *Code*.

## CHAPTER 18 • New

**18.1.3.7** All means of egress from health care occupancies that traverse non-health care spaces shall conform to the requirements of this *Code* for health care occupancies, unless otherwise permitted by [18.1.3.7](#).

**18.1.3.8** Exit through a horizontal exit into other contiguous occupancies that do not conform to health care egress provisions, but that do comply with requirements set forth in the appropriate occupancy chapter of this *Code*, shall be permitted, provided that both of the following criteria apply:

- (1) The occupancy does not contain high hazard contents.
- (2) The horizontal exit complies with the requirements of [18.2.2.5](#).

**18.1.3.9** Egress provisions for areas of health care facilities that correspond to other occupancies shall meet the corresponding requirements of this *Code* for such occupancies, and, where the clinical needs of the occupant necessitate the locking of means of egress, staff shall be present for the supervised release of occupants during all times of use.

**18.1.3.10** Auditoriums, chapels, staff residential areas, or other occupancies provided in connection with health care facilities shall have means of egress provided in accordance with other applicable sections of this *Code*.

**18.1.3.11** Any area with a hazard of contents classified higher than that of the health care occupancy and located in the same building shall be protected as required by [18.3.2](#).

**Paragraph 18/19.1.3.1** directs the user to the multiple occupancies provisions of [6.1.14](#), which permit protecting multiple occupancies either as mixed occupancies or as separated occupancies. The provisions of [18/19.1.3.2](#) through [18/19.1.3.11](#) have the effect of modifying those of [6.1.14](#) for the very specific situations described.

The provision of [18/19.1.3.2](#) permits use of the provision of [6.1.14.4.6](#) relative to atrium walls being part of the separation that creates separated occupancies. However, [18/19.1.3.2](#) adds two criteria not found in [6.1.14.4.6](#). The occupancies being separated from the health-care occupancy by the atrium walls must not be industrial or storage occupancies, as the smoke partition required by [6.1.14.4.6\(1\)](#) might not afford the health care occupancy — an occupancy that employs a defend-in-place strategy — with sufficient protection against the hazards of industrial and storage occupancy spaces. Further, the smoke partitions are not to serve as the enclosure of hazardous areas. See the commentary following [6.1.14.4.6](#).

**Paragraph 18/19.1.3.3** permits the classification of spaces as occupancies other than health care, although those spaces are located in buildings used primarily for health care purposes. For example, offices are permitted to be classified as business

## CHAPTER 19 • Existing

**19.1.3.7** All means of egress from health care occupancies that traverse non-health care spaces shall conform to the requirements of this *Code* for health care occupancies, unless otherwise permitted by [19.1.3.8](#).

**19.1.3.8** Exit through a horizontal exit into other contiguous occupancies that do not conform to health care egress provisions, but that do comply with requirements set forth in the appropriate occupancy chapter of this *Code*, shall be permitted, provided that both of the following criteria apply:

- (1) The occupancy does not contain high hazard contents.
- (2) The horizontal exit complies with the requirements of [19.2.2.5](#).

**19.1.3.9** Egress provisions for areas of health care facilities that correspond to other occupancies shall meet the corresponding requirements of this *Code* for such occupancies, and, where the clinical needs of the occupant necessitate the locking of means of egress, staff shall be present for the supervised release of occupants during all times of use.

**19.1.3.10** Auditoriums, chapels, staff residential areas, or other occupancies provided in connection with health care facilities shall have means of egress provided in accordance with other applicable sections of this *Code*.

**19.1.3.11** Any area with a hazard of contents classified higher than that of the health care occupancy and located in the same building shall be protected as required by [19.3.2](#).

occupancies; cafeterias are permitted to be classified as assembly occupancies; and dormitories for other than inpatients are permitted to be classified as residential occupancies, provided that additional criteria are met.

The provision of [18/19.1.3.4\(1\)](#) prohibits the other (i.e., non-health care) occupancy from providing housing or treatment services simultaneously to four or more inpatients or providing customary access to patients incapable of self-preservation. This requirement is intended to permit one, two, or three ambulatory inpatients to visit doctors' offices simultaneously in an adjacent business occupancy, for example, without requiring classification of the business occupancy as a health care facility. This concept is further enforced by the provision of [18/19.1.3.5.2](#). In addition, emergency egress from the health care occupancy into the other occupancy is permitted, because emergency egress is not considered customary access (see [18/19.1.3.7](#) and [18/19.1.3.8](#)).

**Paragraph 18/19.1.3.4(2)** requires that the other occupancy be separated from the health care occupancy by construction having a minimum 2-hour fire resistance rating. The fire barrier is permitted to be vertically aligned (i.e., a wall assembly where the occupancies are located in adjacent spaces on the same floor) or

## CHAPTER 18 • New

horizontally aligned (i.e., a floor assembly where the occupancies are located on different, but adjacent, floors).

The provisions of 18/19.1.3.6 represent a change from the 2009 edition of the *Code*. The change is mainly a relocation of material that previously was part of the current provisions of 18/19.1.3.4 (18/19.1.2.2 in the 2009 edition). The material was moved to clarify that the provisions for separated occupancies are permitted to be addressed separately from those addressing differing construction types for the occupancies involved. The provisions clarify that, for purposes of applying the building construction requirements of 18/19.1.6 and Table 18/19.1.6.1, the story height of a non-health care occupancy located above a health care occupancy can be ignored. For example, where Table 18.1.6.1 limits the height of a new, sprinklered health care occupancy building of Type II(000) construction to not more than one story, a three-story Type II(000) building would be permitted if the following conditions were met:

1. The health care occupancy occupies only the first story.
2. Business occupancies occupy the second and third stories [note that 38.1.6, applicable to new business occupancies, has no minimum construction requirements, so the Type II(000) construction is permitted in accordance with 18.1.3.6(2)].
3. The floor/ceiling assembly (and the structural frame that supports the floor assembly) between the first and second stories has a minimum 2-hour fire resistance rating — in other words, the Type II(000) building has embedded within it structural elements that create a 2-hour separation above the health care occupancy.
4. The whole building is of Type II(000) construction, as differing construction types can occur only in a side-by-side, not stacked, fashion — see 8.2.1.3(1) where a minimum 2-hour *vertically aligned* fire barrier is required for purposes of separating one building construction type from another.

If the requirements of 18/19.1.3.6 are not met, the area would be considered a multiple occupancy requiring protection as mixed occupancies. The most restrictive life safety requirements applicable to any one occupancy present would be required for all the occupancies, unless separate safeguards are approved in accordance with 6.1.14.3.2. In most cases, the requirements of the health care occupancy would be stricter than those of the other occupancies, requiring that health care occupancy requirements be met throughout the building. Such generalization should not lead to compliance only with Chapters 18 and 19, as each provision of the applicable occupancy chapters needs to be compared and the most stringent identified and implemented. See 6.1.14.3.2.

Paragraph 18/19.1.3.5.1 addresses a subject similar to that of 18/19.1.3.4 but specifically covers ambulatory care facilities, medical clinics, and similar areas that primarily provide outpatient

## CHAPTER 19 • Existing

services and are contiguous to a health care occupancy. If these facilities are separated by 2-hour fire resistance-rated construction, they are permitted to be classified as ambulatory health care facilities or as business occupancies, whichever applies. The provisions applicable to business occupancies and ambulatory health care facilities are based on the assumption that most people are treated on an outpatient basis. If four or more inpatients who are incapable of self-preservation are treated simultaneously, the facility must meet the requirements for health care occupancies. Conversely, if three or fewer inpatients who are incapable of self-preservation are present in the contiguous outpatient facility on a regular basis, the facility would be classified as an occupancy other than health care.

Exhibit 18/19.9 shows a portion of hospital building complex that is located contiguous to an inpatient wing and used as an emergency department. The provisions of 18.1.3.5.1 can be used to determine whether the emergency department is permitted to be classified as an ambulatory health care occupancy. In most cases, emergency departments of hospitals are classified as part of the health care occupancy.

Paragraph 18/19.1.3.7 specifies that the means of egress from health care occupancies that traverse non-health care spaces must conform to the requirements for health care occupancies. However, an exemption is permitted by 18/19.1.3.8 where a 2-hour separating barrier is provided to meet the

Exhibit 18/19.9

Emergency department contiguous to hospital inpatient wing.

## CHAPTER 18 • New

requirements for a horizontal exit. Where a 2-hour barrier serves as a horizontal exit, it is acceptable to exit from a health care occupancy into a different occupancy if the other occupancy complies with the *Code* provisions applicable to that occupancy and does not contain high hazard contents. For example, if a horizontal exit is provided between a hospital and a business occupancy, inpatients are permitted to exit into the business occupancy through a horizontal exit. In this instance, corridor width, corridor partitions, stairway details, and similar features must conform to the provisions of either **Chapter 38** or **Chapter 39**, which address business occupancies. However, the horizontal exit must comply with all the requirements of **18/19.2.2.5**, which include provisions in addition to those required by the core provisions of **7.2.4** applicable to horizontal exits.

Health care occupancy patients are sometimes moved to nonmedical areas — such as a chapel for religious services or an auditorium for recreation — that typically do not meet the provisions applicable to health care occupancies. **Paragraph 18/19.1.3.9** permits such areas to be regulated by the provisions applicable to the corresponding occupancy (which would be an assembly occupancy in the case of chapels or auditoriums). **Paragraph 18/19.1.3.9** addresses a subject similar to that addressed in **18/19.1.3.10** but adds the requirement that, where the clinical needs of the occupants necessitate the locking of doors, staff must be present for the supervised unlocking of doors and release of occupants. This additional requirement ensures that procedures are in place for the ready release of occupants.

Auditoriums, chapels, and other areas separated from the health care occupancy by construction meeting the criteria of **6.1.14.4** for separated occupancies are permitted to be designed in accordance with the appropriate occupancy chapter governing their use, rather than in accordance with those applicable to the health care occupancy.

**Paragraph 18/19.1.3.11** regulates spaces in other occupancies in the same building as a health care facility that, although comprising only a portion of the facility, contain more hazardous materials (in quantity or type) than are usually found in health care occupancies. Spaces such as rooms used for the storage of combustible materials, trash collection rooms, gift shops, and paint shops must be protected in accordance with **18/19.3.2**.

**Paragraph 18/19.1.3.12** prohibits another occupancy, such as storage, that contains highly hazardous contents, such as flammable liquids, from being located in a building housing a health care occupancy. This requirement limits use, based on occupancy classification, with regard to hazard of contents. For example, **18/19.1.3.12** does not intend to exclude laboratory

**18.1.3.12** Non-health care–related occupancies classified as containing high hazard contents shall not be permitted in buildings housing health care occupancies.

## CHAPTER 19 • Existing

operations from being part of a health care facility. The intent is to prevent a portion of a hospital from being designed and used as an educational or research facility — which would be classified as an educational occupancy, business occupancy, or possibly an industrial occupancy — where a laboratory would use and store sizable quantities of flammable liquids.

The recurring theme in the provisions of **18/19.1.3.1** through **18/19.1.3.12** is one of separating the health care occupancy from another occupancy by construction having a minimum 2-hour fire resistance rating. Such 2-hour fire resistance–rated construction includes more than the basic construction material comprising the fire barrier and the initial construction. Joints and penetrations, including those made after the building is occupied, must be protected by appropriately rated through-penetration fire-stopping materials. **Exhibit 18/19.10** shows a fire-rated barrier separating an industrial occupancy portion of a hospital from the inpatient health care occupancy portion. Note the protection of the joints and penetrations.

Exhibit 18/19.10

*Joint and penetration protection in a fire barrier that separates occupancies.*

**19.1.3.12** Non-health care–related occupancies classified as containing high hazard contents shall not be permitted in buildings housing health care occupancies.

## CHAPTER 18 • New

**18.1.4 Definitions.**

**18.1.4.1 General.** For definitions, see [Chapter 3](#), Definitions.

**18.1.4.2 Special Definitions.** The following is a list of special terms used in this chapter:

- (1) **Ambulatory Health Care Occupancy.** (See [3.3.190.1](#).)
- (2) **Deep-fat Frying.** (See [3.3.55](#).)
- (3) **Hospital.** (See [3.3.144](#).)
- (4) **Limited Care Facility.** (See [3.3.90.2](#).)
- (5) **Nursing Home.** (See [3.3.142.2](#).)

The provision of [18.1.4.1](#) reminds the user that definitions of many of the terms used in the *Code* appear in [Chapter 3](#).

[Section 3.3](#) defines the terms *hospital*, *nursing home*, and *limited care facility*. Each must house four or more people incapable of self-preservation on a 24-hour basis in order to be classified as a health care occupancy.

Occupants of hospitals or nursing homes are assumed to be nonambulatory and incapable of self-preservation. In making this judgment, due consideration should be given to the use of physical restraints and tranquilizing drugs, which can render occupants immobile. Variable staffing criteria and levels of care differentiate hospitals from nursing homes. The difference between nursing homes and limited care facilities is less clear.

Although limited care facilities house four or more occupants incapable of self-preservation due to age or physical or mental limitations, occupants are generally considered to be ambulatory and to require only limited assistance during emergency evacuation. Buildings that house ambulatory occupants who are mentally handicapped or undergoing treatment for alcohol or drug dependency and who can be expected to evacuate a structure with limited assistance meet the criteria for limited care facilities. Day-care facilities that provide day care for the aged, children, mentally handicapped, or others would be classified as other than health care. See [Chapters 16](#) and [17](#).

Although age itself is not sufficient justification for developing a separate subclassification for a health care occupancy, the elderly pose an increased challenge in the achievement of fire safety. Experiences in buildings where the elderly are housed demonstrate that the response of the elderly to a fire might not be in the interest of self-preservation. Upon discovering a fire, elderly occupants might ignore it, become transfixed by it, or seek refuge from it in their rooms and fail to notify anyone of the fire. In some cases, the elderly have resisted efforts to remove them from the building and familiar surroundings.

**18.1.5 Classification of Hazard of Contents.** The classification of hazard of contents shall be as defined in [Section 6.2](#).

## CHAPTER 19 • Existing

**19.1.4 Definitions.**

**19.1.4.1 General.** For definitions, see [Chapter 3](#), Definitions.

**19.1.4.2 Special Definitions.** The following is a list of special terms used in this chapter:

- (1) **Ambulatory Health Care Occupancy.** (See [3.3.190.1](#).)
- (2) **Deep-fat Frying.** (See [3.3.55](#).)
- (3) **Hospital.** (See [3.3.144](#).)
- (4) **Limited Care Facility.** (See [3.3.90.2](#).)
- (5) **Nursing Home.** (See [3.3.142.2](#).)

Terms such as *residential*, *lodging and boarding*, and *custodial care* were used in the health care occupancy chapters of earlier editions of the *Code* but have been deleted to avoid confusion with the residential board and care occupancy classification addressed by [Chapters 32](#) and [33](#). Board and care facilities, personal care homes, halfway houses, assisted living facilities, or other similar facilities house occupants who might require medication and personal care services but do not require the close supervision and services typical of the occupants in a health care facility. Therefore, these facilities would be classified as residential board and care occupancies. Occupant capability must be carefully evaluated to determine whether application of health care criteria (contained in [Chapters 18](#) and [19](#)) or application of lesser safeguards associated with residential board and care occupancies (prescribed by [Chapters 32](#) and [33](#)) are more appropriate.

Prior to the 1981 edition of the *Code*, occupancies that offered medical services on an outpatient basis would have been regulated within the chapter covering business occupancies. The threat to life in an outpatient facility where four or more patients might be subject to medical procedures requiring general anesthesia, treatments such as hemodialysis, or freestanding emergency service is significantly greater than that typical of a business occupancy. Conversely, application of the requirements for health care facilities that contemplate 24-hour care would be unnecessarily restrictive. In establishing the occupancy classification of an ambulatory health care occupancy, the intent was to develop requirements that fall between the restrictions applicable to business occupancies and health care occupancies (i.e., inpatient health care) in terms of the level of life safety provided. For the 2015 edition of the *Code*, [Chapters 20](#) and [21](#) have been revised so that the requirements for ambulatory health care occupancies are self-contained, without need to consult the business occupancy chapters. See [Chapters 20](#) and [21](#).

**19.1.5 Classification of Hazard of Contents.** The classification of hazard of contents shall be as defined in [Section 6.2](#).

## CHAPTER 18 • New

## CHAPTER 19 • Existing

**18.1.6 Minimum Construction Requirements.**

**18.1.6.1** Health care occupancies shall be limited to the building construction types specified in [Table 18.1.6.1](#), unless otherwise permitted by [18.1.6.2](#) through [18.1.6.7](#). (See [8.2.1](#).)

**19.1.6 Minimum Construction Requirements.**

**19.1.6.1** Health care occupancies shall be limited to the building construction types specified in [Table 19.1.6.1](#), unless otherwise permitted by [19.1.6.2](#) through [19.1.6.7](#). (See [8.2.1](#).)

**Table 18.1.6.1 Construction Type Limitations**

The total number of stories of the building is to be determined as follows:

- (1) The total number of stories is to be counted starting with the level of exit discharge and ending with the highest occupiable story of the building.
- (2) Stories below the level of exit discharge are not counted as stories.
- (3) Interstitial spaces used solely for building or process systems directly related to the level above or below are not considered a separate story.
- (4) A mezzanine in accordance with 8.6.9 is not counted as a story.

<sup>†</sup>Sprinklered throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7. (See 19.3.5.)

<sup>‡</sup>Basements are not counted as stories.

**18.1.6.2** Any building of Type I(442), Type I(332), Type II(222), or Type II(111) construction shall be permitted to include roofing systems involving combustible supports, decking, or roofing, provided that all of the following criteria are met:

**19.1.6.2\*** Any building of Type I(442), Type I(332), Type II(222), or Type II(111) construction shall be permitted to include roofing systems involving combustible supports, decking, or roofing, provided that all of the following criteria are met:

## CHAPTER 18 • New

- (1) The roof covering shall meet Class A requirements in accordance with ASTM E 108, *Standard Test Methods for Fire Tests of Roof Coverings*, or ANSI/UL 790, *Test Methods for Fire Tests of Roof Coverings*.
- (2) The roof shall be separated from all occupied portions of the building by a noncombustible floor assembly having not less than a 2-hour fire resistance rating that includes not less than 2½ in. (63 mm) of concrete or gypsum fill.
- (3) The structural elements supporting the 2-hour fire resistance-rated floor assembly specified in 18.1.6.2(2) shall be required to have only the fire resistance rating required of the building.

**18.1.6.3** Any building of Type I(442), Type I(332), Type II(222), or Type II(111) construction shall be permitted to include roofing systems involving combustible supports, decking, or roofing, provided that all of the following criteria are met:

- (1) The roof covering shall meet Class A requirements in accordance with ASTM E 108, *Standard Test Methods for Fire Tests of Roof Coverings*, or ANSI/UL 790, *Test Methods for Fire Tests of Roof Coverings*.
- (2) The roof/ceiling assembly shall be constructed with fire-retardant-treated wood meeting the requirements of NFPA 220, *Standard on Types of Building Construction*.
- (3) The roof/ceiling assembly shall have the required fire resistance rating for the type of construction.

**18.1.6.4** Interior nonbearing walls in buildings of Type I or Type II construction shall be constructed of noncombustible or limited-combustible materials, unless otherwise permitted by 18.1.6.5.

**18.1.6.5** Interior nonbearing walls required to have a fire resistance rating of 2 hours or less shall be permitted to be of fire-retardant-treated wood enclosed within noncombustible or limited-combustible materials, provided that such walls are not used as shaft enclosures.

**18.1.6.6** Fire-retardant-treated wood that serves as supports for the installation of fixtures and equipment shall be permitted to be installed behind noncombustible or limited-combustible sheathing.

**18.1.6.7** All buildings with more than one level below the level of exit discharge shall have all such lower levels separated from the level of exit discharge by not less than Type II(111) construction.

## CHAPTER 19 • Existing

- (1) The roof covering shall meet Class C requirements in accordance with ASTM E 108, *Standard Test Methods for Fire Tests of Roof Coverings*, or ANSI/UL 790, *Test Methods for Fire Tests of Roof Coverings*.
- (2) The roof shall be separated from all occupied portions of the building by a noncombustible floor assembly that includes not less than 2½ in. (63 mm) of concrete or gypsum fill.
- (3) The attic or other space shall be either unoccupied or protected throughout by an approved automatic sprinkler system.

**A.19.1.6.2** Unoccupied space, for the purposes of 19.1.6.2(3), is space not normally occupied by persons, fuel-fired equipment, or hazardous contents.

**19.1.6.3** Any building of Type I(442), Type I(332), Type II(222), or Type II(111) construction shall be permitted to include roofing systems involving combustible supports, decking, or roofing, provided that all of the following criteria are met:

- (1) The roof covering shall meet Class A requirements in accordance with ASTM E 108, *Standard Test Methods for Fire Tests of Roof Coverings*, or ANSI/UL 790, *Test Methods for Fire Tests of Roof Coverings*.
- (2) The roof/ceiling assembly shall be constructed with fire-retardant-treated wood meeting the requirements of NFPA 220, *Standard on Types of Building Construction*.
- (3) The roof/ceiling assembly shall have the required fire resistance rating for the type of construction.

**19.1.6.4** Interior nonbearing walls in buildings of Type I or Type II construction shall be constructed of noncombustible or limited-combustible materials, unless otherwise permitted by 19.1.6.5.

**19.1.6.5** Interior nonbearing walls required to have a fire resistance rating of 2 hours or less shall be permitted to be fire-retardant-treated wood enclosed within noncombustible or limited-combustible materials, provided that such walls are not used as shaft enclosures.

**19.1.6.6** Fire-retardant-treated wood that serves as supports for the installation of fixtures and equipment shall be permitted to be installed behind noncombustible or limited-combustible sheathing.

**19.1.6.7** Each exterior wall of frame construction and all interior stud partitions shall be firestopped to cut off all concealed draft openings, both horizontal and vertical, between any cellar or basement and the first floor, and such firestopping shall consist of wood not less than 2 in. (51 mm) (nominal) thick or shall be of noncombustible material.

## CHAPTER 18 • New

Table 18/19.1.6.1 is applied relative to building construction types. See NFPA 220, *Standard on Types of Building Construction*, and NFPA 5000, *Building Construction and Safety Code*, for definitions of construction types. Table A.8.2.1.2 summarizes the details associated with Type I through Type V construction.

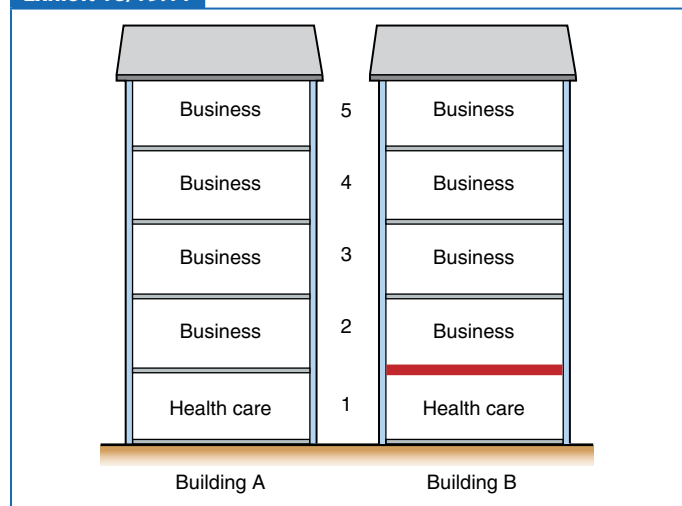

Table 18/19.1.6.1 is formatted differently than the minimum construction requirements table of the \_\_\_\_\_.1.6 subsection of other occupancy chapters. Table 18/19.1.6.1 establishes building construction type limitations based on the total number of stories in a building; the other minimum construction tables establish criteria in terms of “stories in height,” as established by 4.6.3. Table 18/19.1.6.1 is applied to health care occupancies by starting the story count with the level of exit discharge and ending with the highest occupiable story, even if that story is not used as a health care occupancy. [Note that a building can have only one level of exit discharge, as defined in 3.3.85.1.] A five-story building where the first story is used as a health care occupancy and the second through fifth stories are used as business occupancies is treated as a five-story building for purposes of applying Table 18/19.1.6.1 for health care occupancies. For occupancies, other than health care, that regulate building construction type (e.g., assembly occupancies), the applicable table is applied to the number of stories in height, with the story count starting with the level of exit discharge and ending with the highest occupiable story containing the occupancy considered. A five-story building where the first story is used as an assembly occupancy and the second through fifth stories are used as business occupancies is treated as a one-story building for purposes of applying Table 12/13.1.6 for assembly occupancies.

The provisions of 18/19.1.3.4 and 18/19.1.3.6 have the effect of modifying the application of Table 18/19.1.6.1 so as to permit its application based on number of “stories in height,” rather than “total number of stories of building,” where an occupancy other than health care is positioned above the stories used as health care occupancies, the occupancies are protected as separated occupancies, and the floor/ceiling assembly (and all supporting construction) that separates the two occupancies is a minimum 2-hour fire resistance–rated barrier.

Exhibit 18/19.11 illustrates the application of the provisions of Table 18.1.6.1 to two buildings whose plans are being reviewed prior to construction. Each building is to house a health care occupancy on the first story and business occupancies on the second through fifth stories. Each building is to be of Type II(111) construction and protected throughout by automatic sprinklers in accordance with 18.3.5.1. In applying the construction requirements of Table 18.1.6.1 to Building A, the appropriate cell is located where the row for Type II(111) under “construction type” and “yes” under “sprinklered” intersects with the column for  $\geq 4$  under “total number of stories of building.” The intersection cell, “NP,” means that the new health care occupancy is not permitted

## CHAPTER 19 • Existing

Exhibit 18/19.11

Application of provisions of Table 18.1.6.1 to total number of stories and to number of stories in height.

to be located in the five-story Type II(111) building. Next, the construction requirements of Table 18.1.6.1 are applied in conjunction with those of 18.1.3.6 to building B. Building B, in addition to having the features of building A, has a 2-hour fire resistance–rated floor/ceiling assembly separating the first and second stories in accordance with 18.1.3.4(2). In accordance with 18.1.3.6(2), Table 18.1.6.1 is applied with respect to the number of stories in height, and not to the total number of stories in the building, which is one, given that the health care occupancy occupies only the first story. In Table 18.1.6.1, the appropriate cell is located where the row for Type II(111) under “construction type” and “yes” under “sprinklered” intersects with the column for 1 story under “total number of stories of building.” The intersection cell, “X,” means that the new health care occupancy is permitted to be located on the first story of the five-story Type II(111) building because of the presence of the 2-hour floor/ceiling assembly that separates the health care occupancy from the business occupancies.

The accuracy of the explanation in the above paragraph has been questioned by some Code users. So the example bears repeating, but in a different way. Where Table 18.1.6.1 limits the height of a new, sprinklered health care occupancy building of Type II(111) construction to not more than three stories, a five-story Type II(111) building with occupancies as shown in Exhibit 18/19.11 would be permitted if the following conditions were met:

1. The health care occupancy occupies only the first story.
2. Business occupancies occupy the second through fifth stories [note that 38.1.6, applicable to new business

## CHAPTER 18 • New

occupancies, has no minimum construction requirements, so the Type II(111) construction is permitted in accordance with 18.1.3.6(2)].

3. The floor/ceiling assembly (and the structural frame that supports the floor assembly) between the first and second stories has a minimum 2-hour fire resistance rating — in other words, the Type II(111) building has embedded within it structural elements that create a 2-hour separation above the health care occupancy.
4. The whole building is of Type II(111) construction, as differing construction types can occur only in a side-by-side, not stacked, fashion — see 8.2.1.3(1) where a minimum 2-hour *vertically aligned* fire barrier is required for purposes of separating one building construction type from another.

The provisions of 18/19.1.6.2(1) and 18/19.1.6.3(1) were revised for the 2012 edition of the *Code* to reflect that NFPA no longer publishes a fire test standard for roof coverings. The appropriate ASTM and UL fire test standards for roof coverings are referenced.

In certain locales, it has been common practice to erect a building with a flat, concrete roof deck. A wood-sheathed, wood frame peaked roof is then added for weather protection. Paragraph 18/19.1.6.2 contains an exemption that permits, under certain conditions, construction of such a combustible roof system on a multistory building without affecting the classification of the building construction. In other words, a Type I or Type II building, which, by definition, has a roof constructed wholly of noncombustible materials, is permitted to retain its Type I or Type II classification and have a combustible wood “roof” in accordance with the provisions of 18/19.1.6.2.

The exemption detailed in 19.1.6.2(3) specifies that the existing attic space must be unoccupied or protected with automatic

**18.1.7 Occupant Load.** The occupant load, in number of persons for whom means of egress and other provisions are required, either shall be determined on the basis of the occupant load factors of Table 7.3.1.2 that are characteristic of the use of the space or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

---

## 18.2 Means of Egress Requirements

**18.2.1 General.** Every aisle, passageway, corridor, exit discharge, exit location, and access shall be in accordance with Chapter 7, unless otherwise modified by 18.2.2 through 18.2.11.

## CHAPTER 19 • Existing

sprinklers. The word “unoccupied” is meant to disallow routine, regular use of the attic, which might increase the likelihood of fire or add a fuel load to the nonsprinklered space. Office or combustible storage spaces, for example, would be prohibited. The word “unoccupied” is not intended to prohibit the presence of mechanical equipment requiring periodic maintenance, such as air-handling units. Although 8.2.3.3 requires fire-rated assemblies to be supported by fire-rated structural members, 18.1.6.2 specifically exempts the 2-hour fire resistance-rated floor assembly (that separates the roof from the occupied floors below) from having to be supported on the floors below by 2-hour-rated structural members, provided that the required fire resistance rating of the building is less than 2 hours.

Paragraph 18/19.1.6.3 is similar to 18/19.1.6.2 in permitting the roofing system to include combustible supports, decking, or roofing but is specific to the use of fire-retardant-treated wood.

Although NFPA 220 does not set combustibility requirements for nonbearing interior walls and partitions, 18/19.1.6.4 adds requirements that exceed those of NFPA 220. Paragraph 18/19.1.6.4 adds that, in Type I and Type II construction, all nonbearing interior walls and partitions must be constructed of noncombustible or limited-combustible materials. The terms *noncombustible material* and *limited-combustible material* are addressed in 4.6.13 and 4.6.14, respectively.

Paragraph 18/19.1.6.5 supplements 18/19.1.6.4 in permitting fire-retardant-treated wood to be used within the core of maximum 2-hour fire resistance-rated interior nonbearing walls where the sheathing of such walls is of noncombustible or limited-combustible materials. Similarly, 18/19.1.6.6 permits fire-retardant-treated wood used for supporting fixtures to be used within the core of walls and partitions similarly sheathed.

**19.1.7 Occupant Load.** The occupant load, in number of persons for whom means of egress and other provisions are required, either shall be determined on the basis of the occupant load factors of Table 7.3.1.2 that are characteristic of the use of the space or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

---

## 19.2 Means of Egress Requirements

**19.2.1 General.** Every aisle, passageway, corridor, exit discharge, exit location, and access shall be in accordance with Chapter 7, unless otherwise modified by 19.2.2 through 19.2.11.

## CHAPTER 18 • New

The provision of 18/19.2.1 mandatorily references the requirements of Chapter 7, unless otherwise modified by the provisions of Section 18/19.2. Many provisions of Chapter 7 are not modified by Chapters 18 and 19 so as to have applicability to health care occupancies. Exhibit 18/19.12 shows a stairway identification sign in a hospital for compliance with the requirements of

Exhibit 18/19.12

Stairway identification sign.

### 18.2.2\* Means of Egress Components.

**A.18.2.2** In planning egress, arrangements should be made to transfer patients from one section of a floor to another section of the same floor that is separated by a fire barrier or smoke barrier in such a manner that patients confined to their beds can be transferred in their beds. Where the building design will allow, the section of the corridor containing an entrance or elevator lobby should be separated from corridors leading from it by fire or smoke barriers. Such arrangement, where the lobby is centrally located, will, in effect, produce a smoke lock, placing a double barrier between the area to which patients might be taken and the area from which they need to be evacuated because of threatening smoke and fire.

**18.2.2.1 Components Permitted.** Components of means of egress shall be limited to the types described in 18.2.2.2 through 18.2.2.10.

## CHAPTER 19 • Existing

7.2.2.5.4. Exhibit 18/19.13 shows directional marking within a horizontal component of the egress path within an exit enclosure of a hospital for compliance with the requirement of 7.10.1.2.2. Neither of these subjects needs to be specifically addressed in Chapters 18 and 19 in order to have applicability to health care occupancies.

Exhibit 18/19.13

Directional marking within a horizontal component of the egress path within an exit enclosure.

### 19.2.2 Means of Egress Components.

**19.2.2.1 Components Permitted.** Components of means of egress shall be limited to the types described in 19.2.2.2 through 19.2.2.10.

## CHAPTER 18 • New

**18.2.2.2 Doors.**

**18.2.2.2.1** Doors complying with 7.2.1 shall be permitted.

**18.2.2.2.2** Locks shall not be permitted on patient sleeping room doors, unless otherwise permitted by one of the following:

- (1) Key-locking devices that restrict access to the room from the corridor and that are operable only by staff from the corridor side shall be permitted, provided that such devices do not restrict egress from the room.
- (2) Locks complying with 18.2.2.2.5 shall be permitted.

Paragraphs 18/19.2.2.2.1 through 18/19.2.2.2.11 address the door provisions of 7.2.1 and provide any modifications particular to health care occupancies.

In the 1991 and earlier editions of the *Code*, numerous provisions of Chapters 18 and 19 specified minimum door width requirements as a leaf width rather than as a clear width. For example, doors from patient rooms to the corridor in new construction were required to be 44 in. (1120 mm) wide. The intent was that, after allowing for the stops built into the door frame and the thickness of the protruding hinge stile edge, a 44 in. (1120 mm) wide door leaf would provide approximately 41½ in. (1055 mm) of clear, unobstructed width. However, there was no requirement for the door to swing a minimum of 90 degrees from the plane of the door opening, so the intended 41½ in. (1055 mm) of clear, unobstructed width was not ensured. Since the 1994 edition of the *Code*, all minimum door width requirements for new health care occupancies have been specified as clear, unobstructed width. For existing doors in health care occupancies, all minimum door width requirements have been specified as clear, unobstructed width, but exceptions continue to recognize existing doors with the minimum door leaf widths previously specified.

**18.2.2.2.3** Doors not located in a required means of egress shall be permitted to be subject to locking.

**18.2.2.2.4** Doors within a required means of egress shall not be equipped with a latch or lock that requires the use of a tool or key from the egress side, unless otherwise permitted by one of the following:

- (1) Locks complying with 18.2.2.2.5 shall be permitted.
- (2)\* Delayed-egress locks complying with 7.2.1.6.1 shall be permitted.
- (3)\* Access-controlled egress doors complying with 7.2.1.6.2 shall be permitted.
- (4) Elevator lobby exit access door locking in accordance with 7.2.1.6.3 shall be permitted.

## CHAPTER 19 • Existing

**19.2.2.2 Doors.**

**19.2.2.2.1** Doors complying with 7.2.1 shall be permitted.

**19.2.2.2.2** Locks shall not be permitted on patient sleeping room doors, unless otherwise permitted by one of the following:

- (1) Key-locking devices that restrict access to the room from the corridor and that are operable only by staff from the corridor side shall be permitted, provided that such devices do not restrict egress from the room.
- (2) Locks complying with 19.2.2.2.5 shall be permitted.

The provisions of 18/19.2.2.2.2 address the locking of patient sleeping room doors. The provisions of 18/19.2.2.2.4 address the locking of doors other than patient sleeping room doors. Where a door-locking option detailed elsewhere in 18/19.2.2.2 is appropriate for use on any egress door, permission to use the option appears in both 18/19.2.2.2.2 and 18/19.2.2.2.4. For example, both 18/19.2.2.2.2(2) and 18/19.2.2.2.4(1) recognize the use of the door-locking provisions of 18/19.2.2.2.5.

Paragraph 18/19.2.2.2.2(1) permits access from the corridor to a patient sleeping room to be limited via a locked door that staff can unlock with keys they keep readily available. Limited access would permit, for example, patient isolation rooms to have doors locked from the corridor side only, so that other patients could not wander into the room and thus endanger themselves. However, the patient within the isolation room with the door locked from the corridor side needs to be able to open the door from the room side without the use of a key or tool.

Paragraphs 18/19.2.2.2.2(2) and 18/19.2.2.2.4(1) recognize use of the provisions of 18/19.2.2.2.5, which address door locking where patients pose a security threat and where patient needs require specialized protective measures for their safety.

**19.2.2.2.3** Doors not located in a required means of egress shall be permitted to be subject to locking.

**19.2.2.2.4** Doors within a required means of egress shall not be equipped with a latch or lock that requires the use of a tool or key from the egress side, unless otherwise permitted by one of the following:

- (1) Locks complying with 19.2.2.2.5 shall be permitted.
- (2)\* Delayed-egress locks complying with 7.2.1.6.1 shall be permitted.
- (3)\* Access-controlled egress doors complying with 7.2.1.6.2 shall be permitted.
- (4) Elevator lobby exit access door locking in accordance with 7.2.1.6.3 shall be permitted.
- (5) Approved existing door-locking installations shall be permitted.

## CHAPTER 18 • New

**A.18.2.2.2.4(2)** Where delayed-egress locks complying with 7.2.1.6.1 are used, the provisions of 18.2.2.2.5 are not required.

**A.18.2.2.2.4(3)** Where access-controlled egress doors complying with 7.2.1.6.2 are used, the provisions of 18.2.2.2.5 are not required.

**Paragraph 18/19.2.2.2.4(2)** addresses the delayed-egress lock described in 7.2.1.6.1. **Paragraph 7.2.1.6.1** specifies detailed requirements for delayed-egress locking hardware, including the requirement that the building be protected throughout by automatic sprinklers or automatic fire detection. The exemption permits the use of the delayed-egress lock on any door in a health care facility. Editions of the *Code* prior to 2009 permitted only one delayed-egress lock along any egress path. The restriction was deleted, as there was not adequate substantiation to retain it. **Exhibit 18/19.14** shows delayed-egress locking hardware on an exit door in a nursing home. The door connects the corridor on the level of exit discharge to an exit stair enclosure landing that provides a door to the outside.

**Paragraph 18/19.2.2.2.4(3)** addresses access-controlled egress door assemblies described in 7.2.1.6.2. **Paragraph 7.2.1.6.2** specifies detailed requirements for doors where ingress is restricted so as to require an electronic key but for which egress is not restricted, as a motion detector is provided to sense a building occupant's approach toward the egress door, unlocking the door automatically.

**Paragraph 18/19.2.2.2.4(4)** permits use of the elevator lobby exit access door-locking provisions of 7.2.1.6.3. **Paragraph 7.2.1.6.3** details 14 criteria that must be met as an alternative to the requirements of 7.4.1.6 that each elevator landing or lobby must have access to at least one exit without the use of a key, a tool, special knowledge, or special effort. See 7.4.1.6 and 7.2.1.6.3.

**Paragraph 19.2.2.2.4(5)** recognizes existing door-locking arrangements that do not meet the provisions of 19.2.2.2.4(1),

**18.2.2.2.5** Door-locking arrangements shall be permitted in accordance with either 18.2.2.2.5.1 or 18.2.2.2.5.2.

**18.2.2.2.5.1\*** Door-locking arrangements shall be permitted where the clinical needs of patients require specialized security measures or where patients pose a security threat, provided that staff can readily unlock doors at all times in accordance with 18.2.2.2.6.

**A.18.2.2.2.5.1** Psychiatric units, Alzheimer units, and dementia units are examples of areas with patients who might have clinical needs that justify door locking. Forensic units and detention units are examples of areas with patients who might pose a security threat. Where Alzheimer or dementia patients in nursing homes are not housed in specialized units, the provisions of 18.2.2.2.5.1 should not apply. (See 18.2.2.2.5.2.)

## CHAPTER 19 • Existing

**A.19.2.2.2.4(2)** Where delayed-egress locks complying with 7.2.1.6.1 are used, the provisions of 19.2.2.2.5 are not required.

**A.19.2.2.2.4(3)** Where access-controlled egress doors complying with 7.2.1.6.2 are used, the provisions of 19.2.2.2.5 are not required.

**Exhibit 18/19.14**

*Delayed-egress locking hardware on door connecting corridor to exit enclosure.*

(2), (3), or (4) where approved by the authority having jurisdiction. For example, the AHJ might permit an existing door-locking system that was installed to reduce the potential for infant abduction but does not meet all the criteria of 19.2.2.2.5.2 to be continued in use. Note that the provision does not relate to previously approved systems (see 3.3.214). Rather, approval of the current AHJ must be secured in order to permit the existing door-locking system to remain in use.

**19.2.2.2.5** Door-locking arrangements shall be permitted in accordance with either 19.2.2.2.5.1 or 19.2.2.2.5.2.

**19.2.2.2.5.1\*** Door-locking arrangements shall be permitted where the clinical needs of patients require specialized security measures or where patients pose a security threat, provided that staff can readily unlock doors at all times in accordance with 19.2.2.2.6.

**A.19.2.2.2.5.1** Psychiatric units, Alzheimer units, and dementia units are examples of areas with patients who might have clinical needs that justify door locking. Forensic units and detention units are examples of areas with patients who might pose a security threat. Where Alzheimer or dementia patients in nursing homes are not housed in specialized units, the provisions of 19.2.2.2.5.1 should not apply. (See 19.2.2.2.5.2.)

## CHAPTER 18 • New

**18.2.2.2.5.2\*** Door-locking arrangements shall be permitted where patient special needs require specialized protective measures for their safety, provided that all of the following criteria are met:

- (1) Staff can readily unlock doors at all times in accordance with **18.2.2.2.6**.
- (2) A total (complete) smoke detection system is provided throughout the locked space in accordance with **9.6.2.9**, or locked doors can be remotely unlocked at an approved, constantly attended location within the locked space.
- (3)\* The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with **18.3.5.1**.
- (4) The locks are electrical locks that fail safely so as to release upon loss of power to the device.
- (5) The locks release by independent activation of each of the following:
  - (a) Activation of the smoke detection system required by **18.2.2.5.2(2)**
  - (b) Waterflow in the automatic sprinkler system required by **18.2.2.5.2(3)**

**A.18.2.2.2.5.2** Pediatric units, maternity units, and emergency departments are examples of areas where patients might have special needs that justify door locking. Door locking arrangements should be permitted to reduce the risk of abduction of infants and children who are patients.

**A.18.2.2.2.5.2(3)** Where locked doors in accordance with **18.2.2.5.2** are proposed for an existing building that is not sprinklered throughout, the authority having jurisdiction might consider permitting the installation based on an analysis of the extent of sprinkler protection provided. Sprinklered areas should include, at a minimum, the secured compartment and compartments that the occupants of the secured compartment must travel through to egress the building.

The provision of **18/19.2.2.5.1** was revised for the 2012 edition of the *Code*. The revision deleted the option of complying with **18/19.2.2.5.2**, as compliance with **18/19.2.2.5.2(1)** alone satisfies the option that was retained, namely that of providing staff the ability to unlock doors at all times in accordance with **18/19.2.2.6**. Thus, the option that was deleted had no practical applicability.

The provisions of **18/19.2.2.5** address features that must be met in order to lock doors for the following conditions:

1. Door locking for the clinical needs of patients who require specialized security measures
2. Door locking where patients pose a security threat
3. Door locking where patient needs require specialized protective measures for their safety

## CHAPTER 19 • Existing

**19.2.2.2.5.2\*** Door-locking arrangements shall be permitted where patient special needs require specialized protective measures for their safety, provided that all of the following are met:

- (1) Staff can readily unlock doors at all times in accordance with **19.2.2.6**.
- (2) A total (complete) smoke detection system is provided throughout the locked space in accordance with **9.6.2.9**, or locked doors can be remotely unlocked at an approved, constantly attended location within the locked space.
- (3)\* The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with **19.3.5.7**.
- (4) The locks are electrical locks that fail safely so as to release upon loss of power to the device.
- (5) The locks release by independent activation of each of the following:
  - (a) Activation of the smoke detection system required by **19.2.2.5.2(2)**
  - (b) Waterflow in the automatic sprinkler system required by **19.2.2.5.2(3)**

**A.19.2.2.2.5.2** Pediatric units, maternity units, and emergency departments are examples of areas where patients might have special needs that justify door locking. Door locking arrangements should be permitted to reduce the risk of abduction of infants and children who are patients.

**A.19.2.2.2.5.2(3)** Where locked doors in accordance with **19.2.2.5.2** are proposed for an existing building that is not sprinklered throughout, the authority having jurisdiction might consider permitting the installation based on an analysis of the extent of sprinkler protection provided. Sprinklered areas should include, at a minimum, the secured compartment and compartments that the occupants of the secured compartment must travel through to egress the building.

**Paragraph 18/19.2.2.5.1** addresses the locking of patient sleeping room doors where patient clinical needs require specialized security measures or where patients pose a security threat. Health care facilities might need to lock patient room doors against egress for functional purposes involving the clinical needs of patients or to prevent patients from harming other building occupants. For example, if certain patients require confinement because they would otherwise leave their rooms and endanger themselves or others, locking patient room doors would provide specialized security. If patient room doors are locked against egress for patient clinical needs or where patients pose a security threat, the provisions of **18/19.2.2.5.1** require that staff be available to unlock doors at all times as addressed by **18/19.2.2.6**.

## CHAPTER 18 • New

The provisions of 18/19.2.2.2.5.2 permit doors to be locked where patient special needs require specialized protective measures for their safety. For example, the provisions of 18/19.2.2.2.5.2 might be used on the doors of a newborn infant nursery or nursery wing of a building to reduce the potential for infant

**18.2.2.2.6** Doors that are located in the means of egress and are permitted to be locked under other provisions of 18.2.2.2.5 shall comply with both of the following:

- (1) Provisions shall be made for the rapid removal of occupants by means of one of the following:
  - (a) Remote control of locks from within the locked smoke compartment
  - (b) Keying of all locks to keys carried by staff at all times
  - (c) Other such reliable means available to the staff at all times
- (2) Only one locking device shall be permitted on each door.

**18.2.2.2.7\*** Doors permitted to be locked in accordance with 18.2.2.2.5.1 shall be permitted to have murals on the egress doors to disguise the doors, provided all of the following are met:

- (1) Staff can readily unlock the doors at all times in accordance with 18.2.2.2.6.
- (2)\* The door-releasing hardware, where provided, is readily accessible for staff use.
- (3)\* Door leaves, windows, and door hardware, other than door-releasing hardware, are permitted to be covered by the murals.
- (4) The murals do not impair the operation of the doors.
- (5) The location and operation of doors disguised with murals are identified in the fire safety plan and are included in staff training.

**A.18.2.2.2.7** In some health care occupancies, especially nursing homes, the use of murals to disguise doors has been found to be beneficial for certain patient populations. This provision is intended to apply to disguising of egress doors by painting the doors or the use of wall paper on the doors. The marking of the means of egress such as required exit signs should be clearly visible and not disguised by the mural. Where decorations are applied to the door, the requirements of Section 18.7 would still apply and painting a mural on the door would not be considered a decoration. Such murals should not obscure required vision panels or affect the required fire resistance rating of fire-rated door assemblies.

## CHAPTER 19 • Existing

abduction. The protective systems required are extensive, as detailed in 18/19.2.2.2.5.2(1) through (5), and blend together staff action, smoke detection, sprinkler protection, failsafe locks, and lock release via multiple independent actions.

**19.2.2.2.6** Doors that are located in the means of egress and are permitted to be locked under other provisions of 19.2.2.2.5 shall comply with all of the following:

- (1) Provisions shall be made for the rapid removal of occupants by means of one of the following:
  - (a) Remote control of locks
  - (b) Keying of all locks to keys carried by staff at all times
  - (c) Other such reliable means available to the staff at all times
- (2) Only one locking device shall be permitted on each door.
- (3) More than one lock shall be permitted on each door, subject to approval of the authority having jurisdiction.

**19.2.2.2.7\*** Doors permitted to be locked in accordance with 19.2.2.2.5.1 shall be permitted to have murals on the egress doors to disguise the doors, provided all of the following are met:

- (1) Staff can readily unlock the doors at all times in accordance with 19.2.2.2.6.
- (2)\* The door-releasing hardware, where provided, is readily accessible for staff use.
- (3)\* Door leaves, windows, and door hardware, other than door-releasing hardware, are permitted to be covered by the murals.
- (4) The murals do not impair the operation of the doors.
- (5) The affected smoke compartments are protected throughout by an approved, supervised automatic sprinkler system in accordance with 19.3.5.7.
- (6) The location and operation of doors disguised with murals are identified in the fire safety plan and are included in staff training.

**A.19.2.2.2.7** In some health care occupancies, especially nursing homes, the use of murals to disguise doors has been found to be beneficial for certain patient populations. This provision is intended to apply to disguising of egress doors by painting the doors or the use of wall paper on the doors. The marking of the means of egress such as required exit signs should be clearly visible and not disguised by the mural. Where decorations are applied to the door, the requirements of Section 19.7 would still apply and painting a mural on the door would not be considered a decoration. Such murals should not obscure required vision panels or affect the required fire resistance rating of fire-rated door assemblies.

## CHAPTER 18 • New

**A.18.2.2.2.7(2)** It is intended that the door-releasing hardware includes levers, locks, knobs, and panic bars, that are directly operated or grasped by staff.

**A.18.2.2.2.7(3)** It is intended that the door hardware that is permitted to be covered (i.e., disguised by the mural) includes items such as hinges, closers, and magnets, which would normally not be directly operated or grasped by staff.

In buildings where the locking of doors is necessary, continuous staff supervision must be provided in order to comply with the performance-based requirements of 18/19.2.2.2.6. Provisions must be made for the prompt release of persons who are restrained either by equipping staff with keys, by providing remote unlocking capabilities from within the locked smoke compartment, or by other reliable means available to staff at all times. If staff relies on the use of keys, a master key system for facilitating the quick release of occupants should be considered. In existing buildings, given the approval of the authority having jurisdiction, 19.2.2.2.6(3) permits more than one lock on a door.

The provisions of 18/19.2.2.2.7 are new to the 2015 edition of the Code. They permit doors to have murals that disguise the door, as might be helpful in dementia units. The door that has a mural must be a door that is permitted to be locked — see 18/19.2.2.2.5 — such as the doors for egressing a sleeping unit, including cross-corridor doors and doors to exit stair enclosures. Exhibit 18/19.15 shows a pair of locked doors in a single opening. The doors are disguised by a mural. The releasing hardware is not covered by the mural as required. The magnetic locks and self-closing devices located near the top of the opening and the rods that latch into the top of the frame and the floor are not covered by the mural, but they would be permitted to be covered. The vision panels in the door leaves are covered by the mural as permitted. See 18/19.2.2.2.7(3).

**18.2.2.2.8\*** Any door in an exit passageway, stairway enclosure, horizontal exit, smoke barrier, or hazardous area enclosure (except boiler rooms, heater rooms, and mechanical equipment rooms) shall be permitted to be held open only by an automatic release device that complies with 7.2.1.8.2. The automatic sprinkler system and the fire alarm system, and the systems required by 7.2.1.8.2, shall be arranged to initiate the closing action of all such doors throughout the smoke compartment or throughout the entire facility.

**A.18.2.2.2.8** It is desirable to keep doors in exit passageways, stair enclosures, horizontal exits, smoke barriers, and required enclosures around hazardous areas closed at all times to impede the travel of smoke and fire gases. Functionally, however, this involves decreased efficiency and limits patient observation by

## CHAPTER 19 • Existing

**A.19.2.2.2.7(2)** It is intended that the door releasing hardware includes levers, locks, knobs, and panic bars that are directly operated or grasped by staff.

**A.19.2.2.2.7(3)** It is intended that the door hardware that is permitted to be covered (i.e., disguised by the mural) includes items such as hinges, closers, and magnets, which would normally not be directly operated or grasped by staff.

Exhibit 18/19.15

*Mural on door subject to locking. (Photo courtesy of the artist, Terry Cox-Joseph)*

**19.2.2.2.8\*** Any door in an exit passageway, stairway enclosure, horizontal exit, smoke barrier, or hazardous area enclosure shall be permitted to be held open only by an automatic release device that complies with 7.2.1.8.2. The automatic sprinkler system, if provided, and the fire alarm system, and the systems required by 7.2.1.8.2, shall be arranged to initiate the closing action of all such doors throughout the smoke compartment or throughout the entire facility.

**A.19.2.2.2.8** It is desirable to keep doors in exit passageways, stair enclosures, horizontal exits, smoke barriers, and required enclosures around hazardous areas closed at all times to impede the travel of smoke and fire gases. Functionally, however, this involves decreased efficiency and limits patient supervision by

## CHAPTER 18 • New

the staff of a facility. To accommodate such needs, it is practical to presume that such doors will be kept open, even to the extent of employing wood chocks and other makeshift devices. Doors in exit passageways, horizontal exits, and smoke barriers should, therefore, be equipped with automatic hold-open devices activated by the methods described, regardless of whether the original installation of the doors was predicated on a policy of keeping them closed.

**18.2.2.2.9** Where doors in a stair enclosure are held open by an automatic release device as permitted in **18.2.2.2.8**, initiation of a door-closing action on any level shall cause all doors at all levels in the stair enclosure to close.

**Paragraph 18/19.2.2.2.8** modifies the requirements of **7.2.1.8.2** addressing automatic-closing doors. According to **7.2.1.8.2** and *NFPA 72<sup>®</sup>, National Fire Alarm and Signaling Code*,<sup>5</sup> the doors must be designed to close automatically by actuation of smoke detectors installed to detect smoke on either side of the door. In addition, where health care occupancy doors that are required to be self-closing are held open, an automatic device must close doors

**18.2.2.2.10** High-rise health care occupancies shall comply with the re-entry provisions of **7.2.1.5.8**.

**Paragraph 18.2.2.2.10** regulates stairway re-entry in new health care occupancies having occupied floor levels more than 75 ft (23 m) above the lowest level of fire department access. In doing so, the *Code* exempts new low-rise health care occupancies from the requirements of **7.2.1.5.8**. Stair doors in new high-rise health care facilities must allow for re-entry in accordance with **Chapter 7**. All stair doors must be unlocked, or they must be interlocked with the building fire alarm to unlock automatically in the event of alarm actuation, or use of **7.2.1.5.8.1** is permitted. **Paragraph 7.2.1.5.8.1** permits stair doors to be locked, provided that the following requirements are met:

1. A minimum of two doors are maintained unlocked.
2. There are no more than four intervening floors between unlocked doors.

**18.2.2.2.11** Horizontal-sliding doors shall be permitted in accordance with **18.2.2.2.11.1** or **18.2.2.2.11.2**.

**18.2.2.2.11.1** Horizontal sliding doors that are not automatic-closing shall be limited to a single leaf and shall have a latch or

## CHAPTER 19 • Existing

the staff of a facility. To accommodate such needs, it is practical to presume that such doors will be kept open, even to the extent of employing wood chocks and other makeshift devices. Doors in exit passageways, horizontal exits, and smoke barriers should, therefore, be equipped with automatic hold-open devices actuated by the methods described, regardless of whether the original installation of the doors was predicated on a policy of keeping them closed.

**19.2.2.2.9** Where doors in a stair enclosure are held open by an automatic release device as permitted in **19.2.2.2.8**, initiation of a door-closing action on any level shall cause all doors at all levels in the stair enclosure to close.

(either throughout the affected smoke compartment or throughout the building) upon operation of the building fire alarm system and upon operation of the building sprinkler system. As a further safeguard for stair enclosures, any automatic action that closes a stair enclosure door on one level must close the doors on the other levels of that stair enclosure in accordance with **18/19.2.2.2.9**.

**19.2.2.2.10\*** Existing health care occupancies shall be exempt from the re-entry provisions of **7.2.1.5.8**.

**A.19.2.2.2.10** Doors to the enclosures of interior stair exits should be arranged to open from the stair side at not less than every third floor so that it will be possible to leave the stairway at such floor if fire renders the lower part of the stair unusable during egress or if occupants seek refuge on another floor.

3. Re-entry is possible at either of the two top floor levels that provides access to a different exit.
4. Unlocked doors are appropriately marked on the stairwell side.
5. Locked doors have signage regarding the location of unlocked doors.

Existing health care occupancies — even those that are in high-rise buildings — are exempt from the stairwell re-entry provisions (see **19.2.2.2.10**).

**19.2.2.2.11** Horizontal-sliding doors shall be permitted in accordance with **19.2.2.2.11.1** or **19.2.2.2.11.2**.

**19.2.2.2.11.1** Horizontal-sliding doors that are not automatic-closing shall be limited to a single leaf and shall have a latch or

## CHAPTER 18 • New

other mechanism that ensures that the doors will not rebound into a partially open position if forcefully closed.

**18.2.2.2.11.2** Horizontal-sliding doors serving an occupant load of fewer than 10 shall be permitted, provided that all of the following criteria are met:

- (1) The area served by the door has no high hazard contents.
- (2) The door is readily operable from either side without special knowledge or effort.
- (3) The force required to operate the door in the direction of door travel is not more than 30 lbf (133 N) to set the door in motion and is not more than 15 lbf (67 N) to close the door or open it to the minimum required width.
- (4) The door assembly complies with any required fire protection rating and, where rated, is self-closing or automatic-closing by means of smoke detection in accordance with 7.2.1.8 and is installed in accordance with NFPA 80, *Standard for Fire Doors and Other Opening Protectives*.
- (5) Where corridor doors are required to latch, the doors are equipped with a latch or other mechanism that ensures that the doors will not rebound into a partially open position if forcefully closed.

**Paragraph 18/19.2.2.2.11.1** establishes requirements exceeding those of 7.2.1.14 for horizontal-sliding doors. If the special form of sliding door addressed in 7.2.1.14 is to be closed manually, the door must consist of a single leaf to avoid openings at the meeting edges of the two leaves, and provisions must be made, by use of a latch or other means, to prevent the door from contacting the frame and rebounding to a partially open position when closed forcefully. The requirements of 7.2.1.14 should be closely reviewed. The sliding door described is highly specialized, and all requirements of 7.2.1.14 must be met. One unique requirement that differentiates this special door from a typical horizontal-sliding door is that it must slide to the side to allow passage through the door opening when force is applied in the direction of egress travel to the door actuator.

**Paragraph 18/19.2.2.2.11.2** permits traditional horizontal-sliding doors (as contrasted with the special form of sliding door addressed in 7.2.1.14) to serve within the required means of

**18.2.2.3 Stairs.** Stairs complying with 7.2.2 shall be permitted.

The provisions of 7.2.2 for stairs, handrails, and guards are numerous. Exhibit 18/19.16 illustrates many of the features required by 7.2.2. The stair riser height is not excessive; the tread depth is sufficient for safe placement of the user's foot; guards are provided on the open side of the stair; the balusters provide protection against falls through the guard; the handrail at the

## CHAPTER 19 • Existing

other mechanism that ensures that the doors will not rebound into a partially open position if forcefully closed.

**19.2.2.2.11.2** Horizontal-sliding doors serving an occupant load of fewer than 10 shall be permitted, provided that all of the following criteria are met:

- (1) The area served by the door has no high hazard contents.
- (2) The door is readily operable from either side without special knowledge or effort.
- (3) The force required to operate the door in the direction of door travel is not more than 30 lbf (133 N) to set the door in motion and is not more than 15 lbf (67 N) to close the door or open it to the minimum required width.
- (4) The door assembly complies with any required fire protection rating and, where rated, is self-closing or automatic-closing by means of smoke detection in accordance with 7.2.1.8 and is installed in accordance with NFPA 80, *Standard for Fire Doors and Other Opening Protectives*.
- (5) Where corridor doors are required to latch, the doors are equipped with a latch or other mechanism that ensures that the doors will not rebound into a partially open position if forcefully closed.

egress. A nearly identical set of provisions for horizontal-sliding doors appears in 7.2.1.4.1(4)(c), which was modeled after 18/19.2.2.2.11.2. The horizontal-sliding door is permitted as an exemption to the requirement of 7.2.1.4.1 that any door in a means of egress be of the swinging type. By limiting the use of the horizontal-sliding door to serving an occupant load of fewer than 10, the provision relies on staff assistance to help ensure that the door will be operated correctly, so as to open to the full required width. Horizontal-sliding doors are frequently used within suites, including critical care units. Such doors do not need to be installed with a breakaway feature, as they are not required to be of the swinging type. The requirement of 18/19.2.2.2.11.2(5) clarifies that the latching criterion applies only where the doors are corridor doors that are required to latch, so as not to have applicability to horizontal-sliding doors, for example, within suites.

**19.2.2.3 Stairs.** Stairs complying with 7.2.2 shall be permitted.

open side provides continuous graspability, including at the turn where the stair run switches direction; an additional handrail is positioned along the wall; and a physical barrier helps to prevent inadvertent travel past the level of exit discharge and into the basement (see 7.7.3.3).

## CHAPTER 18 • New

## CHAPTER 19 • Existing

Exhibit 18/19.16

*Egress stair, handrails, guards, and barrier to inadvertent travel past the level of exit discharge.*

**18.2.2.4 Smokeproof Enclosures.** Smokeproof enclosures complying with 7.2.3 shall be permitted.

**18.2.2.5 Horizontal Exits.** Horizontal exits complying with 7.2.4 and the modifications of 18.2.2.5.1 through 18.2.2.5.7 shall be permitted.

**18.2.2.5.1** Accumulation space shall be provided in accordance with 18.2.2.5.1.1 and 18.2.2.5.1.2.

**18.2.2.5.1.1** Not less than 30 net ft<sup>2</sup> (2.8 net m<sup>2</sup>) per patient in a hospital or nursing home, or not less than 15 net ft<sup>2</sup> (1.4 net m<sup>2</sup>) per resident in a limited care facility, shall be provided within the aggregated area of corridors, patient rooms, treatment rooms, lounge or dining areas, and other similar areas on each side of the horizontal exit.

**18.2.2.5.1.2** On stories not housing bedridden or litterborne patients, not less than 6 net ft<sup>2</sup> (0.56 net m<sup>2</sup>) per occupant shall be provided on each side of the horizontal exit for the total number of occupants in adjoining compartments.

**18.2.2.5.2** The total egress capacity of the other exits (stairs, ramps, doors leading outside the building) shall not be reduced below one-third of that required for the entire area of the building.

**18.2.2.5.3** A single door shall be permitted in a horizontal exit if all of the following conditions apply:

- (1) The exit serves one direction only.
- (2) Such door is a swinging door or a special-purpose horizontally sliding accordion or folding door assembly complying with 7.2.1.14.
- (3) The door is not less than 41½ in. (1055 mm) in clear width.

**19.2.2.4 Smokeproof Enclosures.** Smokeproof enclosures complying with 7.2.3 shall be permitted.

**19.2.2.5 Horizontal Exits.** Horizontal exits complying with 7.2.4 and the modifications of 19.2.2.5.1 through 19.2.2.5.4 shall be permitted.

**19.2.2.5.1** Accumulation space shall be provided in accordance with 19.2.2.5.1.1 and 19.2.2.5.1.2.

**19.2.2.5.1.1** Not less than 30 net ft<sup>2</sup> (2.8 net m<sup>2</sup>) per patient in a hospital or nursing home, or not less than 15 net ft<sup>2</sup> (1.4 net m<sup>2</sup>) per resident in a limited care facility, shall be provided within the aggregated area of corridors, patient rooms, treatment rooms, lounge or dining areas, and other similar areas on each side of the horizontal exit.

**19.2.2.5.1.2** On stories not housing bedridden or litterborne patients, not less than 6 net ft<sup>2</sup> (0.56 net m<sup>2</sup>) per occupant shall be provided on each side of the horizontal exit for the total number of occupants in adjoining compartments.

**19.2.2.5.2** The total egress capacity of the other exits (stairs, ramps, doors leading outside the building) shall not be reduced below one-third of that required for the entire area of the building.

**19.2.2.5.3\*** A door in a horizontal exit shall not be required to swing with egress travel as specified in 7.2.4.3.8(1).

**A.19.2.2.5.3** The waiver of the requirement for doors to swing in the direction of egress travel is based on the assumption that, in this occupancy, there is no possibility of a panic rush that might prevent the opening of doors that swing against egress travel.

## CHAPTER 18 • New

**18.2.2.5.4** A horizontal exit involving a corridor 8 ft (2440 mm) or more in width and serving as a means of egress from both sides of the doorway shall have the opening protected by a pair of swinging doors arranged to swing in opposite directions from each other, with each door having a clear width of not less than 41½ in. (1055 mm), or by a special-purpose horizontally sliding accordion or folding door assembly that complies with [7.2.1.14](#) and provides a clear width of not less than 6 ft 11 in. (2110 mm).

**18.2.2.5.5** A horizontal exit involving a corridor 6 ft (1830 mm) or more in width and serving as a means of egress from both sides of the doorway shall have the opening protected by a pair of swinging doors, arranged to swing in opposite directions from each other, with each door having a clear width of not less than 32 in. (810 mm), or by a special-purpose horizontally sliding accordion or folding door assembly that complies with [7.2.1.14](#) and provides a clear width of not less than 64 in. (1625 mm).

**18.2.2.5.6** An approved vision panel shall be required in each horizontal exit door.

**18.2.2.5.7** Center mullions shall be prohibited in horizontal exit door openings.

Special recognition is given to horizontal travel and the use of horizontal exits in health care facilities because of practical difficulties involving vertical egress travel, such as on stairways. Horizontal exits are permitted to provide up to two-thirds of the total required egress capacity for a given fire area — an extension of the one-half of total egress capacity limitation of [7.2.4.1.2](#). Every floor and every fire section must have at least one exit consisting of a door leading directly outside the building, an interior stair, an outside stair, a smokeproof enclosure, a ramp, or an exit passageway (see [18/19.2.4.4](#)). No fire area can be served by horizontal exits only (see [18/19.2.2.5.2](#)). In the event that a horizontal exit also serves as a smoke barrier, see the commentary following [A.18/19.2.4.4](#), and also see [18/19.3.7](#).

The requirements for horizontal exits in [18/19.2.2.5](#) are illustrated in [Exhibit 18/19.17](#), [Exhibit 18/19.18](#), and [Exhibit 18/19.19](#).

Doors in new horizontal exits are required to swing in the direction of egress travel. In the case of a fire barrier that serves as a new horizontal exit for two adjoining fire areas, a pair of doors arranged with each leaf to swing in a direction opposite from the other, or some equivalent arrangement, must be used. If a fire barrier serves as a horizontal exit from only one fire area, the door opening is permitted to be protected by a single door

## CHAPTER 19 • Existing

A desirable arrangement, which is possible with corridors 8 ft (2440 mm) or more in width, is to have two 42 in. (1070 mm) doors, normally closed, each swinging with the egress travel (in opposite directions).

**19.2.2.5.4** Door openings in horizontal exits shall be protected by one of the following methods:

- (1) Such door openings shall be protected by a swinging door providing a clear width of not less than 32 in. (810 mm).
- (2) Such door openings shall be protected by a special-purpose horizontally sliding accordion or folding door assemblies that complies with [7.2.1.14](#) and provides a clear width of not less than 32 in. (810 mm).
- (3) Such door openings shall be protected by an existing 34 in. (865 mm) swinging door.

providing 41½ in. (1055 mm) clear width in new hospitals and nursing homes or 32 in. (810 mm) clear width in new limited care facilities. See [Exhibit 18/19.17](#).

The *Code* recognizes the use of special-purpose horizontally sliding accordion or folding doors complying with [7.2.1.14](#) for the protection of openings in horizontal exits. The use of power-operated sliding doors results in an obstruction-free opening for normal traffic while providing adequate fire protection for openings under fire emergency conditions.

Corridors in new limited care facilities and new psychiatric hospitals are required to be 6 ft (1830 mm) wide; therefore, it would not be practical to install a pair of 41½ in. (1055 mm) clear width doors to protect corridor openings in a horizontal exit. Recognizing this practical consideration and the fact that no obstructions, such as mullions mounted at the center of a two-door opening, are permitted, doors protecting openings in horizontal exits of new limited care facilities and new psychiatric hospitals are required to provide a minimum 32 in. (810 mm) clear width. See [Exhibit 18/19.18](#).

Prohibiting center mullions in new construction provides one, large, usable door opening where two doors are positioned within a door frame and eliminates any obstructions

CHAPTER 18 • New

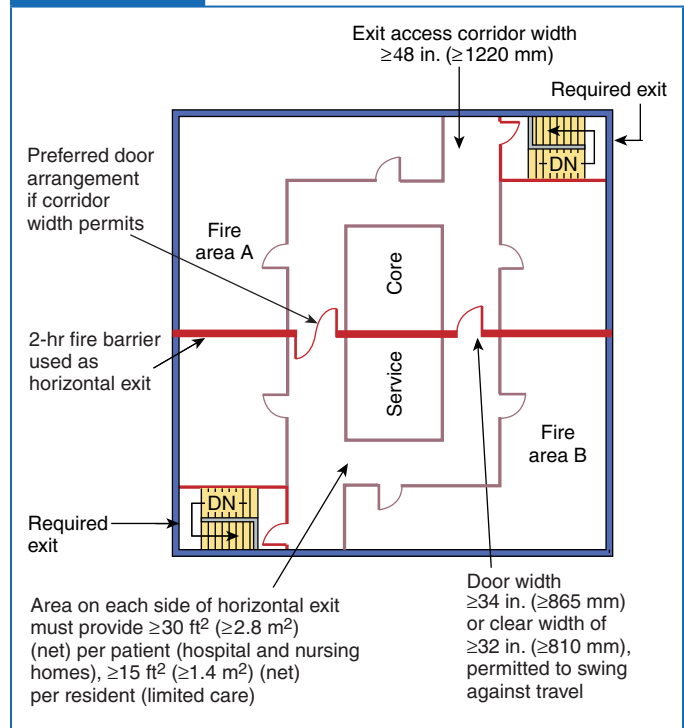

CHAPTER 19 • Existing

Exhibit 18/19.17

Exhibit 18/19.19

Horizontal exit in an existing health care occupancy.

Exhibit 18/19.18

Horizontal exit in new limited care facility or psychiatric hospital.

that would restrict the movement of patients in beds, in wheelchairs, or on gurneys.

The Code permits corridors in existing health care occupancies to be 48 in. (1220 mm) wide, and it is, therefore, impractical in many instances to install a pair of cross-corridor doors in a horizontal exit. However, the 48 in. (1220 mm) corridor width will allow the opening of a single door against the flow of travel with minimal difficulty. A power-operated sliding door might be used to reduce problems associated with door swing. The Code permits special-purpose horizontally sliding accordion or folding doors complying with 7.2.1.14 for the protection of openings in horizontal exits. The use of power-operated sliding doors results in an obstruction-free opening for normal traffic while still providing adequate fire protection for openings.

In the case of an existing fire barrier serving as a horizontal exit for two adjoining fire areas, and where corridor widths will allow, a pair of doors with each leaf arranged to swing in a direction opposite from the other should be used. Each leaf in the pair of doors must either be a minimum of 34 in. (865 mm) wide or provide a clear opening width of 32 in. (810 mm). See Exhibit 18/19.19.

New horizontal exits installed in an existing facility are subject to the rehabilitation provisions of Chapter 43. The category of rehabilitation work associated with the addition of a door or wall (i.e., reconfiguration of space) is classified as modification in

## CHAPTER 18 • New

accordance with 43.2.2.1.3 or as reconstruction in accordance with 43.2.2.1.4. Per 43.5.1.3, applicable both to modification and reconstruction, the newly constructed element must comply

**18.2.2.6 Ramps.**

**18.2.2.6.1** Ramps complying with 7.2.5 shall be permitted.

**18.2.2.6.2** Ramps enclosed as exits shall be of sufficient width to provide egress capacity in accordance with 18.2.3.

Ramps with a slope minimally graduated so as not to be dangerous for use in both normal and emergency traffic require so much space that they would be impracticable in most situations. They are, however, the only practicable method of moving bed-ridden patients from one floor elevation to another, except by elevators, which may not be available during fire conditions.

Ramps might compensate for minor differences in floor levels between adjoining sections of buildings, as shown in

**Exhibit 18/19.20**

*Indoor ramp for small elevation change between building sections.*

**18.2.2.7 Exit Passageways.** Exit passageways complying with 7.2.6 shall be permitted.

**18.2.2.8 Fire Escape Ladders.** Fire escape ladders complying with 7.2.9 shall be permitted.

The ladder addressed by 18/19.2.2.8 and 7.2.9 is called a fire escape ladder but is used in nonemergency situations for accessing rooftop spaces and mechanical equipment platforms. Exhibit 18/19.22 shows a fire escape ladder used for rooftop access and egress. Fire escape ladders are permitted in the

## CHAPTER 19 • Existing

with the requirements applicable to new construction. Thus, the new horizontal exit door must be installed in accordance with Chapter 18.

**19.2.2.6 Ramps.**

**19.2.2.6.1** Ramps complying with 7.2.5 shall be permitted.

**19.2.2.6.2** Ramps enclosed as exits shall be of sufficient width to provide egress capacity in accordance with 19.2.3.

**Exhibit 18/19.20.** Ramps might be the best means for providing egress from exterior discharge doors with modest elevation differences to grade level (see 7.1.7), as shown in Exhibit 18/19.21. Note in Exhibit 18/19.20 and Exhibit 18/19.21 that handrails are provided as required by 7.2.5.5.2. Additionally, guards are provided on the ramp in Exhibit 18/19.21, as required by 7.2.5.5.1. Such ramps must be constructed in accordance with 18/19.2.2.6 and 7.2.5.

**Exhibit 18/19.21**

*Outdoor ramp for modest elevation change between exit discharge door level and grade level.*

**19.2.2.7 Exit Passageways.** Exit passageways complying with 7.2.6 shall be permitted.

**19.2.2.8 Fire Escape Ladders.** Fire escape ladders complying with 7.2.9 shall be permitted.

means of egress of health care occupancies because the limitations imposed on the ladder by the criteria of 7.2.9 ensure that the ladder will not be used for egress by patients and residents of health care occupancies.

## CHAPTER 18 • New

## CHAPTER 19 • Existing

**18.2.2.9 Alternating Tread Devices.** Alternating tread devices complying with 7.2.11 shall be permitted.

**18.2.2.10 Areas of Refuge.** Areas of refuge used as part of a required accessible means of egress shall comply with 7.2.12.

### 18.2.3 Capacity of Means of Egress.

**18.2.3.1** The capacity of means of egress shall be in accordance with Section 7.3.

**18.2.3.2 Reserved.**

**18.2.3.3 Reserved.**

The method used in calculating egress capacity acknowledges that increasing the width of egress systems results in increasing the occupant flow through that system. The provisions of 19.2.3.3 (as well as the reference 18.2.3.1 makes to Section 7.3) compute stair egress capacity in sprinklered health care occupancies on the basis of 0.3 in. (7.6 mm) per person. Therefore, a 44 in. (1120 mm) stair provides egress capacity for 146 persons [44 in./0.3 in. per person (1120 mm/7.6 mm per person) = 146 persons]. Similarly, a 50 in. (1270 mm) stair provides capacity for 167 persons. In nonsprinklered existing health care occupancies,

**Exhibit 18/19.22**

*Fire escape ladder for rooftop access and egress.*

**19.2.2.9 Alternating Tread Devices.** Alternating tread devices complying with 7.2.11 shall be permitted.

**19.2.2.10 Areas of Refuge.** Areas of refuge used as part of a required accessible means of egress shall comply with 7.2.12.

### 19.2.3 Capacity of Means of Egress.

**19.2.3.1** The capacity of means of egress shall be in accordance with Section 7.3.

**19.2.3.2** The capacity of means of egress providing travel by means of stairs shall be 0.6 in. (15 mm) per person, and the capacity of means of egress providing horizontal travel (without stairs) by means such as doors, ramps, or horizontal exits shall be ½ in. (13 mm) per person, unless otherwise permitted by 19.2.3.3.

**19.2.3.3** The capacity of means of egress in health care occupancies protected throughout by an approved, supervised automatic sprinkler system in accordance with 19.3.5.7 shall be 0.3 in. (7.6 mm) per person for travel by means of stairs and 0.2 in. (5 mm) per person for horizontal travel without stairs.

stair egress capacity is computed on the basis of 0.6 in. (15 mm) per person. The capacity of level surfaces and doors in fully sprinklered health care occupancy smoke compartments is computed on the basis of 0.2 in. (5 mm) per person, and on ½ in. (13 mm) per person in nonsprinklered existing health care occupancy smoke compartments. Egress capacity calculations must use clear width as specified in 7.2.1.2.

In earlier editions of the *Code*, egress capacity for health care occupancies was calculated using more conservative egress capacity factors. For example, stair capacity for nonsprinklered

## CHAPTER 18 • New

health care occupancies was calculated on the basis of 1 in. (25 mm) per person, rather than the current factor of 0.3 in. (7.6 mm) per person, based on the belief that extra width was needed to create space that could serve as a refuge area. The capacity of health care egress system components was set conservatively in recognition of the slow rate of travel for patients and the fact that space was needed for patients on litters and in wheelchairs.

Recent editions of the *Code* use a different concept for egress system design in health care occupancies. Life safety from fire in health care facilities relies on a defend-in-place principle.

**18.2.3.4\*** Aisles, corridors, and ramps required for exit access in a hospital or nursing home shall be not less than 8 ft (2440 mm) in clear and unobstructed width, unless otherwise permitted by one of the following:

- (1)\* Aisles, corridors, and ramps in adjunct areas not intended for the housing, treatment, or use of inpatients shall be not less than 44 in. (1120 mm) in clear and unobstructed width.
- (2)\* Noncontinuous projections not more than 6 in. (150 mm) from the corridor wall, positioned not less than 38 in. (965 mm) above the floor, shall be permitted.
- (3)\* Exit access within a room or suite of rooms complying with the requirements of 18.2.5 shall be permitted.
- (4) Projections into the required width shall be permitted for wheeled equipment, provided that all of the following conditions are met:
  - (a) The wheeled equipment does not reduce the clear unobstructed corridor width to less than 60 in. (1525 mm).
  - (b) The health care occupancy fire safety plan and training program address the relocation of the wheeled equipment during a fire or similar emergency.
  - (c)\* The wheeled equipment is limited to the following:
    - i. Equipment in use and carts in use
    - ii. Medical emergency equipment not in use
    - iii. Patient lift and transport equipment
- (5)\* Where the corridor width is at least 8 ft (2440 mm), projections into the required width shall be permitted for fixed furniture, provided that all of the following conditions are met:
  - (a) The fixed furniture is securely attached to the floor or to the wall.
  - (b) The fixed furniture does not reduce the clear unobstructed corridor width to less than 6 ft (1830 mm), except as permitted by 18.2.3.4(2).
  - (c) The fixed furniture is located only on one side of the corridor.
  - (d) The fixed furniture is grouped such that each grouping does not exceed an area of 50 ft<sup>2</sup> (4.6 m<sup>2</sup>).

## CHAPTER 19 • Existing

Horizontal exits or smoke barriers are used to subdivide each story to provide an area of refuge on each story without requiring travel by means of stairs. Flow rates for exits (capacity) are established on the assumption that able-bodied staff, visitors, and ambulatory patients will principally use exit stairs for emergency evacuation. Nonambulatory patients will remain in the building, and those on the floor of fire origin will be moved horizontally to an area of refuge. The defend-in-place principle is complemented by the requirement that all new health care facilities be fully protected by automatic sprinklers.

**19.2.3.4\*** Any required aisle, corridor, or ramp shall be not less than 48 in. (1220 mm) in clear width where serving as means of egress from patient sleeping rooms, unless otherwise permitted by one of the following:

- (1) Aisles, corridors, and ramps in adjunct areas not intended for the housing, treatment, or use of inpatients shall be not less than 44 in. (1120 mm) in clear and unobstructed width.
- (2)\* Where corridor width is at least 6 ft (1830 mm), noncontinuous projections not more than 6 in. (150 mm) from the corridor wall, above the handrail height, shall be permitted.
- (3) Exit access within a room or suite of rooms complying with the requirements of 19.2.5 shall be permitted.
- (4) Projections into the required width shall be permitted for wheeled equipment, provided that all of the following conditions are met:
  - (a) The wheeled equipment does not reduce the clear unobstructed corridor width to less than 60 in. (1525 mm).
  - (b) The health care occupancy fire safety plan and training program address the relocation of the wheeled equipment during a fire or similar emergency.
  - (c)\* The wheeled equipment is limited to the following:
    - i. Equipment in use and carts in use
    - ii. Medical emergency equipment not in use
    - iii. Patient lift and transport equipment
- (5)\* Where the corridor width is at least 8 ft (2440 mm), projections into the required width shall be permitted for fixed furniture, provided that all of the following conditions are met:
  - (a) The fixed furniture is securely attached to the floor or to the wall.
  - (b) The fixed furniture does not reduce the clear unobstructed corridor width to less than 6 ft (1830 mm), except as permitted by 19.2.3.4(2).
  - (c) The fixed furniture is located only on one side of the corridor.
  - (d) The fixed furniture is grouped such that each grouping does not exceed an area of 50 ft<sup>2</sup> (4.6 m<sup>2</sup>).

## CHAPTER 18 • New

- (e) The fixed furniture groupings addressed in 18.2.3.4(5)(d) are separated from each other by a distance of at least 10 ft (3050 mm).
  - (f)\* The fixed furniture is located so as to not obstruct access to building service and fire protection equipment.
  - (g) Corridors throughout the smoke compartment are protected by an electrically supervised automatic smoke detection system in accordance with 18.3.4, or the fixed furniture spaces are arranged and located to allow direct supervision by the facility staff from a nurses' station or similar space.
- (6)\* Cross-corridor door openings in corridors with a required minimum width of 8 ft (2440 mm) shall have a clear width of not less than 6 ft 11 in. (2110 mm) for pairs of doors or a clear width of not less than 4½ in. (1055 mm) for a single door.
  - (7) Nursing home corridors shall be permitted to be not less than 6 ft (1830 mm) wide in smoke compartments housing not more than 30 patients.
  - (8) Cross-corridor door openings in corridors with a required minimum width of 6 ft (1830 mm) shall have a clear width of not less than 64 in. (1625 mm) for pairs of doors or a clear width of not less than 4½ in. (1055 mm) for a single door.

**A.18.2.3.4** It is not the intent that the required corridor width be maintained clear and unobstructed at all times. Projections into the required width are permitted by 7.3.2.2. It is not the intent that 18.2.3.4 supersede 7.3.2.2.

Corridor width is addressed in 18/19.2.3.4 and 18.2.3.5. Exit access corridors in new hospitals and nursing homes are required to be at least 8 ft (2440 mm) in clear width, based on the assumption that, during a fire emergency, some patients might require movement on litters or in wheelchairs. Also, multiple files of persons should be able to use the corridor at one time, with those who move more quickly passing those who move more slowly. Exhibit 18/19.23 shows a nursing home corridor with virtually no items projecting into the required corridor clear width. Exhibit 18/19.24 shows hospital corridor clutter that projects into the required clear width.

Exit access corridors in existing health care occupancies are required to be at least 48 in. (1220 mm) in clear width. This specified minimum leaves little safety margin.

## CHAPTER 19 • Existing

- (e) The fixed furniture groupings addressed in 19.2.3.4(5)(d) are separated from each other by a distance of at least 10 ft (3050 mm).
- (f)\* The fixed furniture is located so as to not obstruct access to building service and fire protection equipment.
- (g) Corridors throughout the smoke compartment are protected by an electrically supervised automatic smoke detection system in accordance with 19.3.4, or the fixed furniture spaces are arranged and located to allow direct supervision by the facility staff from a nurses' station or similar space.
- (h) The smoke compartment is protected throughout by an approved, supervised automatic sprinkler system in accordance with 19.3.5.8.

**A.19.2.3.4** It is not the intent that the required corridor width be maintained clear and unobstructed at all times. Projections into the required width are permitted by 7.3.2.2. It is not the intent that 19.2.3.4 supersede 7.3.2.2. Existing corridors more than 48 in. (1220 mm) in width are not permitted to be reduced in width, unless they exceed the width requirements of 18.2.3.4 or 18.2.3.5. (See 4.6.7.4, 4.6.7.5, and 4.6.12.2.)

Exhibit 18/19.23

Nursing home where required corridor clear width is maintained.

## CHAPTER 18 • New

## CHAPTER 19 • Existing

Exhibit 18/19.24

Hospital where required corridor clear width is encumbered.

The provision of 18.2.3.4(7) is new to the 2015 edition of the Code. The reduction in corridor width, from 8 ft (2440 mm) to 6 ft (1830 mm) in nursing home smoke compartments housing not more than 30 residents, is another of the changes made over the last two revision cycles to create a more home-like setting. It is common for resident sleeping rooms to surround an open space that is part corridor and part living area. Exhibit 18/19.25 shows a

**A.18.2.3.4(1)** Occupant characteristics are an important factor to be evaluated in setting egress criteria. Egress components in nonpatient use areas, such as administrative office spaces, should be evaluated based on actual use. A clear corridor width of not less than 44 in. (1120 mm) is specified, assuming occupants in nonpatient areas will be mobile and capable of evacuation without assistance.

In both new and existing health care occupancies, a minimum corridor width of 44 in. (1120 mm) is permitted by 18/19.2.3.4(1) within areas not subject to use by inpatients, such as admin-

**A.18.2.3.4(2)** The intent of 18.2.3.4 is to permit limited non-continuous projections along the corridor wall. These include hand-rub dispensing units complying with 18.3.2.6, nurse charting units, wall-mounted computers, telephones, artwork, bulletin

Exhibit 18/19.25

Corridor with one open side at perimeter of living space.

nursing home smoke compartment utilizing the corridor width reduction of 18.2.3.4(7). The corridor has a wall at its outer perimeter where it abuts the resident sleeping room walls. The corridor is open to the living space at the center of the smoke compartment. Maintaining the required clear corridor width might be a challenge that can be accomplished easier where the corridor flooring material is different from that of the living space.

istrative office spaces, where occupants are assumed to be mobile and capable of evacuation without assistance.

**A.19.2.3.4(2)** The intent of 19.2.3.4(2) is to permit limited non-continuous projections along the corridor wall. These include hand-rub dispensing units complying with 19.4.3, nurse charting units, wall-mounted computers, telephones, artwork, bulletin

## CHAPTER 18 • New

boards, display case frames, cabinet frames, fire alarm boxes, and similar items. It is not the intent to permit the narrowing of the corridor by the walls themselves. The provision of 7.3.2.2 permits projections up to 4½ in. (114 mm) to be present at and below the 38 in. (965 mm) height specified in 18.2.3.4(2), and it is not the intent of 18.2.3.4 (2) to prohibit such projections. Permitting projections above the 38 in. (965 mm) handrail height complies with the intent of the requirement, as such projections will not interfere with the movement of gurneys, beds, and wheelchairs. Projections below handrail height for limited items, such as fire extinguisher cabinets and recessed water coolers, also will not interfere with equipment movement.

Building codes and accessibility codes might require cane detection below projections that exceed 4 in. (102 mm).

Exhibit 18/19.26 and Exhibit 18/19.27 illustrate the minimum clear width requirements of 18/19.2.3.4 and 18/19.2.3.4(2). For new limited care facilities and psychiatric hospitals, which, by definition, involve patients who are more ambulatory than those in general hospitals and nursing homes, 18.2.3.5 establishes the minimum required corridor width as 6 ft (1830 mm), as opposed to the minimum 8 ft (2440 mm) in new general hospitals and nursing homes.

Exhibit 18/19.26

Exit access corridor in new health care facility.

## CHAPTER 19 • Existing

boards, display case frames, cabinet frames, fire alarm boxes, and similar items. It is not the intent to permit the narrowing of the corridor by the walls themselves. The provision of 7.3.2.2 permits projections up to 4½ in. (114 mm) to be present at and below the 38 in. (965 mm) handrail height, and it is not the intent of 19.2.3.4(2) to prohibit such projections.

Building codes and accessibility codes might require cane detection below projections that exceed 4 in. (102 mm).

The actual corridor width is permitted to be considered as the clear width if handrail encroachment, and encroachments below handrail height, do not exceed 4½ in. (114 mm) on each side of the corridor (see 7.3.2.2).

Exhibit 18/19.28 shows a flip down charting station that, when in its upright and closed position, qualifies as a noncontinuous projection not more than 6 in. (150 mm) from the corridor wall, as permitted by 18/19.2.3.4(2). Note that, in existing facilities, the corridor width must be at least 6 ft (1830 mm) in order to be permitted the projections addressed in 19.2.3.4(2).

Exhibit 18/19.27

Exit access corridor in existing health care facility.

## CHAPTER 18 • New

The second paragraph of [A.18/A.19.2.3.4\(2\)](#) is new to the 2015 edition of the *Code*. The 2010 *ADA Standards for Accessible Design*<sup>6</sup> (2010 *ADA Standards*) and ICC/ANSI A117.1, *Accessible Buildings and Usable Buildings and Facilities*,<sup>7</sup> limit protrusions from walls occurring within the 27 in. to 80 in. (685 mm to 2030 mm) height range to a maximum of 4 in. (102 mm). Protrusions of more than 4 in. (102 mm) within that height range are not readily detectable and avoidable by long-cane users. The provision of [18/19.2.3.4\(2\)](#) permits maximum 6 in. (150 mm) projections in corridors. [Exhibit 18/19.29](#) depicts a corridor wall with a projection exceeding the 4 in. (102 mm) limitation of the *ADA Standards* and ICC/ANSI A117.1 as might occur where the provision of [18/19.2.3.4\(2\)](#) is used, since it requires the projection to be positioned not less than 38 in. (965 mm) above the floor. Note that the projection mounting height places it above cane detection height so that the projection is undetected and not avoided. The minimum 38 in. (965 mm) mounting height was established for the three reasons that follow: (1) to permit a wheelchair user to pass in close proximity to the wall, (2) to accommodate the placement of a handrail below the permitted obstruction, and (3) to elevate the protruding object so that its presence was readily apparent. The corridor must be at least 6 ft (1830 mm) in width for the projection

Exhibit 18/19.28

Corridor width projection created by charting station.

## CHAPTER 19 • Existing

to be permitted — see [18.2.3.4](#), [18.2.3.5](#), and [19.2.3.4\(2\)](#). The minimum 6 ft (1830 mm) corridor width is sufficient for travel without forcing the wheelchair user to be near a wall. A handrail is a helpful item on a corridor wall but is not a required feature. As a reasonable compromise that permits the requirements of the accessibility standards to be met and make the presence of the protruding object obvious, the AHJ could allow protrusions to be mounted within 27 in. (685 mm) of the floor and require that they extend to at least a 38 in. (965 mm) height. Such arrangement is depicted in [Exhibit 18/19.30](#). Note that the long-cane user is able to detect the projection and avoid it.

Exhibit 18/19.29

Protrusion from wall is above cane detection height range.

Exhibit 18/19.30

Protrusion from wall is within cane detection height range.

## CHAPTER 18 • New

**A.18.2.3.4(3)** Exit access should be arranged to avoid any obstructions to the convenient removal of nonambulatory persons carried on stretchers or on mattresses serving as stretchers.

**A.18.2.3.4(4)(c)** Wheeled equipment and carts in use include food service carts, housekeeping carts, medication carts, isolation carts, and similar items. Isolation carts should be permitted in the corridor only where patients require isolation precautions.

Unattended wheeled crash carts and other similar wheeled emergency equipment are permitted to be located in the corridor when “not in use,” because they need to be immediately accessible during a clinical emergency. Note that “not in use” is not the same as “in storage.” Storage is not permitted to be open to the corridor, unless it meets one of the provisions permitted in **18.3.6.1** and is not a hazardous area.

Wheeled portable patient lift or transport equipment needs to be readily available to clinical staff for moving, transferring, toileting, or relocating patients. These devices are used daily for safe handling of patients and to provide for worker safety. This equipment might not be defined as “in use” but needs to be convenient for the use of caregivers at all times.

The provisions of **18/19.2.3.4(4)**, permitting corridor width projections, are based on the premise that a combination of 60 in. (1525 mm) of clear width, with the projection in place, and a program to help ensure relocation of the projections during a fire or

Exhibit 18/19.31

Soiled linen collection cart in use.

## CHAPTER 19 • Existing

**A.19.2.3.4(4)(c)** Wheeled equipment and carts in use include food service carts, housekeeping carts, medication carts, isolation carts, and similar items. Isolation carts should be permitted in the corridor only where patients require isolation precautions.

Unattended wheeled crash carts and other similar wheeled emergency equipment are permitted to be located in the corridor when “not in use,” because they need to be immediately accessible during a clinical emergency. Note that “not in use” is not the same as “in storage.” Storage is not permitted to be open to the corridor, unless it meets one of the provisions permitted in **19.3.6.1** and is not a hazardous area.

Wheeled portable patient lift or transport equipment needs to be readily available to clinical staff for moving, transferring, toileting, or relocating patients. These devices are used daily for safe handling of patients and to provide for worker safety. This equipment might not be defined as “in use” but needs to be convenient for the use of caregivers at all times.

similar emergency can be expected to work together effectively to permit specified, functionally necessary items to encroach on required corridor width. The permitted items are detailed in **18/19.2.3.4(4)(c)**. **Exhibit 18/19.31** shows a wheeled cart for the collection of soiled linen where the presence of staff makes it obvious that the cart is in use. **Exhibit 18/19.32** shows a wheeled housekeeping cart where the absence of staff in the corridor

Exhibit 18/19.32

Housekeeping cart in corridor without indication of whether it is in use.

## CHAPTER 18 • New

poses the question of whether the cart is in use. **Exhibit 18/19.33** clarifies the issue, as staff is again present at the cart after having performed a cleaning function in a resident room. The wheeled equipment shown in **Exhibit 18/19.31**, **Exhibit 18/19.32**, and **Exhibit 18/19.33** is addressed in 18/19.2.3.4(4)(c)i.

Medical emergency equipment, as addressed in **paragraph 18/19.2.3.4(4)(c)ii**, includes crash carts as shown in **Exhibit 18/19.34**. Such medical emergency equipment, even where not in use, is permitted in the corridor, as it needs to be readily available for movement into a patient room in case of medical emergency.

**Exhibit 18/19.33**

*Housekeeping cart confirmed as being in use.*

**A.18.2.3.4(5)** The means for affixing the furniture can be achieved with removable brackets to allow cleaning and maintenance. Affixing the furniture to the floor or wall prevents the furniture from moving, so as to maintain a minimum 6 ft (1830 mm) corridor clear width. Affixing the furniture to the floor or wall also provides a sturdiness that allows occupants to safely transfer in and out.

**A.18.2.3.4(5)(f)** Examples of building service and fire protection equipment include fire extinguishers, manual fire alarm boxes, shutoff valves, and similar equipment.

The provisions of 18/19.2.3.4(5) were added to help make the health care occupancy setting, particularly that of nursing homes, more homelike. The provisions reflect the trend of the nursing home industry to move away from institutional models to a new household model. A lengthy corridor that provides no

## CHAPTER 19 • Existing

**Exhibit 18/19.34**

*Wheeled medical emergency equipment — permitted in corridor even when not in use.*

**A.19.2.3.4(5)** The means for affixing the furniture can be achieved with removable brackets to allow cleaning and maintenance. Affixing the furniture to the floor or wall prevents the furniture from moving, so as to maintain a minimum 6 ft (1830 mm) corridor clear width. Affixing the furniture to the floor or wall also provides a sturdiness that allows occupants to safely transfer in and out.

**A.19.2.3.4(5)(f)** Examples of building service and fire protection equipment include fire extinguishers, manual fire alarm boxes, shutoff valves, and similar equipment.

place to sit can make a resident's travel to the other end of a corridor, as might be done to visit another resident, an arduous task.

The provisions of 18/19.2.3.4(5) permit fixed furniture in corridors that are at least 8 ft (2440 mm) wide. Many existing health care occupancies have 8 ft (2440 mm) wide corridors, as they

CHAPTER 18 • New

were built to the requirements of this Code applicable to new construction. However, at the time of construction, there was no forethought to providing seating alcoves outside the required corridor width as shown in Exhibit 18/19.35. This new provision should be particularly useful to such existing facilities. However, use of the provision is also permitted for new construction.

NFPA technical staff fields code questions from NFPA members and AHJs. One member asked if wardrobes (i.e., clothes closets) could be fixed in place in the corridor, in accordance with the provisions of 18/19.2.3.4(5), so as to encroach on the requisite 8 ft (2440 mm) width. The provisions of 18/19.2.3.4(5) were written to accommodate seating areas. The fixed furniture is intended to include chairs, sofas, tables, and similar low-height furniture associated with creating seating areas. It was the committee’s intent that the height of the furniture not obstruct staff’s view of the length of the corridor section in which the furniture is placed. A wardrobe is not intended to be permitted by the provisions of 18/19.2.3.4(5).

Exhibit 18/19.36 illustrates the combined use of the provisions of 18/19.2.3.4(4) and 18/19.2.3.4(5). The fixed furniture is located only on one side of the corridor. The wheeled equipment can be positioned at both sides. The wheeled equipment is portable and is brought into place after the furniture has been fastened in place. The provision that prohibits the wheeled equipment from reducing the clear unobstructed corridor width to less than 60 in. (1525 mm) has the effect of prohibiting any wheeled equipment from being positioned on the opposite side of the corridor from the fixed furniture, unless the corridor width exceeds 8 ft (2440 mm) to the extent necessary to provide the required clear corridor width.

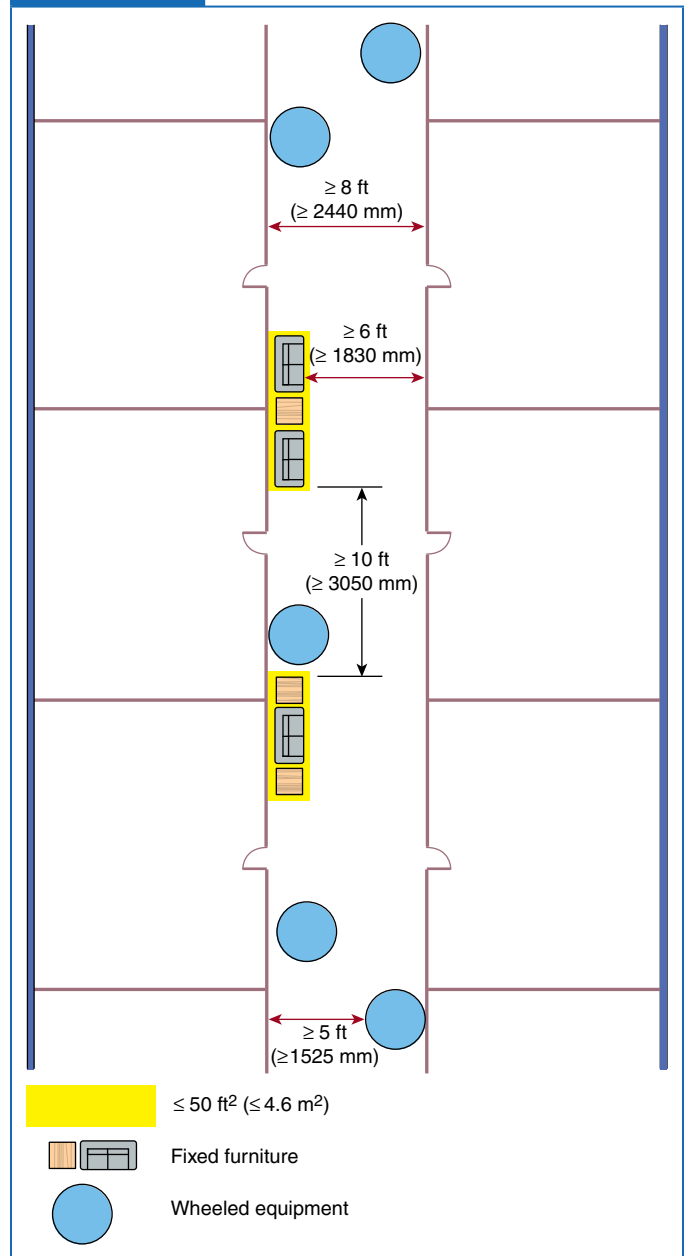

Exhibit 18/19.35

Seating alcove not encroaching on required corridor width.

CHAPTER 19 • Existing

Exhibit 18/19.36

Combined effect of corridor width projections permitted for fixed furniture and wheeled equipment.

## CHAPTER 18 • New

**A.18.2.3.4(6)** The 8 ft (2440 mm) corridor width does not need to be maintained at the door or the open door leaf. A reduction for the frame and leaf is acceptable as long as the minimum clear width is provided at the door opening in the direction of egress travel. In situations where egress occurs only in one direction, it is permissible to have a single door leaf.

The provision of [18.2.3.4\(6\)](#) clarifies the extent to which the cross-corridor door opening and the open door leaves can reduce the required minimum 8 ft (2440 mm) corridor width.

**18.2.3.5** Aisles, corridors, and ramps required for exit access in a limited care facility or hospital for psychiatric care shall be not less than 6 ft (1830 mm) in clear and unobstructed width, unless otherwise permitted by one of the following:

- (1)\* Aisles, corridors, and ramps in adjunct areas not intended for the housing, treatment, or use of inpatients shall be not less than 44 in. (1120 mm) in clear and unobstructed width.
- (2)\* Noncontinuous projections not more than 6 in. (150 mm) from the corridor wall, positioned not less than 38 in. (965 mm) above the floor, shall be permitted.
- (3)\* Exit access within a room or suite of rooms complying with the requirements of [18.2.5](#) shall be permitted.
- (4) Projections into the required width shall be permitted for wheeled equipment, provided that all of the following conditions are met:
  - (a) The wheeled equipment does not reduce the clear unobstructed corridor width to less than 60 in. (1525 mm).
  - (b) The health care occupancy fire safety plan and training program address the relocation of the wheeled equipment during a fire or similar emergency.
  - (c)\* The wheeled equipment is limited to the following:
    - i. Equipment in use and carts in use
    - ii. Medical emergency equipment not in use
    - iii. Patient lift and transport equipment
- (5)\* Cross-corridor door openings in corridors with a required minimum width of 6 ft (1830 mm) shall have a clear width of not less than 64 in. (1625 mm) for pairs of doors or a clear width of not less than 32 in. (810 mm) for a single door.

**A.18.2.3.5(1)** See [A.18.2.3.4\(1\)](#).

**A.18.2.3.5(2)** The intent of [18.2.3.5](#) is to permit limited noncontinuous projections along the corridor wall. These include hand-rub dispensing units complying with [18.3.2.6](#), nurse charting units, wall-mounted computers, telephones, artwork, bulletin boards, display case frames, cabinet frames, fire alarm boxes,

## CHAPTER 19 • Existing

**19.2.3.5** The aisle, corridor, or ramp shall be arranged to avoid any obstructions to the convenient removal of nonambulatory persons carried on stretchers or on mattresses serving as stretchers.

and similar items. It is not the intent to permit the narrowing of the corridor by the walls themselves. The provision of 7.3.2.2 permits projections up to 4½ in. (114 mm) to be present at and below the 38 in. (965 mm) height specified in 18.2.3.5(2), and it is not the intent of 18.2.3.5(2) to prohibit such projections. Permitting projections above the 38 in. (965 mm) handrail height complies with the intent of the requirement, as such projections will not interfere with the movement of gurneys, beds, and wheelchairs. Projections below handrail height for limited items, such as fire extinguisher cabinets and recessed water coolers, also will not interfere with equipment movement.

Building codes and accessibility codes might require cane detection below projections that exceed 4 in. (102 mm).

**A.18.2.3.5(3)** See A.18.2.3.4(3)(3).

**A.18.2.3.5(4)(c)** Wheeled equipment and carts in use include food service carts, housekeeping carts, medication carts, isolation carts, and similar items. Isolation carts should be permitted in the corridor only where patients require isolation precautions.

Unattended wheeled crash carts and other similar wheeled emergency equipment are permitted to be located in the corridor when “not in use,” because they need to be immediately accessible during a clinical emergency. Note that “not in use,” is not the same as “in storage.” Storage is not permitted to be open to the corridor, unless it meets one of the provisions permitted in 18.3.6.1 and is not a hazardous area.

Wheeled portable patient lift or transport equipment needs to be readily available to clinical staff for moving, transferring, toileting, or relocating patients. These devices are used daily for safe handling of patients and to provide for worker safety. This equipment might not be defined as “in use” but needs to be convenient for the use of caregivers at all times.

**A.18.2.3.5(5)** The 6 ft 1830 mm) corridor width does not need to be maintained at the door or the open door leaf. A reduction for the frame and leaf is acceptable as long as the minimum clear width is provided at the door opening in the direction of egress travel. In situations where egress occurs only in one direction, it is permissible to have a single door leaf.

**18.2.3.6** The minimum clear width for doors in the means of egress from sleeping rooms; diagnostic and treatment areas, such as x-ray, surgery, or physical therapy; and nursery rooms shall be as follows:

- (1) Hospitals and nursing homes — 41½ in. (1055 mm)
- (2) Psychiatric hospitals and limited care facilities — 32 in. (810 mm)

**18.2.3.7** The requirements of 18.2.3.6 shall not apply where otherwise permitted by one of the following:

**19.2.3.6** The minimum clear width for doors in the means of egress from hospitals, nursing homes, limited care facilities, psychiatric hospital sleeping rooms, and diagnostic and treatment areas, such as x-ray, surgery, or physical therapy, shall be not less than 32 in. (810 mm) wide.

**19.2.3.7** The requirement of 19.2.3.6 shall not apply where otherwise permitted by the following:

## CHAPTER 18 • New

- (1) Doors that are located so as not to be subject to use by any health care occupant shall be not less than 32 in. (810 mm) in clear width.
- (2) Doors in exit stair enclosures shall be not less than 32 in. (810 mm) in clear width.
- (3) Doors serving newborn nurseries shall be not less than 32 in. (810 mm) in clear width.
- (4) Where a pair of doors is provided, all of the following criteria shall be met:
  - (a) Not less than one of the doors shall provide not less than a 32 in. (810 mm) clear width opening.
  - (b) A rabbet, bevel, or astragal shall be provided at the meeting edge.
  - (c) The inactive door leaf shall have an automatic flush bolt to provide positive latching.

In editions of the *Code* prior to 1994, numerous health care occupancy provisions specified minimum requirements for door widths as a leaf width rather than as a clear width. For example, new doors from patient rooms to the corridor were required to be 44 in. (1120 mm) wide; existing doors were required to be 34 in. (865 mm) wide. The intent was that, after allowing for the stops built into the door frame and for the thickness of the protruding hinge stile edge, a 44 in. (1120 mm) wide door leaf would provide approximately 41½ in. (1055 mm) of clear, unobstructed width; a 34 in. (865 mm) wide door leaf would provide approximately 32 in. (810 mm) of clear, unobstructed width. However, there was no requirement for the door to swing a minimum of 90 degrees from the plane of the door opening, so the intended clear, unobstructed width was not ensured. Since the 1994 edition, minimum door width requirements for health care occupancies have been specified as clear, unobstructed width; exemptions continue to recognize existing doors with the minimum door leaf widths previously specified. **Exhibit 18/19.37** illustrates door leaf measurement, rather than clear opening measurement, as permitted by 19.2.3.7(1). Paragraph 19.2.2.5.4(3), applicable to horizontal exit doors, and 19.3.7.10, applicable to smoke barrier

**Exhibit 18/19.37**

Minimum door (leaf) width measurement for existing doors.

## CHAPTER 19 • Existing

- (1) Existing 34 in. (865 mm) doors shall be permitted.
- (2) Existing 28 in. (710 mm) corridor doors in facilities where the fire plans do not require evacuation by bed, gurney, or wheelchair shall be permitted.

doors, also permit existing doors to provide the minimum required width via a door leaf measurement.

**Exhibit 18/19.38** shows a pair of doors to a resident room in a nursing home as addressed by 18.2.3.7(4). The narrow, inactive door leaf is being held in a partially open position, while the corresponding narrow door leaf in the door opening to the resident room across the hall is in its closed position.

**Exhibit 18/19.38**

Pair of door leaves provided in corridor door openings to resident rooms.

## CHAPTER 18 • New

**18.2.4 Number of Means of Egress.**

**18.2.4.1** The number of means of egress shall be in accordance with [Section 7.4](#).

**18.2.4.2** Not less than two exits shall be provided on every story.

**18.2.4.3** Not less than two separate exits shall be accessible from every part of every story.

**18.2.4.4\*** Not less than two exits shall be accessible from each smoke compartment, and egress shall be permitted through an adjacent compartment(s), provided that the two required egress paths are arranged so that both do not pass through the same adjacent smoke compartment.

**A.18.2.4.4** An exit is not necessary for each individual smoke compartment if there is access to an exit through other smoke compartments without passing through the smoke compartment of fire origin.

The provisions of [18.2.4.1](#) require new construction to comply with the provisions of [Section 7.4](#) for number of means of egress. For existing installations, the provisions of [19.2.4.1](#) mandate the use of [Section 7.4](#), with the exception of the provision of [7.4.1.2](#), which requires three means of egress when the occupant load exceeds 500 and four when it exceeds 1000. It would not be practical to require an existing installation with adequate egress capacity but only two means of egress to install a third or fourth means of egress.

[Exhibit 18/19.39](#) can be used to illustrate the application of [18/19.2.4.2](#) and [18/19.2.4.3](#). The four exits depicted (i.e., exit stair 1, exit stair 2, horizontal exit 1, and horizontal exit 2) meet the requirement of [18/19.2.4.2](#) that not less than two exits be provided on the story. Occupants of all areas on the story have access to not less than two separate exits as required by [18/19.2.4.3](#). For example, occupants of area A have access to exit stair 1 and horizontal exit 1. If horizontal exit 1 were replaced by a wall with no door openings, occupants of area A would have access to only one exit in violation of the requirement of [18/19.2.4.3](#).

[Exhibit 18/19.40](#) can be used to illustrate the application of [18/19.2.4.4](#). Smoke barrier 1 and smoke barrier 2 divide the floor into three smoke compartments — area A, area B, and area C. Access to two exits is provided from each smoke compartment. For area A, exit stair 1 provides access to one exit, and traveling through smoke barrier 1 into area B provides access to the second exit, exit stair 2. For area B, exit stair 2 provides access to one exit, and traveling through smoke barrier 1 into area A provides access to the second exit, exit stair 1. For area C, the two remotely located pairs of doors in smoke barrier 2 provide access to exit stair 1 in area A and exit stair 2 in area B, but passage into area B

## CHAPTER 19 • Existing

**19.2.4 Number of Means of Egress.**

**19.2.4.1** The number of means of egress shall be in accordance with [7.4.1.1](#) and [7.4.1.3](#) through [7.4.1.6](#).

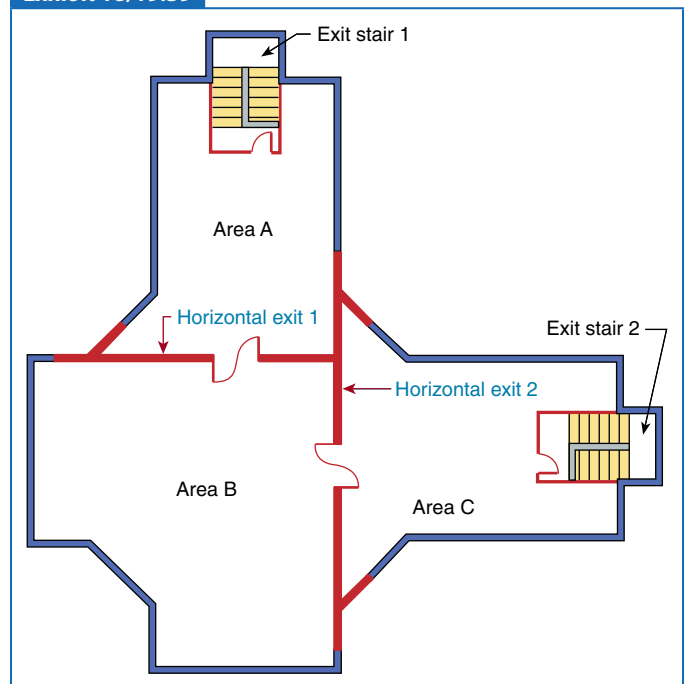

**19.2.4.2** Not less than two exits shall be provided on every story.

**19.2.4.3** Not less than two separate exits shall be accessible from every part of every story.

**19.2.4.4\*** Not less than two exits shall be accessible from each smoke compartment, and egress shall be permitted through an adjacent compartment(s), provided that the two required egress paths are arranged so that both do not pass through the same adjacent smoke compartment.

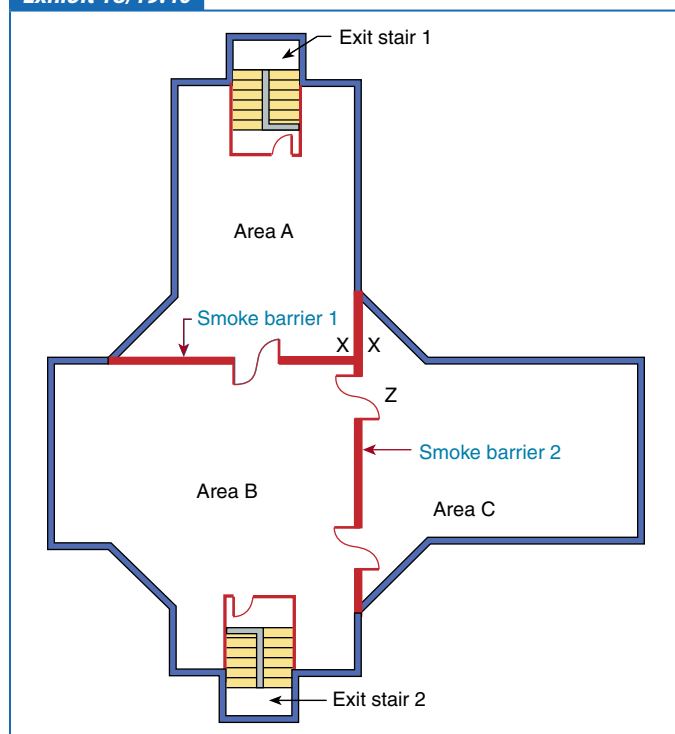

**A.19.2.4.4** An exit is not necessary for each individual smoke compartment if there is access to an exit through other smoke compartments without passing through the smoke compartment of fire origin.

is required. Area C is deficient in that both of its exit accesses require passage into area B, which might be the smoke compartment of fire origin. To satisfy the provision of [18/19.2.4.4](#) — that egress paths not require travel through the same smoke compartment — either an exit stair can be added to area C, or the door at Z can be relocated to position XX.

**Exhibit 18/19.39**

*Minimum of two exits accessible from all parts of floor.*

Exhibit 18/19.40

Arrangement of exits for smoke compartments formed by smoke barriers.

### 18.2.5 Arrangement of Means of Egress.

**18.2.5.1 General.** Arrangement of means of egress shall comply with [Section 7.5](#).

**18.2.5.2 Dead-End Corridors.** Dead-end corridors shall not exceed 30 ft (9.1 m).

**18.2.5.3 Common Path of Travel.** Common path of travel shall not exceed 100 ft (30 m).

An existing dead-end corridor in excess of 30 ft (9.1 m) is permitted to remain in use if it is impractical and unfeasible to alter. [Exhibit 18/19.41](#) illustrates the maximum 30 ft (9.1 m) dead-end corridor limitation imposed by [18.2.5.2](#) and the maximum 100 ft (30 m) common path of travel limitation imposed by [18.2.5.3](#) on

### 19.2.5 Arrangement of Means of Egress.

**19.2.5.1 General.** Arrangement of means of egress shall comply with [Section 7.5](#).

**19.2.5.2\* Dead-End Corridors.** Existing dead-end corridors not exceeding 30 ft (9.1 m) shall be permitted. Existing dead-end corridors exceeding 30 ft (9.1 m) shall be permitted to continue in use if it is impractical and unfeasible to alter them.

**A.19.2.5.2** Every exit or exit access should be arranged, if practical and feasible, so that no corridor has a dead end exceeding 30 ft (9.1 m).

**19.2.5.3 Reserved.**

new construction in health care occupancies. The common path of travel limitation was added to the *Code* for the 2009 edition and was not made retroactive to existing common path of travel arrangements. However, existing common path of travel arrangements continue to be addressed indirectly by the

## CHAPTER 18 • New

requirements of 19.2.5.5, which require a room to be provided with a second exit access door where the room exceeds 1000 ft<sup>2</sup> (93 m<sup>2</sup>) and is used for sleeping or the room exceeds 2500 ft<sup>2</sup> (230 m<sup>2</sup>) and is not used for sleeping. The presence of a remotely located second exit access door from a space typically has the effect of shortening the common path of travel.

**18.2.5.4\* Intervening Rooms or Spaces.** Every corridor shall provide access to not less than two approved exits in accordance with Sections 7.4 and 7.5 without passing through any intervening rooms or spaces other than corridors or lobbies.

**A.18.2.5.4** The term *intervening rooms or spaces* means rooms or spaces serving as a part of the required means of egress from another room.

**Paragraph 18/19.2.5.4** specifically prohibits an exit access arrangement that takes an occupant into a corridor and then requires passage through an occupiable space, such as another patient sleeping or treatment room, to gain access to a required exit. Once an occupant reaches the exit access corridor, that corridor is thought to be a safer portion of the exit access than an occupiable room because of the features required by 18/19.3.6. The occupant must be able to reach an exit without having to leave the safety provided by the corridor.

The requirement of 18/19.2.5.4 is commonly violated in existing buildings that lose general access to an exit following a

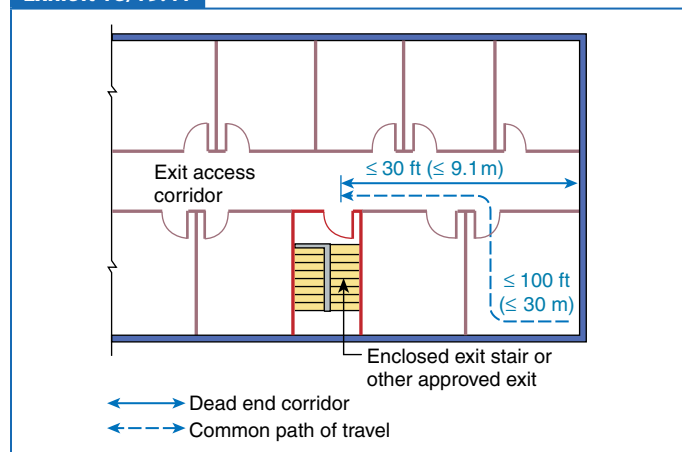

### 18.2.5.5 Two Means of Egress.

**18.2.5.5.1** Sleeping rooms of more than 1000 ft<sup>2</sup> (93 m<sup>2</sup>) shall have not less than two exit access doors remotely located from each other.

**18.2.5.5.2** Non-sleeping rooms of more than 2500 ft<sup>2</sup> (230 m<sup>2</sup>) shall have not less than two exit access doors remotely located from each other.

## CHAPTER 19 • Existing

Exhibit 18/19.41

Dead-end corridor and common path of travel limitations in new health care occupancy.

**19.2.5.4\* Intervening Rooms or Spaces.** Every corridor shall provide access to not less than two approved exits in accordance with Sections 7.4 and 7.5 without passing through any intervening rooms or spaces other than corridors or lobbies.

**A.19.2.5.4** The term *intervening rooms or spaces* means rooms or spaces serving as a part of the required means of egress from another room.

building rehabilitation project in which the end of a wing is turned into a suite. Prior to the creation of the suite, the existing exit stair enclosure located at the end of the wing was accessible to all occupants of the floor via the corridor running the length of the floor. After the rehabilitation, the exit stair is located within the suite and only the occupants of the suite are credited with having access to the exit. The occupants outside the suite would have to enter the suite to access the exit stair in violation of the provision of 18/19.2.5.4.

### 19.2.5.5 Two Means of Egress.

**19.2.5.5.1** Sleeping rooms of more than 1000 ft<sup>2</sup> (93 m<sup>2</sup>) shall have not less than two exit access doors remotely located from each other.

**19.2.5.5.2** Non-sleeping rooms of more than 2500 ft<sup>2</sup> (230 m<sup>2</sup>) shall have not less than two exit access doors remotely located from each other.

## CHAPTER 18 • New

The provision of 18/19.2.5.5.1 requires a second exit access door from any sleeping room that exceeds 1000 ft<sup>2</sup> (93 m<sup>2</sup>). The provision of 18/19.2.5.5.2 requires a second exit access door from any non-sleeping room that exceeds 2500 ft<sup>2</sup> (230 m<sup>2</sup>).

The two exit access doors required by 18/19.2.5.5.1 and 18/19.2.5.5.2 are required to be remotely located from each other in accordance with 7.5.1.3. Paragraphs 7.5.1.3.2 and 7.5.1.3.3 address the one-half and one-third diagonal measurement criteria for other than existing situations (see 7.5.1.3.5). Exhibit 18/19.42 depicts a patient sleeping room in a new health care occupancy that exceeds the 1000 ft<sup>2</sup> (93 m<sup>2</sup>) threshold and a non-sleeping room in a new health care occupancy that exceeds the 2500 ft<sup>2</sup> (230 m<sup>2</sup>) threshold, so that each room requires a second exit access door. The two exit access doors must be separated by a distance,  $d$ , that is at least one-third the room diagonal measurement,  $D$ , because the new health care occupancy must be sprinklered. See 7.5.1.3.3.

The requirement for a second exit access door from the large area room is another way of addressing the concern on which common path of travel limitations are based. The concern is that a large area with only one exit access door might allow a fire near the door to grow to such a size that, by the time the room occupant approaches the door, it will no longer provide a tenable egress path. Any new common path of travel is regulated by 18.2.5.3 and 18.2.5.5. Any existing common path of travel is regulated by 19.2.5.5. See the commentary following 18/19.2.5.3.

## CHAPTER 19 • Existing

Exhibit 18/19.42

Two exit access doors required for sleeping room exceeding 1000 ft<sup>2</sup> (93 m<sup>2</sup>) and non-sleeping room exceeding 2500 ft<sup>2</sup> (230 m<sup>2</sup>).

### 18.2.5.6 Corridor Access.

**18.2.5.6.1\*** Every habitable room shall have an exit access door leading directly to an exit access corridor, unless otherwise provided in 18.2.5.6.2, 18.2.5.6.3, and 18.2.5.6.4.

**A.18.2.5.6.1** For the purposes of this paragraph, it is the intent that the term *habitable rooms* not include individual bathrooms, closets, and similar spaces, as well as briefly occupied work spaces, such as control rooms in radiology and small storage rooms in a pharmacy.

### 19.2.5.6 Corridor Access.

**19.2.5.6.1\*** Every habitable room shall have an exit access door leading directly to an exit access corridor, unless otherwise provided in 19.2.5.6.2, 19.2.5.6.3, and 19.2.5.6.4.

**A.19.2.5.6.1** For the purposes of this paragraph, it is the intent that the term *habitable rooms* not include individual bathrooms, closets, and similar spaces, as well as briefly occupied work spaces, such as control rooms in radiology and small storage rooms in a pharmacy.

## CHAPTER 18 • New

**18.2.5.6.2** Exit access from a patient sleeping room with not more than eight patient beds shall be permitted to pass through one intervening room to reach an exit access corridor, provided that the intervening room is equipped with an approved automatic smoke detection system in accordance with [Section 9.6](#).

**18.2.5.6.3** Rooms having an exit door opening directly to the outside from the room at the finished ground level shall not be required to have an exit access door leading directly to an exit access corridor.

**18.2.5.6.4** Rooms within suites complying with [18.2.5.7](#) shall not be required to have an exit access door leading directly to an exit access corridor.

The term *habitable room* is used in [18/19.2.5.6.1](#) in lieu of the term *patient sleeping room* to clarify that all occupied rooms in a health care facility must have direct access to a corridor leading to an exit (or must be arranged to comply with one of the exemptions).

[Exhibit 18/19.43](#) illustrates the intent of [18/19.2.5.6](#). The intervening room is permitted between room A and the corridor, because room A has an exit door directly to the outside at ground level, as addressed in [18/19.2.5.6.3](#). The intervening room is permitted between sleeping room B and the corridor if it meets the maximum eight-bed exemption of [18/19.2.5.6.2](#), or if it complies with the sleeping suite provisions of [18/19.2.5.7.2](#). The intervening room is permitted between the examination

**Exhibit 18/19.43**

Direct access to corridor from habitable rooms.

## CHAPTER 19 • Existing

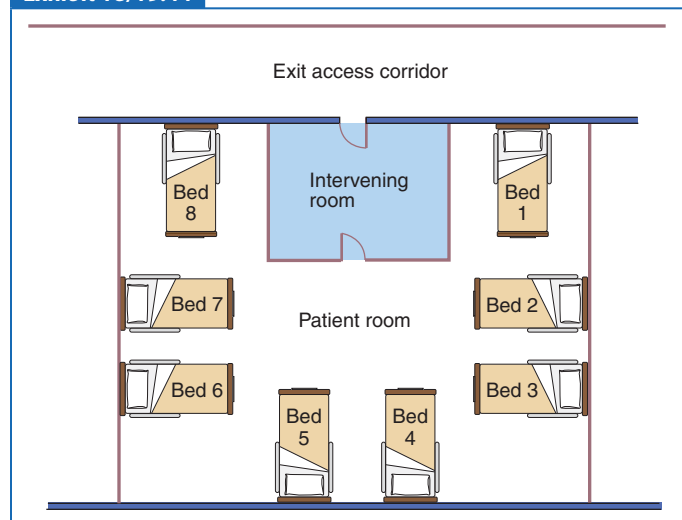

**19.2.5.6.2** Exit access from a patient sleeping room with not more than eight patient beds shall be permitted to pass through one intervening room to reach an exit access corridor, provided that the intervening room is equipped with an approved automatic smoke detection system in accordance with [Section 9.6](#), or the furnishings and furniture, in combination with all other combustibles within the area, are of such minimum quantity and arrangements that a fully developed fire is unlikely to occur.

**19.2.5.6.3** Rooms having an exit door opening directly to the outside from the room at the finished ground level shall not be required to have an exit access door leading directly to an exit access corridor.

**19.2.5.6.4** Rooms within suites complying with [19.2.5.7](#) shall not be required to have an exit access door leading directly to an exit access corridor.

room C and the corridor if it complies with the non-sleeping suite provisions of [18/19.2.5.7.3](#).

Exit access from a patient sleeping room to the corridor is permitted to pass through an intervening room in accordance with [18/19.2.5.6.2](#). See [Exhibit 18/19.44](#). Locking hardware on the two doors in the path to the corridor is permitted only under the special conditions addressed by [18/19.2.2.2.2](#). If the maximum eight-bed patient room (including the intervening room) exceeds 1000 ft<sup>2</sup> (93 m<sup>2</sup>), a second exit access door, remote from the first, is required in accordance with [18/19.2.5.5.1](#).

**Exhibit 18/19.44**

Intervening room between maximum eight-bed patient sleeping room and corridor.

## CHAPTER 18 • New

## 18.2.5.7 Suites.

In editions of the *Code* prior to 2006, the provisions for suites of rooms were dispersed as parts of subsections of **Chapters 18** and **19**. The suite provisions were extensively revised for the 2006 edition. The applicable criteria were revised, grouped, and formatted so as to appear as a complete package in **18/19.2.5.7**. The provisions of **18/19.2.5.7.1** are general and apply to all suites; **18/19.2.5.7.2** addresses sleeping suites; **18/19.2.5.7.3** addresses

Exhibit 18/19.45

Coronary care suite as example of sleeping suite.

## 18.2.5.7.1 General.

**18.2.5.7.1.1 Suite Permission.** Suites complying with **18.2.5.7** shall be permitted to be used to meet the corridor access requirements of **18.2.5.6**.

**18.2.5.7.1.2\* Suite Separation.** Suites shall be separated from the remainder of the building, and from other suites, by walls and doors meeting the requirements of **18.3.6.2** through **18.3.6.5**.

**A.18.2.5.7.1.2** Two or more contiguous suites with an aggregate area not exceeding the suite size limitations of **18.2.5.7.2.3** and **18.2.5.7.3.3** are permitted to be considered a single suite, so as not to require separation from each other.

## CHAPTER 19 • Existing

## 19.2.5.7 Suites.

patient care non-sleeping suites; and **18/19.2.5.7.4** addresses non-patient-care suites. **Exhibit 18/19.45** shows a coronary care suite, as might be addressed by the provisions of **18/19.2.5.7.2** for sleeping suites. **Exhibit 18/19.46** shows an emergency department suite, as might be addressed by the provisions of **18/19.2.5.7.3** for patient care non-sleeping suites.

Exhibit 18/19.46

Emergency department suite as example of patient care non-sleeping suite.

## 19.2.5.7.1 General.

**19.2.5.7.1.1 Suite Permission.** Suites complying with **19.2.5.7** shall be permitted to be used to meet the corridor access requirements of **19.2.5.6**.

**19.2.5.7.1.2\* Suite Separation.** Suites shall be separated from the remainder of the building, and from other suites, by one of the following:

- (1) Walls and doors meeting the requirements of **19.3.6.2** through **19.3.6.5**
- (2) Existing approved barriers and doors that limit the transfer of smoke

**A.19.2.5.7.1.2** Two or more contiguous suites with an aggregate area not exceeding the suite size limitation of **19.2.5.7.2.3** and **19.2.5.7.3.3** are permitted to be considered a single suite, so as not to require separation from each other. The intent of

## CHAPTER 18 • New

**18.2.5.7.1.3 Suite Hazardous Contents Areas.**

(A)\* Intervening rooms shall not be hazardous areas as defined by [18.3.2](#).

(B) Hazardous areas within a suite shall be separated from the remainder of the suite in accordance with [18.3.2.1](#), unless otherwise provided in [18.2.5.7.1.3\(C\)](#).

(C)\* Hazardous areas within a suite shall not be required to be separated from the remainder of the suite where complying with all of the following:

- (1) The suite is primarily a hazardous area.
- (2) The suite is protected by an approved automatic smoke detection system in accordance with [Section 9.6](#).
- (3) The suite is separated from the rest of the health care facility as required for a hazardous area by [18.3.2.1](#).

**A.18.2.5.7.1.3(A)** The term *intervening room* means a room serving as a part of the required means of egress from another room.

**A.18.2.5.7.1.3(C)** Examples of suites that might be hazardous areas are medical records and pharmaceutical suites.

**18.2.5.7.1.4 Suite Subdivision.** The subdivision of suites shall be by means of noncombustible or limited-combustible partitions or partitions constructed with fire-retardant-treated wood enclosed with noncombustible or limited-combustible materials, and such partitions shall not be required to be fire rated.

Suite A, as illustrated in [Exhibit 18/19.47](#), is separated, in accordance with [18/19.2.5.7.1.2](#), from both the corridor and the abutting rooms (i.e., suite B and room C) by walls and doors meeting the corridor separation criteria of [18/19.3.6](#). Walls and partitions within the suite subdivide the space in accordance with [18/19.2.5.7.1.4](#). The storage room is classified as a hazardous area

## CHAPTER 19 • Existing

[19.2.5.7.1.2\(2\)](#) is to continue to permit suites that have smoke-resisting walls separating them from the rest of the building, even though the walls might not have a fire resistance rating. This requirement includes walls that comply with [19.3.6.2.4](#), even though sprinkler protection is not provided.

**19.2.5.7.1.3 Suite Hazardous Contents Areas.**

(A)\* Intervening rooms shall not be hazardous areas as defined by [19.3.2](#).

(B) Hazardous areas within a suite shall be separated from the remainder of the suite in accordance with [19.3.2.1](#), unless otherwise provided in [19.2.5.7.1.3\(C\)](#) or [19.2.5.7.1.3\(D\)](#).

(C)\* Hazardous areas within a suite shall not be required to be separated from the remainder of the suite where complying with both of the following:

- (1) The suite is primarily a hazardous area.
- (2) The suite is separated from the rest of the health care facility as required for a hazardous area by [19.3.2.1](#).

(D)\* Spaces containing sterile surgical materials limited to a one-day supply in operating suites or similar spaces that are sprinklered in accordance with [19.3.5.7](#) shall be permitted to be open to the remainder of the suite without separation.

**A.19.2.5.7.1.3(A)** The term *intervening room* means a room serving as a part of the required means of egress from another room.

**A.19.2.5.7.1.3(C)** Examples of suites that might be hazardous areas are medical records and pharmaceutical suites.

**A.19.2.5.7.1.3(D)** It is the intent that the provision of [19.2.5.7.1.3\(D\)](#) apply only where the quantities of combustibles occupy an area exceeding 50 ft<sup>2</sup> (4.6 m<sup>2</sup>) so as to be a hazardous contents area. Where quantities of combustibles occupy less than 50 ft<sup>2</sup> (4.6 m<sup>2</sup>), there is no restriction on quantity.

**19.2.5.7.1.4 Suite Subdivision.** The subdivision of suites shall be by means of noncombustible or limited-combustible partitions or partitions constructed with fire-retardant-treated wood enclosed with noncombustible or limited-combustible materials, and such partitions shall not be required to be fire rated.

and is further isolated from suite A, the corridor, and the abutting suite B in accordance with [18/19.2.5.7.1.3\(B\)](#) and [18/19.3.2.1](#).

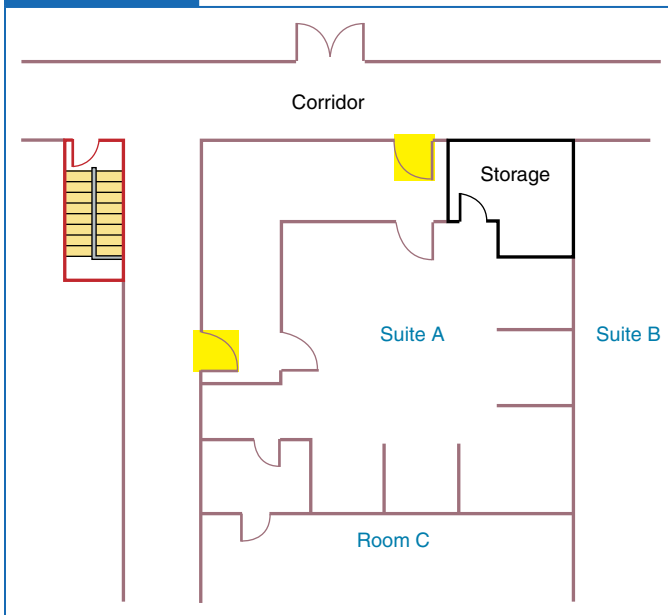

The suite provisions are widely used to create a grouping of rooms and spaces that functions effectively, because such suites are exempted from other *Code* provisions that might adversely affect the functional needs. For example, in [Exhibit 18/19.47](#), the

## CHAPTER 18 • New

space used to access the open-front cubicles is considered to be circulation space and not a corridor. Therefore, the corridor provisions of 18/19.3.6 do not apply within the suite. The openness permitted by the suite provisions is needed for the functional purposes of patient monitoring and care. Equipment that might not be permitted in the required corridor clear width is not prohibited within the circulation space of a suite. The sleeping and

Exhibit 18/19.47

Suite subdivision and separation in accordance with 18/19.2.5.7.1.2.

Exhibit 18/19.48

Equipment within circulation space of sleeping suite.

## CHAPTER 19 • Existing

treatment rooms within a suite are not required to be separated from the circulation space by corridor walls and latching doors. This permits the separation at the room fronts to be via cubicle curtains or nonlatching sliding glass doors that would not be permitted for patient room door openings located off a corridor. Exhibit 18/19.48 shows equipment within the circulation space of a sleeping suite. Exhibit 18/19.49 shows a room separated from the circulation space of a suite by a sliding curtain. Exhibit 18/19.50 shows a room separated from the circulation space of a suite by a sliding glass door.

Exhibit 18/19.49

Sliding curtain separating room from circulation space within suite.

Exhibit 18/19.50

Nonlatching sliding glass door separating room from circulation space within suite.

## CHAPTER 18 • New

**18.2.5.7.2 Sleeping Suites.** Sleeping suites shall be in accordance with the following:

- (1) Sleeping suites for patient care shall comply with the provisions of 18.2.5.7.2.1 through 18.2.5.7.2.4.
- (2) Sleeping suites not for patient care shall comply with the provisions of 18.2.5.7.4.

**18.2.5.7.2.1 Sleeping Suite Supervision.**

(A) Sleeping suites shall be provided with constant staff supervision within the suite.

(B)\* Sleeping suites shall be arranged in accordance with one of the following:

- (1)\* Patient sleeping rooms within sleeping suites shall provide one of the following:
  - (a) The patient sleeping rooms shall be arranged to allow for direct supervision from a normally attended location within the suite, such as is provided by glass walls, and cubicle curtains shall be permitted.
  - (b) Any patient sleeping rooms without the direct supervision required by 18.2.5.7.2.1(B)(1)(a) shall be provided with smoke detection in accordance with Section 9.6 and 18.3.4.
- (2) Sleeping suites shall be provided with a total (complete) coverage automatic smoke detection system in accordance with 9.6.2.9 and 18.3.4.

**A.18.2.5.7.2.1(B)** Supervision of sleeping suites is accomplished by direct supervision by staff, smoke detection, or a combination of direct supervision and smoke detection. The following three options are available for meeting the supervision requirements for patient sleeping suites having an area not exceeding 7500 ft<sup>2</sup> (700 m<sup>2</sup>):

- (1) Direct supervision of all sleeping rooms by staff from a normally attended location within the suite [in accordance with 18.2.5.7.2.1(B)(1)(a)].
- (2) Supervision of those sleeping rooms that can be directly supervised [in accordance with 18.2.5.7.2.1(B)(1)(a)] and smoke detection provided in the sleeping rooms that cannot be directly supervised [in accordance with 18.2.5.7.2.1(B)(1)(b)] as depicted in Figure A.18.2.5.7.2.1(B)(a).
- (3) Total (complete) coverage smoke detection throughout the sleeping suite [in accordance with 18.2.5.7.2.1(B)(2)] as depicted in Figure A.18.2.5.7.2.1(B)(b).

Where the option for total (complete) coverage smoke detection is used, the provision of 9.6.2.9 requires detectors in all occupiable areas that are suitable for smoke detector operation. For example, an area subject to shower steam would not require a smoke detector.

## CHAPTER 19 • Existing

**19.2.5.7.2 Sleeping Suites.** Sleeping suites shall be in accordance with the following:

- (1) Sleeping suites for patient care shall comply with the provisions of 19.2.5.7.2.1 through 19.2.5.7.2.4.
- (2) Sleeping suites not for patient care shall comply with the provisions of 19.2.5.7.4.

**19.2.5.7.2.1 Sleeping Suite Supervision.**

(A) Sleeping suites shall be provided with constant staff supervision within the suite.

(B)\* Sleeping suites shall be arranged in accordance with one of the following:

- (1)\* Patient sleeping rooms within sleeping suites shall provide one of the following:
  - (a) The patient sleeping rooms shall be arranged to allow for direct supervision from a normally attended location within the suite, such as is provided by glass walls, and cubicle curtains shall be permitted.
  - (b) Any patient sleeping rooms without the direct supervision required by 19.2.5.7.2.1(B)(1)(a) shall be provided with smoke detection in accordance with Section 9.6 and 19.3.4.
- (2) Sleeping suites shall be provided with a total (complete) coverage automatic smoke detection system in accordance with 9.6.2.9 and 19.3.4.

**A.19.2.5.7.2.1(B)** Supervision of existing sleeping suites is accomplished by direct supervision by staff, automatic smoke detection, or a combination of direct supervision and smoke detection. The following three options are available for meeting the supervision requirements for patient sleeping suites having an area not exceeding 5000 ft<sup>2</sup> (460 m<sup>2</sup>):

- (1) Direct supervision of all sleeping rooms by staff from a normally attended location within the suite [in accordance with 19.2.5.7.2.1(B)(1)(a)].
- (2) Supervision of those sleeping rooms that can be directly supervised [in accordance with 19.2.5.7.2.1(B)(1)(a)] and automatic smoke detection provided in the sleeping rooms that cannot be directly supervised [in accordance with 19.2.5.7.2.1(B)(1)(b)] as depicted in Figure A.19.2.5.7.2.1(B)(a).
- (3) Total (complete) coverage automatic smoke detection throughout the sleeping suite [in accordance with 19.2.5.7.2.1(B)(2)] as depicted in Figure A.19.2.5.7.2.1(B)(b).

Where the option for total (complete) coverage automatic smoke detection is used, the provision of 9.6.2.9 requires detectors in all occupiable areas that are suitable for smoke detector operation. For example, an area subject to shower steam would not require a smoke detector.

## CHAPTER 18 • New

**Figure A.18.2.5.7.2.1(B)(a)** All Sleeping Rooms Provided Either with Direct Supervision by Staff or Smoke Detection.

For patient sleeping suites having an area greater than 7500 ft<sup>2</sup> (700 m<sup>2</sup>), both direct supervision by staff and total (complete) coverage smoke detection throughout the sleeping suite are required [in accordance with 18.2.5.7.2.3(C)] as depicted in Figure A.18.2.5.7.2.1(B)(c).

**A.18.2.5.7.2.1(B)(1)** The interior partitions or walls might extend full height to the ceiling, provided that they do not obscure visual supervision of the suite. Where they do obscure visual supervision, see 18.2.5.7.2.1(B)(2).

#### 18.2.5.7.2.2 Sleeping Suite Means of Egress.

(A)\* Sleeping suites shall have exit access to a corridor complying with 18.3.6 or to a horizontal exit, directly from the suite.

## CHAPTER 19 • Existing

**Figure A.19.2.5.7.2.1(B)(a)** All Sleeping Rooms Provided Either with Direct Supervision by Staff or Smoke Detection.

For patient sleeping suites having an area greater than 5000 ft<sup>2</sup> (460 m<sup>2</sup>) but not greater than 7500 ft<sup>2</sup> (700 m<sup>2</sup>), sprinkler protection is required throughout the suite and the supervision requirements of 19.2.5.7.2.1 also apply. Such protection might take the form of standard-response sprinklers in accordance with 19.3.5.7 or quick-response sprinklers in accordance with 19.3.5.8. Where standard-response sprinklers are used in accordance with 19.3.5.7, the suite must be protected by total (complete) automatic smoke detection [in accordance with 19.2.5.7.2.3(B)(1)] as depicted in Figure A.19.2.5.7.2.1(B)(c).

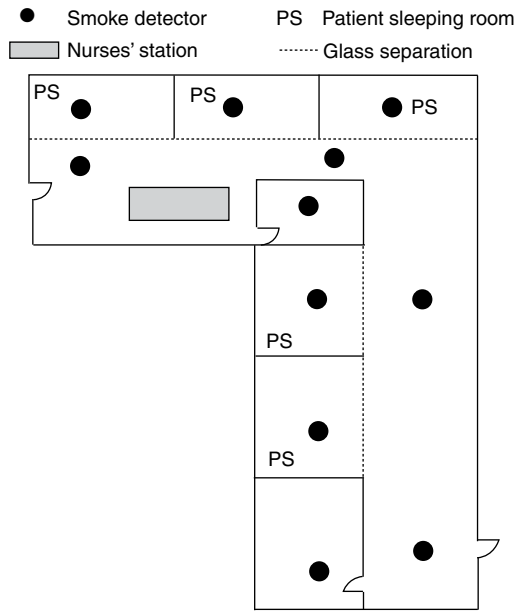

For patient sleeping suites having an area greater than 7500 ft<sup>2</sup> (700 m<sup>2</sup>), the suite must be protected by quick-response sprinklers in accordance with 19.3.5.8, direct supervision of all sleeping rooms must be provided by staff, and total (complete) coverage automatic smoke detection must be provided throughout the sleeping suite [in accordance with 19.2.5.7.2.3(C)] as depicted in Figure A.19.2.5.7.2.1(B)(d).

**A.19.2.5.7.2.1(B)(1)** The interior partitions or walls might extend full height to the ceiling, provided that they do not obscure visual supervision of the suite. Where they do obscure visual supervision, see 19.2.5.7.2.1(B)(2).

#### 19.2.5.7.2.2 Sleeping Suite Means of Egress.

(A)\* Sleeping suites shall have exit access to a corridor complying with 19.3.6 or to a horizontal exit, directly from the suite.

CHAPTER 18 • New

**Figure A.18.2.5.7.2.1(B)(b)** Supervision Provided by Total (Complete) Smoke Detection Throughout the Sleeping Suite.

CHAPTER 19 • Existing

**Figure A.19.2.5.7.2.1(B)(b)** Supervision Provided by Total (Complete) Smoke Detection Throughout the Sleeping Suite.

**Figure A.19.2.5.7.2.1(B)(c)** For Suites  $>5000 \text{ ft}^2$  ( $>460 \text{ m}^2$ ) and  $\leq 7500 \text{ ft}^2$  ( $\leq 700 \text{ m}^2$ ) Protected by Standard-Response Sprinklers, Total (Complete) Smoke Detection Required Throughout the Sleeping Suite.

## CHAPTER 18 • New

**Figure A.18.2.5.7.2.1(B)(c)** For Suites  $>7500\text{ ft}^2$  ( $>700\text{ m}^2$ ), All Sleeping Rooms Must Be Provided with Direct Supervision by Staff and Total (Complete) Smoke Detection Installed Throughout the Sleeping Suite.

**(B)** Sleeping suites of more than  $1000\text{ ft}^2$  ( $93\text{ m}^2$ ) shall have not less than two exit access doors remotely located from each other.

**(C)\*** For suites requiring two exit access doors, one of the exit access doors from the suite shall be permitted to be to one of the following:

- (1) An exit stair
- (2) An exit passageway
- (3) An exit door to the exterior
- (4) Another suite, provided that the separation between the suites complies with the corridor requirements of 18.3.6.2 through 18.3.6.5

**A.18.2.5.7.2.2(A)** Where only one means of egress is required from the suite, it needs to be provided by a door opening directly to a corridor complying with 18.3.6 or to a horizontal exit.

**A.18.2.5.7.2.2(C)** Where the second exit access for a sleeping suite is through an adjacent suite, it is the intent that the 100 ft (30 m) travel distance limitation in the suite be applied only to the suite under consideration.

### 18.2.5.7.2.3 Sleeping Suite Maximum Size.

**(A)** Reserved.

## CHAPTER 19 • Existing

**FIGURE A.19.2.5.7.2.1(B)(d)** For Suites  $>7500\text{ ft}^2$  ( $>700\text{ m}^2$ ), All Sleeping Rooms Must Be Provided with Direct Supervision by Staff and Total (Complete) Smoke Detection Installed Throughout the Sleeping Suite.

**(B)** Sleeping suites of more than  $1000\text{ ft}^2$  ( $93\text{ m}^2$ ) shall have not less than two exit access doors remotely located from each other.

**(C)\*** For suites requiring two exit access doors, one of the exit access doors from the suite shall be permitted to be to one of the following:

- (1) An exit stair
- (2) An exit passageway
- (3) An exit door to the exterior
- (4) Another suite, provided that the separation between the suites complies with the corridor requirements of 19.3.6.2 through 19.3.6.5

**A.19.2.5.7.2.2(A)** Where only one means of egress is required from the suite, it needs to be provided by a door opening directly to a corridor complying with 19.3.6 or to a horizontal exit.

**A.19.2.5.7.2.2(C)** Where the second exit access for a sleeping suite is through an adjacent suite, it is the intent that the 100 ft (30 m) travel distance limitation in the suite be applied only to the suite under consideration.

### 19.2.5.7.2.3 Sleeping Suite Maximum Size.

**(A)** Sleeping suites shall not exceed  $5000\text{ ft}^2$  ( $460\text{ m}^2$ ), unless otherwise provided in 19.2.5.7.2.3(B) or 19.2.5.7.2.3(C).

## CHAPTER 18 • New

**(B)** Sleeping suites shall not exceed 7500 ft<sup>2</sup> (700 m<sup>2</sup>), unless otherwise provided in 18.2.5.7.2.3(C).

**(C)** Sleeping suites greater than 7500 ft<sup>2</sup> (700 m<sup>2</sup>) and not exceeding 10,000 ft<sup>2</sup> (930 m<sup>2</sup>) shall be permitted where both of the following are provided in the suite:

- (1)\* Direct visual supervision in accordance with 18.2.5.7.2.1(B)(1)(a)
- (2) Total (complete) coverage automatic smoke detection in accordance with 9.6.2.9 and 18.3.4

**A.18.2.5.7.2.3(C)(1)** The alternative of 18.2.5.7.2.1(D)(1)(b) is not to be applied, since 18.2.5.7.2.3 (C)(2) requires total coverage automatic smoke detection for the suite that exceeds 7500 ft<sup>2</sup> (700 m<sup>2</sup>) but does not exceed 10,000 ft<sup>2</sup> (930 m<sup>2</sup>).

#### 18.2.5.7.2.4 Sleeping Suite Travel Distance.

**(A)** Travel distance between any point in a sleeping suite and an exit access door to another suite, an exit access corridor door, or a horizontal exit door from that suite shall not exceed 100 ft (30 m).

**(B)** Travel distance between any point in a sleeping suite and an exit shall not exceed 200 ft (61 m).

**Exhibit 18/19.51** illustrates the provisions of 18/19.2.5.7.2 through 18/19.2.5.7.2.4, applicable to sleeping suites for patient care. For sleeping suites not used for patient care, see 18/19.2.5.7.2(2) and 18/19.2.5.7.4.

All new health care occupancy buildings must be sprinklered. Not all existing health care occupancy buildings are required to be sprinklered. For the purposes of **Exhibit 18/19.51**, the building is protected throughout by an electrically supervised automatic sprinkler system in accordance with 18/19.3.5.

The features of sleeping suite A in **Exhibit 18/19.51** are outlined in paragraphs 1 through 6, which follow.

## CHAPTER 19 • Existing

**(B)** Sleeping suites shall not exceed 7500 ft<sup>2</sup> (700 m<sup>2</sup>) where the smoke compartment is protected throughout by one of the following:

- (1) Approved electrically supervised sprinkler system in accordance with 19.3.5.7 and total (complete) coverage automatic smoke detection in accordance with 9.6.2.9 and 19.3.4
- (2) Approved electrically supervised sprinkler system protection complying with 19.3.5.8

**(C)** Sleeping suites greater than 7500 ft<sup>2</sup> (700 m<sup>2</sup>), and not exceeding 10,000 ft<sup>2</sup> (930 m<sup>2</sup>), shall be permitted where all of the following are provided in the suite:

- (1)\* Direct visual supervision in accordance with 19.2.5.7.2.1(B)(1)(a)
- (2) Total (complete) coverage automatic smoke detection in accordance with 9.6.2.9 and 19.3.4
- (3) Approved electrically supervised sprinkler system protection complying with 19.3.5.8

**A.19.2.5.7.2.3(C)(1)** The alternative of 19.2.5.7.2.1(D)(1)(b) is not to be applied, since 19.2.5.7.2.3 requires total coverage automatic smoke detection for the suite that exceeds 7500 ft<sup>2</sup> (700 m<sup>2</sup>) but does not exceed 10,000 ft<sup>2</sup> (930 m<sup>2</sup>).

#### 19.2.5.7.2.4 Sleeping Suite Travel Distance.

**(A)** Travel distance between any point in a sleeping suite and an exit access door to another suite, an exit access corridor door, or a horizontal exit door from that suite shall not exceed 100 ft (30 m).

**(B)** Travel distance between any point in a sleeping suite and an exit shall not exceed the following:

- (1) 150 ft (46 m) if the building is not protected throughout by an approved electrically supervised sprinkler system complying with 19.3.5.7
- (2) 200 ft (61 m) if the building is protected throughout by an approved electrically supervised sprinkler system complying with 19.3.5.7

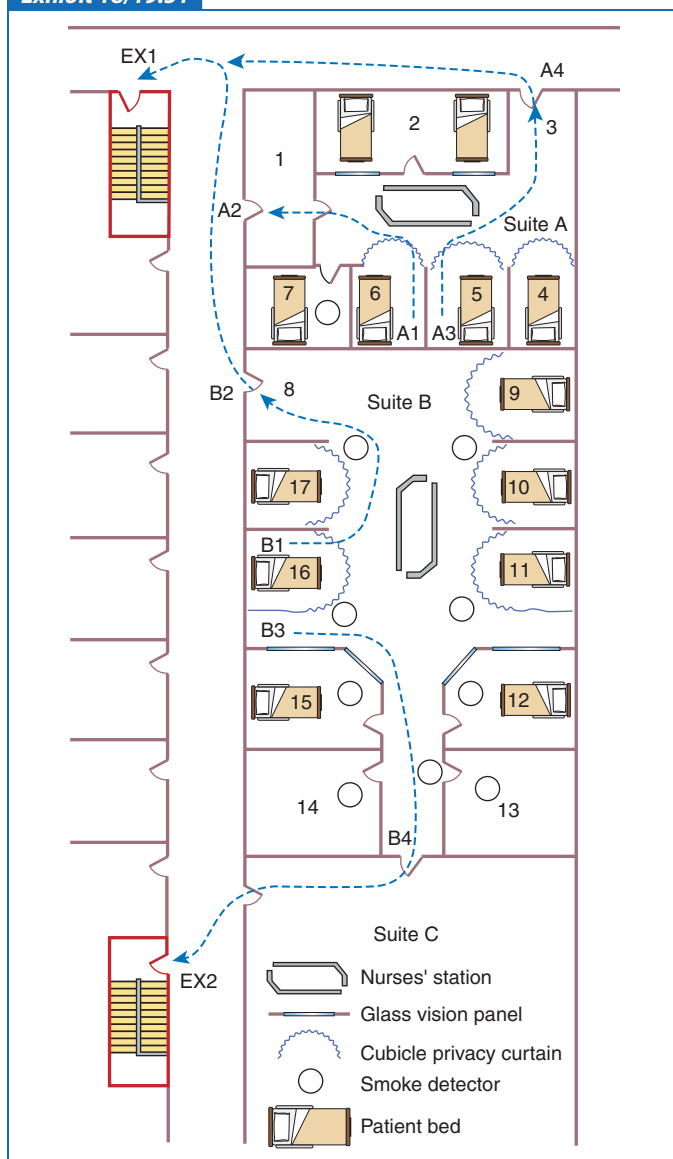

**1.** The suite is more than 1000 ft<sup>2</sup> (93 m<sup>2</sup>), so as to require a second exit access door in accordance with 18/19.2.5.7.2.2(B). One of the two required exit access doors is provided at point A2; the other is provided at point A4. The doors are permitted to open onto a common corridor but are required to be remotely located from each other (see 7.5.1.3).

**2.** The door to the corridor at point A4 and the door to the corridor at point A2 each satisfy the requirement of 18/19.2.5.7.2.2(A); that is, that sleeping suites be provided with exit access to the corridor or to a horizontal exit, directly from the suite.

## CHAPTER 18 • New

## CHAPTER 19 • Existing

Exhibit 18/19.51

Sleeping suites for patient care.

3. The door to the corridor at point A4 and the door to the corridor at point A2 do not make use of 18/19.2.5.7.2.2(C), which permits one of the exit access paths to be to an exit stair, exit passageway, exit door to the exterior, or another suite.

4. The provision of 18/19.2.5.7.2.1(B)(1) is met in consideration of the following:

- a. Direct supervision of the room at point 1 is not required, because the room is not used for sleeping.
- b. Direct supervision of the room at point 2 is provided via the glass vision panels in the wall separating it from the circulation space.

- c. Direct supervision of the beds at points 4, 5, and 6 is provided, because the patient bed areas are open to the circulation space for other than the condition where the cubicle curtains are drawn across the open cubicle front for privacy, as permitted by 18/19.2.5.7.2.1(B)(1)(a).
- d. Direct supervision of the room at point 7 is not feasible, so smoke detection is provided within the room in accordance with the alternative permitted by 18/19.2.5.7.2.1(B)(1)(b).

5. The suite is not more than 7500 ft<sup>2</sup> (700 m<sup>2</sup>), so as to comply with 18/19.2.5.7.2.3(B) and be exempted from the additional provisions of 18/19.2.5.7.2.3(C).

6. The portion of the travel distance from any point within the suite to an exit access door from the suite (e.g., from point A1 to A2 or from point A3 to A4) — or to a door to another suite or a horizontal exit door — is not more than 100 ft (30 m) in accordance with 18/19.2.5.7.2.4(A). The overall travel distance from any point within the suite to the nearest exit (e.g., from point A1 to EX1 or from point A3 to EX1) in the sprinklered building is not more than 200 ft (61 m) in accordance with 18.2.5.7.2.4(B) or 19.2.5.7.2.4(B)(2). If the suite were an existing sleeping suite in a nonsprinklered building, the overall travel distance from point A1 to EX1 or from point A3 to EX1 would be limited to 150 ft (46 m) in accordance with 19.2.5.7.2.4(B)(1).

The features of sleeping suite B in Exhibit 18/19.51 are outlined in paragraphs 1 through 5, which follow.

1. The suite is more than 1000 ft<sup>2</sup> (93 m<sup>2</sup>), so as to require a second exit access door in accordance with 18/19.2.5.7.2.2(B). One of the two required exit access doors is provided at point B2; the other is provided by the door at point B4 that opens into suite C, as permitted by 18/19.2.5.7.2.2(C)(4). Note that the separation between suite B and suite C must comply with the corridor requirements of 18/19.3.6.2 through 18/19.3.6.5. In other words, the separation between the suites is treated the same as the walls separating the suites from the corridor. Additionally, the suite is more than 7500 ft<sup>2</sup> (700 m<sup>2</sup>), but not more than 10,000 ft<sup>2</sup> (930 m<sup>2</sup>), as addressed in paragraph 5.

2. The door to the corridor at point B2 satisfies the requirement of 18/19.2.5.7.2.2(A); that is, that sleeping suites be provided with exit access to a corridor or a horizontal exit, directly from the suite.

3. The provision of 18/19.2.5.7.2.1(B)(1) is met in consideration of the following:

- a. Direct supervision of the rooms at points 13 and 14 is not required, because the rooms are not used for sleeping.
- b. Direct supervision of the rooms at points 12 and 15 is provided via the glass vision panels in the walls separating the rooms from the circulation space. As explained

## CHAPTER 18 • New

in paragraph 5, the suite is required to be provided throughout with smoke detection and with direct visual supervision of all sleeping rooms, because the suite exceeds 7500 ft<sup>2</sup> (700 m<sup>2</sup>). The presence of the smoke detection system does not exempt the requirement for direct supervision.

- c. Direct supervision of the beds at points 9 through 11 and 16 and 17 is provided, because the patient bed areas are open to the circulation space for other than the condition where the cubicle curtains are drawn across the open cubicle front for privacy, as permitted by 18/19.2.5.7.2.1(B)(1)(a). As explained in paragraph 4, the suite is required to be provided throughout with smoke detection, and with direct visual supervision of all sleeping rooms, because the suite exceeds 7500 ft<sup>2</sup> (700 m<sup>2</sup>). The presence of the smoke detection system does not exempt the requirement for direct supervision.

4. The suite is more than 7500 ft<sup>2</sup> (700 m<sup>2</sup>), but not more than 10,000 ft<sup>2</sup> (930 m<sup>2</sup>), which requires compliance with the provisions of 18/19.2.5.7.2.3(C), because the suite exceeds the area limitation of 18/19.2.5.7.2.3(B). As noted in the introduction to Exhibit 18/19.51, the building is protected throughout by an electrically supervised automatic sprinkler system in accordance with 18/19.3.5. Paragraph 18/19.2.5.7.2.3(C)(2) requires sleeping suites larger than 7500 ft<sup>2</sup> (700 m<sup>2</sup>) to be protected by a total coverage automatic smoke detection system (see 9.6.2.9).

**18.2.5.7.3 Patient Care Non-Sleeping Suites.** Non-sleeping suites shall be in accordance with the following:

- (1) Non-sleeping suites for patient care shall comply with the provisions of 18.2.5.7.3.1 through 18.2.5.7.3.3.
- (2) Non-sleeping suites not for patient care shall comply with the provisions of 18.2.5.7.4.

**18.2.5.7.3.1 Patient Care Non-Sleeping Suite Means of Egress.**

(A) Patient care non-sleeping suites shall have exit access to a corridor complying with 18.3.6 or to a horizontal exit, directly from the suite.

(B) Patient care non-sleeping suites of more than 2500 ft<sup>2</sup> (230 m<sup>2</sup>) shall have not less than two exit access doors remotely located from each other.

(C)\* For suites requiring two exit access doors, one of the exit access doors shall be permitted to be to one of the following:

- (1) An exit stair
- (2) An exit passageway
- (3) An exit door to the exterior

## CHAPTER 19 • Existing

Further, 18/19.2.5.7.2.3(C)(1) requires direct visual supervision in accordance with 18/19.2.5.7.2.1(B)(1)(a), which has the effect of precluding the use of the smoke detection alternative of 18/19.2.5.7.2.1(B)(1)(b). In other words, a sleeping suite in excess of 7500 ft<sup>2</sup> (700 m<sup>2</sup>) must be provided with direct visual supervision of all sleeping rooms, regardless of the fact that the suite also has a smoke detection system.

5. The portion of the travel distance from any point within the suite to an exit access door from the suite (e.g., from point B1 to B2 or from point B3 to B4) is not more than 100 ft (30 m) in accordance with 18/19.2.5.7.2.4(A). The overall travel distance from any point within the suite to the nearest exit (e.g., from point B1 to EX1 or from point B3 to EX2) in the sprinklered building is not more than 200 ft (61 m) in accordance with 18.2.5.7.2.4(B) or 19.2.5.7.2.4(B)(2). If the suite were an existing sleeping suite in a nonsprinklered building, the overall travel distance from point B1 to EX1 or from point B3 to EX2 would be limited to 150 ft (46 m) in accordance with 19.2.5.7.2.4(B)(1).

The provision of 18/19.2.5.7.2.1(C) permits one of the two means of egress from a patient care sleeping suite to be via an exit — such as an exit stair, exit passageway, or an exit door to the exterior — that is reached from within the suite. The text clarifies that egress credit is not exclusively given to horizontal movement on the floor, as might be suggested by the defend-in-place protection strategy detailed in the total concept provisions of 18/19.1.1.3.

**19.2.5.7.3 Patient Care Non-Sleeping Suites.** Non-sleeping suites shall be in accordance with the following:

- (1) Non-sleeping suites for patient care shall comply with the provisions of 19.2.5.7.3.1 through 19.2.5.7.3.3.
- (2) Non-sleeping suites not for patient care shall comply with the provisions of 19.2.5.7.4.

**19.2.5.7.3.1 Patient Care Non-Sleeping Suite Means of Egress.**

(A) Patient care non-sleeping suites shall have exit access to a corridor complying with 19.3.6 or to a horizontal exit, directly from the suite.

(B) Patient care non-sleeping suites of more than 2500 ft<sup>2</sup> (230 m<sup>2</sup>) shall have not less than two exit access doors remotely located from each other.

(C)\* For suites requiring two exit access doors, one of the exit access doors shall be permitted to be to one of the following:

- (1) An exit stair
- (2) An exit passageway
- (3) An exit door to the exterior

## CHAPTER 18 • New

(4) Another suite, provided that the separation between the suites complies with the corridor requirements of 18.3.6.2 through 18.3.6.5.

**A.18.2.5.7.3.1(C)** Where the second exit access for a nonsleeping suite is through an adjacent suite, it is the intent that the adjacent suite not be considered an intervening room.

**18.2.5.7.3.2 Patient Care Non-Sleeping Suite Maximum Size.**

(A) Non-sleeping suites shall not exceed 12,500 ft<sup>2</sup> (1160 m<sup>2</sup>), unless otherwise provided in 18.2.5.7.3.2(B).

(B) Non-sleeping suites greater than 12,500 ft<sup>2</sup> (1160 m<sup>2</sup>) and not exceeding 15,000 ft<sup>2</sup> (1390 m<sup>2</sup>) shall be permitted where provided with total (complete) coverage automatic smoke detection in accordance with 9.6.2.9 and 18.3.4.

**18.2.5.7.3.3 Patient Care Non-Sleeping Suite Travel Distance.**

(A) Travel distance within a non-sleeping suite to an exit access door to another suite, an exit access corridor door, or a horizontal exit door from the suite shall not exceed 100 ft (30 m).

(B) Travel distance between any point in a non-sleeping suite and an exit shall not exceed 200 ft (61 m).

**Exhibit 18/19.52** illustrates the provision of 18/19.2.5.7.3, applicable to non-sleeping suites for patient care. For non-sleeping suites not used for patient care, see 18/19.2.5.7.3(2) and 18/19.2.5.7.4.

All new health care occupancy buildings must be sprinklered. All existing health care occupancy buildings are not required to be sprinklered. For the purposes of **Exhibit 18/19.52**,

## CHAPTER 19 • Existing

(4) Another suite, provided that the separation between the suites complies with the corridor requirements of 19.3.6.2 through 19.3.6.5.

**A.19.2.5.7.3.1(C)** Where the second exit access for a nonsleeping suite is through an adjacent suite, it is the intent that the adjacent suite not be considered an intervening room.

**19.2.5.7.3.2 Patient Care Non-Sleeping Suite Maximum Size.** Non-sleeping suites shall not exceed 10,000 ft<sup>2</sup> (930 m<sup>2</sup>), unless otherwise provided in 19.2.5.7.3.2(A) or 19.2.5.7.3.2(B).

(A) Non-sleeping suites greater than 10,000 ft<sup>2</sup> (930 m<sup>2</sup>) and not exceeding 12,500 ft<sup>2</sup> (1161 m<sup>2</sup>) shall be permitted where the smoke compartment is protected throughout by one of the following:

- (1) Approved electrically supervised sprinkler system in accordance with 19.3.5.7 and total (complete) coverage automatic smoke detection in accordance with 9.6.2.9 and 19.3.4
- (2) Approved electrically supervised sprinkler system protection complying with 19.3.5.8

(B) Non-sleeping suites greater than 12,500 ft<sup>2</sup> (1161 m<sup>2</sup>) and not exceeding 15,000 ft<sup>2</sup> (1394 m<sup>2</sup>) shall be permitted where both of the following are provided in the suite:

- (1) Total (complete) coverage automatic smoke detection in accordance with 9.6.2.9 and 19.3.4
- (2) Approved electrically supervised sprinkler system protection complying with 19.3.5.8

**19.2.5.7.3.3 Patient Care Non-Sleeping Suite Travel Distance.**

(A) Travel distance within a non-sleeping suite to an exit access door to another suite, an exit access corridor door, or a horizontal exit door from the suite shall not exceed 100 ft (30 m).

(B) Travel distance between any point in a non-sleeping suite and an exit shall not exceed the following:

- (1) 150 ft (46 m) if the building is not protected throughout by an approved electrically supervised sprinkler system complying with 19.3.5.7
- (2) 200 ft (61 m) if the building is protected throughout by an approved electrically supervised sprinkler system complying with 19.3.5.7

the building is protected throughout by an electrically supervised automatic sprinkler system in accordance with 18/19.3.5.

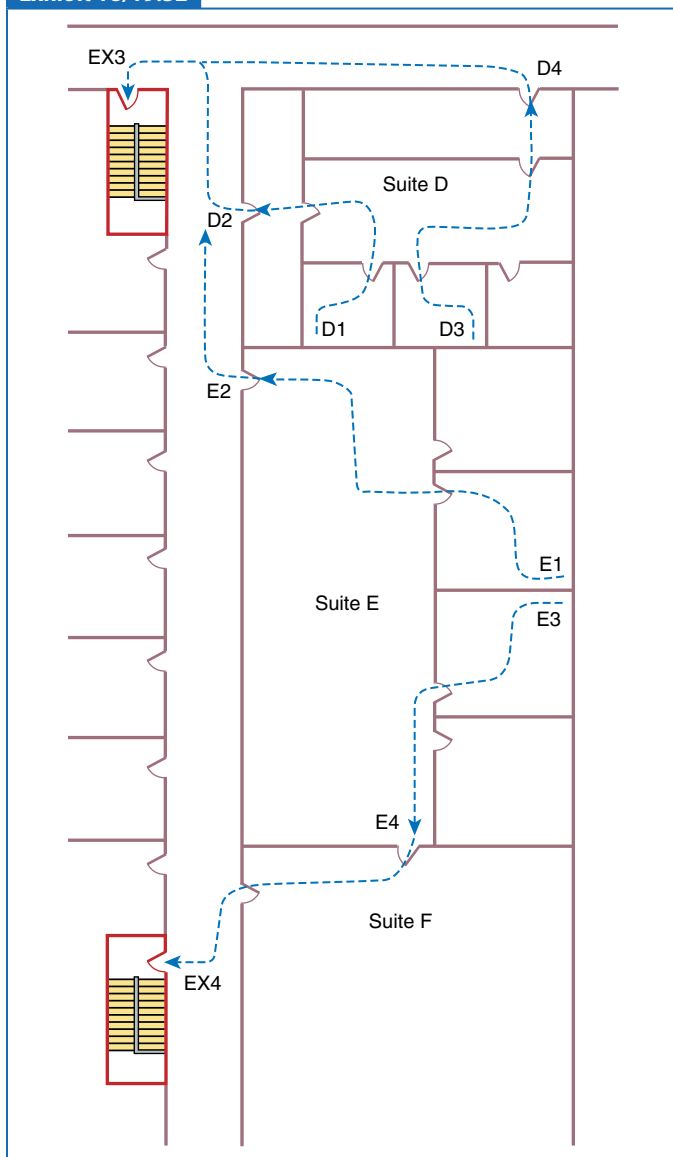

The features of non-sleeping suite D in **Exhibit 18/19.52** are outlined in paragraphs 1 through 4, which follow.

**1.** The suite is more than 2500 ft<sup>2</sup> (230 m<sup>2</sup>), so as to require a second exit access door in accordance with 18/19.2.5.7.3.1(B).

## CHAPTER 18 • New

## CHAPTER 19 • Existing

Exhibit 18/19.52

Non-sleeping suites for patient care.

One of the two required exit access doors is provided at point D2; the other is provided at point D4. The doors are permitted to open onto a common corridor but are required to be remotely located from each other (see 7.5.1.3).

2. The corridor exit access door at either point D2 or point D4 can be used to satisfy the requirement of 18/19.2.5.7.3.1(A); that is, that the suite be provided with exit access to a corridor or a horizontal exit, directly from the suite.

3. Non-sleeping suite D does not exceed 12,500 ft<sup>2</sup> (1160 m<sup>2</sup>), as required by 18/19.2.5.7.3.2(A).

4. The portion of the travel distance from any point within the suite to an exit access door from the suite (e.g., from point D1 to D2 or from point D3 to D4) is not more than 100 ft (30 m) in accordance with 18/19.2.5.7.3.3(A). The overall travel distance from any point within the suite to the nearest exit (e.g., from point D1 to EX3 or from point D3 to EX3) in the sprinklered building is not more than 200 ft (61 m) in accordance with 18.2.5.7.3.3(B) or 19.2.5.7.3.3(B)(2). If the suite were an existing non-sleeping suite used for patient care in a nonsprinklered building, the overall travel distance from point D1 to EX3, or from point D3 to EX3, would be limited to 150 ft (46 m) in accordance with 19.2.5.7.3.3(B)(1).

The features of non-sleeping suite E, used for patient care, in Exhibit 18/19.52 are outlined in paragraphs 1 through 4, which follow.

1. The suite is more than 2500 ft<sup>2</sup> (230 m<sup>2</sup>), so as to require a second exit access door in accordance with 18/19.2.5.7.3.1(B). One of the two required exit access doors is provided at point E2; the other is provided by the door at point E4 that opens into suite F, as permitted by 18/19.2.5.7.3.1(C). Note that the separation between suite E and suite F must comply with the corridor requirements of 18/19.3.6.2 through 18/19.3.6.5. In other words, the separation between the suites is treated the same as the walls separating the suites from the corridor.

2. The corridor exit access door at point E2 satisfies the requirement of 18/19.2.5.7.3.1(A); that is, that the suite be provided with exit access to the corridor or to a horizontal exit, directly from the suite.

3. Non-sleeping suite E does not exceed 15,000 ft<sup>2</sup> (930 m<sup>2</sup>), as required by 18/19.2.5.7.3.2(B) and the suite is provided with complete coverage smoke detection.

4. The portion of the travel distance from any point within the suite to an exit access door from the suite (e.g., from point E1 to E2 or from point E3 to E4) is not more than 100 ft (30 m) in accordance with 18/19.2.5.7.3.3(A). The overall travel distance from any point within the suite to the nearest exit (e.g., from point E1 to EX3 or from point E3 to EX4) in the sprinklered building is not more than 200 ft (61 m) in accordance with 18.2.5.7.3.3(B) or 19.2.5.7.3.3(B)(2). If the suite were an existing non-sleeping suite in a nonsprinklered building, the overall travel distance from point E1 to EX3, or from point E3 to EX4, would be limited to 150 ft (46 m) in accordance with 19.2.5.7.3.3(B)(1).

The provision of 18/19.2.5.7.3.1(C) permits one of the two means of egress from a patient care non-sleeping suite to be via an exit — such as an exit stair, exit passageway, or an exit door to the exterior — that is reached from within the suite. The text clarifies that egress credit is not exclusively given to horizontal movement on the floor, as might be suggested by the defend-in-place protection strategy detailed in the total concept provisions of 18/19.1.1.3.

## CHAPTER 18 • New

**18.2.5.7.4 Non-Patient-Care Suites.** The egress provisions for non-patient-care suites shall be in accordance with the primary use and occupancy of the space.

The provisions of 18/19.2.5.7.4, in conjunction with 18/19.2.5.7.2(2) and 18/19.2.5.7.3(2), clarify that suites not used for patient care are to be addressed by the requirements applicable to the primary use of the space. The requirements applicable to the primary use of the space are to be used, regardless of whether the suite is considered incidental to the primary occupancy (i.e., a health care occupancy), so as to be subject to the provisions of Chapters 18 and 19 in accordance with 6.1.14.1.3. For example, if an existing suite in a hospital is used for medical records storage, so as to constitute an existing ordinary hazard storage use, and the building is sprinklered, the

## 18.2.6 Travel Distance to Exits.

**18.2.6.1** Travel distance shall be measured in accordance with Section 7.6.

**18.2.6.2** Travel distance shall comply with 18.2.6.2.1 through 18.2.6.2.4.

**18.2.6.2.1** The travel distance between any point in a room and an exit shall not exceed 200 ft (61 m).

**18.2.6.2.2 Reserved.**

**18.2.6.2.3** The travel distance between any point in a health care sleeping room and an exit access door in that room shall not exceed 50 ft (15 m).

**18.2.6.2.4** The travel distance within suites shall be in accordance with 18.2.5.7.

Travel distance limitations for suites, as addressed in 18/19.2.6.2.4, are included within the suites provisions of 18/19.2.5.7. See the commentary and exhibits that follow 18.2.5.7.2.4(B) and 19.2.5.7.2.4(B)(2) for sleeping suites and 18.2.5.7.3.3(B) and 19.2.5.7.3.3(B)(2) for non-sleeping suites.

Exhibit 18/19.53 illustrates the travel distance limitations set by 18/19.2.6.2.1 through 18/19.2.6.2.3, applicable to other than suites. Travel distance is measured only to the nearest exit (point E in Exhibit 18/19.53), not to the second exit required by 18/19.2.4.1, which is not shown in the exhibit. The smoke barrier depicted is not an exit, although travel through the cross-corridor door opening in the smoke barrier, into the adjoining smoke

## CHAPTER 19 • Existing

**19.2.5.7.4 Non-Patient-Care Suites.** The egress provisions for non-patient-care suites shall be in accordance with the primary use and occupancy of the space.

maximum 100 ft (30 m) common path of travel limitation of Table 42.2.5 for ordinary hazard storage would apply, even though Chapter 19 for existing health care occupancies establishes no maximum common path of travel. In the 2012 edition of the Code, a requirement limiting the travel distance within the non-patient-care suite to an arbitrary value, that might differ from the travel distance limitation imposed by the occupancy chapter indicative of the suite's use, was deleted. The travel distance limitation for the occupancy for which the suite is used is to be applied.

## 19.2.6 Travel Distance to Exits.

**19.2.6.1** Travel distance shall be measured in accordance with Section 7.6.

**19.2.6.2** Travel distance shall comply with 19.2.6.2.1 through 19.2.6.2.4.

**19.2.6.2.1** The travel distance between any point in a room and an exit shall not exceed 150 ft (46 m), unless otherwise permitted by 19.2.6.2.2.

**19.2.6.2.2** The maximum travel distance specified in 19.2.6.2.1 shall be permitted to be increased by 50 ft (15 m) in buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 19.3.5.7.

**19.2.6.2.3** The travel distance between any point in a health care sleeping room and an exit access door in that room shall not exceed 50 ft (15 m).

**19.2.6.2.4** The travel distance within suites shall be in accordance with 19.2.5.7.

Exhibit 18/19.53

Travel distance measurement.

## CHAPTER 18 • New

compartment, and along the corridor will eventually lead to the second required exit. In evaluating travel distance for sleeping rooms, the two tests outlined in paragraphs 1 and 2, which follow, are required.

**1. Is the travel distance within the sleeping room excessive?** Regardless of the presence of sprinklers, 18/19.2.6.2.3 limits this travel distance (X to C in Exhibit 18/19.53) to 50 ft (15 m). If a fire were to start in a patient sleeping room, the ability to leave the room quickly would be important. Provided that the travel within the room does not exceed 50 ft (15 m), it should be possible to learn quickly of the fire within such a room and move, or be moved, to the corridor before the fire grows to such size that it would block patient and staff access to the door to the

**18.2.7 Discharge from Exits.** Discharge from exits shall be arranged in accordance with Section 7.7.

**18.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with Section 7.8.

### 18.2.9 Emergency Lighting.

**18.2.9.1** Emergency lighting shall be provided in accordance with Section 7.9.

**18.2.9.2** Buildings equipped with, or in which patients require the use of, life-support systems (*see 18.5.1.3*) shall have emergency lighting equipment supplied by the life safety branch of the electrical system as described in NFPA 99, *Health Care Facilities Code*.

### 18.2.10 Marking of Means of Egress.

**18.2.10.1** Means of egress shall have signs in accordance with Section 7.10, unless otherwise permitted by 18.2.10.3 or 18.2.10.4.

**18.2.10.2 Reserved.**

**18.2.10.3** Where the path of egress travel is obvious, signs shall not be required at gates in outside secured areas.

**18.2.10.4** Access to exits within rooms or sleeping suites shall not be required to be marked where staff is responsible for relocating or evacuating occupants.

**18.2.10.5** Illumination of required exit and directional signs in buildings equipped with, or in which patients use, life-support systems (*see 18.5.1.3*) shall be provided as follows:

- (1) Illumination shall be supplied by the life safety branch of the electrical system as described in NFPA 99, *Health Care Facilities Code*.
- (2) Self-luminous exit signs complying with 7.10.4 shall be permitted.

## CHAPTER 19 • Existing

corridor. The 50 ft (15 m) travel distance restriction within a room applies only to sleeping rooms.

**2. Is the overall travel distance excessive?** For new construction and sprinklered existing buildings, 18/19.2.6.2.1 and 19.2.6.2.2 limit the total travel distance (X to E in Exhibit 18/19.53) to 200 ft (61 m). For nonsprinklered existing buildings, the total travel distance is limited to 150 ft (46 m) per 19.2.6.2.1.

For non-sleeping rooms, travel distance is evaluated by a single test of whether the overall travel distance is excessive. For new construction and sprinklered existing buildings, 18/19.2.6.2.1 and 19.2.6.2.2 limit the total travel distance (X to E in Exhibit 18/19.53) to 200 ft (61 m). For nonsprinklered existing buildings, the distance is limited to 150 ft (46 m) per 19.2.6.2.1.

**19.2.7 Discharge from Exits.** Discharge from exits shall be arranged in accordance with Section 7.7.

**19.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with Section 7.8.

### 19.2.9 Emergency Lighting.

**19.2.9.1** Emergency lighting shall be provided in accordance with Section 7.9.

**19.2.9.2 Reserved.**

### 19.2.10 Marking of Means of Egress.

**19.2.10.1** Means of egress shall have signs in accordance with Section 7.10, unless otherwise permitted by 19.2.10.2, 19.2.10.3, or 19.2.10.4.

**19.2.10.2** Where the path of egress travel is obvious, signs shall not be required in one-story buildings with an occupant load of fewer than 30 persons.

**19.2.10.3** Where the path of egress travel is obvious, signs shall not be required at gates in outside secured areas.

**19.2.10.4** Access to exits within rooms or sleeping suites shall not be required to be marked where staff is responsible for relocating or evacuating occupants.

## CHAPTER 18 • New

Health care occupancy buildings are provided with emergency or standby power for functional needs as well as for compliance with *Code* requirements. **Exhibit 18/19.54** shows an emergency power generator in a hospital. **Exhibit 18/19.55** shows the electrical panels associated with distribution of the emergency power.

Each new health care facility equipped with, or requiring the use of, life-support systems is required by **18.2.10.5** to have the marking of the means of egress and emergency lighting supplied by the life safety branch of the electrical systems described in NFPA 99, *Health Care Facilities Code*.<sup>8</sup>

A facility would not be required to have an emergency generator if the building were a freestanding unit in which, as a normal practice, all the following apply:

1. Management maintains admitting and discharge policies that preclude the provision of care for any patient or resident who might need to be sustained by electrical life-support equipment, such as respirators or suction apparatus.
2. No surgical treatment requiring general anesthesia is offered.
3. Battery-operated systems or equipment is provided to maintain power to exit lights and illumination of egress corridors, stairways, medical preparation areas, and the like for a minimum of 1½ hours.

Additionally, battery power would be required to be supplied to all alarm systems. For additional information, refer to NFPA 99.

NFPA 99 requires that emergency power supplies be arranged and protected to minimize the possibility of a single incident affecting both normal and emergency power supplies simultaneously. Circuits are to be run separately. Emergency and normal circuits are “joined” at the transfer switch, so damage to the transfer switch would interrupt normal and emergency power supplies simultaneously. The transfer switch is, therefore, a critical item and should be separated from any potential source of fire, including the emergency generator and attendant fuel supply.

### 18.2.11 Special Means of Egress Features. (Reserved)

## 18.3 Protection

**18.3.1 Protection of Vertical Openings.** Any vertical opening shall be enclosed or protected in accordance with **Section 8.6**, unless otherwise modified by **18.3.1.1** through **18.3.1.8**.

### 18.3.1.1 Reserved.

## CHAPTER 19 • Existing

**Exhibit 18/19.54***Hospital emergency power generator.***Exhibit 18/19.55***Emergency power distribution panels.*

### 19.2.11 Special Means of Egress Features. (Reserved)

## 19.3 Protection

**19.3.1 Protection of Vertical Openings.** Any vertical opening shall be enclosed or protected in accordance with **Section 8.6**, unless otherwise modified by **19.3.1.1** through **19.3.1.8**.

**19.3.1.1** Where enclosure is provided, the construction shall have not less than a 1-hour fire resistance rating.

## CHAPTER 18 • New

**18.3.1.2** Unprotected vertical openings in accordance with **8.6.9.1** shall be permitted.

**18.3.1.3** **Subparagraph 8.6.7(1)(b)** shall not apply to patient sleeping and treatment rooms.

**18.3.1.4** Multilevel patient sleeping areas in psychiatric facilities shall be permitted without enclosure protection between levels, provided that all of the following conditions are met:

- (1) The entire normally occupied area, including all communicating floor levels, is sufficiently open and unobstructed so that a fire or other dangerous condition in any part is obvious to the occupants or supervisory personnel in the area.
- (2) The egress capacity provides simultaneously for all the occupants of all communicating levels and areas, with all communicating levels in the same fire area being considered as a single floor area for purposes of determination of required egress capacity.
- (3) The height between the highest and lowest finished floor levels does not exceed 13 ft (3960 mm), and the number of levels is permitted to be unrestricted.

**18.3.1.5** Unprotected openings in accordance with **8.6.6** shall not be permitted.

**18.3.1.6** Reserved.

**18.3.1.7** A door in a stair enclosure shall be self-closing and shall normally be kept in the closed position, unless otherwise permitted by **18.3.1.8**.

**18.3.1.8** Doors in stair enclosures shall be permitted to be held open under the conditions specified by **18.2.2.2.7** and **18.2.2.2.8**.

**Subsection 18/19.3.1** specifies protection levels required to maintain floor-to-floor separation in health care facilities. For new construction, **18.3.1** references **Section 8.6**, which requires 2-hour enclosures around vertical openings connecting more than three stories in buildings. One-hour enclosure of vertical openings is required in all other new health care occupancies. For existing health care occupancies, **19.3.1.1** requires 1-hour enclosure of vertical openings. Note that this requirement is more than the ½ hour required by **8.6.5(3)** for existing enclosures of vertical openings. Health care occupancies employ a defend-in-place strategy that recognizes the difficulty in evacuating patients to the outside. Thus, the ½ hour typically permitted for existing enclosures in existing buildings is not applicable to existing health care occupancies.

## CHAPTER 19 • Existing

**19.3.1.2** Unprotected vertical openings in accordance with **8.6.9.1** shall be permitted.

**19.3.1.3** **Subparagraph 8.6.7(1)(b)** shall not apply to patient sleeping and treatment rooms.

**19.3.1.4** Multilevel patient sleeping areas in psychiatric facilities shall be permitted without enclosure protection between levels, provided that all of the following conditions are met:

- (1) The entire normally occupied area, including all communicating floor levels, is sufficiently open and unobstructed so that a fire or other dangerous condition in any part is obvious to the occupants or supervisory personnel in the area.
- (2) The egress capacity provides simultaneously for all the occupants of all communicating levels and areas, with all communicating levels in the same fire area being considered as a single floor area for purposes of determination of required egress capacity.
- (3) The height between the highest and lowest finished floor levels does not exceed 13 ft (3960 mm), and the number of levels is permitted to be unrestricted.

**19.3.1.5** Unprotected openings in accordance with **8.6.6** shall not be permitted.

**19.3.1.6** Where a full enclosure of a stairway that is not a required exit is impracticable, the required enclosure shall be permitted to be limited to that necessary to prevent a fire originating in any story from spreading to any other story.

**19.3.1.7** A door in a stair enclosure shall be self-closing and shall normally be kept in the closed position, unless otherwise permitted by **19.3.1.8**.

**19.3.1.8** Doors in stair enclosures shall be permitted to be held open under the conditions specified by **19.2.2.2.7** and **19.2.2.2.8**.

Per **19.3.1.6**, if an existing stairway is not used as an exit and full enclosure is not possible, the enclosure is permitted to be limited to that necessary to prevent fire or smoke originating in any one story from spreading to another story. For example, in a two-story building, the stair might be enclosed at the first-floor level and left open at the second-floor level.

**Paragraph 18/19.3.1.2** references the permitted convenience opening described in **8.6.9.1** and illustrated in **Exhibit 18/19.56**. This exemption applies to any nonconcealed vertical opening, not only to a convenience stair. This exemption would permit a light well to connect two stories or permit a stair to connect two levels of a medical library, a file storage area, or an administrative office, for example. The exemption would not

## CHAPTER 18 • New

permit omission of firestopping around pipe penetrations of a floor slab or omission of protection for duct penetrations.

**Paragraph 18/19.3.1.3** modifies the atrium provisions of 8.6.7(1)(b) for applicability to health care occupancies. Patient sleeping and treatment rooms must be separated from the atrium by partitions complying with 8.6.7(1) or 8.6.7(1)(c) — either 1-hour-rated walls or glass protected by closely spaced sprinklers.

**Paragraph 18/19.3.1.4** recognizes the vertical openings inherent in multilevel patient sleeping areas similar to those described for detention and correctional occupancies in 22.4.4.6 and 23.3.1.2.

**Paragraph 18/19.3.1.7** requires fire doors protecting openings in stairway enclosures to be self-closing and normally maintained in a closed position. However, 18/19.3.1.8 permits stairway doors meeting specified conditions to be held open by an automatic-closing device. If stair enclosure doors are not automatic-closing in accordance with 7.2.1.8.2 (see 18/19.2.2.8), they should be provided with a sign that states “Fire Exit — Keep Door Closed,” as they are susceptible to being chocked open because there is no electromagnet to hold the door in the open position.

## 18.3.2 Protection from Hazards.

### 18.3.2.1 Hazardous Areas.

**18.3.2.1.1** Any hazardous areas shall be protected in accordance with Section 8.7, and the areas addressed in 18.3.2.1.2 and 18.3.2.1.3 shall be protected as indicated.

## CHAPTER 19 • Existing

**Exhibit 18/19.56**

*Permitted convenience opening.*

## 19.3.2 Protection from Hazards.

**19.3.2.1 Hazardous Areas.** Any hazardous areas shall be safeguarded by a fire barrier having a 1-hour fire resistance rating or shall be provided with an automatic extinguishing system in accordance with 8.7.1.

**19.3.2.1.1** An automatic extinguishing system, where used in hazardous areas, shall be permitted to be in accordance with 19.3.5.9.

**19.3.2.1.2\*** Where the sprinkler option of 19.3.2.1 is used, the areas shall be separated from other spaces by smoke partitions in accordance with Section 8.4.

**A.19.3.2.1.2** Penetrations of hazardous area walls located above ceilings that comply with Section 8.4 are not required to be sealed to comply with 19.3.2.1.2.

**19.3.2.1.3** The doors shall be self-closing or automatic-closing.

**19.3.2.1.4** Doors in rated enclosures shall be permitted to have nonrated, factory- or field-applied protective plates extending not more than 48 in. (1220 mm) above the bottom of the door.

## CHAPTER 18 • New

**18.3.2.1.2** The following areas shall be considered hazardous areas and shall be protected by fire barriers having a minimum 1-hour fire resistance rating in accordance with **Section 8.3**:

- (1) Boiler and fuel-fired heater rooms
- (2) Central/bulk laundries larger than 100 ft<sup>2</sup> (9.3 m<sup>2</sup>)
- (3) Paint shops employing hazardous substances and materials in quantities less than those that would be classified as a severe hazard
- (4) Physical plant maintenance shops
- (5) Rooms with soiled linen in volume exceeding 64 gal (242 L)
- (6) Rooms with collected trash in volume exceeding 64 gal (242 L)
- (7) Storage rooms larger than 100 ft<sup>2</sup> (9.3 m<sup>2</sup>) and storing combustible material

**18.3.2.1.3** The following areas shall be considered hazardous areas and shall be protected by smoke partitions in accordance with **Section 8.4**:

- (1) Laboratories employing flammable or combustible materials in quantities less than those that would be considered a severe hazard
- (2) Storage rooms larger than 50 ft<sup>2</sup> (4.6 m<sup>2</sup>) but not exceeding 100 ft<sup>2</sup> (9.3 m<sup>2</sup>) and storing combustible material

Hazardous areas are spaces containing materials that, due to their basic nature (as in the case of flammable liquids), or because of the quantity of combustible materials involved, represent a significantly higher hazard than would otherwise be typical in the general areas of health care facilities.

A list of typically hazardous areas is included in **18.3.2.1.2**, **18.3.2.1.3**, and **19.3.2.1.5**. The lists are meant to be representative, not all-inclusive. The general reference in **18/19.3.2.1** to **Section 8.7** provides the authority having jurisdiction with the opportunity to regulate any space judged to represent a significantly higher hazard than most spaces.

The protection of hazardous areas is particularly of concern for a protect-in-place occupancy like that of health care facilities. Hazardous areas typical of health care occupancies are shown in the five exhibits that follow. **Exhibit 18/19.57** shows a clean utility room. **Exhibit 18/19.58** shows a medical equipment servicing room. **Exhibit 18/19.59** shows the sign outside the door of a soiled linen room. **Exhibit 18/19.60** shows a central laundry. **Exhibit 18/19.61** shows clean linen storage.

**Chapter 18** requires automatic sprinkler protection throughout all new health care facilities. Therefore, all hazardous spaces

## CHAPTER 19 • Existing

**19.3.2.1.5** Hazardous areas shall include, but shall not be restricted to, the following:

- (1) Boiler and fuel-fired heater rooms
- (2) Central/bulk laundries larger than 100 ft<sup>2</sup> (9.3 m<sup>2</sup>)
- (3) Paint shops
- (4) Repair shops
- (5) Rooms with soiled linen in volume exceeding 64 gal (242 L)
- (6) Rooms with collected trash in volume exceeding 64 gal (242 L)
- (7) Rooms or spaces larger than 50 ft<sup>2</sup> (4.6 m<sup>2</sup>), including repair shops, used for storage of combustible supplies and equipment in quantities deemed hazardous by the authority having jurisdiction
- (8) Laboratories employing flammable or combustible materials in quantities less than those that would be considered a severe hazard

Exhibit 18/19.57

Clean utility room.

## CHAPTER 18 • New

## CHAPTER 19 • Existing

Exhibit 18/19.58

Medical equipment servicing room.

Exhibit 18/19.60

Central laundry.

Exhibit 18/19.59

Soiled linen room sign.

Exhibit 18/19.61

Clean linen storage.

in new construction must be sprinklered. Where a hazardous area is judged to represent a severe exposure, such as in the case of boiler rooms, laundries, paint shops, and soiled linen rooms, 1-hour fire resistance-rated separation is also necessary. Hazardous areas that are not judged to be severe also require a separation, but the separation is permitted to use a non-fire-rated smoke partition in accordance with [Section 8.4](#) (see [8.7.1.2](#)). Doors protecting openings in such partitions must be tight-fitting and equipped with a closing device (see [18.3.6.3.11](#) and [8.4.3.5](#)). Door openings in 1-hour fire resistance-rated barriers must be protected with  $\frac{3}{4}$ -hour fire protection-rated door assemblies.

In existing health care occupancies, hazardous areas must be separated from other areas by barriers having a 1-hour fire resistance rating, complete with approved fire doors protecting

door openings; otherwise, automatic sprinkler protection must be installed. If automatic sprinkler protection is provided, the hazardous area must still be separated from the rest of the building by non-fire-rated smoke partitions in accordance with [Section 8.4](#). See [19.3.2.1.2](#).

Note that, in [18.3.2.1.2](#) and in [19.3.2.1.5](#), the entries related to soiled linen and collected trash address volume of material and not the generic label on the room door such as *soiled linen room* or *trash collection room*. In editions of the *Code* prior to 2009, the authority having jurisdiction was at a disadvantage in applying the provisions of [18/19.3.2](#) to rooms that were not

## CHAPTER 18 • New

identified as soiled linen rooms or trash collection rooms but that had significant soiled linen or trash present, albeit in a small percentage of the overall room area, as some of the rooms were large. The current criteria for soiled linen and collected trash apply to rooms where the soiled linen or collected trash volume exceeds 64 gal (242 L). Facility operators have the option, for example, of protecting multiple rooms on a floor as hazardous areas, so as to permit the introduction of soiled linen (or collected trash) into any of those rooms, or of protecting one room as a hazardous area and limiting the placement of soiled linen (or collected trash) to that room only. Designers of new facilities will most likely opt to protect multiple rooms to ensure flexibility in use once the facility is operating.

Provisions for the enclosure of rooms used for charging linen and waste chutes, or for the rooms into which these chutes empty, are provided in [Section 9.5](#). The enclosure requirements of [9.5.1](#) supplement the provisions of [9.5.2](#) for installing and maintaining the rubbish chutes and laundry

**18.3.2.2 Laboratories.** Laboratories in which chemicals are handled or stored shall comply with NFPA 45, *Standard on Fire Protection for Laboratories Using Chemicals*.

NFPA 99, *Health Care Facilities Code*, no longer addresses laboratories. The provisions of [18/19.3.2.2](#) reference the use of NFPA 45, *Standard on Fire Protection for Laboratories Using Chemicals*.<sup>12</sup>

**18.3.2.3 Hyperbaric Chambers.** Health care occupancies housing hyperbaric chambers shall comply with [8.7.5](#).

**18.3.2.4 Medical Gas.** Areas where medical gas is stored or administered, and the operation, testing, and maintenance of medical gases shall be in accordance with NFPA 99, *Health Care Facilities Code*.

The provisions of [18.3.2.4](#) do not require compliance with all of the medical gas-related provisions of NFPA 99, *Health Care Facilities Code*. Rather, the provisions of NFPA 99 are made applicable to areas where medical gas is stored or administered, and to the operation, testing, and maintenance of medical gases. For existing facilities, medical gas storage is to be treated in accordance with the provisions of [Section 8.7](#) for hazardous areas. In

## CHAPTER 19 • Existing

chutes in accordance with NFPA 82, *Standard on Incinerators and Waste and Linen Handling Systems and Equipment*.<sup>9</sup>

If flammable liquids are handled or stored, NFPA 30, *Flammable and Combustible Liquids Code*,<sup>10</sup> must be consulted to establish the minimum criteria necessary to mitigate this hazard.

**Paragraph 19.3.2.1.4** recognizes the benefit of protective plates for the protection of doors that are frequently assaulted with carts and other wheeled vehicles. Without the exemption, the minimum 45-minute fire protection-rated doors to hazardous area rooms would be subject to the requirements of [8.3.3](#), which, via a mandatory reference to NFPA 80, *Standard for Fire Doors and Other Opening Protectives*,<sup>11</sup> would not permit the field application of protective plates to fire-rated doors. The field application of protective plates must be accomplished without reducing the fire performance of the door — such as might result if the door is drilled through its entire thickness for the installation of through-bolts.

**19.3.2.2 Laboratories.**

**19.3.2.2.1** Laboratories in which chemicals are handled or stored shall comply with the operational requirements of NFPA 45, *Standard on Fire Protection for Laboratories Using Chemicals*.

**19.3.2.2.2** Laboratories employing quantities of flammable, combustible, or hazardous materials that are considered a severe hazard shall be protected in accordance with [8.7.1.1](#).

**19.3.2.3 Hyperbaric Chambers.** Health care occupancies housing hyperbaric chambers shall comply with [8.7.5](#).

**19.3.2.4 Medical Gas.** Medical gas storage shall be in accordance with [Section 8.7](#) and the provisions of NFPA 99, *Health Care Facilities Code*, applicable to operation, maintenance, and testing.

existing facilities the provisions of NFPA 99 are made applicable to the operation, testing, and maintenance of medical gases. [Exhibit 18/19.62](#) shows oxygen cylinder storage in a hospital. [Exhibit 18/19.63](#) shows a panel for monitoring the medical gas systems at a hospital. The illuminated red indicator advises that the oxygen liquid level is low at the tank farm.

## CHAPTER 18 • New

Exhibit 18/19.62

Oxygen cylinder storage.

**18.3.2.5 Cooking Facilities.**

**18.3.2.5.1** Cooking facilities shall be protected in accordance with **9.2.3**, unless otherwise permitted by **18.3.2.5.2**, **18.3.2.5.3**, or **18.3.2.5.4**.

Commercial cooking equipment is addressed in **18/19.3.2.5.1**. It must be installed and protected in accordance with NFPA 96, *Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations*.<sup>13</sup> A regularly serviced, fixed automatic fire-extinguishing system would be required for the protection of cooking surfaces and exhaust and duct systems where cooking operations involve the potential for grease-laden vapors.

**18.3.2.5.2\*** Where residential cooking equipment is used for food warming or limited cooking, the equipment shall not be required to be protected in accordance with **9.2.3**, and the presence of the equipment shall not require the area to be protected as a hazardous area.

**A.18.3.2.5.2** This provision is intended to permit appliances used for reheating, limited cooking, and food preparation, such as microwave ovens, hot plates, electric skillets, toasters, and nourishment centers to be exempt from the requirements for commercial cooking equipment and hazardous area protection. Limited quantities of butter, cooking spray, or oil can be used.

**18.3.2.5.3\*** Within a smoke compartment, where residential or commercial cooking equipment is used to prepare meals for 30 or fewer persons, one cooking facility shall be permitted to be

## CHAPTER 19 • Existing

Exhibit 18/19.63

Medical gas monitoring panel.

**19.3.2.5 Cooking Facilities.**

**19.3.2.5.1** Cooking facilities shall be protected in accordance with **9.2.3**, unless otherwise permitted by **19.3.2.5.2**, **19.3.2.5.3**, or **19.3.2.5.4**.

The provision of **18/19.3.2.5.2** exempts residential cooking equipment used for food warming or limited cooking from the specialized extinguishment requirements of NFPA 96 and the classification of the equipment as constituting a hazardous area, along with the requisite separation or protection that would accompany such classification.

**19.3.2.5.2\*** Where residential cooking equipment is used for food warming or limited cooking, the equipment shall not be required to be protected in accordance with **9.2.3**, and the presence of the equipment shall not require the area to be protected as a hazardous area.

**A.19.3.2.5.2** This provision is intended to permit appliances used for reheating, limited cooking, and food preparation, such as microwave ovens, hot plates, electric skillets, toasters, and nourishment centers, to be exempt from the requirements for commercial cooking equipment and hazardous area protection. Limited quantities of butter, cooking spray, or oil can be used.

**19.3.2.5.3\*** Within a smoke compartment, where residential or commercial cooking equipment is used to prepare meals for 30 or fewer persons, one cooking facility shall be permitted to be

## CHAPTER 18 • New

open to the corridor, provided that all of the following conditions are met:

- (1) The portion of the health care facility served by the cooking facility is limited to 30 beds and is separated from other portions of the health care facility by a smoke barrier constructed in accordance with 18.3.7.3, 18.3.7.6, and 18.3.7.8.
- (2) The cooktop or range is equipped with a range hood of a width at least equal to the width of the cooking surface, with grease baffles or other grease-collecting and clean-out capability.
- (3)\* The hood systems have a minimum airflow of 500 cfm (14,000 L/min).
- (4) The hood systems that are not ducted to the exterior additionally have a charcoal filter to remove smoke and odor.
- (5) The cooktop or range complies with all of the following:
  - (a) The cooktop or range is protected with a fire suppression system listed in accordance with ANSI/UL 300, *Standard for Fire Testing of Fire Extinguishing Systems for Protection of Commercial Cooking Equipment*, or is tested and meets all requirements of UL 300A, *Extinguishing System Units for Residential Range Top Cooking Surfaces*, in accordance with the applicable testing document's scope.
  - (b) A manual release of the extinguishing system is provided in accordance with Section 10.5 of NFPA 96, *Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations*.
  - (c) An interlock is provided to turn off all sources of fuel and electrical power to the cooktop or range when the suppression system is activated.
- (6)\* The use of solid fuel for cooking is prohibited.
- (7) Deep-fat frying is prohibited.
- (8) Portable fire extinguishers in accordance with NFPA 96 are located in all kitchen areas.
- (9)\* A switch meeting all of the following is provided:
  - (a) A locked switch, or a switch located in a restricted location, is provided within the cooking facility that deactivates the cooktop or range.
  - (b) The switch is used to deactivate the cooktop or range whenever the kitchen is not under staff supervision.
  - (c) The switch is on a timer, not exceeding a 120-minute capacity, that automatically deactivates the cooktop or range, independent of staff action.
- (10) Procedures for the use, inspection, testing, and maintenance of the cooking equipment are in accordance with 11 of NFPA 96 and the manufacturer's instructions are followed.
- (11)\* Not less than two AC-powered photoelectric smoke alarms with battery backup, interconnected in accordance with

## CHAPTER 19 • Existing

open to the corridor, provided that all of the following conditions are met:

- (1) The portion of the health care facility served by the cooking facility is limited to 30 beds and is separated from other portions of the health care facility by a smoke barrier constructed in accordance with 19.3.7.3, 19.3.7.6, and 19.3.7.8.
- (2) The cooktop or range is equipped with a range hood of a width at least equal to the width of the cooking surface, with grease baffles or other grease-collecting and clean-out capability.
- (3)\* The hood systems have a minimum airflow of 500 cfm (14,000 L/min).
- (4) The hood systems that are not ducted to the exterior additionally have a charcoal filter to remove smoke and odor.
- (5) The cooktop or range complies with all of the following:
  - (a) The cooktop or range is protected with a fire suppression system listed in accordance with ANSI/UL 300, *Standard for Fire Testing of Fire Extinguishing Systems for Protection of Commercial Cooking Equipment*, or is tested and meets all requirements of UL 300A, *Extinguishing System Units for Residential Range Top Cooking Surfaces*, in accordance with the applicable testing document's scope.
  - (b) A manual release of the extinguishing system is provided in accordance with Section 10.5 of NFPA 96, *Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations*.
  - (c) An interlock is provided to turn off all sources of fuel and electrical power to the cooktop or range when the suppression system is activated.
- (6)\* The use of solid fuel for cooking is prohibited.
- (7) Deep-fat frying is prohibited.
- (8) Portable fire extinguishers in accordance with NFPA 96 are located in all kitchen areas.
- (9)\* A switch meeting all of the following is provided:
  - (a) A locked switch, or a switch located in a restricted location, is provided within the cooking facility that deactivates the cooktop or range.
  - (b) The switch is used to deactivate the cooktop or range whenever the kitchen is not under staff supervision.
  - (c) The switch is on a timer, not exceeding a 120-minute capacity, that automatically deactivates the cooktop or range, independent of staff action.
- (10) Procedures for the use, inspection, testing, and maintenance of the cooking equipment are in accordance with 11 of NFPA 96 and the manufacturer's instructions are followed.
- (11)\* Not less than two AC-powered photoelectric smoke alarms with battery backup, interconnected in accordance with

## CHAPTER 18 • New

**9.6.2.10.3**, and equipped with a silence feature are located not closer than 20 ft (6.1 m) and not further than 25 ft (7.6 m) from the cooktop or range.

- (12)\* The smoke alarms required by **18.3.2.5.3(11)** are permitted to be located outside the kitchen area where such placement is necessary for compliance with the 20 ft (7.6 m) minimum distance criterion.
- (13)\* A single system smoke detector is permitted to be installed in lieu of the smoke alarms required in **18.3.2.5.3(11)** provided the following criteria are met:
- The detector is located not closer than 20 ft (6.1 m) and not further than 25 ft (7.6 m) from the cooktop or range.
  - The detector is permitted to initiate a local audible alarm signal only.
  - The detector is not required to initiate a buildingwide occupant notification signal.
  - The detector is not required to notify emergency forces.
  - The local audible signal initiated by the detector is permitted to be silenced and reset by a button on the detector or by a switch installed within 10 ft (3.0 m) of the system smoke detector.
- (14) System smoke detectors that are required to be installed in corridors or spaces open to the corridor by other sections of this chapter are not used to meet the requirements of **18.3.2.5.3(11)** and are located not closer than 25 ft (7.6 m) to the cooktop or range.

**A.18.3.2.5.3** The intent of **18.3.2.5.3** is to limit the number of persons for whom meals are routinely prepared to not more than 30. Staff and feeding assistants are not included in this number.

**A.18.3.2.5.3(3)** The minimum airflow of 500 cfm (14,000 L/m) is intended to require the use of residential hood equipment at the higher end of equipment capacities. It is also intended to draw a sufficient amount of the cooking vapors into the grease baffle and filter system to reduce migration beyond the hood.

**A.18.3.2.5.3(6)** The intent of this provision is to limit cooking fuel to gas or electricity. The prohibition of solid fuels for cooking is not intended to prohibit charcoal grilling on grills located outside the facility.

**A.18.3.2.5.3(9)** The intent of this requirement is that the fuel source for the cooktop or range is to be turned on only when staff is present or aware that the kitchen is being used. The timer function is meant to provide an additional safeguard if the staff forgets to deactivate the cooktop or range. If a cooking activity

## CHAPTER 19 • Existing

**9.6.2.10.3**, and equipped with a silence feature are located not closer than 20 ft (6.1 m) and not further than 25 ft (7.6 m) from the cooktop or range.

- (12)\* The smoke alarms required by **19.3.2.5.3(11)** are permitted to be located outside the kitchen area where such placement is necessary for compliance with the 20 ft (7.6 m) minimum distance criterion.
- (13)\* A single system smoke detector is permitted to be installed in lieu of the smoke alarms required in **19.3.2.5.3(11)** provided the following criteria are met:
- The detector is located not closer than 20 ft (6.1 m) and not further than 25 ft (7.6 m) from the cooktop or range.
  - The detector is permitted to initiate a local audible alarm signal only.
  - The detector is not required to initiate a building-wide occupant notification signal.
  - The detector is not required to notify the emergency forces.
  - The local audible signal initiated by the detector is permitted to be silenced and reset by a button on the detector or by a switch installed within 10 ft (3.0 m) of the system smoke detector.
- (14) System smoke detectors that are required to be installed in corridors or spaces open to the corridor by other sections of this chapter are not used to meet the requirements of **19.3.2.5.3(11)** and are located not closer than 25 ft (7.6 m) to the cooktop or range.
- (15) The smoke compartment is protected throughout by an approved, supervised automatic sprinkler system in accordance with **Section 9.7**.

**A.19.3.2.5.3** The intent of **19.3.2.5.3** is to limit the number of persons for whom meals are routinely prepared to not more than 30. Staff and feeding assistants are not included in this number.

**A.19.3.2.5.3(3)** The minimum airflow of 500 cfm (14,000 L/m) is intended to require the use of residential hood equipment at the higher end of equipment capacities. It is also intended to draw a sufficient amount of the cooking vapors into the grease baffle and filter system to reduce migration beyond the hood.

**A.19.3.2.5.3(6)** The intent of this provision is to limit cooking fuel to gas or electricity. The prohibition of solid fuels for cooking is not intended to prohibit charcoal grilling on grills located outside the facility.

**A.19.3.2.5.3(9)** The intent of this requirement is that the fuel source for the cooktop or range is to be turned on only when staff is present or aware that the kitchen is being used. The timer function is meant to provide an additional safeguard if the staff forgets to deactivate the cooktop or range. If a cooking activity

## CHAPTER 18 • New

lasts longer than 120 minutes, the timer would be required to be manually reset.

**A.18.3.2.5.3(11)** Protection of the cooktop or range is accomplished by the sprinklers that are required in the space and the required cooktop hood fire suppression system. The smoke alarms are intended to notify staff who might not be in the immediate area. Smoke alarms should be maintained a minimum of 20 ft (6.1 m) away from the cooktop or range as studies have shown this distance to be the threshold for significantly reducing nuisance alarms caused by cooking. The intent of the interconnected smoke alarms, with silence feature, is that while the devices would alert staff members to a potential problem, if it is a nuisance alarm, the staff members can use the silence feature instead of disabling the alarm. The referenced study indicates that nuisance alarms are reduced with photoelectric smoke alarms. Providing two interconnected alarms provides a safety factor since they are not electrically supervised by the fire alarm system. (*Smoke Alarms – Pilot Study of Nuisance Alarms Associated with Cooking*)

**A.18.3.2.5.3(12)** The provision of 18.3.2.5.3(12) recognizes that it is more important to maintain the 20 ft (6.1 m) minimum spacing criterion between the smoke alarm and the cooktop or range, to minimize nuisance alarms, than to assure that the smoke alarm is located within the kitchen area itself.

**A.18.3.2.5.3(13)** The requirements of 18.3.2.5.3(13) are intended to allow the local staff to silence and reset the system smoke detector without the assistance of the engineering or maintenance personnel. This provision is not intended to require the system smoke detector to initiate a building-wide occupant alarm signal or to notify the emergency forces.

The provisions of 18/19.3.2.5.3 permit small kitchens for resident use to be open to the corridor. The technical committee acted in response to requests from advocates for moving nursing home care away from an institutional model to a household model. Decentralized kitchens and small dining areas help to create the feeling and focus of home.

For residents with dementia, it is important to have spaces that look familiar to increase their understanding and ability to function at their highest level. For this reason, it is important that nursing homes have the choice of using residential appliances in decentralized kitchens. The provisions allow residential equipment to be used, without requiring the commercial-grade vent hood, and include appropriate safeguards for the maximum 30 persons affected, as addressed by 18/19.3.2.5.3. The safeguards include automatic fire suppression, a prohibition on deep fat frying, adequate exhaust and filter system airflow, interlocks for shutting off the fuel supply and electricity to the cooktop or range, and a host of other features as enumerated in 18.3.2.5.3(1)

## CHAPTER 19 • Existing

lasts longer than 120 minutes, the timer would be required to be manually reset.

**A.19.3.2.5.3(11)** Protection of the cooktop or range is accomplished by the sprinklers that are required in the space and the required cooktop hood fire suppression system. The smoke alarms are intended to notify staff who might not be in the immediate area. Smoke alarms should be maintained a minimum of 20 ft (6.1 m) away from the cooktop or range as studies have shown this distance to be the threshold for significantly reducing nuisance alarms caused by cooking. The intent of the interconnected smoke alarms, with silence feature, is that while the devices would alert staff members to a potential problem, if it is a nuisance alarm, the staff members can use the silence feature instead of disabling the alarm. The referenced study indicates that nuisance alarms are reduced with photoelectric smoke alarms. Providing two interconnected alarms provides a safety factor since they are not electrically supervised by the fire alarm system. (*Smoke Alarms – Pilot Study of Nuisance Alarms Associated with Cooking*)

**A.19.3.2.5.3(12)** The provision of 19.3.2.5.3 recognizes that it is more important to maintain the 20 ft (6.1 m) minimum spacing criterion between the smoke alarm and the cooktop or range, to minimize nuisance alarms, than to assure that the smoke alarm is located within the kitchen area itself.

**A.19.3.2.5.3(13)** The requirements of 19.3.2.5.3(13) are intended to allow the local staff to silence and reset the system smoke detector without the assistance of the engineering or maintenance personnel. This provision is not intended to require the system smoke detector to initiate a building-wide occupant alarm signal or to notify the emergency forces.

through (14) and 19.3.2.5.3(1) through (15). The provision of 19.3.2.5.3(15), applicable to sprinkler protection of the smoke compartment containing the cooking equipment that is open to the corridor, need not be made an explicit requirement of 18.3.2.5.3, because all new health care occupancy buildings must be sprinklered in accordance with 18.3.5.1.

Permitting kitchens to be open to common spaces and corridors enhances the feeling and memories of home for older adults. This allows residents to see and smell the food being prepared, which can enhance their appetites and evoke positive memories. Some residents, based on their abilities and cognition level, might even be able to participate in food preparation activities such as stirring, measuring ingredients, peeling vegetables, or folding towels. This becomes a social activity, where they can easily converse with the staff member cooking, as well as a way for the residents to maintain their functional abilities and to feel that they are important contributing members of society.

## CHAPTER 18 • New

**Exhibit 18/19.64** shows a resident living area open to a corridor. **Exhibit 18/19.65** shows a kitchen that is open to a dining area and open to the resident living area shown in **Exhibit 18/19.64**. Thus, the kitchen is open to the corridor. The kitchen is without a

**Exhibit 18/19.64**

Resident living area open to corridor.

**Exhibit 18/19.65**

Kitchen open to resident living area, which is open to corridor.

**18.3.2.5.4\*** Within a smoke compartment, residential or commercial cooking equipment that is used to prepare meals for 30 or fewer persons shall be permitted, provided that the cooking facility complies with all of the following conditions:

- (1) The space containing the cooking equipment is not a sleeping room.

## CHAPTER 19 • Existing

cooktop or range, as the photograph was taken before the provisions of **18/19.3.2.5.3** were added to the *Code*.

The criteria of **18.3.2.5.3(1)** through (14) and **19.3.2.5.3(1)** through (15) are clearly delineated, and many of the items are accompanied by advisory annex text. The criteria of **18/19.3.2.5.3(11)**, related to smoke alarm placement, is clarified by **18/19.3.2.5.3(12)**, which explains that the minimum 20 ft (6.1 m) placement from the cooktop or range is permitted to be accomplished by locating one or both smoke alarms in the adjoining corridor. **Exhibit 18/19.66** shows one smoke alarm placement strategy that could be utilized.

The provision of **18/19.3.2.5.3(13)** is new to the 2015 edition of the *Code*. It permits one system smoke detector to substitute for the two smoke alarms required by **18/19.3.2.5.3(11)**. The provisions exempt the smoke detector from some functions normally provided by a system smoke detector and require the detector to provide other functions so as to accomplish what the two smoke alarms are intended to do — namely, sense smoke and notify staff without initiating occupant notification and summoning emergency forces.

**Exhibit 18/19.66**

Smoke alarm placement providing required minimum 20 ft (6.1 m) clearance from cooktop.

**19.3.2.5.4\*** Within a smoke compartment, residential or commercial cooking equipment that is used to prepare meals for 30 or fewer persons shall be permitted, provided that the cooking facility complies with all of the following conditions:

- (1) The space containing the cooking equipment is not a sleeping room.

## CHAPTER 18 • New

- (2) The space containing the cooking equipment is separated from the corridor by partitions complying with [18.3.6.2](#) through [18.3.6.5](#).
- (3) The requirements of [18.3.2.5.3](#)(1) through (10) are met.

**A.18.3.2.5.4** The provisions of [18.3.2.5.4](#) differ from those of [18.3.2.5.3](#), as they apply to cooking equipment that is separated from the corridor.

The provision of [18/19.3.2.5.4](#) exempts from the provisions of [9.2.3](#) a cooking equipment arrangement that is not open to the

**18.3.2.5.5\*** Where cooking facilities are protected in accordance with [9.2.3](#), the presence of the cooking equipment shall not cause the room or space housing the equipment to be classified as a hazardous area with respect to the requirements of [18.3.2.1](#), and the room or space shall not be permitted to be open to the corridor.

**A.18.3.2.5.5** The provision of [18.3.2.5.5](#) clarifies that protected commercial cooking equipment does not require an enclosure (separation) as a hazardous area in accordance with [Section 8.7](#), as is required by [18.3.2.1](#).

**18.3.2.6 Heliports.** Buildings that house health care occupancies, as indicated in [18.1.1.1.4](#), and have rooftop heliports shall be protected in accordance with NFPA 418, *Standard for Heliports*.

### 18.3.3 Interior Finish.

**18.3.3.1 General.** Interior finish shall be in accordance with [Section 10.2](#).

**18.3.3.2\* Interior Wall and Ceiling Finish.** Interior wall and ceiling finish materials complying with [Section 10.2](#) shall be permitted throughout if Class A, except as indicated in [18.3.3.2.1](#) or [18.3.3.2.2](#).

**A.18.3.3.2** The reductions in class of interior finish prescribed by [10.2.8.1](#) are permitted to be used.

**18.3.3.2.1** Walls and ceilings shall be permitted to have Class A or Class B interior finish in individual rooms having a capacity not exceeding four persons.

**18.3.3.2.2** Corridor wall finish not exceeding 48 in. (1220 mm) in height that is restricted to the lower half of the wall shall be permitted to be Class A or Class B.

#### 18.3.3.3 Interior Floor Finish.

**18.3.3.3.1** Interior floor finish shall comply with [Section 10.2](#).

## CHAPTER 19 • Existing

- (2) The space containing the cooking equipment shall be separated from the corridor by partitions complying with [19.3.6.2](#) through [19.3.6.5](#).
- (3) The requirements of [19.3.2.5.3](#)(1) through (10) and (13) are met.

**A.19.3.2.5.4** The provisions of [19.3.2.5.4](#) differ from those of [19.3.2.5.3](#), as they apply to cooking equipment that is separated from the corridor.

corridor but that meets all the criteria of [18/19.2.5.3](#), except for smoke detection.

**19.3.2.5.5\*** Where cooking facilities are protected in accordance with [9.2.3](#), the presence of the cooking equipment shall not cause the room or space housing the equipment to be classified as a hazardous area with respect to the requirements of [19.3.2.1](#), and the room or space shall not be permitted to be open to the corridor.

**A.19.3.2.5.5** The provision of [19.3.2.5.5](#) clarifies that protected commercial cooking equipment does not require an enclosure (separation) as a hazardous area in accordance with [Section 8.7](#), as is required by [19.3.2.1](#).

### 19.3.3 Interior Finish.

**19.3.3.1 General.** Interior finish shall be in accordance with [Section 10.2](#).

**19.3.3.2\* Interior Wall and Ceiling Finish.** Existing interior wall and ceiling finish materials complying with [Section 10.2](#) shall be permitted to be Class A or Class B.

**A.19.3.3.2** The reduction in class of interior finish prescribed by [10.2.8.1](#) is permitted to be used.

**19.3.3.3 Interior Floor Finish.** No restrictions shall apply to existing interior floor finish.

## CHAPTER 18 • New

**18.3.3.3.2** Interior floor finish in exit enclosures and exit access corridors and spaces not separated from them by walls complying with 18.3.6 shall be Class I or Class II.

**18.3.3.3.3** Interior floor finish shall comply with 10.2.7.1 or 10.2.7.2, as applicable.

New interior finishes on walls and ceilings are limited to Class A materials, with the exception of small rooms (see 18.3.3.2.1) and the lower portion of corridor walls (see 18.3.3.2.2). However, if the new interior wall and ceiling finish material is installed in a sprinklered smoke compartment (all new health care occupancies are required to be sprinklered by 18.3.5.1), the Class A requirement can be relaxed to Class B per the provisions of 10.2.8.1. Existing interior finish materials are permitted to be Class A or Class B without requiring sprinkler protection.

Paragraph 18.3.3.2.1 permits Class B interior wall and ceiling finish materials in rooms with a capacity of four or fewer persons, but, again, the presence of automatic sprinklers would relax this requirement to permit Class C materials. Paragraph 18.3.3.2.2 permits wall finish in corridors to be of Class B materials where located 48 in. (1220 mm) or less above the floor, but, once again, the presence of automatic sprinklers would relax this requirement to permit Class C materials. This provision recognizes fire research that has shown the finish on the lower half of the wall to be far less significant in its influence on early fire growth than the finish on the upper half.<sup>14</sup> In the case of textile materials on walls or ceilings, 10.2.4.1 would take precedence and require automatic sprinkler protection in conjunction with

### 18.3.4 Detection, Alarm, and Communications Systems.

**18.3.4.1 General.** Health care occupancies shall be provided with a fire alarm system in accordance with Section 9.6.

#### 18.3.4.2\* Initiation.

**A.18.3.4.2** It is not the intent of this *Code* to require single-station smoke alarms that might be required by local codes to be connected to or to initiate the building fire alarm system.

**18.3.4.2.1** Initiation of the required fire alarm systems shall be by manual means in accordance with 9.6.2 and by means of any required sprinkler system waterflow alarms, detection devices, or detection systems, unless otherwise permitted by 18.3.4.2.2 and 18.3.4.2.3.

**18.3.4.2.2** Manual fire alarm boxes in patient sleeping areas shall not be required at exits if located at all nurses' control

## CHAPTER 19 • Existing

Class A materials, or such wall and ceiling materials must be proven safe by specialized fire testing.

Existing interior finishes on walls and ceilings are limited solely on the basis of flame spread. Paragraph 10.2.3.4.4 exempts existing interior finishes from the limitations based on smoke development.

Paragraph 10.2.6.1 provides for the application of approved fire-retardant coatings to existing interior finish materials for the purpose of reducing the flame spread characteristics to an acceptable level. Similarly, 10.2.6.2 permits the surfaces of walls, partitions, columns, and ceilings to be finished with factory-applied fire-retardant-coated products. The commentary following 10.2.6.2 offers additional guidance.

It has been shown that floor coverings will not spread a fire until the fire approaches flashover (see A.10.2.7.3 and associated commentary). Automatic sprinklers will activate well in advance of any significant involvement of a floor covering. Paragraph 18.3.3.2 has the effect of regulating new interior floor finish in exit enclosures and exit access corridors only in nonsprinklered areas, as 10.2.8.2 permits the Class II criterion to be reduced to no rating where sprinkler protection is provided. Existing floor finish materials are permitted to continue to be used.

### 19.3.4 Detection, Alarm, and Communications Systems.

**19.3.4.1 General.** Health care occupancies shall be provided with a fire alarm system in accordance with Section 9.6.

#### 19.3.4.2\* Initiation.

**A.19.3.4.2** It is not the intent of this *Code* to require single-station smoke alarms, which might be required by local codes, to be connected to or to initiate the building fire alarm system.

**19.3.4.2.1** Initiation of the required fire alarm systems shall be by manual means in accordance with 9.6.2 and by means of any required sprinkler system waterflow alarms, detection devices, or detection systems, unless otherwise permitted by 19.3.4.2.2 through 19.3.4.2.5.

**19.3.4.2.2** Manual fire alarm boxes in patient sleeping areas shall not be required at exits if located at all nurses' control

## CHAPTER 18 • New

stations or other continuously attended staff location, provided that both of the following criteria are met:

- (1) Such manual fire alarm boxes are visible and continuously accessible.
- (2) Travel distances required by 9.6.2.5 are not exceeded.

**18.3.4.2.3** The system smoke detector installed in accordance with 18.3.2.5.3(13) shall not be required to initiate the fire alarm system.

**18.3.4.3 Notification.** Positive alarm sequence in accordance with 9.6.3.4 shall be permitted.

**18.3.4.3.1 Occupant Notification.** Occupant notification shall be accomplished automatically in accordance with 9.6.3, unless otherwise modified by the following:

- (1) Paragraph 9.6.3.2.3 shall not be permitted to be used.
- (2)\* In lieu of audible alarm signals, visible alarm-indicating appliances shall be permitted to be used in critical care areas.
- (3) The provision of 18.3.2.5.3(13)(c) shall be permitted to be used.

**A.18.3.4.3.1(2)** It is the intent of this provision to permit a visible fire alarm signal instead of an audible signal to reduce interference between the fire alarm and medical equipment monitoring alarms.

**18.3.4.3.2 Emergency Forces Notification.**

**18.3.4.3.2.1** Emergency forces notification shall be accomplished in accordance with 9.6.4, except that the provision of 18.3.2.5.3(13)(d) shall be permitted to be used.

**18.3.4.3.2.2 Reserved.**

**18.3.4.3.3 Annunciation and Annunciation Zoning.**

**18.3.4.3.3.1** Annunciation and annunciation zoning shall be provided in accordance with 9.6.7, unless otherwise permitted by 18.3.4.3.3.2 or 18.3.4.3.3.3.

## CHAPTER 19 • Existing

stations or other continuously attended staff location, provided that both of the following criteria are met:

- (1) Such manual fire alarm boxes are visible and continuously accessible.
- (2) Travel distances required by 9.6.2.5 are not exceeded.

**19.3.4.2.3** The system smoke detector installed in accordance with 19.3.2.5.3(13) shall not be required to initiate the fire alarm system.

**19.3.4.2.4** Fixed extinguishing systems protecting commercial cooking equipment in kitchens that are protected by a complete automatic sprinkler system shall not be required to initiate the fire alarm system.

**19.3.4.2.5** Detectors required by 19.7.5.3 and 19.7.5.5 shall not be required to initiate the fire alarm system.

**19.3.4.3 Notification.** Positive alarm sequence in accordance with 9.6.3.4 shall be permitted in health care occupancies protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1).

**19.3.4.3.1 Occupant Notification.** Occupant notification shall be accomplished automatically in accordance with 9.6.3, unless otherwise modified by the following:

- (1)\* In lieu of audible alarm signals, visible alarm-indicating appliances shall be permitted to be used in critical care areas.
- (2) Where visual devices have been installed in patient sleeping areas in place of an audible alarm, they shall be permitted where approved by the authority having jurisdiction.
- (3) The provision of 19.3.2.5.3(13)(c) shall be permitted to be used.

**A.19.3.4.3.1(1)** It is the intent of this provision to permit a visible fire alarm signal instead of an audible signal to reduce interference between the fire alarm and medical equipment monitoring alarms.

**19.3.4.3.2 Emergency Forces Notification.**

**19.3.4.3.2.1** Emergency forces notification shall be accomplished in accordance with 9.6.4, except that the provision of 19.3.2.5.3(13)(d) shall be permitted to be used.

**19.3.4.3.2.2** Smoke detection devices or smoke detection systems equipped with reconfirmation features shall not be required to automatically notify the fire department, unless the alarm condition is reconfirmed after a period not exceeding 120 seconds.

**19.3.4.3.3 Reserved.**

## CHAPTER 18 • New

**18.3.4.3.3.2** The alarm zone shall be permitted to coincide with the permitted area for smoke compartments.

**18.3.4.3.3.3** The provision of 9.6.7.4.5, which permits sprinkler system waterflow to be annunciated as a single building zone, shall be prohibited.

**18.3.4.4 Fire Safety Functions.** Operation of any activating device in the required fire alarm system shall be arranged to accomplish automatically any control functions to be performed by that device. (See 9.6.5.)

**18.3.4.5 Detection.**

**18.3.4.5.1 General.** Detection systems, where required, shall be in accordance with Section 9.6.

**18.3.4.5.2 Detection in Spaces Open to Corridors.** See 18.3.6.1.

**18.3.4.5.3\* Nursing Homes.** An approved automatic smoke detection system shall be installed in corridors throughout smoke compartments containing patient sleeping rooms and in spaces open to corridors as permitted in nursing homes by 18.3.6.1, unless otherwise permitted by one of the following:

- (1) Corridor systems shall not be required where each patient sleeping room is protected by an approved smoke detection system.
- (2) Corridor systems shall not be required where patient room doors are equipped with automatic door-closing devices with integral smoke detectors on the room side installed in accordance with their listing, provided that the integral detectors provide occupant notification.

**A.18.3.4.5.3** The requirement for smoke detectors in spaces open to the corridors eliminates the requirements of 18.3.6.1(1)(c), (2)(b), and (5)(b) for direct supervision by the facility staff of nursing homes.

A manual fire alarm system is required by 18/19.3.4.1 and 18/19.3.4.2. Manual fire alarm boxes are normally located along the natural routes of egress and are also located to cover all portions of the building. Paragraph 18/19.3.4.2.2 permits manual fire alarm boxes, under certain conditions, to be located only at

## CHAPTER 19 • Existing

**19.3.4.4 Fire Safety Functions.** Operation of any activating device in the required fire alarm system shall be arranged to accomplish automatically any control functions to be performed by that device. (See 9.6.5.)

**19.3.4.5 Detection.**

**19.3.4.5.1 Corridors.** An approved automatic smoke detection system in accordance with Section 9.6 shall be installed in all corridors of limited care facilities, unless otherwise permitted by one of the following:

- (1) Where each patient sleeping room is protected by an approved smoke detection system, and a smoke detector is provided at smoke barriers and horizontal exits in accordance with Section 9.6, the corridor smoke detection system shall not be required on the patient sleeping room floors.
- (2) Smoke compartments protected throughout by an approved, supervised automatic sprinkler system in accordance with 19.3.5.7 shall be permitted.

**19.3.4.5.2 Detection in Spaces Open to Corridors.** See 19.3.6.1.

continuously attended staff positions in sleeping areas. This arrangement provides the opportunity for prompt notification of fire without requiring staff to leave their normal workstations. In new installations, it would normally be desirable to have manual fire alarm boxes at all attended staff locations and at

## CHAPTER 18 • New

entrances to exits, because the additional cost of the extra fire alarm boxes would be minimal. However, the exemptions recognize that the fire alarm boxes located near the exits might lead to nuisance alarms if patients misuse them.

Manual fire alarm boxes should be located so that those qualified to send an alarm can summon aid without having to leave their zone of ordinary activity or pass out of the sight and hearing of people immediately exposed to, or in direct view of, a fire. The operation of a manual fire alarm box should automatically summon attendants who can assist in removing physically helpless occupants and controlling mentally disabled occupants.

**Paragraph 19.3.4.2.5** addresses smoke detectors installed for a special purpose — to provide an exemption to **paragraphs 19.7.5.3** and **19.7.5.5**, which require that newly introduced upholstered furniture and mattresses be resistant to cigarette ignition and have limited rates of heat release. **Paragraph 19.3.4.2.4** exempts such smoke detectors from having to initiate the building alarm system.

**Paragraph 18/19.3.4.3** permits positive alarm sequence in accordance with **9.6.3.4** in sprinklered health care occupancies (see **18.3.5.1** and **19.3.4.3**). The criteria for positive alarm sequence are detailed in *NFPA 72, National Fire Alarm and Signaling Code*, and include the criteria specified in paragraphs 1 through 4, which follow.

1. The signal from an automatic fire detection device selected for positive alarm sequence operation must be acknowledged at the control unit by trained personnel within 15 seconds of annunciation in order to initiate the alarm investigation phase. If the signal is not acknowledged within 15 seconds, notification signals in accordance with the building evacuation or relocation plan and remote signals must be automatically and immediately activated (i.e., immediate occupant notification and emergency force notification must occur).

2. Trained personnel have up to 180 seconds during the alarm investigation phase to evaluate the fire condition and reset the system. If the system is not reset during the investigation phase, notification signals in accordance with the building evacuation or relocation plan and remote signals must be automatically and immediately activated (i.e., immediate occupant notification and emergency force notification must occur).

3. If a second automatic fire detector selected for positive alarm sequence is actuated during the alarm investigation phase, notification signals in accordance with the building evacuation or relocation plan and remote signals must be automatically and immediately activated (i.e., immediate occupant notification and emergency force notification must occur).

4. If any other initiating device is actuated (e.g., a manual fire alarm box), notification signals in accordance with the building evacuation or relocation plan and remote signals must be

## CHAPTER 19 • Existing

automatically and immediately activated (i.e., immediate occupant notification and emergency force notification must occur).

Occupant notification (see **18/19.3.4.3.1**) and emergency forces notification (see **18/19.3.4.3.2**) can be delayed during the 180-second alarm investigation phase associated with the positive alarm sequence permitted by **18/19.3.4.3**.

Actuation of the fire alarm must initiate the operation of alerting devices throughout the affected zone or building, as appropriate. See **9.6.3.6.2** and **9.6.3.6.3**, which address occupant notification by zone. Visible alerting devices are permitted to substitute for audible devices in critical care areas. See **A.18.3.4.3.1(2)** and **A.19.3.4.3.1(1)**.

Although **18/19.3.4.3.1** requires occupant notification, coded messages are permitted to be used to notify staff and trained responders. As part of their emergency duties, staff will then keep patients and visitors informed of expected actions.

**Paragraph 18.3.4.3.1(1)** specifically prohibits new health care occupancies from using **9.6.3.2.3**, which exempts detectors at doors used for the exclusive operation of automatic door release from the requirements for occupant notification. Note that the use of **9.6.3.2.1** and **9.6.3.2.2**, which exempt detectors used for recalling elevators or closing dampers from initiating occupant notification, respectively, is not prohibited. Although such detectors must be arranged to initiate the health care occupancy alarm system in accordance with **18.3.4.2.1**, subsequent automatic occupant notification is not required.

Emergency forces notification is addressed in **18/19.3.4.3.2**. **Paragraph 19.3.4.3.2.2** permits the continued use of an existing alarm system feature that delays fire department notification for up to 120 seconds where smoke detectors or smoke detection systems are equipped with a reconfirmation feature. However, staff notification, as required by **19.3.4.3.1**, cannot be delayed by the existing smoke detection system with reconfirmation feature.

The alarm must automatically transmit to a point outside the facility. If the fire department legally committed to serve the facility does not permit automatic alarm transmission, arrangements are to be made for the prompt notification of the fire department or such other assistance as may be available in the case of fire or other emergency. **Paragraph 9.6.4.2** lists various acceptable methods for automatically notifying the fire department. The fire department should also be called manually to verify and confirm the automatic transmission of the alarm. In larger facilities, this might be the responsibility of the facility telephone operator; in smaller facilities, it might be the responsibility of the nursing staff.

The provisions of **18.3.4.3.3** require annunciation and annunciation zoning for new fire alarm systems. **Exhibit 18/19.67** shows an alarm system annunciator panel positioned on the wall of a minor entrance to a hospital. The minor entrance is the location by which the fire department enters the building when

## CHAPTER 18 • New

## CHAPTER 19 • Existing

Exhibit 18/19.67

Alarm system annunciator panel on wall of minor entrance to hospital.

responding to a call for assistance. The hospital facility floor plan is attached to the wall in the vicinity of the annunciator panel so that the abbreviated zone identifiers displayed at the annunciator panel can be converted to visual cues as to the section of the building from which the alarm signal was received.

The provision of 18.3.4.3.3 prohibits sprinkler system waterflow from being annunciated as a single building zone. The

### 18.3.5 Extinguishment Requirements.

**18.3.5.1\*** Buildings containing health care occupancies shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7, unless otherwise permitted by 18.3.5.5.

**A.18.3.5.1** In areas where the replenishment of water supplies is not immediately available from on-site sources, alternate provisions for the water-fill rate requirements of NFPA 13, *Standard for the Installation of Sprinkler Systems*, and NFPA 22, *Standard for Water Tanks for Private Fire Protection*, that are acceptable to the authority having jurisdiction should be provided. Appropriate means for the replenishment of these supplies from other sources, such as fire department tankers, public safety organizations, or other independent contractors should be incorporated into the overall fire safety plan of the facility.

prohibition was written in reaction to the addition of 9.6.7.4.5, which permits such single-zone annunciation so as not to prohibit a so-called sprinkler system “birdcage” piping configuration, in which the sprinkler branch lines are run vertically through the building, rather than horizontally, providing an economical installation alternative. The resulting piping network resembles a birdcage, which is responsible for the name. With such a piping configuration, it is not practical to provide waterflow devices for every floor, since each branch line typically serves multiple floors. Therefore, a single waterflow device is provided on the supply piping ahead of the branch lines, resulting in the sprinkler system being annunciated as a single zone. Such an arrangement has the potential to increase the time required for emergency responders to locate the fire and is inconsistent with the protection level mandated for health care occupancies.

Paragraph 19.3.4.5.1 requires smoke detectors in the corridors of existing limited care facilities. Staffing levels in hospitals and nursing homes reasonably ensure discovery of a fire at an early stage. In existing hospitals and nursing homes, it is considered reasonable to rely on staff to sound the alarm.

Paragraph 18.3.4.5.3 requires corridor smoke detection systems in new nursing homes. The justification for the creation of this requirement stated that corridor smoke detectors are needed for redundancy, since, in some fire scenarios, the corridor detector might be the first device to provide notification of fire, and the cost of installing a corridor smoke detection system as part of new construction is minor.

Subsection 18/19.3.4 addresses required fire alarm equipment. Reliability is of primary importance; therefore, electrical supervision of the system and system components is specified by reference to Section 9.6. In the event of circuit fault, component failure, or other trouble, continuous trouble indication is required and should be provided at a constantly attended location.

### 19.3.5 Extinguishment Requirements.

**19.3.5.1** Buildings containing nursing homes shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7, unless otherwise permitted by 19.3.5.5.

## CHAPTER 18 • New

With automatic sprinkler protection required throughout new health care facilities and quick-response sprinklers required in smoke compartments containing patient sleeping rooms, a fire and its life-threatening byproducts can be reduced, thereby allowing the defend-in-place concept to continue. The difficulty in maintaining the proper integrity of life safety elements has been considered, and it has been judged that the probability of a sprinkler system operating as designed is equal to or greater than other life safety features.

**18.3.5.2 Reserved.****18.3.5.3 Reserved.**

**18.3.5.4** The sprinkler system required by **18.3.5.1** shall be installed in accordance with **9.7.1.1(1)**.

**18.3.5.5** In Type I and Type II construction, alternative protection measures shall be permitted to be substituted for sprinkler protection without causing a building to be classified as non-sprinklered in specified areas where the authority having jurisdiction has prohibited sprinklers.

**18.3.5.6\*** Listed quick-response or listed residential sprinklers shall be used throughout smoke compartments containing patient sleeping rooms.

**A.18.3.5.6** The requirements for use of quick-response sprinklers intend that quick-response sprinklers be the predominant type of sprinkler installed in the smoke compartment. It is recognized, however, that quick-response sprinklers might not be approved for installation in all areas, such as those where NFPA 13, *Standard for the Installation of Sprinkler Systems*, requires sprinklers of the intermediate- or high-temperature classification. It is not the intent of the **18.3.5.6** requirements to prohibit the use of standard sprinklers in limited areas of a smoke compartment where intermediate- or high-temperature sprinklers are required.

Residential sprinklers are considered acceptable in patient sleeping rooms of all health care facilities, even though not specifically listed for this purpose in all cases.

Where the installation of quick-response sprinklers is impracticable in patient sleeping room areas, appropriate equivalent protection features acceptable to the authority having jurisdiction should be provided. It is recognized that the use of quick-response sprinklers might be limited in facilities housing

## CHAPTER 19 • Existing

**19.3.5.2** High-rise buildings shall comply with **19.4.2**.

**19.3.5.3** Where required by **19.1.6**, buildings containing hospitals or limited care facilities shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with **Section 9.7**, unless otherwise permitted by **19.3.5.5**.

**19.3.5.4\*** The sprinkler system required by **19.3.5.1** or **19.3.5.3** shall be installed in accordance with **9.7.1.1(1)**.

**A.19.3.5.4** It is not the intent to require existing standard sprinklers in existing sprinkler systems to be replaced with listed quick-response or listed residential sprinklers. It is the intent that new sprinkler systems installed in existing buildings comply with the requirements of **Chapter 18**, including **18.3.5.6**.

**19.3.5.5** In Type I and Type II construction, alternative protection measures shall be permitted to be substituted for sprinkler protection in specified areas where the authority having jurisdiction has prohibited sprinklers, without causing a building to be classified as nonsprinklered.

**19.3.5.6 Reserved.**

## CHAPTER 18 • New

certain types of patients or by the installation limitations of quick-response sprinklers.

**18.3.5.7 Reserved.****18.3.5.8 Reserved.**

## CHAPTER 19 • Existing

**19.3.5.7\*** Where this *Code* permits exceptions for fully sprinklered buildings or smoke compartments, the sprinkler system shall meet all of the following criteria:

- (1) It shall be in accordance with **Section 9.7**.
- (2) It shall be installed in accordance with **9.7.1.1(1)**, unless it is an approved existing system.
- (3) It shall be electrically connected to the fire alarm system.
- (4) It shall be fully supervised.
- (5) In Type I and Type II construction, where the authority having jurisdiction has prohibited sprinklers, approved alternative protection measures shall be permitted to be substituted for sprinkler protection in specified areas without causing a building to be classified as nonsprinklered.

**A.19.3.5.7** It is intended that any valve that controls automatic sprinklers in the building or portions of the building, including sectional and floor control valves, be electrically supervised. Valves that control isolated sprinkler heads, such as in laundry and trash chutes, are not required to be electrically supervised. Appropriate means should be provided to ensure that valves that are not electrically supervised remain open.

**19.3.5.8\*** Where this *Code* permits exceptions for fully sprinklered buildings or smoke compartments and specifically references this paragraph, the sprinkler system shall meet all of the following criteria:

- (1) It shall be installed throughout the building or smoke compartment in accordance with **Section 9.7**.
- (2) It shall be installed in accordance with **9.7.1.1(1)**, unless it is an approved existing system.
- (3) It shall be electrically connected to the fire alarm system.
- (4) It shall be fully supervised.
- (5) It shall be equipped with listed quick-response or listed residential sprinklers throughout all smoke compartments containing patient sleeping rooms.
- (6)\* Standard-response sprinklers shall be permitted to be continued to be used in approved existing sprinkler systems where quick-response and residential sprinklers were not listed for use in such locations at the time of installation.
- (7) Standard-response sprinklers shall be permitted for use in hazardous areas protected in accordance with **19.3.2.1**.

**A.19.3.5.8** The provisions of **19.3.5.8(6)** and **(7)** are not intended to supplant NFPA 13, *Standard for the Installation of Sprinkler Systems*, which requires that residential sprinklers with more than a 10°F (5.6°C) difference in temperature rating not be mixed within a room. Currently there are no additional prohibitions in NFPA 13 on the mixing of sprinklers having different thermal response characteristics. Conversely, there are no design

## CHAPTER 18 • New

**18.3.5.9 Reserved.**

**18.3.5.10\*** Sprinklers shall not be required in clothes closets of patient sleeping rooms in hospitals where the area of the closet does not exceed 6 ft<sup>2</sup> (0.55 m<sup>2</sup>), provided that the distance from the sprinkler in the patient sleeping room to the back wall of the closet does not exceed the maximum distance permitted by NFPA 13, *Standard for the Installation of Sprinkler Systems*.

**A.18.3.5.10** This exception is limited to hospitals, as nursing homes and many limited care facilities might have more combustibles within the closets. The limited amount of clothing found in the small clothes closets in hospital patient rooms is typically far less than the amount of combustibles in casework cabinets that do not require sprinkler protection, such as nurse servers. In many hospitals, especially new hospitals, it is difficult to make a distinction between clothes closets and cabinet work. The exception is far more restrictive than similar exceptions for hotels and apartment buildings. NFPA 13, *Standard for the Installation of Sprinkler Systems*, already permits the omission of sprinklers in wardrobes [see 8.1.1(7) of NFPA 13]. It is not the intent of 18.3.5.10 to affect the wardrobe provisions of NFPA 13. It is the intent that the sprinkler protection in the room covers the closet as if there were no door on the closet. (*See 8.5.3.2.3 of NFPA 13.*)

**18.3.5.11\*** Sprinklers in areas where cubicle curtains are installed shall be in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*.

**A.18.3.5.11** For the proper operation of sprinkler systems, cubicle curtains and sprinkler locations need to be coordinated.

## CHAPTER 19 • Existing

parameters to make practical the mixing of residential and other types of sprinklers.

Residential sprinklers are considered acceptable in patient sleeping rooms of all health care facilities, even though not specifically listed for this purpose in all cases.

**A.19.3.5.8(6)** It is not the intent of the *Code* to permit standard-response sprinklers to meet the criteria of 19.3.5.8 just because the sprinklers were installed before quick-response sprinklers were invented or listed. The intent of 19.3.5.8(6) is to permit older quick-response systems to be credited, even though there might be some standard-response sprinklers in existence due to the fact that quick-response sprinklers were unavailable for those specific locations at the time. For example, in the early days of quick-response sprinklers, there were no high-temperature quick-response sprinklers available.

**19.3.5.9** Isolated hazardous areas shall be permitted to be protected in accordance with 9.7.1.2. For new installations in existing health care occupancies, where more than two sprinklers are installed in a single area, waterflow detection shall be provided to sound the building fire alarm or to notify, by a signal, any constantly attended location, such as PBX, security, or emergency room, at which the necessary corrective action shall be taken.

**19.3.5.10\*** Sprinklers shall not be required in clothes closets of patient sleeping rooms in hospitals where the area of the closet does not exceed 6 ft<sup>2</sup> (0.55 m<sup>2</sup>), provided that the distance from the sprinkler in the patient sleeping room to the back wall of the closet does not exceed the maximum distance permitted by NFPA 13, *Standard for the Installation of Sprinkler Systems*.

**A.19.3.5.10** This exception is limited to hospitals, as nursing homes and many limited care facilities might have more combustibles within the closets. The limited amount of clothing found in the small clothes closets in hospital patient rooms is typically far less than the amount of combustibles in casework cabinets that do not require sprinkler protection, such as nurse servers. In many hospitals, especially new hospitals, it is difficult to make a distinction between clothes closets and cabinet work. The exception is far more restrictive than similar exceptions for hotels and apartment buildings. NFPA 13, *Standard for the Installation of Sprinkler Systems*, already permits the omission of sprinklers in wardrobes [see 8.1.1(7) of NFPA 13]. It is not the intent of 19.3.5.10 to affect the wardrobe provisions of NFPA 13. It is the intent that the sprinkler protection in the room covers the closet as if there were no door on the closet. (*See 8.5.3.2.3 of NFPA 13.*)

**19.3.5.11\*** Newly introduced cubicle curtains in sprinklered areas shall be installed in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*.

**A.19.3.5.11** For the proper operation of sprinkler systems, cubicle curtains and sprinkler locations need to be coordinated.

## CHAPTER 18 • New

Improperly designed systems might obstruct the sprinkler spray from reaching the fire or might shield the heat from the sprinkler. Many options are available to the designer including, but not limited to, hanging the cubicle curtains 18 in. (455 mm) below the sprinkler deflector; using a ½ in. (13 mm) diagonal mesh or a 70 percent open weave top panel that extends 18 in. (455 mm) below the sprinkler deflector; or designing the system to have a horizontal and minimum vertical distance that meets the requirements of NFPA 13, *Standard for the Installation of Sprinkler Systems*. The test data that form the basis of the NFPA 13 requirements are from fire tests with sprinkler discharge that penetrated a single privacy curtain.

**18.3.5.12** Portable fire extinguishers shall be provided in all health care occupancies in accordance with [Section 9.9](#).

[Paragraph 18.3.5.1](#) requires automatic sprinkler protection throughout all new health care facilities; [18.3.5.6](#) requires the use of quick-response or residential sprinklers throughout all smoke compartments containing patient sleeping rooms.

[Paragraph 19.3.5.1](#) requires automatic sprinkler protection throughout all existing nursing homes.

[Paragraph 19.3.5.2](#) references the existing health care occupancy high-rise building sprinkler requirement of [19.4.2](#). Without the cross-reference, the user who consults [19.3.5](#) to identify the sprinkler requirements applicable to existing health care occupancies might miss the requirement that is located in the chapter subsection on high-rise buildings.

Where sprinkler protection is specified, complete building coverage in accordance with the provisions of NFPA 13, *Standard for the Installation of Sprinkler Systems*,<sup>15</sup> is required (see [18/19.3.5.4](#)). The Code does not exempt any area of the building from sprinkler protection (see [Section 9.7](#)). However, where automatic sprinkler protection is omitted from certain spaces in Type I and Type II construction at the mandate of the authority having jurisdiction, and the AHJ approves alternative protective measures, the building is still considered fully protected throughout in accordance with the [18/19.3.5.5](#). Sprinklers are permitted to be omitted only from areas in buildings of fire-rated, noncombustible construction, which are locations considered to have sufficient structural fire resistance to outlast most fires. Use of alternative protective measures should be carefully evaluated to ensure protection equivalent to that provided by automatic sprinklers. Where other automatic fire-extinguishing systems are used as an alternative to sprinklers for specific spaces, it is suggested that the spaces also be separated by fire resistance-rated construction from the remainder of the building that is protected by automatic sprinklers.

The word “supervised,” as used in [18/19.3.5.1](#), means that a distinct supervisory signal must be provided to a constantly attended location in the event of any malfunction or action that

## CHAPTER 19 • Existing

Improperly designed systems might obstruct the sprinkler spray from reaching the fire or might shield the heat from the sprinkler. Many options are available to the designer including, but not limited to, hanging the cubicle curtains 18 in. (455 mm) below the sprinkler deflector; using ½ in. (13 mm) diagonal mesh or a 70 percent open weave top panel that extends 18 in. (455 mm) below the sprinkler deflector; or designing the system to have a horizontal and minimum vertical distance that meets the requirements of NFPA 13, *Standard for the Installation of Sprinkler Systems*. The test data that forms the basis of the NFPA 13 requirements is from fire tests with sprinkler discharge that penetrated a single privacy curtain.

**19.3.5.12** Portable fire extinguishers shall be provided in all health care occupancies in accordance with [Section 9.9](#).

would impair sprinkler performance. Supervision must be provided, for example, for water supply and sprinkler control valves, fire pump power and running conditions, water tank levels and temperatures, pressure in pressure tanks, air pressure in dry-pipe systems, building temperature, and city water pressure. Supervision should include all sprinkler sectional control valves, in addition to main control valves. See also [9.7.2](#).

The intent of [19.3.5.7](#) is to permit the deletion of redundant features of fire protection within an individual smoke compartment that is sprinklered. [Paragraph 19.3.5.7](#), for example, could be used to permit higher flame spread for interior wall/ceiling finish or nonrated corridor partitions within the sprinklered smoke compartment. In a limited care facility, the corridor smoke detection could be eliminated within the sprinklered smoke compartment, as detailed in [19.3.4.5.1\(2\)](#). However, certain general building protection features must be maintained, unless the building is fully sprinklered. For example, no relaxation in exit features (see [Section 19.2](#)) or building construction requirements (see [19.1.6](#)) should be granted unless the building is fully protected by automatic sprinklers.

[Paragraph 19.3.5.8](#) provides sprinkler system criteria, which other sections of the chapter can require by reference, for permitting exemptions to requirements where automatic sprinkler protection is provided that utilizes quick-response sprinklers throughout smoke compartments having sleeping rooms. For example, [19.3.7.3\(2\)](#) permits elimination of dampers in ducts penetrating smoke barriers where compartments on both sides of the barriers are sprinkler protected under certain conditions. This paragraph permits elimination of dampers where compartments not used for patient sleeping are sprinklered, using either standard-response or quick-response sprinklers, or where compartments having patient sleeping rooms use quick-response or residential sprinklers.

The exemption provided by [19.3.5.8\(6\)](#), for use of standard-response sprinklers in lieu of quick-response or residential

## CHAPTER 18 • New

sprinklers, has been used for purposes not intended by the *Code*. When the exemption was written for the 1991 edition of the *Code*, it addressed the case where quick-response or residential sprinklers were installed throughout the smoke compartment, except in locations where the listing of the sprinkler prohibited its use. For example, the earliest quick-response sprinklers were not listed for use under sloped ceilings, in skylights, or in high ambient temperature areas. The exemption has been editorially revised over multiple editions of the *Code* so as to become unclear and subject to misapplication. The exemption has been misapplied to situations where the smoke compartment is sprinklered with standard-response sprinklers that were installed prior to the advent of quick-response or residential sprinklers. The exemption is not intended to “grandfather” such existing systems. Where another provision of Chapter 19 references 19.3.5.8, such reference is made because the presence of quick-response or residential sprinklers is needed to afford the intended level of life safety. The technical committee agenda for the next revision cycle will include the subject of revising the exemption to express the original intent.

The provision of 18/19.3.5.10 exempts sprinklers from small clothes closets in patient rooms where the sprinkler protecting the room is positioned so as to be able to discharge water to the back wall of the closet. The concept is explained in A.18/A.19.3.5.10.

Portable fire extinguishers, as addressed in 18/19.3.5.12, are required throughout the health care occupancy. Portable fire extinguisher type and capacity are chosen for a particular location based on the challenge presented by the hazards in the area. Exhibit 18/19.68, Exhibit 18/19.69, and Exhibit 18/19.70

Exhibit 18/19.68

Portable fire extinguisher located in corridor of patient treatment area.

## CHAPTER 19 • Existing

show three types of portable extinguishers identified while walking through a hospital. Note that the extinguishers are labeled with a tag that matches the identifier attached to the wall or cabinet. Further, bar codes are present to permit scanning for inspection record keeping.

Exhibit 18/19.69

Portable fire extinguisher located in medical equipment servicing area.

Exhibit 18/19.70

Portable fire extinguisher located in electrical equipment room.

## CHAPTER 18 • New

**18.3.6 Corridors.**

**Subsection 18/19.3.6** essentially stipulates that all areas that contain combustibles in sufficient quantities to produce a life-threatening fire must be separated from exit access corridors by partitions. Corridor partitions in new health care occupancies and sprinklered existing health care occupancies must be able to limit the transfer of smoke but need not be fire rated. In non-sprinklered existing health care occupancies, the corridor partitions must have a minimum ½-hour fire resistance rating.

A summary of the provisions of 18/19.3.6 follows.

**18.3.6.1 Corridor Separation.** Corridors shall be separated from all other areas by partitions complying with 18.3.6.2 through 18.3.6.5 (see also 18.2.5.4), unless otherwise permitted by one of the following:

- (1) Spaces shall be permitted to be unlimited in area and open to the corridor, provided that all of the following criteria are met:
  - (a)\* The spaces are not used for patient sleeping rooms, treatment rooms, or hazardous areas.
  - (b) The corridors onto which the spaces open in the same smoke compartment are protected by an electrically supervised automatic smoke detection system in accordance with 18.3.4, or the smoke compartment in which the space is located is protected throughout by quick-response sprinklers.
  - (c) The open space is protected by an electrically supervised automatic smoke detection system in accordance with 18.3.4, or the entire space is arranged and located to allow direct supervision by the facility staff from a nurses' station or similar space.
  - (d) The space does not obstruct access to required exits.
- (2) Waiting areas shall be permitted to be open to the corridor, provided that all of the following criteria are met:
  - (a) The aggregate waiting area in each smoke compartment does not exceed 600 ft<sup>2</sup> (55.7 m<sup>2</sup>).
  - (b) Each area is protected by an electrically supervised automatic smoke detection system in accordance with 18.3.4, or each area is arranged and located to allow direct supervision by the facility staff from a nursing station or similar space.
  - (c) The area does not obstruct access to required exits.

## CHAPTER 19 • Existing

**19.3.6 Corridors.**

1. **Paragraph 18/19.3.6.1** establishes requirements for corridor partitions (walls) to be provided, complete with numerous exemptions.
2. **Paragraph 18/19.3.6.2** establishes construction requirements for corridor partitions.
3. **Paragraph 18/19.3.6.3** establishes requirements for doors in corridor partitions.
4. **Paragraph 18/19.3.6.4** addresses transfer grilles.
5. **Paragraph 18/19.3.6.5** permits miscellaneous openings, such as mail slots.

**19.3.6.1 Corridor Separation.** Corridors shall be separated from all other areas by partitions complying with 19.3.6.2 through 19.3.6.5 (see also 19.2.5.4), unless otherwise permitted by one of the following:

- (1) Smoke compartments protected throughout by an approved supervised automatic sprinkler system in accordance with 19.3.5.8 shall be permitted to have spaces that are unlimited in size and open to the corridor, provided that all of the following criteria are met:
  - (a)\* The spaces are not used for patient sleeping rooms, treatment rooms, or hazardous areas.
  - (b) The corridors onto which the spaces open in the same smoke compartment are protected by an electrically supervised automatic smoke detection system in accordance with 19.3.4, or the smoke compartment in which the space is located is protected throughout by quick-response sprinklers.
  - (c) The open space is protected by an electrically supervised automatic smoke detection system in accordance with 19.3.4, or the entire space is arranged and located to allow direct supervision by the facility staff from a nurses' station or similar space.
  - (d) The space does not obstruct access to required exits.
- (2) In smoke compartments protected throughout by an approved, supervised automatic sprinkler system in accordance with 19.3.5.8, waiting areas shall be permitted to be open to the corridor, provided that all of the following criteria are met:
  - (a) The aggregate waiting area in each smoke compartment does not exceed 600 ft<sup>2</sup> (55.7 m<sup>2</sup>).
  - (b) Each area is protected by an electrically supervised automatic smoke detection system in accordance with 19.3.4, or each area is arranged and located to allow direct supervision by the facility staff from a nursing station or similar space.
  - (c) The area does not obstruct access to required exits.

## CHAPTER 18 • New

- (3)\* This requirement shall not apply to spaces for nurses' stations.
- (4) Gift shops not exceeding 500 ft<sup>2</sup> (46.4 m<sup>2</sup>) shall be permitted to be open to the corridor or lobby.
- (5) In a limited care facility, group meeting or multipurpose therapeutic spaces shall be permitted to open to the corridor, provided that all of the following criteria are met:
  - (a) The space is not a hazardous area.
  - (b) The space is protected by an electrically supervised automatic smoke detection system in accordance with 18.3.4, or the space is arranged and located to allow direct supervision by the facility staff from the nurses' station or similar location.
  - (c) The space does not obstruct access to required exits.
- (6) Cooking facilities in accordance with 18.3.2.5.3 shall be permitted to be open to the corridor.

## CHAPTER 19 • Existing

- (3)\* This requirement shall not apply to spaces for nurses' stations.
- (4) Gift shops not exceeding 500 ft<sup>2</sup> (46.4 m<sup>2</sup>) shall be permitted to be open to the corridor or lobby, provided that one of the following criteria is met:
  - (a) The building is protected throughout by an approved automatic sprinkler system in accordance with Section 9.7.
  - (b) The gift shop is protected throughout by an approved automatic sprinkler system in accordance with Section 9.7, and storage is separately protected.
- (5) Limited care facilities in smoke compartments protected throughout by an approved, supervised automatic sprinkler system in accordance with 19.3.5.8 shall be permitted to have group meeting or multipurpose therapeutic spaces open to the corridor, provided that all of the following criteria are met:
  - (a) The space is not a hazardous area.
  - (b) The space is protected by an electrically supervised automatic smoke detection system in accordance with 19.3.4, or the space is arranged and located to allow direct supervision by the facility staff from the nurses' station or similar location.
  - (c) The space does not obstruct access to required exits.
- (6) Cooking facilities in accordance with 19.3.2.5.3 shall be permitted to be open to the corridor.
- (7) Spaces, other than patient sleeping rooms, treatment rooms, and hazardous areas, shall be permitted to be open to the corridor and unlimited in area, provided that all of the following criteria are met:
  - (a) The space and the corridors onto which it opens, where located in the same smoke compartment, are protected by an electrically supervised automatic smoke detection system in accordance with 19.3.4.
  - (b)\* Each space is protected by automatic sprinklers, or the furnishings and furniture, in combination with all other combustibles within the area, are of such minimum quantity and arrangement that a fully developed fire is unlikely to occur.
  - (c) The space does not obstruct access to required exits.
- (8)\* Waiting areas shall be permitted to be open to the corridor, provided that all of the following criteria are met:
  - (a) Each area does not exceed 600 ft<sup>2</sup> (55.7 m<sup>2</sup>).
  - (b) The area is equipped with an electrically supervised automatic smoke detection system in accordance with 19.3.4.
  - (c) The area does not obstruct any access to required exits.
- (9) Group meeting or multipurpose therapeutic spaces, other than hazardous areas, that are under continuous supervision

## CHAPTER 18 • New

**A.18.3.6.1(1)(a)** The presence of stored combustible materials in a room or space open to the corridor does not necessarily result in the room or space being classified as a hazardous area. In some circumstances, the amount and type of combustibles might result in the room or space being classified as a hazardous area by the authority having jurisdiction.

**A.18.3.6.1(3)** A typical nurses' station would normally contain one or more of the following with associated furniture and furnishings:

- (1) Charting area
- (2) Clerical area
- (3) Nourishment station
- (4) Storage of small amounts of medications, medical equipment and supplies, clerical supplies, and linens
- (5) Patient monitoring and communication equipment

**Paragraph 18/19.3.6.1** requires that all spaces be separated from corridors by partitions. The intent is to limit the risk of exposing the corridor to fire. Exemptions are provided to permit specific areas to be open to the corridor. **Paragraphs 18.3.6.1(1) through (6) and 19.3.6.1(1) through (9)** specify those areas that are permitted to be open to corridors

## CHAPTER 19 • Existing

by facility staff shall be permitted to be open to the corridor, provided that all of the following criteria are met:

- (a) Each area does not exceed 1500 ft<sup>2</sup> (139 m<sup>2</sup>).
- (b) Not more than one such space is permitted per smoke compartment.
- (c) The area is equipped with an electrically supervised automatic smoke detection system in accordance with **19.3.4**.
- (d) The area does not obstruct access to required exits.

**A.19.3.6.1(1)(a)** The presence of stored combustible materials in a room or space open to the corridor does not necessarily result in the room or space being classified as a hazardous area. In some circumstances, the amount and type of combustibles might result in the room or space being classified as a hazardous area by the authority having jurisdiction.

**A.19.3.6.1(3)** A typical nurses' station would normally contain one or more of the following with associated furniture and furnishings:

- (1) Charting area
- (2) Clerical area
- (3) Nourishment station
- (4) Storage of small amounts of medications, medical equipment and supplies, clerical supplies, and linens
- (5) Patient monitoring and communication equipment

**A.19.3.6.1(7)(b)** A fully developed fire (flashover) occurs if the rate of heat release of the burning materials exceeds the capability of the space to absorb or vent that heat. The ability of common lining (wall, ceiling, and floor) materials to absorb heat is approximately 0.75 Btu/ft<sup>2</sup> (0.07 kJ/m<sup>2</sup>) of lining. The venting capability of open doors or windows is in excess of 20 Btu/ft<sup>2</sup> (1.95 kJ/m<sup>2</sup>) of opening. In a fire that has not reached flashover conditions, fire will spread from one furniture item to another only if the burning item is close to another furniture item. For example, if individual furniture items have a heat release rate of 500 Btu/s (525 kW) and are separated by 12 in. (305 mm) or more, the fire is not expected to spread from item to item, and flashover is unlikely to occur. (*See also the NFPA Fire Protection Handbook.*)

**A.19.3.6.1(8)** This provision permits waiting areas to be located across the corridor from each other, provided that neither area exceeds the 600 ft<sup>2</sup> (55.7 m<sup>2</sup>) limitation.

**Paragraph 18/19.3.6.1(1)** contains provisions that permit unlimited size spaces, such as recreation/lounge/waiting areas [or wheelchair and gurney storage alcoves not larger than 50 ft<sup>2</sup> (4.6 m<sup>2</sup>), so as not to constitute a hazardous area], to be open to the corridor. **Exhibit 18/19.71** shows a large waiting space as might be permitted to be open to the corridor by the provisions

## CHAPTER 18 • New

of 18/19.3.6.1(1). New health care occupancies are offered this exemption because they are sprinklered; existing health care occupancies must be sprinklered in order to use the exemption. The staff must visually supervise the open space from a permanent staff location, or equivalent early warning of fire must be provided by an electrically supervised smoke detection system within the open space. Interconnected corridors that are not separated from the open space must be equipped with an electrically supervised smoke detection system, or the sprinklers throughout the smoke compartment must be quick-response sprinklers. Exhibit 18/19.72 illustrates the provisions of 18/19.3.6.1(1). The black-filled circles at the left of the exhibit depict quick-response sprinklers; the blue-filled circles depict standard-response sprinklers. In the smoke compartment on the

Exhibit 18/19.71

Large waiting space open to corridor.

Exhibit 18/19.72

Spaces permitted to be open to corridor.

## CHAPTER 19 • Existing

left, which includes patient sleeping rooms, the open space has direct supervision from the nurses' station located across the corridor. In the smoke compartment on the right, which contains no patient sleeping rooms, none of the three open spaces has direct supervision, so each space is equipped with smoke detection (denoted by the unfilled circle); because the sprinklers in this compartment are standard-response sprinklers, the required smoke detection must be extended into the corridor of that smoke compartment.

In Exhibit 18/19.72, in the larger of the two smoke compartments, the smaller of the two open spaces at the upper half of the exhibit is meant to depict a wheelchair and gurney storage alcove not larger than 50 ft<sup>2</sup> (4.6 m<sup>2</sup>). By limiting the alcove size to not more than 50 ft<sup>2</sup> (4.6 m<sup>2</sup>) and restricting its use to the storage of wheelchairs and gurneys, such space is not a hazardous area [see 18.3.2.1.3(2) and 19.3.2.1.5(7)]. The open space created by the alcove meets the use limitation of 18/19.3.6.1(1)(a) by not being used for patient sleeping, for patient treatment, or as a hazardous area. Smoke detection of the space is required in accordance with 18/19.3.6.1(1)(c) because of the lack of direct supervision by staff, but the smoke detector shown in the exhibit could be omitted if the corridor detectors were positioned to cover the storage alcove in accordance with the spacing provisions of NFPA 72, *National Fire Alarm and Signaling Code*, and the listing of the smoke detectors. A similar alcove is shown in Exhibit 18/19.73; it is used for clean linen storage; the space is larger than 50 ft<sup>2</sup> (4.6 m<sup>2</sup>), but much of the alcove area is not subject to placement of materials, as the front of the linen cart must be accessed.

Exhibit 18/19.73

Linen storage alcove open to corridor.

## CHAPTER 18 • New

Waiting areas that are open to the corridor where their aggregate area exceeds 600 ft<sup>2</sup> (55.7 m<sup>2</sup>) in any smoke compartment are permitted only if the provisions of 18/19.3.6.1(1) are met. Provided that the waiting areas that are open to the corridor do not exceed 600 ft<sup>2</sup> (55.7 m<sup>2</sup>) in aggregate area in any smoke compartment, they are permitted to meet the less demanding criteria of 18/19.3.6.1(2). Exhibit 18/19.74 shows a small waiting space, as might be permitted to be open to the corridor by the provisions of 18/19.3.6.1(2).

The smoke compartment utilizing the open space exemption of 18/19.3.6.1(2) must be sprinklered, and, where the smoke compartment is used for patient sleeping, the sprinklers must be quick-response sprinklers [see 18.3.5.6 and 19.3.5.8(5)]. Each waiting area must be located to allow direct visual supervision by the staff or be equipped with an electrically supervised automatic smoke detection system. In all cases, waiting spaces must be arranged so as not to obstruct access to exits. Exhibit 18/19.75 illustrates the provisions of 18/19.3.6.1(2). The waiting space at the left of the compartment shown in Exhibit 18/19.75 receives direct supervision from the nurses' station located across the corridor. The waiting space in the upper right of the compartment has no direct supervision and, therefore, must be provided with smoke detection (represented by unfilled circle).

Although 18/19.3.6.1(1) does not permit treatment spaces to be open to corridors, and 18/19.3.6.1(2) limits the open spaces for use as waiting areas, 18/19.3.6.1(5) permits group meeting or multipurpose therapeutic spaces to be open to corridors in limited care facilities. Where the sprinklered smoke compartment utilizing the open space exemption is used for patient sleeping,

Exhibit 18/19.74

Small waiting space open to corridor.

## CHAPTER 19 • Existing

the sprinklers must be quick-response sprinklers [see 18.3.5.6 and 19.3.5.8(5)]. These spaces are not permitted to be hazardous areas or to obstruct access to required exits.

Paragraphs 18/19.3.6.1(1), 18/19.3.6.1(2), and 18/19.3.6.1(5) require that the open space be supervised by the staff or be protected by a smoke detection system. Staff supervision is important; it allows the staff to see, hear, or smell a developing fire or to prevent the ignition of a fire by virtue of their presence. The use of closed-circuit television or mirrors does not offer all the protection provided by staff and should not be relied on as a substitute for direct supervision. Adequate supervision is not provided if the staff cannot readily supervise the space without special effort (e.g., by looking around a corner). Exhibit 18/19.76 shows a sitting area located at the end of a corridor in a nursing

Exhibit 18/19.75

Waiting spaces of limited aggregate area open to corridor.

Exhibit 18/19.76

Sitting area open to corridor but not readily supervised by staff.

## CHAPTER 18 • New

home. The sitting area is open to the corridor but located such that staff cannot readily supervise the space. Smoke detection is provided to compensate for the lack of staff supervision. **Exhibit 18/19.77** shows the ceiling-mounted smoke detector in the open space.

Areas used for charting and communication by staff are permitted to be open to the corridor, as are nurses' stations. **Exhibit 18/19.78** shows a nurses' station open to the corridor. See **18/19.3.6.1(3)**.

Gift shops are addressed in **18/19.3.6.1(4)**. Many gift shops, particularly those containing combustible storage and having sizable retail areas, pose a hazard well beyond that which is considered normal to patient-occupied spaces and, thus, merit protection as hazardous areas. **Exhibit 18/19.79** shows a large gift shop separated from the corridor and protected as a hazardous area. However, it is recognized that many small retail areas [e.g., less than 500 ft<sup>2</sup> (46.4 m<sup>2</sup>)] constitute a relatively minor hazard that is mitigated adequately by automatic sprinkler protection. **Paragraph 18/19.3.6.1(4)** provides the facility some flexibility in

**Exhibit 18/19.77**

*Smoke detection for space open to corridor but not readily supervised by staff.*

**18.3.6.2\* Construction of Corridor Walls.**

**A.18.3.6.2** It is the intent of the *Code* that there be no required fire resistance or area limitations for vision panels in corridor walls and doors.

## CHAPTER 19 • Existing

the design and operation of gift shops. The gift shop must be sprinklered, and, for existing health care occupancy buildings that are not sprinklered throughout, any storage associated with the gift shop must be protected in a separate room. Where the stored materials are combustible and the storage room exceeds 50 ft<sup>2</sup> (4.6 m<sup>2</sup>), such room must be protected as a hazardous area in accordance with **19.3.2.1.5(7)**.

**Exhibit 18/19.78**

*Nurses' station open to corridor.*

**Exhibit 18/19.79**

*Large gift shop separated from corridor and protected as a hazardous area.*

**19.3.6.2 Construction of Corridor Walls.**

## CHAPTER 18 • New

An architectural, exposed, suspended-grid acoustical tile ceiling with penetrating items, such as sprinkler piping and sprinklers; ducted HVAC supply and return-air diffusers; speakers; and recessed lighting fixtures, is capable of limiting the transfer of smoke.

**18.3.6.2.1** Corridor walls shall be permitted to terminate at the ceiling where the ceiling is constructed to limit the transfer of smoke.

**18.3.6.2.2** No fire resistance rating shall be required for corridor walls.

**18.3.6.2.3\*** Corridor walls shall form a barrier to limit the transfer of smoke.

**A.18.3.6.2.3** While a corridor wall is required to form a barrier to limit the transfer of smoke, such a barrier is not required to be either a smoke barrier or a smoke partition — two terms for which specific *Code* definitions and requirements apply.

## CHAPTER 19 • Existing

**19.3.6.2.1** Corridor walls shall be continuous from the floor to the underside of the floor or roof deck above; through any concealed spaces, such as those above suspended ceilings; and through interstitial structural and mechanical spaces, unless otherwise permitted by **19.3.6.2.4** through **19.3.6.2.8**.

**19.3.6.2.2\*** Corridor walls shall have a minimum ½-hour fire resistance rating.

**A.19.3.6.2.2** The intent of the minimum ½-hour fire resistance rating for corridor partitions is to require a nominal fire rating, particularly where the fire rating of existing partitions cannot be documented. Examples of acceptable partition assemblies would include, but are not limited to, ½ in. (13 mm) gypsum board, wood lath and plaster, gypsum lath, or metal lath and plaster.

**19.3.6.2.3\*** Corridor walls shall form a barrier to limit the transfer of smoke.

**A.19.3.6.2.3** The purpose of extending a corridor wall above a lay-in ceiling or through a concealed space is to provide a barrier to limit the passage of smoke. Such a barrier is not required to be either a smoke barrier or a smoke partition — two terms for which specific *Code* definitions and requirements apply. The intent of **19.3.6.2.3** is not to require light-tight barriers above lay-in ceilings or to require an absolute seal of the room from the corridor. Small holes, penetrations, or gaps around items such as ductwork, conduit, or telecommunication lines should not affect the ability of this barrier to limit the passage of smoke.

**19.3.6.2.4\*** In smoke compartments protected throughout by an approved, supervised automatic sprinkler system in accordance with **19.3.5.7**, a corridor shall be permitted to be separated from all other areas by non-fire-rated partitions and shall be permitted to terminate at the ceiling where the ceiling is constructed to limit the transfer of smoke.

**A.19.3.6.2.4** An architectural, exposed, suspended-grid acoustical tile ceiling with penetrating items, such as sprinkler piping and sprinklers; ducted HVAC supply and return-air diffusers; speakers; and recessed lighting fixtures, is capable of limiting the transfer of smoke.

**19.3.6.2.5** Existing corridor partitions shall be permitted to terminate at ceilings that are not an integral part of a floor construction if 60 in. (1525 mm) or more of space exists between the top

## CHAPTER 18 • New

## CHAPTER 19 • Existing

The building construction types addressed by 18/19.1.6.1 might affect the choice of materials used to construct corridor walls/partitions. For example, corridor construction materials in buildings of Type I or Type II construction must be either noncombustible or limited-combustible, as required by 18/19.1.6.4.

In new health care occupancies and sprinklered existing health care occupancies, corridor walls need not be fire rated but must be constructed to resist the passage of smoke. Corridor walls in such buildings are permitted to terminate at ceilings, provided that the wall and ceiling resist the passage of smoke. Where suspended ceilings are provided, partitions are permitted to terminate at the suspended ceiling without any additional special protection if the suspended ceiling will resist the passage of smoke. The ability of the ceiling to resist the passage of smoke must be carefully evaluated, and guidance is provided in A.18.3.6.2 and A.19.3.6.2.4. There are no restrictions in terms of area or fire

of the ceiling subsystem and the bottom of the floor or roof above, provided that all the following criteria are met:

- (1) The ceiling is part of a fire-rated assembly tested to have a minimum 1-hour fire resistance rating in compliance with the provisions of Section 8.3.
- (2) The corridor partitions form smoke-tight joints with the ceilings, and joint filler, if used, is noncombustible.
- (3) Each compartment of interstitial space that constitutes a separate smoke area is vented, in a smoke emergency, to the outside by mechanical means having the capacity to provide not less than two air changes per hour but, in no case, a capacity less than 5000 ft<sup>3</sup>/min (2.35 m<sup>3</sup>/s).
- (4) The interstitial space is not used for storage.
- (5) The space is not used as a plenum for supply, exhaust, or return air, except as noted in 19.3.6.2.5(3).

**19.3.6.2.6\*** Existing corridor partitions shall be permitted to terminate at monolithic ceilings that resist the passage of smoke where there is a smoke-tight joint between the top of the partition and the bottom of the ceiling.

**A.19.3.6.2.6** Monolithic ceilings are continuous horizontal membranes composed of noncombustible or limited-combustible materials, such as plaster or gypsum board, with seams or cracks permanently sealed.

**19.3.6.2.7** Fixed fire window assemblies in accordance with Section 8.3 shall be permitted in corridor walls, unless otherwise permitted in 19.3.6.2.8.

**19.3.6.2.8** There shall be no restrictions in area and fire resistance of glass and frames in smoke compartments protected throughout by an approved, supervised automatic sprinkler system in accordance with 19.3.5.7.

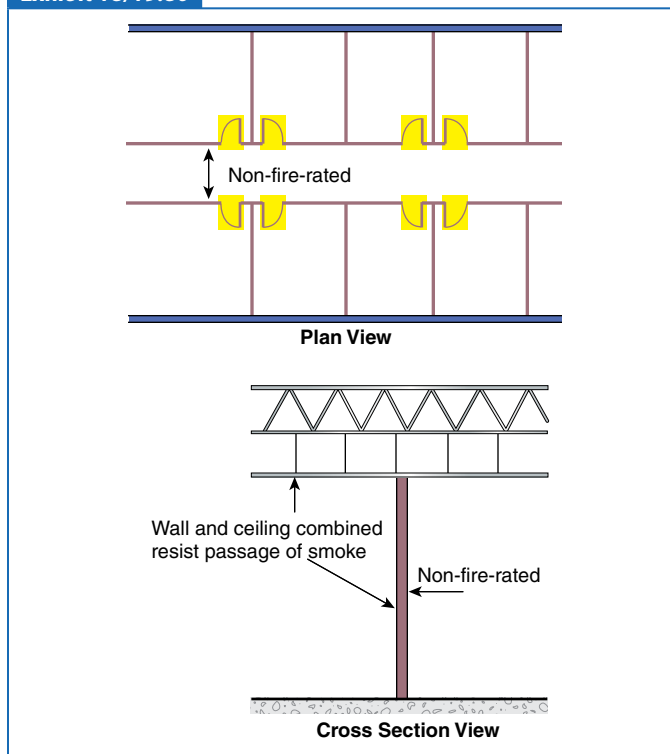

resistance for glazing used in these non-fire-rated corridor partitions. These requirements are illustrated in Exhibit 18/19.80.

Editions of the *Code* prior to 1997 required that corridor walls in nonsprinklered health care occupancies have a minimum 20-minute fire resistance rating. The change to a minimum ½-hour fire resistance rating was not meant to implement a more stringent requirement. Rather, the intent was to correlate with a change made in Chapter 8, where the range of fire resistance ratings that had previously been 20-minute, ½-hour, and ¾-hour ratings was simplified to the single category of a ½-hour fire resistance rating. See the explanation in A.8.3.1.1(4) for determining that existing walls in good condition, which previously received credit for providing a 20-minute rating, provide a ½-hour rating. It is not the intent to throw into noncompliance existing walls that were previously judged to meet the former 20-minute rating criterion.

## CHAPTER 18 • New

## CHAPTER 19 • Existing

Exhibit 18/19.80

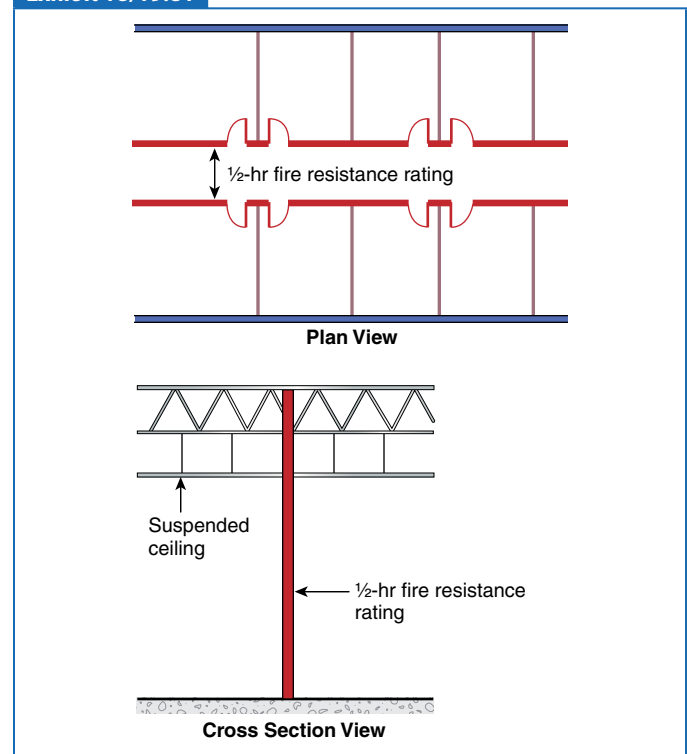

Corridor walls in new health care occupancies and existing sprinklered health care occupancies.

In nonsprinklered existing health care occupancies, corridor walls must be constructed of assemblies having a minimum fire resistance rating of  $\frac{1}{2}$  hour. In setting the requirements for  $\frac{1}{2}$ -hour corridor wall partitions, it was intended to accept the separation provided by existing partitions of any substantial construction that are capable of serving as a barrier for a short period of time — without requiring documentation of a specific fire rating. The  $\frac{1}{2}$ -hour rating is intended to permit partitions of wood lath and plaster,  $\frac{1}{2}$  in. (13 mm) gypsum board, and similar materials. Ordinary glass would not be permitted in corridor walls of nonsprinklered health care occupancies.

Fire-rated existing corridor partitions must be constructed to extend continuously through all concealed spaces — for example, through to the floor or roof deck above a suspended ceiling. This requirement is illustrated in Exhibit 18/19.81.

Openings in corridor partitions in nonsprinklered smoke compartments must be suitably protected to maintain corridor separation. Fixed fire windows are permitted by 19.3.6.2.7, which references Section 8.3. Section 8.3 requires compliance with NFPA 80, *Standard for Fire Doors and Other Opening Protectives*. The use of fire protection-rated glazing in a partition reduces the fire resistance capability of the partition because of radiant

Exhibit 18/19.81

Corridor walls in existing nonsprinklered health care smoke compartment.

energy transfer through the glass panel. The excessive use of glazing in corridor walls of nonsprinklered smoke compartments, therefore, should be avoided. In sprinklered smoke compartments, there are no restrictions on the use of glass and glazing in corridor walls (see 19.3.6.2.8).

Paragraph 19.3.6.2.5 specifies criteria for terminating existing corridor partitions at ceilings where the interstitial space above the ceiling meets certain criteria. However, the minimum  $\frac{1}{2}$ -hour fire resistance rating of the corridor walls still applies. The walls are permitted to terminate at a ceiling that has been tested as a portion of a floor/ceiling or roof/ceiling assembly having a fire resistance rating of 1 hour or more. Each compartment located above such a ceiling must be equipped with an automatic mechanical smoke exhaust system that is capable of providing a minimum of two air changes per hour but exhausting not less than 5000 ft<sup>3</sup>/min (2.35 m<sup>3</sup>/s). See the additional criteria in 19.3.6.2.5(1) through (5).

Where a monolithic ceiling composed of noncombustible materials, such as plaster or gypsum board with permanently sealed seams forming a continuous horizontal membrane, is provided, existing partitions are permitted to terminate at the underside of the ceiling in accordance with 19.3.6.2.6.

## CHAPTER 18 • New

**18.3.6.3\* Corridor Doors.**

**A.18.3.6.3** While it is recognized that closed doors serve to maintain tenable conditions in a corridor and adjacent patient rooms, such doors, which, under normal or fire conditions, are self-closing, might create a special hazard for the personal safety of a room occupant. Such closed doors might present a problem of delay in discovery, confining fire products beyond tenable conditions.

Because it is critical for responding staff members to be able to immediately identify the specific room involved, it is recommended that approved automatic smoke detection that is interconnected with the building fire alarm be considered for rooms having doors equipped with closing devices. Such detection is permitted to be located at any approved point within the room. When activated, the detector is required to provide a warning that indicates the specific room of involvement by activation of a fire alarm annunciator, nurse call system, or any other device acceptable to the authority having jurisdiction.

Where a nurse server penetrates a corridor wall, the access opening on the corridor side of the nurse server must be protected as is done for a corridor door.

**18.3.6.3.1\*** Doors, including doors or panels to nurse servers and pass-through openings, protecting corridor openings shall be constructed to resist the passage of smoke, and the following also shall apply:

- (1) Compliance with NFPA 80, *Standard for Fire Doors and Other Opening Protectives*, shall not be required.
- (2) For other than doors protecting pass-through openings, a clearance between the bottom of the door and the floor covering not exceeding 1 in. (25 mm) shall be permitted.
- (3) For doors protecting pass-through openings, a clearance between the bottom of the door and the sill not exceeding  $\frac{1}{8}$  in. (3 mm) shall be permitted.
- (4) Doors to toilet rooms, bathrooms, shower rooms, sink closets, and similar auxiliary spaces that do not contain flammable or combustible material shall not be required to be constructed to resist the passage of smoke.

**A.18.3.6.3.1** Gasketing of doors should not be necessary to achieve resistance to the passage of smoke if the door is relatively tight-fitting.

**18.3.6.3.2 Reserved.**

## CHAPTER 19 • Existing

**19.3.6.3\* Corridor Doors.**

**A.19.3.6.3** The provision of 19.3.6.3 requires the door leaves to be of substantial construction that is sufficient to resist fire for 20 minutes. These doors, described as 1 $\frac{3}{4}$  in. (44 mm) thick, solid-bonded wood-core doors, are nonrated doors and are not subject to the requirements of NFPA 80, *Standard for Fire Doors and Other Opening Protectives*.

**19.3.6.3.1\*** Doors, including doors or panels to nurse servers and pass-through openings, protecting corridor openings in other than required enclosures of vertical openings, exits, or hazardous areas shall be doors constructed to resist the passage of smoke and shall be constructed of materials such as the following:

- (1) 1 $\frac{3}{4}$  in. thick, solid-bonded core wood
- (2) Material that resists fire for a minimum of 20 minutes.

**A.19.3.6.3.1** Gasketing of doors should not be necessary to achieve resistance to the passage of smoke if the door is relatively tight-fitting.

**19.3.6.3.2** The requirements of 19.3.6.3.1 shall not apply where otherwise permitted by either of the following:

- (1) Doors to toilet rooms, bathrooms, shower rooms, sink closets, and similar auxiliary spaces that do not contain flammable or combustible materials shall not be required to comply with 19.3.6.3.1.

## CHAPTER 18 • New

**18.3.6.3.3 Reserved.****18.3.6.3.4 Reserved.**

**18.3.6.3.5** Doors shall be self-latching and provided with positive latching hardware.

## CHAPTER 19 • Existing

- (2) In smoke compartments protected throughout by an approved, supervised automatic sprinkler system in accordance with **19.3.5.7**, the door construction materials requirements of **19.3.6.3.1** shall not be mandatory, but the doors shall be constructed to resist the passage of smoke.

**19.3.6.3.3** Compliance with NFPA 80, *Standard for Fire Doors and Other Opening Protectives*, shall not be required.

**19.3.6.3.4** A clearance between the bottom of the door and the floor covering not exceeding 1 in. (25 mm) shall be permitted for corridor doors.

**19.3.6.3.5\*** Doors shall be provided with a means for keeping the door closed that is acceptable to the authority having jurisdiction, and the following requirements also shall apply:

- (1) The device used shall be capable of keeping the door fully closed if a force of 5 lbf (22 N) is applied at the latch edge of the door.
- (2) Roller latches shall be prohibited on corridor doors in buildings not fully protected by an approved automatic sprinkler system in accordance with **19.3.5.7**.

**A.19.3.6.3.5** While it is recognized that closed doors serve to maintain tenable conditions in a corridor and adjacent patient rooms, such doors, which, under normal or fire conditions, are self-closing, might create a special hazard for the personal safety of a room occupant. Such closed doors might present a problem of delay in discovery, confining fire products beyond tenable conditions.

Because it is critical for responding staff members to be able to immediately identify the specific room involved, it is recommended that approved automatic smoke detection that is interconnected with the building fire alarm be considered for rooms having doors equipped with closing devices. Such detection is permitted to be located at any approved point within the room. When activated, the detector is required to provide a warning that indicates the specific room of involvement by activation of a fire alarm annunciator, nurse call system, or any other device acceptable to the authority having jurisdiction.

In existing buildings, use of the following options reasonably ensures that patient room doors will be closed and remain closed during a fire:

- (1) Doors should have positive latches, and a suitable program that trains staff to close the doors in an emergency should be established.
- (2) It is the intent of the *Code* that no new installations of roller latches be permitted; however, repair or replacement of roller latches is not considered a new installation.
- (3) Doors protecting openings to patient sleeping or treatment rooms, or spaces having a similar combustible loading,

## CHAPTER 18 • New

**18.3.6.3.6** Doors to toilet rooms, bathrooms, shower rooms, sink closets, and similar auxiliary spaces that do not contain flammable or combustible materials shall not be required to meet the latching requirements of **18.3.6.3.5**.

**18.3.6.3.7** Powered doors that comply with the requirements of **7.2.1.9** shall not be required to meet the latching requirements of **18.3.6.3.5**, provided that both of the following criteria are met:

- (1) The door is equipped with a means for keeping the door closed that is acceptable to the authority having jurisdiction.
- (2) The device used is capable of keeping the door fully closed if a force of 5 lbf (22 N) is applied at the latch edge of a swinging door and applied in any direction to a sliding or folding door, whether or not power is applied.

**18.3.6.3.8** Corridor doors utilizing an inactive leaf shall have automatic flush bolts on the inactive leaf to provide positive latching.

#### **18.3.6.3.9 Roller Latches.**

**18.3.6.3.9.1** Roller latches shall be prohibited, except as permitted by **18.3.6.3.9.2**.

**18.3.6.3.9.2** Roller latches shall be permitted for acute psychiatric settings where patient special clinical needs require specialized protective measures for their safety, provided that the roller latches are capable of keeping the door fully closed if a force of 5 lbf (22 N) is applied at the latch edge of the door.

**18.3.6.3.10\*** Doors shall not be held open by devices other than those that release when the door is pushed or pulled.

**A.18.3.6.3.10** Doors should not be blocked open by furniture, door stops, chocks, tie-backs, drop-down or plunger-type devices, or other devices that necessitate manual unlatching or releasing action to close. Examples of hold-open devices that release when the door is pushed or pulled are friction catches or magnetic catches.

**18.3.6.3.11** Door-closing devices shall not be required on doors in corridor wall openings other than those serving required exits, smoke barriers, or enclosures of vertical openings and hazardous areas.

**18.3.6.3.12\*** Nonrated, factory- or field-applied protective plates, unlimited in height, shall be permitted.

## CHAPTER 19 • Existing

might be held closed using a closer exerting a closing force of not less than 5 lbf (22 N) on the door latch stile.

**19.3.6.3.6** The requirements of **19.3.6.3.5** shall not apply where otherwise permitted by either of the following:

- (1) Doors to toilet rooms, bathrooms, shower rooms, sink closets, and similar auxiliary spaces that do not contain flammable or combustible materials shall not be required to comply with **19.3.6.3.5**.
- (2) Existing roller latches demonstrated to keep the door closed against a force of 5 lbf (22 N) shall be permitted to be kept in service.

**19.3.6.3.7** Powered doors that comply with the requirements of **7.2.1.9** shall be considered as complying with the requirements of **19.3.6.3.5**, provided that both of the following criteria are met:

- (1) The door is equipped with a means for keeping the door closed that is acceptable to the authority having jurisdiction.
- (2) The device used is capable of keeping the door fully closed if a force of 5 lbf (22 N) is applied at the latch edge of a swinging door and applied in any direction to a sliding or folding door, whether or not power is applied.

**19.3.6.3.8 Reserved.**

**19.3.6.3.9 Reserved.**

**19.3.6.3.10\*** Doors shall not be held open by devices other than those that release when the door is pushed or pulled.

**A.19.3.6.3.10** Doors should not be blocked open by furniture, door stops, chocks, tie-backs, drop-down or plunger-type devices, or other devices that necessitate manual unlatching or releasing action to close. Examples of hold-open devices that release when the door is pushed or pulled are friction catches or magnetic catches.

**19.3.6.3.11** Door-closing devices shall not be required on doors in corridor wall openings other than those serving required exits, smoke barriers, or enclosures of vertical openings and hazardous areas.

**19.3.6.3.12\*** Nonrated, factory- or field-applied protective plates, unlimited in height, shall be permitted.

## CHAPTER 18 • New

**A.18.3.6.3.12** It is not the intent of 18.3.6.3.12 to prohibit the application of push plates, hardware, or other attachments on corridor doors in health care occupancies.

**18.3.6.3.13** Dutch doors shall be permitted where they conform to 18.3.6.3 and meet all of the following criteria:

- (1) Both the upper leaf and lower leaf are equipped with a latching device.
- (2) The meeting edges of the upper and lower leaves are equipped with an astragal, a rabbet, or a bevel.
- (3) Where protecting openings in enclosures around hazardous areas, the doors comply with NFPA 80, *Standard for Fire Doors and Other Opening Protectives*.

#### 18.3.6.4 Transfer Grilles.

**18.3.6.4.1** Transfer grilles shall not be used in corridor walls or doors, unless otherwise permitted by 18.3.6.4.2.

**18.3.6.4.2** Doors to toilet rooms, bathrooms, shower rooms, sink closets, and similar auxiliary spaces that do not contain flammable or combustible materials shall be permitted to have ventilating louvers or to be undercut.

#### 18.3.6.5 Openings.

**18.3.6.5.1\*** In other than smoke compartments containing patient bedrooms, miscellaneous openings, such as mail slots, pharmacy pass-through windows, laboratory pass-through windows, and cashier pass-through windows, shall be permitted to be installed in vision panels or doors without special protection, provided that both of the following criteria are met:

- (1) The aggregate area of openings per room does not exceed 80 in.<sup>2</sup> (0.05 m<sup>2</sup>).
- (2) The openings are installed at or below half the distance from the floor to the room ceiling.

## CHAPTER 19 • Existing

**A.19.3.6.3.12** It is not the intent of 19.3.6.3.12 to prohibit the application of push plates, hardware, or other attachments on corridor doors in health care occupancies.

**19.3.6.3.13** Dutch doors shall be permitted where they conform to 19.3.6.3 and meet all of the following criteria:

- (1) Both the upper leaf and lower leaf are equipped with a latching device.
- (2) The meeting edges of the upper and lower leaves are equipped with an astragal, a rabbet, or a bevel.
- (3) Where protecting openings in enclosures around hazardous areas, the doors comply with NFPA 80, *Standard for Fire Doors and Other Opening Protectives*.

**19.3.6.3.14** Door frames shall be labeled, shall be of steel construction, or shall be of other materials in compliance with the provisions of Section 8.3, unless otherwise permitted by 19.3.6.3.15.

**19.3.6.3.15** Door frames in smoke compartments protected throughout by an approved, supervised automatic sprinkler system in accordance with 19.3.5.7 shall not be required to comply with 19.3.6.3.14.

**19.3.6.3.16** Fixed fire window assemblies in accordance with Section 8.3 shall be permitted in corridor doors.

**19.3.6.3.17** Restrictions in area and fire resistance of glass and frames required by Section 8.3 shall not apply in smoke compartments protected throughout by an approved, supervised automatic sprinkler system in accordance with 19.3.5.7.

#### 19.3.6.4 Transfer Grilles.

**19.3.6.4.1** Transfer grilles shall not be used in corridor walls or doors, unless otherwise permitted by 19.3.6.4.2.

**19.3.6.4.2** Doors to toilet rooms, bathrooms, shower rooms, sink closets, and similar auxiliary spaces that do not contain flammable or combustible materials shall be permitted to have ventilating louvers or to be undercut.

#### 19.3.6.5 Openings.

**19.3.6.5.1\*** Miscellaneous openings, such as mail slots, pharmacy pass-through windows, laboratory pass-through windows, and cashier pass-through windows, shall be permitted to be installed in vision panels or doors without special protection, provided that both of the following criteria are met:

- (1) The aggregate area of openings per room does not exceed 20 in.<sup>2</sup> (0.015 m<sup>2</sup>).
- (2) The openings are installed at or below half the distance from the floor to the room ceiling.

## CHAPTER 18 • New

**A.18.3.6.5.1** It is not the intent of 18.3.6.5.1 to permit mail slots or pass-through openings in doors or walls of rooms designated as a hazardous area.

**18.3.6.5.2 Reserved.**

Paragraphs 18.3.6.3.1(2) and 19.3.6.3.4 permit a maximum 1 in. (25 mm) clearance between the bottom of corridor doors — other than doors required in enclosures of vertical openings, exits, and hazardous areas, and for new nurse servers [see 18.3.6.3.1(3)] — and the upper surface of the floor-covering material. The paragraph avoids using the word “undercut,” because of the negative connotation that word conjures. It is not the intent to permit the door to be deliberately undercut for purposes of making the building heating, ventilating, and air-conditioning system function. That practice is prohibited by NFPA 90A, *Standard for the Installation of Air-Conditioning and Ventilating Systems*.<sup>16</sup> Also see 18/19.3.6.4, which addresses the concept by prohibiting transfer grilles in corridor walls.

The provisions of 18/19.3.6.3.1 require nurse servers and similar pass-through devices in corridor walls to meet the requirements for corridor doors. Further, 18.3.6.3.1(3) limits the clearance at the bottom of the door protecting such pass-through openings to not more than 1/8 in. (3 mm). Exhibit 18/19.82 shows a nurse server, or sliding supply shelving unit. When the

**Exhibit 18/19.82**

*Nurse server, or sliding supply shelving unit, in corridor wall.*

## CHAPTER 19 • Existing

**A.19.3.6.5.1** It is not the intent of 19.3.6.5.1 to permit mail slots or pass-through openings in doors or walls of rooms designated as a hazardous area.

**19.3.6.5.2** The alternative requirements of 19.3.6.5.1 shall not apply where otherwise modified by the following:

- (1) Openings in smoke compartments containing patient bedrooms shall not be permitted to be installed in vision panels or doors without special protection.
- (2) For rooms protected throughout by an approved, supervised automatic sprinkler system in accordance with 19.3.5.7, the aggregate area of openings per room shall not exceed 80 in.<sup>2</sup> (0.05 m<sup>2</sup>).

shelving unit is moved into its stored location within the patient room, a side-hinged swinging door is closed to provide the smoke resisting barrier required of the corridor wall. Note the cabinet doors located within the patient room. The doors can be opened to access supplies.

Paragraph 18.3.6.3.5 requires that doors in corridor walls in new health care occupancies be self-latching and that the latch provide positive latching. The purpose is to ensure that doors, once closed by staff, will latch against the frame automatically, without staff having to set such latch, and, once latched, remain closed until a deliberate unlatching action is initiated, such as turning a lever handle. Roller latches are not permitted in new health care occupancies, except in acute psychiatric settings where patient needs require specialized protective measures for their safety, as addressed in 18.3.6.3.9.2.

Paragraph 18.3.6.3.7 exempts powered doors in compliance with 7.2.1.9 from having to be self-latching and positive latching where complying with performance-based criteria that ensure that the closed door functions equivalently to one that is self-latching and positive latching. The provision of 18.3.6.3.7(2) clarifies that the 5 lbf (22 N) performance criterion must be met whether or not power is applied to the door.

Paragraph 18.3.6.3.8 requires that new corridor doors utilizing an inactive leaf be provided with automatic flush bolts on the inactive leaf so that positive latching is provided without staff having to throw a manual flush bolt, ensuring that the door stays closed.

Doors protecting openings in non-fire-rated corridor partitions — as permitted in new and existing sprinklered health care occupancies — must be able to resist the passage of smoke but are not required to have a fire protection rating. Door-closing devices are not required, except on doors protecting openings in exit enclosures, horizontal exits, vertical openings, or required enclosures of hazardous areas. There are no restrictions — in terms of area or fire rating for glazing used in corridor doors — in new and sprinklered existing health care occupancies.

## CHAPTER 18 • New

Patient room corridor doors are not required to have a fire protection rating in new and sprinklered existing health care occupancies. In existing nonsprinklered health care occupancies, the door need not be a true 20-minute fire protection-rated assembly; rather, it is permitted to be a substantial door, such as those constructed of 1¾ in. (44 mm) thick, solid-bonded core wood. Some consider these doors to be equivalent to 20-minute fire protection-rated doors for which the self-closer has been omitted. If the doors were truly 20-minute fire protection-rated assemblies, field-applied protective plates would be prohibited. Paragraph 18/19.3.6.3.12 reminds the user that factory- or field-applied protective plates are permitted without any height restriction.

The provisions of 18/19.3.6.3.13 address Dutch doors in corridor walls, as shown in Exhibit 18/19.83.

Existing corridor doors are not specifically required to be provided with a positive latch. However, they must be capable of being closed and maintained closed against a force of 5 lbf (22 N), applied at the latch edge of the door. In nonsprinklered buildings, roller latches are not permitted. Where positive latches are used, doors must be equipped with a latch that cannot be held in the retracted position. See 19.3.6.3.5.

Corridor doors in nonsprinklered smoke compartments in existing health care occupancies are required to be installed in steel frames, or frames in compliance with Section 8.3, which would include frames typical of a 20-minute fire protection-rated door assembly, such as might be provided by a heavy wood frame. In accordance with 19.3.6.3.16 and Section 8.3,

Exhibit 18/19.83

Dutch door in corridor wall.

## CHAPTER 19 • Existing

fixed wired glass vision panels are permitted in existing doors, provided that the glass is set in approved metal frames. Other fire-rated glazing must be used in accordance with its listing. Labeled door frames and closing devices are not required, except on doors protecting openings in exit enclosures, horizontal exits, vertical openings, or required enclosures of hazardous areas.

Paragraph 18/19.3.6.4 addresses transfer grilles in corridor walls. The use of an exit access corridor as an exhaust-air, a supply-air, or a return-air plenum for the building air-handling system is not permitted. Corridor doors are not permitted to be deliberately undercut to facilitate transfer of air, but a maximum 1 in. (25 mm) clearance is permitted at the bottom of the door in accordance with 18.3.6.3.1(2) and 19.3.6.3.4. Transfer grilles are not permitted in corridor walls (see 18/19.3.6.4.1) or corridor doors. Also see NFPA 90A. However, sink closets, bathrooms, and toilets can have doors equipped with a fixed grille or louver to allow exhaust air to be “made up” from the corridor, provided that the space is not used for the storage of flammable or combustible supplies [see 18.3.6.3.1(3) and 19.3.6.3.2(1)]. When using this exemption for sink closets, caution must be exercised to ensure that the closet is not used for the storage of combustibles.

Paragraph 18/19.3.6.5 establishes restrictions for miscellaneous openings in corridor walls. For practical reasons, many small openings are required in corridor walls for use as mail slots, as cashier windows, and as pass-throughs to laboratory or pharmacy spaces. Exhibit 18/19.84 shows a pass-through opening in a window in a corridor wall. Paragraph 18/19.3.6.5 permits such openings. Openings are not permitted in smoke compartments having sleeping rooms. In other sprinklered smoke compartments, the opening must be limited to a maximum of 80 in.<sup>2</sup> (0.05 m<sup>2</sup>) and must be located in the lower half of the partition. In existing, nonsprinklered, non-sleeping smoke compartments, the opening size is limited to 20 in.<sup>2</sup> (0.015 m<sup>2</sup>).

Exhibit 18/19.84

Pass-through opening in window in corridor wall.

## CHAPTER 18 • New

**18.3.7\* Subdivision of Building Spaces.**

**A.18.3.7** See **A.18.2.2**.

The title of **18/19.3.7**, Subdivision of Building Spaces, is terminology for the practice of providing smoke barriers to divide a floor into two or more smoke compartments. If there is a fire in one of the smoke compartments, other smoke compartments on the floor can be kept relatively free of smoke for the short-term safety of the patients in those non-fire compartments. More importantly, doors in smoke barriers permit patients to be relocated by horizontal travel (as opposed to vertical travel, as might be conducted over stairs) from the fire compartment to a safe smoke compartment so as to complement the defend-in-place strategy. The defend-in-place strategy minimizes the need to evacuate the building early in a fire in recognition that patients might be endangered during an evacuation process (see **18/19.1.1.3**). **Exhibit 18/19.85** shows smoke barrier doors through which patients can be relocated to a safe smoke compartment.

**18.3.7.1** Buildings containing health care facilities shall be subdivided by smoke barriers (see **18.2.4.3**), unless otherwise permitted by **18.3.7.2**, as follows:

- (1) To divide every story used by inpatients for sleeping or treatment into not less than two smoke compartments
- (2) To divide every story having an occupant load of 50 or more persons, regardless of use, into not less than two smoke compartments
- (3) To limit the size of each smoke compartment required by **18.3.7.1**(1) and (2) to an area not exceeding 22,500 ft<sup>2</sup> (2100 m<sup>2</sup>), unless the area is an atrium separated in accordance with **8.6.7**, in which case no limitation in size is required
- (4) To limit the travel distance from any point to reach a door in the required smoke barrier to a distance not exceeding 200 ft (61 m)

**18.3.7.2** The smoke barrier subdivision requirement of **18.3.7.1** shall not apply to any of the following occupancies:

- (1) Stories that do not contain a health care occupancy located directly above the health care occupancy
- (2) Areas on health care floors that do not contain a health care occupancy and that are separated from the health care occupancy by a fire barrier complying with **7.2.4.3**

## CHAPTER 19 • Existing

**19.3.7 Subdivision of Building Spaces.**

**Exhibit 18/19.85**

*Smoke barrier door opening providing for patient relocation to safe smoke compartment.*

**19.3.7.1** Smoke barriers shall be provided to divide every story used for sleeping rooms for more than 30 patients into not less than two smoke compartments (see **19.2.4.4**), and the following also shall apply:

- (1) The size of any such smoke compartment shall not exceed 22,500 ft<sup>2</sup> (2100 m<sup>2</sup>), and the travel distance from any point to reach a door in the required smoke barrier shall not exceed 200 ft (61 m).
- (2) Where neither the length nor width of the smoke compartment exceeds 150 ft (46 m), the travel distance to reach the smoke barrier door shall not be limited.
- (3) The area of an atrium separated in accordance with **8.6.7** shall not be limited in size.

**19.3.7.2** For purposes of the requirements of **19.3.7**, the number of health care occupants shall be determined by actual count of patient bed capacity.

## CHAPTER 18 • New

- (3) Stories that do not contain a health care occupancy and that are below the health care occupancy
- (4) Open-air parking structures protected throughout by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#)

**18.3.7.3** Any required smoke barrier shall be constructed in accordance with [Section 8.5](#) and shall have a minimum 1-hour fire resistance rating, unless otherwise permitted by one of the following:

- (1) This requirement shall not apply where an atrium is used, and both of the following criteria also shall apply:
  - (a) Smoke barriers shall be permitted to terminate at an atrium wall constructed in accordance with [8.6.7\(1\)\(c\)](#).
  - (b) Not less than two separate smoke compartments shall be provided on each floor.
- (2)\* Smoke dampers shall not be required in duct penetrations of smoke barriers in fully ducted heating, ventilating, and air-conditioning systems.

**A.18.3.7.3(2)** Where the smoke control system design requires dampers so that the system will function effectively, it is not the intent of the provision to permit the damper to be omitted.

This provision is not intended to prevent the use of plenum returns where ducting is used to return air from a ceiling plenum through smoke barrier walls. Short stubs or jumper ducts are not acceptable. Ducting is required to connect at both sides of the opening and to extend into adjacent spaces away from the wall. The intent is to prohibit open-air transfers at or near the smoke barrier walls.

**18.3.7.4** Materials and methods of construction used for required smoke barriers shall not reduce the required fire resistance rating.

**18.3.7.5** Accumulation space shall be provided in accordance with [18.3.7.5.1](#) and [18.3.7.5.2](#).

**18.3.7.5.1** Not less than 30 net ft<sup>2</sup> (2.8 net m<sup>2</sup>) per patient in a hospital or nursing home, or not less than 15 net ft<sup>2</sup> (1.4 net m<sup>2</sup>) per resident in a limited care facility, shall be provided within the aggregate area of corridors, patient rooms, treatment rooms, lounge or dining areas, and other low hazard areas on each side of the smoke barrier.

**18.3.7.5.2** On stories not housing bedridden or litterborne patients, not less than 6 net ft<sup>2</sup> (0.56 net m<sup>2</sup>) per occupant shall be provided on each side of the smoke barrier for the total number of occupants in adjoining compartments.

## CHAPTER 19 • Existing

**19.3.7.3** Any required smoke barrier shall be constructed in accordance with [Section 8.5](#) and shall have a minimum ½-hour fire resistance rating, unless otherwise permitted by one of the following:

- (1) This requirement shall not apply where an atrium is used, and both of the following criteria also shall apply:
  - (a) Smoke barriers shall be permitted to terminate at an atrium wall constructed in accordance with [8.6.7\(1\)\(c\)](#).
  - (b) Not less than two separate smoke compartments shall be provided on each floor.
- (2)\* Smoke dampers shall not be required in duct penetrations of smoke barriers in fully ducted heating, ventilating, and air-conditioning systems where an approved, supervised automatic sprinkler system in accordance with [19.3.5.8](#) has been provided for smoke compartments adjacent to the smoke barrier.

**A.19.3.7.3(2)** Where the smoke control system design requires dampers in order that the system functions effectively, it is not the intent of the exception to permit the damper to be omitted.

This provision is not intended to prevent the use of plenum returns where ducting is used to return air from a ceiling plenum through smoke barrier walls. Short stubs or jumper ducts are not acceptable. Ducting is required to connect at both sides of the opening and to extend into adjacent spaces away from the wall. The intent is to prohibit open-air transfers at or near the smoke barrier walls.

**19.3.7.4 Reserved.**

**19.3.7.5** Accumulation space shall be provided in accordance with [19.3.7.5.1](#) and [19.3.7.5.2](#).

**19.3.7.5.1** Not less than 30 net ft<sup>2</sup> (2.8 net m<sup>2</sup>) per patient in a hospital or nursing home, or not less than 15 net ft<sup>2</sup> (1.4 net m<sup>2</sup>) per resident in a limited care facility, shall be provided within the aggregate area of corridors, patient rooms, treatment rooms, lounge or dining areas, and other low hazard areas on each side of the smoke barrier.

**19.3.7.5.2** On stories not housing bedridden or litterborne patients, not less than 6 net ft<sup>2</sup> (0.56 net m<sup>2</sup>) per occupant shall be provided on each side of the smoke barrier for the total number of occupants in adjoining compartments.

## CHAPTER 18 • New

**18.3.7.6\*** Doors in smoke barriers shall be substantial doors, such as nonrated 1¾ in. (44 mm) thick, solid-bonded wood-core doors, or shall be of construction that resists fire for a minimum of 20 minutes, and shall meet the following requirements:

- (1) Nonrated factory- or field-applied protective plates, unlimited in height, shall be permitted.
- (2) Cross-corridor openings in smoke barriers shall be protected by a pair of swinging doors or a special-purpose horizontally sliding accordion or folding door assembly complying with **7.2.1.14**, unless otherwise permitted by **18.3.7.7**.
- (3) The swinging doors addressed by **18.3.7.6(2)** shall be arranged so that each door swings in a direction opposite from the other.
- (4) The minimum clear width of swinging doors shall be as follows:
  - (a) Where the corridor is required to be a minimum of 8 ft (2440 mm) wide — 41½ in. (1055 mm)
  - (b) Where the corridor is required to be a minimum of 6 ft (1830 mm) wide — 32 in. (810 mm)
- (5) The minimum clear width opening for horizontal sliding doors shall be as follows:
  - (a) Where the corridor is required to be a minimum of 8 ft (2440 mm) wide — 6 ft 11 in. (2110 mm)
  - (b) Where the corridor is required to be a minimum of 6 ft (1830 mm) wide — 64 in. (1625 mm)
- (6) The clearance under the bottom of smoke barrier doors shall not exceed ¾ in. (19 mm).

**A.18.3.7.6** Smoke barrier doors are intended to provide access to adjacent zones. The pair of cross-corridor doors are required to be opposite swinging. Access to both zones is required.

It is not the intent of **18.3.7.6** to prohibit the application of push plates, hardware, or other attachments on some barrier doors in health care occupancies. The provision of **18.3.7.6** requires the door leaves to be of substantial construction that is sufficient to resist fire for 20 minutes. Non-labeled 1¾ in. (44 mm) solid, bonded wood-core doors that are used in place of labeled 20-minute fire doors are not subject to the requirements of NFPA 80, *Standard for Fire Doors and Other Opening Protectives*, therefore, nonrated factory or field-applied protective plates unlimited in height are permitted.

**18.3.7.7** Cross-corridor openings in smoke barriers that are not in required means of egress from a health care space shall be permitted to be protected by a single-leaf door.

**18.3.7.8\*** Doors in smoke barriers shall comply with **8.5.4** and all of the following:

- (1) The doors shall be self-closing or automatic-closing in accordance with **18.2.2.2.7**.
- (2) Latching hardware shall not be required.

## CHAPTER 19 • Existing

**19.3.7.6** Openings in smoke barriers shall be protected using one of the following methods:

- (1) Fire-rated glazing
- (2) Existing wired glass panels in steel frames

**19.3.7.6.1\*** Nonrated factory- or field-applied protective plates, unlimited in height, shall be permitted.

**A.19.3.7.6.1** It is not the intent of **19.3.7.6.1** to prohibit the application of push plates, hardware, or other attachments on smoke barrier doors in health care occupancies.

**19.3.7.6.2** Vision panels, if provided, in doors shall be protected using one of the following methods:

- (1) Fixed fire window assemblies in accordance with **Section 8.5**
- (2) Existing wired glass panels in steel frames

**19.3.7.7 Reserved.**

**19.3.7.8\*** Doors in smoke barriers shall comply with **8.5.4** and all of the following:

- (1) The doors shall be self-closing or automatic-closing in accordance with **19.2.2.2.7**.
- (2) Latching hardware shall not be required

## CHAPTER 18 • New

- (3) Stops shall be required at the head and sides of door frames.
- (4) Rabbits, bevels, or astragals shall be required at the meeting edges of pairs of doors.
- (5) Center mullions shall be prohibited.

**A.18.3.7.8** Smoke barriers might include walls having door openings other than cross-corridor doors. There is no restriction in the *Code* regarding which doors or how many doors form part of a smoke barrier. For example, doors from the corridor to individual rooms are permitted to form part of a smoke barrier. Split astragals (i.e., astragals installed on both door leaves) are also considered astragals.

**18.3.7.9\*** Vision panels consisting of fire-rated glazing in approved frames shall be provided in each cross-corridor swinging door and at each cross-corridor horizontal-sliding door in a smoke barrier.

**A.18.3.7.9** It is not the intent to require the frame to be a listed assembly.

**18.3.7.9.1** The bottom of at least one vision panel in each leaf shall be not more than 43 in. (1090 mm) above the finished floor.

**18.3.7.10** Vision panels in doors in smoke barriers, if provided, shall be of fire-rated glazing in approved frames.

**Paragraph 18.3.7.1** requires that all floors of a building housing a new health care occupancy — other than those meeting one of the four exemptions offered by 18.3.7.2 — be subdivided into smoke compartments.

Per 18.3.7.1(1), any floor used by inpatients for sleeping or treatment must be subdivided into at least two smoke compartments, regardless of floor size or number of patients. Also, 18.3.7.1(2) requires any floor with an occupant load of 50 or more persons, regardless of size or use, to be subdivided into at least two smoke compartments, using smoke barriers. However, 18.3.7.2(1) through (4) provide exemptions for some non-health care occupancy floors.

**Exhibit 18/19.86** and the text that follows illustrate the use of 18.3.7.1(1) and (2) and the four exemptions of 18.3.7.2. The provision of 18.3.7.2(4) was revised for the 2015 edition of the *Code*, permitting the former 18.3.7.2(4) to be deleted.

The following requirements are illustrated in **Exhibit 18/19.86**:

1. Floors 10 through 12 do not contain a health care occupancy and are located above the health care occupancy — per 18.3.7.2(1), they do not require smoke barriers. The word “directly” as used in 18.3.7.2(1) is not meant to limit the omission of smoke barriers to only floor 10.
2. Floors 6B through 9B are health care occupancy floors used for inpatient sleeping or treatment. Per 18.3.7.1(1), they must be subdivided by smoke barriers.

## CHAPTER 19 • Existing

- (3) The doors shall not be required to swing in the direction of egress travel.

**A.19.3.7.8** Smoke barriers might include walls having door openings other than cross-corridor doors. There is no restriction in the *Code* regarding which doors or how many doors form part of a smoke barrier. For example, doors from the corridor to individual rooms are permitted to form part of a smoke barrier.

**19.3.7.9** Door openings in smoke barriers shall be protected using one of the following methods:

- (1) Swinging door providing a clear width of not less than 32 in. (810 mm)
- (2) Special-purpose horizontally sliding accordion or folding door assemblies complying with 7.2.1.14 and providing a clear width of not less than 32 in. (810 mm)

**19.3.7.10** The requirement of 19.3.7.9 shall not apply to existing 34 in. (865 mm) doors.

Exhibit 18/19.86

*Smoke barriers for new health care occupancy buildings.*

## CHAPTER 18 • New

- Floors 6A through 9A do not contain a health care occupancy and are separated from the health care occupancy by 2-hour fire resistance-rated barriers complying with the provisions of 7.2.4.3, applicable to horizontal exit fire barriers. Per 18.3.7.2(2), they do not require smoke barriers.
- Floors 4 and 5 do not contain a health care occupancy and are below the health care occupancy. Per 18.3.7.3(3), they do not require smoke barriers.
- Floor 3 is a health care occupancy floor used for inpatient sleeping or treatment. Per 18.3.7.1(1), it must be subdivided by smoke barriers.
- Floors 1 and 2 are used as an open-air parking structure and are protected by a supervised automatic sprinkler system. Per 18.3.7.2(4), or 18.3.7.2(3) as discussed above, these floors are exempt from the smoke barrier requirement.

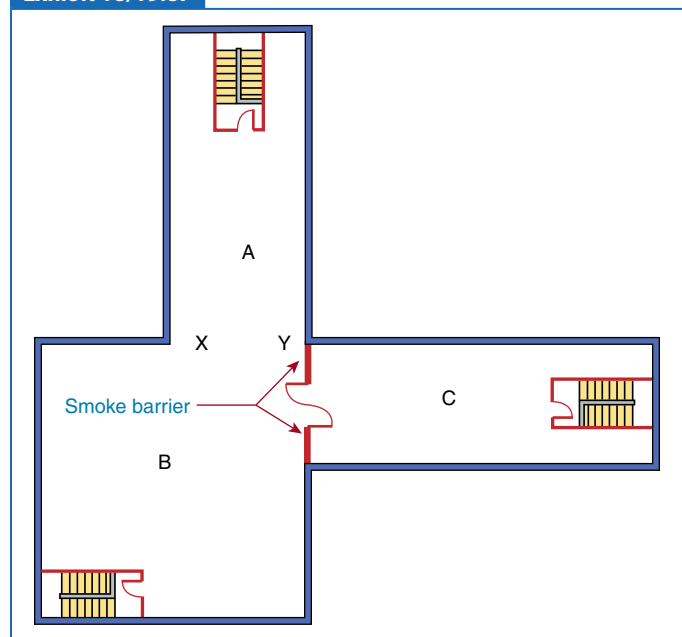

For existing health care occupancies, the introductory portion of 19.3.7.1 requires smoke barriers only for the purpose of subdividing stories having sleeping rooms for more than 30 patients. Subdivision is not required on treatment floors (provided that there are no sleeping rooms), regardless of floor area or number of patients. Patient bed capacity is to be used to determine the number of patients per story (see 19.3.7.2).

Paragraphs 18.3.7.1(3) through (5) and 19.3.7.1(1) do not present criteria related to whether smoke barriers are required in a building. Rather, they specify dimensional criteria for smoke compartments where the presence of smoke barriers is required by 18.3.7.1(1) and (2) or the introductory portion of 19.3.7.1. The maximum area of any smoke compartment created by subdividing the floor cannot exceed 22,500 ft<sup>2</sup> (2100 m<sup>2</sup>). If the compartment were perfectly square, the maximum area would measure 150 ft × 150 ft (46 m × 46 m). However, to provide the facility and designer with flexibility in the arrangement of smoke compartments, the arbitrary 150 ft (46 m) length and width limits of earlier editions were replaced in 1991 by a 200 ft (61 m) travel limitation from any point in the smoke compartment to a door in the smoke barrier [see 18.3.7.1(4) and 19.3.7.1(1)]. Smoke compartments must be designed so that a person is able to reach a smoke barrier door within a distance of travel of 200 ft (61 m) from any point in a compartment, measured along the natural path of travel in accordance with 7.6.1. However, the travel limitation is exempted by 19.3.7.1(2) for existing smoke compartments where neither the length nor width of the smoke compartment exceeds 150 ft (46 m).

In Exhibit 18/19.87, the construction of one smoke barrier divides the floor into two smoke compartments. If either smoke compartment — one consisting of the combination of areas A and B and the other consisting of area C — exceeds 22,500 ft<sup>2</sup> (2100 m<sup>2</sup>) or requires occupant travel in excess of 200 ft (61 m) to reach the doors in the smoke barrier, further subdivision using

## CHAPTER 19 • Existing

Exhibit 18/19.87

Smoke barrier dividing floor into two smoke compartments.

additional smoke barriers is required [unless both are existing smoke compartments and neither the compartment length nor width exceeds 150 ft (46 m)]. Assuming that the smoke compartment consisting of the combination of areas A and B is too large to meet the specified conditions, a second smoke barrier extending from point X to point Y might provide a logical solution.

Exhibit 18/19.88 illustrates the travel distance limitation to a door in a smoke barrier. Although the room positioned at the top of the exhibit between the smoke barrier and the enclosed exit

Exhibit 18/19.88

Limited travel distance to door in smoke barrier.

## CHAPTER 18 • New

stair has a short travel distance to an exit ( $X$  to  $E$ ), the enclosed exit stair is not usable by those incapable of self-preservation. Therefore, the distance of travel to the doors in the smoke barrier ( $X$  to  $B$ ) must not exceed 200 ft (61 m). For the existing smoke compartment, the 200 ft (61 m) criterion would be exempted if neither the smoke compartment length nor the width exceeds 150 ft (46 m). For this floor plan, an additional pair of doors in the smoke barrier where it crosses the corridor in the top half of the exhibit might provide a logical solution to a smoke compartment travel distance problem.

Horizontal exits are permitted to be substituted for smoke barriers. In such cases, the horizontal exit would also have to be constructed to comply with the smoke barrier requirements. See 7.2.4 and Section 8.5.

Areas open to atriums are not permitted to be used for patient sleeping or treatment areas (see 18/19.3.1.3). Atrium smoke compartments arranged in accordance with 8.6.7 are not limited in size.

Paragraphs 18/19.3.7.6 through 18/19.3.7.10 address smoke barrier doors. Although the cross-corridor smoke barrier doors in new health care occupancies are required to resist the penetration of fire for at least 20 minutes, they are not required to have a true fire protection rating. Similarly, the smoke barrier doors in existing health care occupancies are not required to have a true fire protection rating. Yet, some incorrectly consider these 1¾ in. (44 mm) thick, solid-bonded wood doors to be 20-minute fire protection-rated doors from which the latch has been omitted. If the door were truly a 20-minute fire protection-rated assembly, field-applied protective plates would be prohibited. Paragraphs 18.3.7.6(1) and 19.3.7.6.1 remind the user that factory- or field-applied protective plates are permitted without any height restriction.

During a fire, the emergency evacuation of patients in a health care facility is an inefficient, time-consuming process. Realistically, if patients must be moved, sizable numbers of occupants can be relocated only through horizontal travel. Smoke barriers and horizontal exits used to subdivide a building serve the following three purposes fundamental to the protection of inpatients:

1. They limit the spread of fire and smoke.
2. They limit the number of occupants exposed to a single fire.
3. They provide for the horizontal relocation of patients by creating a safe area on the same floor level.

The smoke barrier requirements result in a floor's area being divided by a barrier into a minimum of two compartments. Although not stated in the *Code*, it would be desirable to subdivide health care facilities in such a way as to have separate banks of elevators in different smoke zones. If evacuation of the building becomes necessary, patients can first be moved horizontally to a temporary area of refuge and then be removed from the floor via elevators.

## CHAPTER 19 • Existing

In new health care occupancies, the openings between the meeting edges of pairs of smoke barrier doors and between the doors and frames must be minimized to retard the transfer of smoke. Because 18.3.7.6(3) requires swinging doors to swing in directions opposite from each other, the protection at the meeting edge does not create a door-closing coordination problem and, therefore, is simple to provide. An overlapping astragal plate on the leading edge of one of the doors will usually suffice for compliance with 18.3.7.8(4).

Dampers are not required in ducted penetrations of smoke barriers in new health care occupancies, as addressed in 18.3.7.3(2). This exemption anticipates that automatic sprinklers will limit fire size and that duct systems will also inhibit the transfer of smoke. This exemption does not prohibit the installation of smoke dampers, nor does it permit the omission of the smoke damper if the damper is required for other reasons. For example, if the building has a smoke control system that needs a smoke damper at the smoke barrier, such a damper must be installed. An automatic-closing damper, activated by a smoke detector, would be required to protect a transfer grille.

Exhibit 18/19.89 shows a cross-corridor door opening in a smoke barrier for which Exhibit 18/19.90, Exhibit 18/19.91, and Exhibit 18/19.92 address penetrations of the smoke barrier in the above-ceiling space. Exhibit 18/19.90 shows wiring and pipe penetrations of the smoke barrier. Exhibit 18/19.91 shows a duct penetration protected by a smoke damper. Exhibit 18/19.92 shows a placard that reminds workers who access the above-ceiling space not to penetrate the smoke barrier.

Note that, for existing smoke barriers, the combination fire/smoke dampers required in 8.5.5.2 are permitted to be omitted

Exhibit 18/19.89

Smoke barrier duct penetration protected by smoke damper.

Exhibit 18/19.93

Details of new smoke barrier.

in engineered smoke control systems if the system design is such that a damper is not required at that point. Paragraph 19.3.7.3(2) also permits deletion of dampers in ducted penetrations of smoke barriers where compartments adjacent to the barrier are protected by automatic sprinklers (quick-response sprinklers in any smoke compartments used for patient sleeping). This exemption would not be permitted if an engineered smoke control system required a damper at this point. Openings for transfer grilles require automatic-closing dampers.

Exhibit 18/19.93 and Exhibit 18/19.94 illustrate some of the detailed requirements of 18/19.3.7 for subdividing building spaces through the use of smoke barriers.

In Exhibit 18/19.95, the smoke barrier requirement for a building with an atrium is satisfied by running the smoke barrier partition directly through the building from one outside wall to

the opposite outside wall and hugging one edge of the open atrium space. In Exhibit 18/19.96, 18/19.3.7.1(3) is used to permit the smoke compartment containing the atrium to be unlimited in size. The patient floor is divided into three smoke compartments by locating two smoke barriers away from the atrium opening, thus preserving the visual impact of the atrium. The center smoke compartment, which includes the atrium, is not limited in size, but the distance of travel from any point to a smoke barrier door is limited to 200 ft (61 m).

## CHAPTER 18 • New

## CHAPTER 19 • Existing

Exhibit 18/19.94

Details of existing smoke barrier.

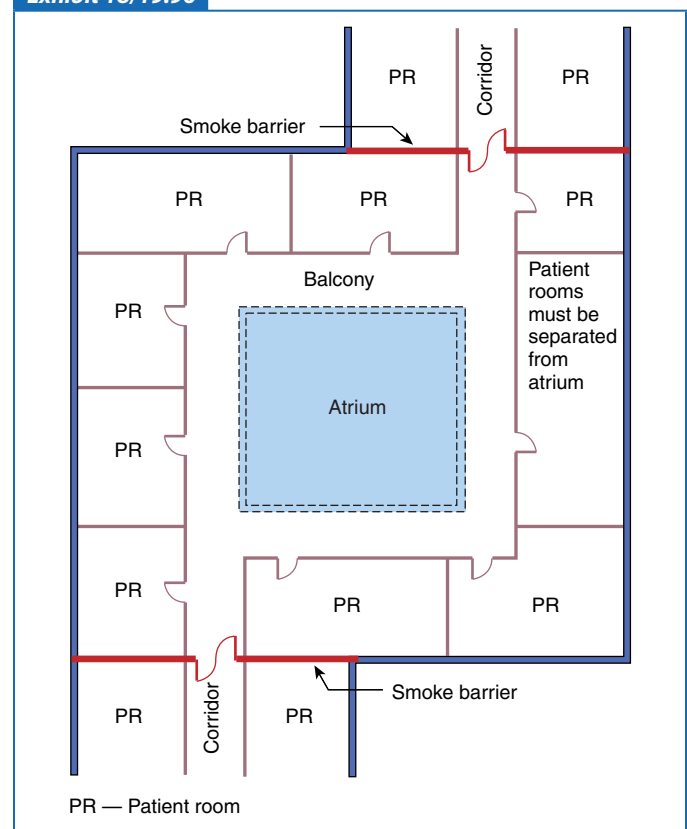

Exhibit 18/19.95

Smoke compartments in atrium building.

The provisions of 18/19.3.7 provide details for the design and installation of smoke barriers. As with other systems and features required by the Code, maintenance and care are important to the proper functioning of smoke barriers under fire or similar emergency. Exhibit 18/19.97 shows an open cross-corridor smoke barrier door on a nonpatient floor of a hospital. Tables line the corridor to support a crafts sale. Note that the door and its required space for proper operation have been left free of obstruction to help ensure that the door will close automatically, without interference, when needed.

Exhibit 18/19.96

Atrium smoke compartment with unlimited area.

Exhibit 18/19.97

Smoke barrier door left free of obstruction to permit proper closing.

## CHAPTER 18 • New

**18.3.8 Special Protection Features. (Reserved)**

Editions of the *Code* prior to 1994 required an outside door or outside window in each room where patients sleep, and the outside window was required to be operable so as to provide venting. In 1994, the operability requirement was deleted, but the

**18.4 Special Provisions**

**18.4.1 Limited Access Buildings.** Limited access buildings or limited access portions of buildings shall not be used for patient sleeping rooms and shall comply with [Section 11.7](#).

**18.4.2 High-Rise Buildings.** High-rise buildings shall comply with [Section 11.8](#).

The provision of [19.4.2.1](#) requires existing high-rise health care occupancy buildings to be sprinklered within 12 years of the adoption of the 2012 edition of the *Code*. This requirement first appeared in the 2009 edition of the *Code*, at which time the 12-year time interval began with the adoption of the 2009 edition. The provision of [19.4.2.2](#) prevents the 12-year interval from

## CHAPTER 19 • Existing

**19.3.8 Special Protection Features. (Reserved)**

outside door or outside window requirement remained. The requirement for an outside window or outside door was deleted for the 2009 edition, as the total concept approach of [18/19.1.1.3](#) can be achieved without reliance on such an opening.

**19.4 Special Provisions**

**19.4.1 Limited Access Buildings.** See [Section 11.7](#) for requirements for limited access buildings.

**19.4.2 High-Rise Buildings.**

**19.4.2.1** All high-rise buildings containing health care occupancies shall be protected throughout by an approved, supervised automatic sprinkler system installed in accordance with [Section 9.7](#) within 12 years of the adoption of this *Code*, except as otherwise provided in [19.4.2.2](#) or [19.4.2.3](#).

**19.4.2.2\*** Where a jurisdiction adopts this edition of the *Code* and previously adopted the 2012 edition, the sprinklering required by [19.4.2.1](#) shall be installed within 9 years of the adoption of this *Code*.

**A.19.4.2.2** The provision of [19.4.2.2](#) is intended to prevent the phase-in period for the installation of sprinklers from being reset to 12 years upon adoption of the 2015 edition of the *Code* in jurisdictions where the 12-year period had already begun via the adoption of the 2012 edition.

**19.4.2.3\*** Where a jurisdiction adopts this edition of the *Code* and previously adopted the 2009 edition, the sprinklering required by [19.4.2.1](#) shall be installed within 6 years of the adoption of this *Code*.

**A.19.4.2.3** The provision of [19.4.2.3](#) is intended to prevent the phase-in period for the installation of sprinklers from being reset to 12 years upon adoption of the 2015 edition of the *Code* in jurisdictions where the 12-year period had already begun via the adoption of the 2009 edition.

starting anew when the 2012 edition is adopted in jurisdictions that previously adopted the 2009 edition. The provision of [19.4.2.3](#) is new to the 2015 edition of the *Code*. As the advisory text of [A.19.4.2.3](#) explains, [19.4.2.3](#) was added to prevent the 12-year interval from starting anew when the 2015 edition is adopted in jurisdictions that previously adopted the 2009 edition.

## CHAPTER 18 • New

**18.4.3\* Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers shall be protected in accordance with **8.7.3.1**, unless all of the following conditions are met:

- (1) Where dispensers are installed in a corridor, the corridor shall have a minimum width of 6 ft (1830 mm).
- (2) The maximum individual dispenser fluid capacity shall be as follows:
  - (a) 0.32 gal (1.2 L) for dispensers in rooms, corridors, and areas open to corridors
  - (b) 0.53 gal (2.0 L) for dispensers in suites of rooms
- (3) Where aerosol containers are used, the maximum capacity of the aerosol dispenser shall be 18 oz (0.51 kg) and shall be limited to Level 1 aerosols as defined in NFPA 30B, *Code for the Manufacture and Storage of Aerosol Products*.
- (4) Dispensers shall be separated from each other by horizontal spacing of not less than 48 in. (1220 mm).
- (5) Not more than an aggregate 10 gal (37.8 L) of alcohol-based hand-rub solution or 1135 oz (32.2 kg) of Level 1 aerosols, or a combination of liquids and Level 1 aerosols not to exceed, in total, the equivalent of 10 gal (37.8 L) or 1135 oz (32.2 kg), shall be in use outside of a storage cabinet in a single smoke compartment, except as otherwise provided in **18.4.3(6)**.
- (6) One dispenser complying with **18.4.3(2)** or (3) per room and located in that room shall not be included in the aggregated quantity addressed in **18.4.3(5)**.
- (7) Storage of quantities greater than 5 gal (18.9 L) in a single smoke compartment shall meet the requirements of NFPA 30, *Flammable and Combustible Liquids Code*.
- (8) Dispensers shall not be installed in the following locations:
  - (a) Above an ignition source within a 1 in. (25 mm) horizontal distance from each side of the ignition source
  - (b) To the side of an ignition source within a 1 in. (25 mm) horizontal distance from the ignition source
  - (c) Beneath an ignition source within a 1 in. (25 mm) vertical distance from the ignition source
- (9) Dispensers installed directly over carpeted floors shall be permitted only in sprinklered smoke compartments.
- (10) The alcohol-based hand-rub solution shall not exceed 95 percent alcohol content by volume.
- (11) Operation of the dispenser shall comply with the following criteria:
  - (a) The dispenser shall not release its contents except when the dispenser is activated, either manually or automatically by touch-free activation.
  - (b) Any activation of the dispenser shall occur only when an object is placed within 4 in. (100 mm) of the sensing device.
  - (c) An object placed within the activation zone and left in place shall not cause more than one activation.

## CHAPTER 19 • Existing

**19.4.3\* Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers shall be protected in accordance with **8.7.3.1**, unless all of the following conditions are met:

- (1) Where dispensers are installed in a corridor, the corridor shall have a minimum width of 6 ft (1830 mm).
- (2) The maximum individual dispenser fluid capacity shall be as follows:
  - (a) 0.32 gal (1.2 L) for dispensers in rooms, corridors, and areas open to corridors
  - (b) 0.53 gal (2.0 L) for dispensers in suites of rooms
- (3) Where aerosol containers are used, the maximum capacity of the aerosol dispenser shall be 18 oz (0.51 kg) and shall be limited to Level 1 aerosols as defined in NFPA 30B, *Code for the Manufacture and Storage of Aerosol Products*.
- (4) Dispensers shall be separated from each other by horizontal spacing of not less than 48 in. (1220 mm).
- (5) Not more than an aggregate 10 gal (37.8 L) of alcohol-based hand-rub solution or 1135 oz (32.2 kg) of Level 1 aerosols, or a combination of liquids and Level 1 aerosols not to exceed, in total, the equivalent of 10 gal (37.8 L) or 1135 oz (32.2 kg), shall be in use outside of a storage cabinet in a single smoke compartment, except as otherwise provided in **19.4.3(6)**.
- (6) One dispenser complying with **18.4.3(2)** or (3) per room and located in that room shall not be included in the aggregated quantity addressed in **19.4.3(5)**.
- (7) Storage of quantities greater than 5 gal (18.9 L) in a single smoke compartment shall meet the requirements of NFPA 30, *Flammable and Combustible Liquids Code*.
- (8) Dispensers shall not be installed in the following locations:
  - (a) Above an ignition source within a 1 in. (25 mm) horizontal distance from each side of the ignition source
  - (b) To the side of an ignition source within a 1 in. (25 mm) horizontal distance from the ignition source
  - (c) Beneath an ignition source within a 1 in. (25 mm) vertical distance from the ignition source
- (9) Dispensers installed directly over carpeted floors shall be permitted only in sprinklered smoke compartments.
- (10) The alcohol-based hand-rub solution shall not exceed 95 percent alcohol content by volume.
- (11) Operation of the dispenser shall comply with the following criteria:
  - (a) The dispenser shall not release its contents except when the dispenser is activated, either manually or automatically by touch-free activation.
  - (b) Any activation of the dispenser shall occur only when an object is placed within 4 in. (100 mm) of the sensing device.
  - (c) An object placed within the activation zone and left in place shall not cause more than one activation.

## CHAPTER 18 • New

- (d) The dispenser shall not dispense more solution than the amount required for hand hygiene consistent with label instructions.
- (e) The dispenser shall be designed, constructed, and operated in a manner that ensures that accidental or malicious activation of the dispensing device is minimized.
- (f) The dispenser shall be tested in accordance with the manufacturer's care and use instructions each time a new refill is installed.

**A.18.4.3** Extensive research, including fire modeling, has indicated that alcohol-based hand-rub solutions can be safely installed in corridors of health care facilities, provided that certain other precautions are taken. The total quantities of flammable liquids in any area should comply with the provisions of other recognized codes, including NFPA 1, *Fire Code*, and NFPA 30, *Flammable and Combustible Liquids Code*. In addition, special consideration should be given to the following:

- (1) Obstructions created by the installation of hand-rub solution dispensers
- (2) Location of dispensers with regard to adjacent combustible materials and potential sources of ignition, especially where dispensers are mounted on walls of combustible construction
- (3) Requirements for other fire protection features, including complete automatic sprinkler protection, to be installed throughout the compartment
- (4) Amount and location of the flammable solutions, both in use and in storage, particularly with respect to potential for leakage or failure of the dispenser

The provisions for alcohol-based hand-rub (ABHR) dispensers were added to the *Code* for the 2006 edition and revised for the 2009, 2012, and 2015 editions. The provisions of 18/19.4.3 permit limited use of such dispensers in corridors, rooms, and suites. Dispensers not meeting all the criteria of 18/19.4.3(1) through 18/19.4.3(11) are subject to regulation as flammable liquids in accordance with 8.7.3.

Note that, in addition to the criteria of 18/19.3.2.6(1) through 18/19.3.2.6(11), the ABHR dispensers are limited to encroaching not more than 6 in. (150 mm) into the minimum 6 ft (1830 mm) width corridor in accordance with 18/19.2.3.4(2). Exhibit 18/19.98 shows an ABHR dispenser installed on a corridor wall.

The provision of 18/19.3.2.6(8) addresses acceptable proximity to combustion sources. Exhibit 18/19.99 illustrates the area, above and to the side of an ignition source, from which ABHR dispensers are prohibited from being located.

## CHAPTER 19 • Existing

- (d) The dispenser shall not dispense more solution than the amount required for hand hygiene consistent with label instructions.
- (e) The dispenser shall be designed, constructed, and operated in a manner that ensures that accidental or malicious activation of the dispensing device is minimized.
- (f) The dispenser shall be tested in accordance with the manufacturer's care and use instructions each time a new refill is installed.

**A.19.4.3** Extensive research, including fire modeling, has indicated that alcohol-based hand-rub solutions can be safely installed in corridors of health care facilities, provided that certain other precautions are taken. The total quantities of flammable liquids in any area should comply with the provisions of other recognized codes, including NFPA 1, *Fire Code*, and NFPA 30, *Flammable and Combustible Liquids Code*. In addition, special consideration should be given to the following:

- (1) Obstructions created by the installation of hand-rub solution dispensers
- (2) Location of dispensers with regard to adjacent combustible materials and potential sources of ignition, especially where dispensers are mounted on walls of combustible construction
- (3) Requirements for other fire protection features, including complete automatic sprinkler protection, to be installed throughout the compartment
- (4) Amount and location of the flammable solutions, both in use and in storage, particularly with respect to potential for leakage or failure of the dispenser

Exhibit 18/19.98

#### 18.4.4 Nonsprinklered Existing Smoke Compartment Rehabilitation.

**18.4.4.1\* General.** Where a modification in a nonsprinklered smoke compartment is exempted by the provisions of 18.1.1.4.3.4 from the sprinkler requirement of 18.3.5.1, the requirements of 18.4.4.2 through 18.4.4.8 shall apply.

**A.18.4.4.1** For example, the provisions of 18.1.1.4.3.1(2) and 18.1.1.4.3.4 do not require the installation of sprinklers if the modification involves less than 50 percent of the area of the

## CHAPTER 18 • New

## CHAPTER 19 • Existing

smoke compartment and less than 4500 ft<sup>2</sup> (420 m<sup>2</sup>) of the area of the smoke compartment.

**18.4.4.2 Minimum Construction Requirements (Nonsprinklered Smoke Compartment Rehabilitation).** Health care occupancies in buildings not protected throughout by an approved, supervised automatic sprinkler system in accordance with 19.3.5.7 shall be limited to the building construction types specified in Table 18.4.4.2.

**18.4.4.3 Capacity of Means of Egress (Nonsprinklered Smoke Compartment Rehabilitation).** The capacity of the means of egress serving the modification area shall be as follows:

- (1) ½ in. (13 mm) per person for horizontal travel, without stairs, by means such as doors, ramps, or level floor surfaces
- (2) 0.6 in. (15 mm) per person for travel by means of stairs

**18.4.4.4 Travel Distance (Nonsprinklered Smoke Compartment Rehabilitation).**

**18.4.4.4.1** The travel distance between any room door required as an exit access and an exit shall not exceed the following:

- (1) 150 ft (46 m) where the travel is wholly within smoke compartments protected throughout by an approved, supervised automatic sprinkler system in accordance with 19.3.5.7
- (2) 100 ft (30 m) where the travel is not wholly within smoke compartments protected throughout by an approved, supervised automatic sprinkler system in accordance with 19.3.5.7

**18.4.4.4.2** The travel distance between any point in a room and an exit shall not exceed the following:

- (1) 200 ft (61 m) where the travel is wholly within smoke compartments protected throughout by an approved supervised sprinkler system in accordance with 19.3.5.7
- (2) 150 ft (46 m) where the travel is not wholly within smoke compartments protected throughout by an approved supervised sprinkler system in accordance with 19.3.5.7

**18.4.4.5 Hazardous Area Protection (Nonsprinklered Smoke Compartment Rehabilitation).**

**18.4.4.5.1** Where a new hazardous area is formed in an existing nonsprinklered smoke compartment, the hazardous area itself shall be protected as indicated in Table 18.4.4.5.1.

**18.4.4.5.2** Laboratories in which chemicals are handled or stored shall comply with NFPA 45, *Standard on Fire Protection for Laboratories Using Chemicals*.

**18.4.4.6 Interior Finish (Nonsprinklered Smoke Compartment Rehabilitation).**

**18.4.4.6.1 General.** Interior finish within the modification area shall be in accordance with Section 10.2.

**Table 18.4.4.2 Construction Type Limitations (Nonsprinklered Buildings)**

Construction Type	Sprinklered	Total Number of Stories of Building <sup>†</sup>			
		1	2	3	≥4
I (442)	Yes	NA	NA	NA	NA
	No	X	X	X	X
I (332)	Yes	NA	NA	NA	NA
	No	X	X	X	X
II (222)	Yes	NA	NA	NA	NA
	No	X	X	X	X
II (111)	Yes	NA	NA	NA	NA
	No	X	NP	NP	NP
II (000)	Yes	NA	NA	NA	NA
	No	NP	NP	NP	NP
III (211)	Yes	NA	NA	NA	NA
	No	NP	NP	NP	NP
III (200)	Yes	NA	NA	NA	NA
	No	NP	NP	NP	NP
IV (2HH)	Yes	NA	NA	NA	NA
	No	NP	NP	NP	NP
V (111)	Yes	NA	NA	NA	NA
	No	NP	NP	NP	NP
V (000)	Yes	NA	NA	NA	NA
	No	NP	NP	NP	NP

NA: Not applicable. X: Permitted. NP: Not permitted.

The total number of stories of the building is required to be determined as follows:

- (1) The total number of stories is to be counted starting with the level of exit discharge and ending with the highest occupiable story of the building.
- (2) Stories below the level of exit discharge are not counted as stories.
- (3) Interstitial spaces used solely for building or process systems directly related to the level above or below are not considered a separate story.
- (4) A mezzanine in accordance with 8.6.9 is not counted as a story.

<sup>†</sup>Basements are not counted as stories.

**18.4.4.6.2 Interior Wall and Ceiling Finish.** Newly installed interior wall and ceiling finish materials complying with Section 10.2 shall be permitted throughout nonsprinklered smoke compartments if the materials are Class A, except as otherwise permitted in 18.4.4.6.2.1 or 18.4.4.6.2.2.

**18.4.4.6.2.1** Walls and ceilings shall be permitted to have Class A or Class B interior finish in individual rooms having a capacity not exceeding four persons.

## CHAPTER 18 • New

## CHAPTER 19 • Existing

**Table 18.4.4.5.1 Hazardous Area Protection (Nonsprinklered Buildings)**

Hazardous Area Description	Protection*/Separation
Boiler and fuel-fired heater rooms	1 hour and sprinklers
Central/bulk laundries larger than 100 ft <sup>2</sup> (9.3 m <sup>2</sup> )	1 hour and sprinklers
Paint shops employing hazardous substances and materials in quantities less than those that would be classified as a severe hazard	1 hour and sprinklers
Physical plant maintenance shops	1 hour and sprinklers
Soiled linen rooms	1 hour and sprinklers
Storage rooms larger than 50 ft <sup>2</sup> (4.6 m <sup>2</sup> ) but not exceeding 100 ft <sup>2</sup> (9.3 m <sup>2</sup> ) and storing combustible material	1 hour or sprinklers ( <i>Also see 18.4.4.7.2.2.</i> )
Storage rooms larger than 100 ft <sup>2</sup> (9.3 m <sup>2</sup> ) and storing combustible material	1 hour and sprinklers
Trash collection rooms	1 hour and sprinklers

\*Minimum fire resistance rating.

**18.4.4.6.2.2** Corridor wall finish not exceeding 48 in. (1220 mm) in height and restricted to the lower half of the wall shall be permitted to be Class A or Class B.

### 18.4.4.6.3 Interior Floor Finish.

**18.4.4.6.3.1** Newly installed interior floor finish shall comply with [Section 10.2](#).

**18.4.4.6.3.2** The requirements for newly installed interior floor finish in exit enclosures and corridors not separated from them by walls complying with [19.3.5.7](#) shall be as follows:

- (1) Unrestricted in smoke compartments protected throughout by an approved, supervised automatic sprinkler system in accordance with [19.3.5.7](#)
- (2) Not less than Class I in smoke compartments not protected throughout by an approved, supervised automatic sprinkler system in accordance with [19.3.5.7](#)

### 18.4.4.7 Corridors (Nonsprinklered Smoke Compartment Rehabilitation).

#### 18.4.4.7.1 Construction of Corridor Walls.

**18.4.4.7.1.1** Where the smoke compartment being modified is not protected throughout by an approved, supervised automatic sprinkler system in accordance with [19.3.5.7](#), corridor walls shall comply with all of the following, as modified by [18.4.4.7.1.2](#):

## CHAPTER 18 • New

- (1) They shall have a minimum ½-hour fire resistance rating.
- (2) They shall be continuous from the floor to the underside of the floor or roof deck above.
- (3) They shall resist the passage of smoke.

**18.4.4.7.1.2** The requirements of **18.4.4.7.1.1** shall be permitted to be modified for conditions permitted by **19.3.6.1(3)** and (4) and **19.3.6.1(6)** through (8).

#### **18.4.4.7.2 Corridor Doors.**

**18.4.4.7.2.1** Where the smoke compartment being modified is not protected throughout by an approved, supervised automatic sprinkler system in accordance with **19.3.5.7**, all of the following shall apply:

- (1) Doors protecting corridor openings shall be constructed of 1¾ in. (44 mm) thick, solid-bonded core wood or of construction that resists the passage of fire for a minimum of 20 minutes.
- (2) Door frames shall be labeled or of steel construction.
- (3) Existing roller latches demonstrated to keep the door closed against a force of 5 lbf (22 N) shall be permitted.

**18.4.4.7.2.2** Door-closing devices shall be required on doors in corridor wall openings serving smoke barriers or enclosures of exits, hazardous contents areas, or vertical openings.

**18.4.4.8 Subdivision of Building Space (Nonsprinklered Smoke Compartment Rehabilitation).** **Subparagraph 18.3.7.3(2)** shall be permitted only where adjacent smoke compartments are protected throughout by an approved, supervised automatic sprinkler system in accordance with **18.3.5.4** and **18.3.5.6**.

**Chapter 18** requires that new health care occupancies be protected throughout by approved, supervised automatic sprinkler systems. However, in establishing the sprinkler requirement, the Technical Committee on Health Care Occupancies realized that rehabilitation often takes place in nonsprinklered existing buildings. The commentary that follows **A.18/19.1.1.4.3.4** explains that nonsprinklered smoke compartments undergoing major rehabilitation are required to be sprinklered as part of the rehabilitation project, but nonsprinklered smoke compartments undergoing minor rehabilitation are not required to be sprinklered simply because the rehabilitation occurs. Paragraph **18.1.1.4.3.4** confirms that, where minor rehabilitation is done in a nonsprinklered smoke compartment, the sprinkler requirements of **18.3.5.1** do not apply. Additionally, **18.1.1.4.3.4** requires that the rehabilitation must not reduce life safety below the level required for new buildings or below the level of the requirements of **18.4.4** for nonsprinklered smoke compartment rehabilitation. Similarly, **18.4.4.1** completes the reference trail by requiring that, where a modification in a nonsprinklered smoke compartment is exempted by the provisions of **18.1.1.4.3.4** from

## CHAPTER 19 • Existing

the sprinkler requirement of **18.3.5.1**, the requirements of **18.4.4.2** through **18.4.4.8** must be met.

The requirements of **18.4.4.2** through **18.4.4.8** provide additional criteria needed for the proper protection of nonsprinklered existing building rehabilitation. For example, **18.4.4.2** limits travel distance to 150 ft (46 m) where the travel is not wholly within sprinklered smoke compartments. If the renovation in the nonsprinklered building is predicated on the provisions of **18.2.6.2.1**, the travel distance limitation could mistakenly be interpreted to be 200 ft (61 m) between any point in a room and an exit. The 200 ft (61 m) limitation is intended to apply only to sprinklered buildings.

**Subsection 18.4.4** serves as a repository for provisions that were contained in the chapter for new health care occupancies before 1991, when sprinklers were mandated for all new health care occupancies. Its provisions remind the user that the requirements interspersed throughout **Chapter 18** are predicated on the presence of sprinkler protection. If sprinklers are not installed, additional requirements must be met in an attempt to achieve a level of life safety approaching that provided in a sprinklered

## CHAPTER 18 • New

building. However, even if all the former specifications for non-sprinklered buildings are met, the overall level of life safety will not necessarily be the same as that provided in a sprinklered facility. When the 1991 edition of the *Code* presented the first

## 18.5 Building Services

### 18.5.1 Utilities.

**18.5.1.1** Utilities shall comply with the provisions of **Section 9.1**.

**18.5.1.2** Power for alarms, emergency communications systems, and illumination of generator set locations shall be in accordance with the essential electrical system requirements of NFPA 99, *Health Care Facilities Code*.

**18.5.1.3** Any health care occupancy, as indicated in **18.1.1.1.4**, that normally uses life-support devices shall have electrical systems designed and installed in accordance with NFPA 99, *Health Care Facilities Code*, unless the facility uses life-support equipment for emergency purposes only.

### 18.5.2 Heating, Ventilating, and Air-Conditioning.

**18.5.2.1** Heating, ventilating, and air-conditioning shall comply with the provisions of **Section 9.2** and shall be installed in accordance with the manufacturer's specifications, unless otherwise modified by **18.5.2.2**.

**18.5.2.2\*** Any heating device, other than a central heating plant, shall be designed and installed so that combustible material cannot be ignited by the device or its appurtenances, and the following requirements shall also apply:

- (1) If fuel-fired, such heating devices shall comply with the following:
  - (a) They shall be chimney connected or vent connected.
  - (b) They shall take air for combustion directly from outside.
  - (c) They shall be designed and installed to provide for complete separation of the combustion system from the atmosphere of the occupied area.
- (2) Any heating device shall have safety features to immediately stop the flow of fuel and shut down the equipment in case of either excessive temperatures or ignition failure.

**A.18.5.2.2** For both new and existing buildings, it is the intent to permit the installation and use of fireplace stoves and room heaters utilizing solid fuel as defined in NFPA 211, *Standard for Chimneys, Fireplaces, Vents, and Solid Fuel-Burning Appliances*, provided that all such devices are installed, maintained, and used in accordance with the appropriate provisions of that standard and all manufacturers' specifications. These

## CHAPTER 19 • Existing

requirement for sprinklering of all new health care occupancies, the overall level of life safety was elevated from that provided by compliance with the nonsprinklered building option.

## 19.5 Building Services

### 19.5.1 Utilities.

**19.5.1.1** Utilities shall comply with the provisions of **Section 9.1**.

**19.5.1.2** Existing installations shall be permitted to be continued in service, provided that the systems do not present a serious hazard to life.

### 19.5.2 Heating, Ventilating, and Air-Conditioning.

**19.5.2.1** Heating, ventilating, and air-conditioning shall comply with the provisions of **Section 9.2** and shall be installed in accordance with the manufacturer's specifications, unless otherwise modified by **19.5.2.2**.

**19.5.2.2\*** Any heating device, other than a central heating plant, shall be designed and installed so that combustible material cannot be ignited by the device or its appurtenances, and the following requirements also shall apply:

- (1) If fuel-fired, such heating devices shall comply with the following:
  - (a) They shall be chimney connected or vent connected.
  - (b) They shall take air for combustion directly from the outside.
  - (c) They shall be designed and installed to provide for complete separation of the combustion system from the atmosphere of the occupied area.
- (2) Any heating device shall have safety features to immediately stop the flow of fuel and shut down the equipment in case of either excessive temperature or ignition failure.

**A.19.5.2.2** For both new and existing buildings, it is the intent to permit the installation and use of fireplace stoves and room heaters using solid fuel as defined in NFPA 211, *Standard for Chimneys, Fireplaces, Vents, and Solid Fuel-Burning Appliances*, provided that all such devices are installed, maintained, and used in accordance with the appropriate provisions of that standard and all manufacturers' specifications. These

## CHAPTER 18 • New

requirements are not intended to permit freestanding solid fuel–burning appliances such as freestanding wood-burning stoves.

**18.5.2.3** The requirements of **18.5.2.2** shall not apply where otherwise permitted by the following:

- (1) Approved, suspended unit heaters shall be permitted in locations other than means of egress and patient sleeping areas, provided that both of the following criteria are met:
  - (a) Such heaters are located high enough to be out of the reach of persons using the area.
  - (b) Such heaters are equipped with the safety features required by **18.5.2.2(2)**.
- (2) Direct-vent gas fireplaces, as defined in NFPA 54, *National Fuel Gas Code*, shall be permitted inside of smoke compartments containing patient sleeping areas, provided that all of the following criteria are met:
  - (a) All such devices shall be installed, maintained, and used in accordance with **9.2.2**.
  - (b) No such device shall be located inside of a patient sleeping room.
  - (c) The smoke compartment in which the direct-vent gas fireplace is located shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with **9.7.1.1(1)** with listed quick-response or listed residential sprinklers.
  - (d)\* The direct-vent fireplace shall include a sealed glass front with a wire mesh panel or screen.
  - (e)\* The controls for the direct-vent gas fireplace shall be locked or located in a restricted location.
  - (f) Electrically supervised carbon monoxide detection in accordance with **Section 9.12** shall be provided in the room where the fireplace is located.
- (3) Solid fuel–burning fireplaces shall be permitted and used only in areas other than patient sleeping areas, provided that all of the following criteria are met:
  - (a) Such areas are separated from patient sleeping spaces by construction having not less than a 1-hour fire resistance rating.
  - (b) The fireplace complies with the provisions of **9.2.2**.
  - (c) The fireplace is equipped with both of the following:
    - i. Hearth raised not less than 4 in. (100 mm)
    - ii. Fireplace enclosure guaranteed against breakage up to a temperature of 650°F (343°C) and constructed of heat-tempered glass or other approved material
  - (d) Electrically supervised carbon monoxide detection in accordance with **Section 9.12** is provided in the room where the fireplace is located
- (4) If, in the opinion of the authority having jurisdiction, special hazards are present, a lock on the enclosure specified in

## CHAPTER 19 • Existing

requirements are not intended to permit freestanding solid fuel–burning appliances such as freestanding wood-burning stoves.

**19.5.2.3** The requirements of **19.5.2.2** shall not apply where otherwise permitted by the following:

- (1) Approved, suspended unit heaters shall be permitted in locations other than means of egress and patient sleeping areas, provided that both of the following criteria are met:
  - (a) Such heaters are located high enough to be out of the reach of persons using the area.
  - (b) Such heaters are equipped with the safety features required by **19.5.2.2(2)**.
- (2) Direct-vent gas fireplaces, as defined in NFPA 54, *National Fuel Gas Code*, shall be permitted inside of smoke compartments containing patient sleeping areas, provided that all of the following criteria are met:
  - (a) All such devices shall be installed, maintained, and used in accordance with **9.2.2**.
  - (b) No such device shall be located inside of a patient sleeping room.
  - (c) The smoke compartment in which the direct-vent gas fireplace is located shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with **9.7.1.1(1)** with listed quick-response or listed residential sprinklers.
  - (d)\* The direct-vent fireplace shall include a sealed glass front with a wire mesh panel or screen.
  - (e)\* The controls for the direct-vent gas fireplace shall be locked or located in a restricted location.
  - (f) Electrically supervised carbon monoxide detection in accordance with **Section 9.12** shall be provided in the room where the fireplace is located.
- (3) Solid fuel–burning fireplaces shall be permitted and used only in areas other than patient sleeping areas, provided that all of the following criteria are met:
  - (a) Such areas are separated from patient sleeping spaces by construction having not less than a 1-hour fire resistance rating.
  - (b) The fireplace complies with the provisions of **9.2.2**.
  - (c) The fireplace is equipped with a fireplace enclosure guaranteed against breakage up to a temperature of 650°F (343°C) and constructed of heat-tempered glass or other approved material.
  - (d) Electrically supervised carbon monoxide detection in accordance with **Section 9.12** is provided in the room where the fireplace is located.
- (4) If, in the opinion of the authority having jurisdiction, special hazards are present, a lock on the enclosure specified in

## CHAPTER 18 • New

18.5.2.3(3)(c)(ii) and other safety precautions shall be permitted to be required.

**A.18.5.2.3(2)(d)** The glass front of a direct-vent fireplace can become extremely hot. Barriers such as screens or mesh installed over the direct-vent glass help reduce the risk of burn from touching the glass.

**A.18.5.2.3(2)(e)** The intent of locating controls in a restricted location is to ensure staff is aware of use of the fireplace and to prevent unauthorized use. Examples of locked controls are a keyed switch or locating the switch in a staff-controlled location such as a staff station.

Paragraphs 18/19.5.2.1 through 18/19.5.2.3 specify safeguards for heating, ventilating, air-conditioning, and other service equipment to minimize the possibility of such devices serving as a source of ignition.

The provision of 18/19.5.2.3(2) permits direct-vent gas fireplaces so as to help to create a more homelike environment in a health care occupancy. Exhibit 18/19.100 shows a gas fireplace in a resident lounge space of a nursing home.

**18.5.3 Elevators, Escalators, and Conveyors.** Elevators, escalators, and conveyors shall comply with the provisions of Section 9.4.

Paragraph 18/19.5.3 requires elevators to comply with Section 9.4, which mandates the fire fighters' emergency operations features required in ASME A17.1/CSA B44, *Safety Code for Elevators and Escalators*,<sup>17</sup> for new elevator installations and ASME A17.3, *Safety Code for Existing Elevators and Escalators*,<sup>18</sup> for existing elevator installations. Phase 1 of the fire fighter's emergency operations requires elevators to be recalled to a designated floor (e.g., the main entrance level lobby or, alternately, to some other floor if smoke is detected in the main entrance level lobby) upon detection of smoke in the elevator machine room, in any

## CHAPTER 19 • Existing

19.5.2.3(3)(c) and other safety precautions shall be permitted to be required.

**A.19.5.2.3(2)(d)** The glass front of a direct-vent fireplace can become extremely hot. Barriers such as screens or mesh installed over the direct-vent glass help reduce the risk of burn from touching the glass.

**A.19.5.2.3(2)(e)** The intent of locating controls in a restricted location is to ensure staff is aware of use of the fireplace and to prevent unauthorized use. Examples of locked controls are a keyed switch or locating the switch in a staff-controlled location such as a staff station.

Exhibit 18/19.100

Gas fireplace in nursing home resident lounge space.

**19.5.3 Elevators, Escalators, and Conveyors.** Elevators, escalators, and conveyors shall comply with the provisions of Section 9.4.

sprinklered elevator hoistway, or in the elevator lobbies on each floor the elevators serve. Phase 1 recall helps to ensure that the elevators are called out of service, so as not to be misused by building occupants once smoke has reached an elevator lobby and its associated elevator shaft doors, or when smoke is present in the elevator machine room or hoistway. Phase 1 also provides for the elevators to be waiting at the designated floor for emergency service personnel use upon their arrival.

The ASME A17.1/CSA B44 and ASME A17.3 codes prohibit elevators from being recalled by other than smoke detection in

## CHAPTER 18 • New

the elevator machine room, the hoistway, or the elevator lobbies. Therefore, the elevator should not be recalled upon initiation of the building fire alarm system. This is consistent with the provision of 9.6.3.2.1 of this Code, which does not require the elevator recall smoke detectors to activate the building evacuation alarm, provided that the smoke detectors initiate a supervisory signal at a constantly attended location. Therefore, elevators will remain in service in parts of the building not affected by the fire and might constitute a valuable, supplemental means for evacuating patients from health care occupancies. In some cases, using an elevator might be the only feasible way to move critically ill patients or patients in restraining devices.

Elevators, however, have many inherent weaknesses that tend to limit reliability. Elevator access doors are designed with operating tolerances that allow smoke transfer into the shaft. During a fire, a power failure might cause an elevator to stop between floors, trapping its passengers.

#### 18.5.4 Waste Chutes, Incinerators, and Laundry Chutes.

**18.5.4.1** Waste chutes, incinerators, and laundry chutes shall comply with the provisions of Section 9.5, unless otherwise specified in 18.5.4.2.

**18.5.4.2** The fire resistance rating of chute service opening rooms shall not be required to exceed 1 hour.

**18.5.4.3** Any waste chute or linen chute, including pneumatic waste and linen systems, shall be provided with automatic extinguishing protection in accordance with Section 9.7. (See Section 9.5.)

**18.5.4.4** Any chute shall discharge into a chute discharge room used for no other purpose and shall be protected in accordance with Section 8.7 and Section 9.5.

**18.5.4.5** Reserved.

**18.5.4.6** Incinerators shall not be directly flue-fed, nor shall any floor-charging chute directly connect with the combustion chamber.

---

## 18.6 Reserved

## CHAPTER 19 • Existing

Many of these elevator weaknesses can be minimized by providing emergency power, separating the elevator lobby from other building spaces, using rated construction, providing an emergency smoke control system, and pressurizing the elevator shaft and adjacent lobbies. These countermeasures represent good fire protection judgment but are not requirements of this Code.

Through emergency planning and staff training, the potential problem of crowded elevators might be avoided. Emergency plans can make effective use of elevators by transferring patients through a horizontal exit, for example, to a separate fire area. Within the separate fire area, a staged evacuation program could be instituted, with the elevators taking patients to the ground level, allowing horizontal movement to the outside.

#### 19.5.4 Waste Chutes, Incinerators, and Laundry Chutes.

**19.5.4.1** Existing chutes or linen chutes, including pneumatic waste and linen systems, that open directly onto any corridor shall be sealed by fire-resistive construction to prevent further use or shall be provided with a fire door assembly having a minimum 1-hour fire protection rating. All new chutes shall comply with Section 9.5.

**19.5.4.2** Reserved.

**19.5.4.3** Any waste chute or linen chute, including pneumatic waste and linen systems, shall be provided with automatic extinguishing protection in accordance with Section 9.7. (See Section 9.5.)

**19.5.4.4** Any chute shall discharge into a chute discharge room used for no other purpose and shall be protected in accordance with Section 8.7 unless otherwise provided in 19.5.4.5.

**19.5.4.5** Existing laundry chutes shall be permitted to discharge into the same room as rubbish discharge chutes, provided that the room is protected by automatic sprinklers in accordance with 19.3.5.9 or 19.3.5.7.

**19.5.4.6** Existing flue-fed incinerators shall be sealed by fire-resistive construction to prevent further use.

---

## 19.6 Reserved

## CHAPTER 18 • New

**18.7\* Operating Features**

**A.18.7** Health care occupants have, in large part, varied degrees of physical disability, and their removal to the outside, or even their disturbance caused by moving, is inexpedient or impractical in many cases, except as a last resort. Similarly, recognizing that there might be an operating necessity for the restraint of the mentally ill, often by use of barred windows and locked doors, fire exit drills are usually extremely disturbing, detrimental, and frequently impracticable.

In most cases, fire exit drills, as ordinarily practiced in other occupancies, cannot be conducted in health care occupancies. Fundamentally, superior construction, early discovery and extinguishment of incipient fires, and prompt notification need to be relied on to reduce the occasion for evacuation of buildings of this class to a minimum.

**18.7.1 Evacuation and Relocation Plan and Fire Drills.**

**18.7.1.1** The administration of every health care occupancy shall have, in effect and available to all supervisory personnel, written copies of a plan for the protection of all persons in the event of fire, for their evacuation to areas of refuge, and for their evacuation from the building when necessary.

**18.7.1.2** All employees shall be periodically instructed and kept informed with respect to their duties under the plan required by **18.7.1.1**.

**18.7.1.3** A copy of the plan required by **18.7.1.1** shall be readily available at all times in the telephone operator's location or at the security center.

**18.7.1.4\*** Fire drills in health care occupancies shall include the transmission of a fire alarm signal and simulation of emergency fire conditions.

**A.18.7.1.4** Many health care occupancies conduct fire drills without disturbing patients by choosing the location of the simulated emergency in advance and by closing the doors to patients' rooms or wards in the vicinity prior to initiation of the drill. The purpose of a fire drill is to test and evaluate the efficiency, knowledge, and response of institutional personnel in implementing the facility fire emergency action plan. Its purpose is not to disturb or excite patients. Fire drills should be scheduled on a random basis to ensure that personnel in health care facilities are drilled not less than once in each 3-month period.

Drills should consider the ability to move patients to an adjacent smoke compartment. Relocation can be practiced using simulated patients or empty wheelchairs.

**18.7.1.5** Infirm or bedridden patients shall not be required to be moved during drills to safe areas or to the exterior of the building.

## CHAPTER 19 • Existing

**19.7\* Operating Features**

**A.19.7** Health care occupants have, in large part, varied degrees of physical disability, and their removal to the outside, or even their disturbance caused by moving, is inexpedient or impractical in many cases, except as a last resort. Similarly, recognizing that there might be an operating necessity for the restraint of the mentally ill, often by use of barred windows and locked doors, fire exit drills are usually extremely disturbing, detrimental, and frequently impracticable.

In most cases, fire exit drills, as ordinarily practiced in other occupancies, cannot be conducted in health care occupancies. Fundamentally, superior construction, early discovery and extinguishment of incipient fires, and prompt notification need to be relied on to reduce the occasion for evacuation of buildings of this class to a minimum.

**19.7.1 Evacuation and Relocation Plan and Fire Drills.**

**19.7.1.1** The administration of every health care occupancy shall have, in effect and available to all supervisory personnel, written copies of a plan for the protection of all persons in the event of fire, for their evacuation to areas of refuge, and for their evacuation from the building when necessary.

**19.7.1.2** All employees shall be periodically instructed and kept informed with respect to their duties under the plan required by **19.7.1.1**.

**19.7.1.3** A copy of the plan required by **19.7.1.1** shall be readily available at all times in the telephone operator's location or at the security center.

**19.7.1.4\*** Fire drills in health care occupancies shall include the transmission of a fire alarm signal and simulation of emergency fire conditions.

**A.19.7.1.4** Many health care occupancies conduct fire drills without disturbing patients by choosing the location of the simulated emergency in advance and by closing the doors to patients' rooms or wards in the vicinity prior to initiation of the drill. The purpose of a fire drill is to test and evaluate the efficiency, knowledge, and response of institutional personnel in implementing the facility fire emergency action plan. Its purpose is not to disturb or excite patients. Fire drills should be scheduled on a random basis to ensure that personnel in health care facilities are drilled not less than once in each 3-month period.

Drills should consider the ability to move patients to an adjacent smoke compartment. Relocation can be practiced using simulated patients or empty wheelchairs.

**19.7.1.5** Infirm or bedridden patients shall not be required to be moved during drills to safe areas or to the exterior of the building.

## CHAPTER 18 • New

**18.7.1.6** Drills shall be conducted quarterly on each shift to familiarize facility personnel (nurses, interns, maintenance engineers, and administrative staff) with the signals and emergency action required under varied conditions.

**18.7.1.7** When drills are conducted between 9:00 p.m. and 6:00 a.m. (2100 hours and 0600 hours), a coded announcement shall be permitted to be used instead of audible alarms.

**18.7.1.8** Employees of health care occupancies shall be instructed in life safety procedures and devices.

The life safety provisions applicable to health care occupancies involve more than fixed building features and systems. Life safety in this defend-in-place occupancy relies heavily on staff readiness and action. The evacuation and relocation plan and fire drill provisions of 18/19.7.1 provide the foundation for carrying out the needed staff duties, as detailed in 18/19.7.2.

The former requirement for patient beds to be on wheels or casters was deleted from the *Code* in 1991. Ordinary practice in health care occupancies is to move patients through the hospital on narrow beds, on gurneys, on carts, or in wheelchairs. The

## 18.7.2 Procedure in Case of Fire.

### 18.7.2.1\* Protection of Patients.

**A.18.7.2.1** Each facility has specific characteristics that vary sufficiently from other facilities to prevent the specification of a universal emergency procedure. The recommendations that follow, however, contain many of the elements that should be considered and adapted, as appropriate, to the individual facility.

Upon discovery of fire, personnel should immediately take the following action:

- (1) If any person is involved in the fire, the discoverer should go to the aid of that person, calling aloud an established code phrase, which provides for both the immediate aid of any endangered person and the transmission of an alarm.
- (2) Any person in the area, upon hearing the code called aloud, should activate the building fire alarm using the nearest manual fire alarm box.
- (3) If a person is not involved in the fire, the discoverer should activate the building fire alarm using the nearest manual fire alarm box.
- (4) Personnel, upon hearing the alarm signal, should immediately execute their duties as outlined in the facility fire safety plan.
- (5) The telephone operator should determine the location of the fire as indicated by the audible signal.

## CHAPTER 19 • Existing

**19.7.1.6** Drills shall be conducted quarterly on each shift to familiarize facility personnel (nurses, interns, maintenance engineers, and administrative staff) with the signals and emergency action required under varied conditions.

**19.7.1.7** When drills are conducted between 9:00 p.m. and 6:00 a.m. (2100 hours and 0600 hours), a coded announcement shall be permitted to be used instead of audible alarms.

**19.7.1.8** Employees of health care occupancies shall be instructed in life safety procedures and devices.

furniture in patient rooms — chairs, nightstands, food trays/tables, and medical equipment — must be moved out of the way to allow patient beds to be turned and moved out of the room. Moving patients in this way requires extra staff time that is usually unavailable during a fire. Emphasis should be placed on the quick movement of patients who are in the room of fire origin, as well as others who are directly exposed to the fire. Patient movement in fire emergencies is often achieved by dragging occupants on bedding, as opposed to moving beds.

## 19.7.2 Procedure in Case of Fire.

### 19.7.2.1\* Protection of Patients.

**A.19.7.2.1** Each facility has specific characteristics that vary sufficiently from other facilities to prevent the specification of a universal emergency procedure. The recommendations that follow, however, contain many of the elements that should be considered and adapted, as appropriate, to the individual facility.

Upon discovery of fire, personnel should immediately take the following action:

- (1) If any person is involved in the fire, the discoverer should go to the aid of that person, calling aloud an established code phrase, which provides for both the immediate aid of any endangered person and the transmission of an alarm.
- (2) Any person in the area, upon hearing the code called aloud, should activate the building fire alarm using the nearest manual fire alarm box.
- (3) If a person is not involved in the fire, the discoverer should activate the building fire alarm using the nearest manual fire alarm box.
- (4) Personnel, upon hearing the alarm signal, should immediately execute their duties as outlined in the facility fire safety plan.
- (5) The telephone operator should determine the location of the fire as indicated by the audible signal.

## CHAPTER 18 • New

- (6) In a building equipped with an uncoded alarm system, a person on the floor of fire origin should be responsible for promptly notifying the facility telephone operator of the fire location.
- (7) If the telephone operator receives a telephone alarm reporting a fire from a floor, the operator should regard that alarm in the same fashion as an alarm received over the fire alarm system and should immediately notify the fire department and alert all facility personnel of the place of fire and its origin.
- (8) If the building fire alarm system is out of order, any person discovering a fire should immediately notify the telephone operator by telephone, and the operator should then transmit this information to the fire department and alert the building occupants.

**18.7.2.1.1** For health care occupancies, the proper protection of patients shall require the prompt and effective response of health care personnel.

**18.7.2.1.2** The basic response required of staff shall include the following:

- (1) Removal of all occupants directly involved with the fire emergency
- (2) Transmission of an appropriate fire alarm signal to warn other building occupants and summon staff
- (3) Confinement of the effects of the fire by closing doors to isolate the fire area
- (4) Relocation of patients as detailed in the health care occupancy's fire safety plan

**18.7.2.2 Fire Safety Plan.** A written health care occupancy fire safety plan shall provide for all of the following:

- (1) Use of alarms
- (2) Transmission of alarms to fire department
- (3) Emergency phone call to fire department
- (4) Response to alarms
- (5) Isolation of fire
- (6) Evacuation of immediate area
- (7) Evacuation of smoke compartment
- (8) Preparation of floors and building for evacuation
- (9) Extinguishment of fire
- (10) Location and operation of doors disguised with murals as permitted by [18.2.2.2.7](#)

### 18.7.2.3 Staff Response.

**18.7.2.3.1** All health care occupancy personnel shall be instructed in the use of and response to fire alarms.

**18.7.2.3.2** All health care occupancy personnel shall be instructed in the use of the code phrase to ensure transmission of an alarm under any of the following conditions:

## CHAPTER 19 • Existing

- (6) In a building equipped with an uncoded alarm system, a person on the floor of fire origin should be responsible for promptly notifying the facility telephone operator of the fire location.
- (7) If the telephone operator receives a telephone alarm reporting a fire from a floor, the operator should regard that alarm in the same fashion as an alarm received over the fire alarm system and should immediately notify the fire department and alert all facility personnel of the place of fire and its origin.
- (8) If the building fire alarm system is out of order, any person discovering a fire should immediately notify the telephone operator by telephone, and the operator should then transmit this information to the fire department and alert the building occupants.

**19.7.2.1.1** For health care occupancies, the proper protection of patients shall require the prompt and effective response of health care personnel.

**19.7.2.1.2** The basic response required of staff shall include the following:

- (1) Removal of all occupants directly involved with the fire emergency
- (2) Transmission of an appropriate fire alarm signal to warn other building occupants and summon staff
- (3) Confinement of the effects of the fire by closing doors to isolate the fire area
- (4) Relocation of patients as detailed in the health care occupancy's fire safety plan

**19.7.2.2 Fire Safety Plan.** A written health care occupancy fire safety plan shall provide for all of the following:

- (1) Use of alarms
- (2) Transmission of alarms to fire department
- (3) Emergency phone call to fire department
- (4) Response to alarms
- (5) Isolation of fire
- (6) Evacuation of immediate area
- (7) Evacuation of smoke compartment
- (8) Preparation of floors and building for evacuation
- (9) Extinguishment of fire
- (10) Location and operation of doors disguised with murals as permitted by [19.2.2.2.7](#)

### 19.7.2.3 Staff Response.

**19.7.2.3.1** All health care occupancy personnel shall be instructed in the use of and response to fire alarms.

**19.7.2.3.2** All health care occupancy personnel shall be instructed in the use of the code phrase to ensure transmission of an alarm under any of the following conditions:

## CHAPTER 18 • New

- (1) When the individual who discovers a fire must immediately go to the aid of an endangered person
- (2) During a malfunction of the building fire alarm system

**18.7.2.3.3** Personnel hearing the code announced shall first activate the building fire alarm using the nearest manual fire alarm box and then shall execute immediately their duties as outlined in the fire safety plan.

In addition to the requirements of [18/19.7.2](#), evacuation plans should stress that the doors of as many patient rooms as possible be closed to block smoke spreading from a fire and, if possible, to confine the fire in a room. This single action taken by the staff (i.e., manually closing the doors) achieves the level of safety to life mandated by the *Code* in [Chapters 18 and 19](#).

In many fatal fires in health care facilities, staff either did not close doors or someone reopened them; the fire spread was

### 18.7.3 Maintenance of Means of Egress.

**18.7.3.1** Proper maintenance shall be provided to ensure the dependability of the method of evacuation selected.

**18.7.3.2** Health care occupancies that find it necessary to lock means of egress doors shall, at all times, maintain an adequate staff qualified to release locks and direct occupants from the immediate danger area to a place of safety in case of fire or other emergency.

**18.7.3.3\*** Where required by the authority having jurisdiction, a floor plan shall be provided to indicate the location of all required means of egress corridors in smoke compartments having spaces not separated from the corridor by partitions.

**A.18.7.3.3** The purpose of this requirement is to provide a means for building designers, occupants, and operators to clearly designate approved egress corridors that can be identified even though physical or other obvious barriers might not be present to indicate their location. Floor plans used to satisfy this requirement might incorporate more than one function and more than one smoke compartment of the building, provided egress corridors are clearly identified where no fixed barriers are present. Such plans should be accessible to the authority having jurisdiction but should not be required to be posted.

The provision of [18/19.7.3.3](#) is new to the 2015 edition of the *Code*. The need for the requirement was identified when [18.2.3.4\(7\)](#) was written to permit nursing home corridor width to be reduced from 8 ft (2440 mm) to 6 ft (1830 mm) in smoke compartments housing not more than 30 residents. See the

## CHAPTER 19 • Existing

- (1) When the individual who discovers a fire must immediately go to the aid of an endangered person
- (2) During a malfunction of the building fire alarm system

**19.7.2.3.3** Personnel hearing the code announced shall first activate the building fire alarm using the nearest manual fire alarm box and then shall execute immediately their duties as outlined in the fire safety plan.

sizable, and the loss of life was high. Emphasis must be placed on training staff to sound an alarm, to rescue patients (as needed), and then to close all doors. The closing of doors historically has had the most significant effect on limiting the spread of fire and smoke.

### 19.7.3 Maintenance of Means of Egress.

**19.7.3.1** Proper maintenance shall be provided to ensure the dependability of the method of evacuation selected.

**19.7.3.2** Health care occupancies that find it necessary to lock means of egress doors shall, at all times, maintain an adequate staff qualified to release locks and direct occupants from the immediate danger area to a place of safety in case of fire or other emergency.

**19.7.3.3\*** Where required by the authority having jurisdiction, a floor plan shall be provided to indicate the location of all required means of egress corridors in smoke compartments having spaces not separated from the corridor by partitions.

**A.19.7.3.3** The purpose of this requirement is to provide a means for building designers, occupants, and operators to clearly designate approved egress corridors that can be identified even though physical or other obvious barriers might not be present to indicate their location. Floor plans used to satisfy this requirement might incorporate more than one function and more than one smoke compartment of the building, provided egress corridors are clearly identified where no fixed barriers are present. Such plans should be accessible to the authority having jurisdiction but should not be required to be posted.

commentary following [A.18/A.19.2.3.4](#), which includes [Exhibit 18/19.25](#). The exhibit might serve as a floor plan required by [18/19.7.3.3](#). Note in the exhibit that the required corridor space is shaded in yellow so as to differentiate it from the living space that is open to the corridor.

## CHAPTER 18 • New

**18.7.4\* Smoking.** Smoking regulations shall be adopted and shall include not less than the following provisions:

- (1) Smoking shall be prohibited in any room, ward, or individual enclosed space where flammable liquids, combustible gases, or oxygen is used or stored and in any other hazardous location, and such areas shall be posted with signs that read NO SMOKING or shall be posted with the international symbol for no smoking.
- (2) In health care occupancies where smoking is prohibited and signs are prominently placed at all major entrances, secondary signs with language that prohibits smoking shall not be required.
- (3) Smoking by patients classified as not responsible shall be prohibited.
- (4) The requirement of 18.7.4(3) shall not apply where the patient is under direct supervision.
- (5) Ashtrays of noncombustible material and safe design shall be provided in all areas where smoking is permitted.
- (6) Metal containers with self-closing cover devices into which ashtrays can be emptied shall be readily available to all areas where smoking is permitted.

**A.18.7.4** The most rigid discipline with regard to prohibition of smoking might not be nearly as effective in reducing incipient fires from surreptitious smoking as the open recognition of smoking, with provision of suitable facilities for smoking. Proper education and training of the staff and attendants in the ordinary fire hazards and their abatement is unquestionably essential. The problem is a broad one, varying with different types and arrangements of buildings; the effectiveness of rules of procedure, which need to be flexible, depends in large part on the management.

The provision of 18/19.7.4(1), related to areas where smoking is prohibited, includes the words “or individual enclosed space.” The words help to clarify that smoking is to be regulated on a space by space basis. For example, smoking is to be prohibited

### 18.7.5 Furnishings, Mattresses, and Decorations.

**18.7.5.1\*** Draperies, curtains, and other loosely hanging fabrics and films serving as furnishings or decorations in health care occupancies shall be in accordance with the provisions of 10.3.1 (see 18.3.5.11), and the following also shall apply:

- (1) Such curtains shall include cubicle curtains.
- (2) Such curtains shall not include curtains at showers and baths.
- (3) Such draperies and curtains shall not include draperies and curtains at windows in patient sleeping rooms.

## CHAPTER 19 • Existing

**19.7.4\* Smoking.** Smoking regulations shall be adopted and shall include not less than the following provisions:

- (1) Smoking shall be prohibited in any room, ward, or individual enclosed space where flammable liquids, combustible gases, or oxygen is used or stored and in any other hazardous location, and such areas shall be posted with signs that read NO SMOKING or shall be posted with the international symbol for no smoking.
- (2) In health care occupancies where smoking is prohibited and signs are prominently placed at all major entrances, secondary signs with language that prohibits smoking shall not be required.
- (3) Smoking by patients classified as not responsible shall be prohibited.
- (4) The requirement of 19.7.4(3) shall not apply where the patient is under direct supervision.
- (5) Ashtrays of noncombustible material and safe design shall be provided in all areas where smoking is permitted.
- (6) Metal containers with self-closing cover devices into which ashtrays can be emptied shall be readily available to all areas where smoking is permitted.

**A.19.7.4** The most rigid discipline with regard to prohibition of smoking might not be nearly as effective in reducing incipient fires from surreptitious smoking as the open recognition of smoking, with provision of suitable facilities for smoking. Proper education and training of the staff and attendants in the ordinary fire hazards and their abatement is unquestionably essential. The problem is a broad one, varying with different types and arrangements of buildings; the effectiveness of rules of procedure, which need to be flexible, depends in large part on the management.

from a room where flammable liquids are stored, but not from the other rooms within the same smoke compartment where those rooms do not meet the criteria of 18/19.7.4(1) for the prohibition of smoking.

### 19.7.5 Furnishings, Mattresses, and Decorations.

**19.7.5.1\*** Draperies, curtains, and other loosely hanging fabrics and films serving as furnishings or decorations in health care occupancies shall be in accordance with the provisions of 10.3.1 (see 19.3.5.11), and the following also shall apply:

- (1) Such curtains shall include cubicle curtains.
- (2) Such curtains shall not include curtains at showers and baths.
- (3) Such draperies and curtains shall not include draperies and curtains at windows in patient sleeping rooms in smoke compartments sprinklered in accordance with 19.3.5.

## CHAPTER 18 • New

- (4) Such draperies and curtains shall not include draperies and curtains in other rooms or areas where the draperies and curtains comply with both of the following:
- Individual drapery or curtain panel area does not exceed 48 ft<sup>2</sup> (4.5 m<sup>2</sup>).
  - Total area of drapery and curtain panels per room or area does not exceed 20 percent of the aggregate area of the wall on which they are located.

**A.18.7.5.1** In addition to the provisions of 10.3.1, which deal with ignition resistance, additional requirements with respect to the location of cubicle curtains relative to sprinkler placement are included in NFPA 13, *Standard for the Installation of Sprinkler Systems*.

**18.7.5.2** Newly introduced upholstered furniture within health care occupancies shall comply with one of the following provisions:

- The furniture shall meet the criteria specified in 10.3.2.1 and 10.3.3.
- The furniture shall be in a building protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1).

**18.7.5.3 Reserved.**

**18.7.5.4** Newly introduced mattresses within health care occupancies shall comply with one of the following provisions:

- The mattresses shall meet the criteria specified in 10.3.2.2 and 10.3.4.
- The mattresses shall be in a building protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1).

**18.7.5.5 Reserved.**

## CHAPTER 19 • Existing

- (4) Such draperies and curtains shall not include draperies and curtains in other rooms or areas where the draperies and curtains comply with all of the following:
- Individual drapery or curtain panel area does not exceed 48 ft<sup>2</sup> (4.5 m<sup>2</sup>).
  - Total area of drapery and curtain panels per room or area does not exceed 20 percent of the aggregate area of the wall on which they are located.
  - Smoke compartment in which draperies or curtains are located is sprinklered in accordance with 19.3.5.

**A.19.7.5.1** In addition to the provisions of 10.3.1, which deal with ignition resistance, additional requirements with respect to the location of cubicle curtains relative to sprinkler placement are included in NFPA 13, *Standard for the Installation of Sprinkler Systems*.

**19.7.5.2** Newly introduced upholstered furniture within health care occupancies shall comply with one of the following provisions, unless otherwise provided in 19.7.5.3:

- The furniture shall meet the criteria specified in 10.3.2.1 and 10.3.3.
- The furniture shall be in a building protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1).

**19.7.5.3** The requirements of 19.7.5.2, 10.3.2.1, and 10.3.3 shall not apply to upholstered furniture belonging to the patient in sleeping rooms of nursing homes where the following criteria are met:

- A smoke detector shall be installed where the patient sleeping room is not protected by automatic sprinklers.
- Battery-powered single-station smoke detectors shall be permitted.

**19.7.5.4** Newly introduced mattresses within health care occupancies shall comply with one of the following provisions, unless otherwise provided in 19.7.5.5:

- The mattresses shall meet the criteria specified in 10.3.2.2 and 10.3.4.
- The mattresses shall be in a building protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1).

**19.7.5.5** The requirements of 19.7.5.4, 10.3.2.2, and 10.3.4 shall not apply to mattresses belonging to the patient in sleeping rooms of nursing homes where the following criteria are met:

- A smoke detector shall be installed where the patient sleeping room is not protected by automatic sprinklers.
- Battery-powered single-station smoke detectors shall be permitted.

## CHAPTER 18 • New

**18.7.5.6** Combustible decorations shall be prohibited in any health care occupancy, unless one of the following criteria is met:

- (1) They are flame-retardant or are treated with approved fire-retardant coating that is listed and labeled for application to the material to which it is applied.
- (2)\* The decorations meet the flame propagation performance criteria contained in Test Method 1 or Test Method 2, as appropriate, of NFPA 701, *Standard Methods of Fire Tests for Flame Propagation of Textiles and Films*.
- (3) The decorations exhibit a heat release rate not exceeding 100 kW when tested in accordance with NFPA 289, *Standard Method of Fire Test for Individual Fuel Packages*, using the 20 kW ignition source.
- (4)\* The decorations, such as photographs, paintings, and other art, are attached directly to the walls, ceiling, and non-fire-rated doors in accordance with the following:
  - (a) Decorations on non-fire-rated doors do not interfere with the operation or any required latching of the door and do not exceed the area limitations of [18.7.5.6\(4\)\(b\)](#), (c), or (d).
  - (b) Decorations do not exceed 20 percent of the wall, ceiling, and door areas inside any room or space of a smoke compartment that is not protected throughout by an approved automatic sprinkler system in accordance with [Section 9.7](#).
  - (c) Decorations do not exceed 30 percent of the wall, ceiling, and door areas inside any room or space of a smoke compartment that is protected throughout by an approved supervised automatic sprinkler system in accordance with [Section 9.7](#).
  - (d) Decorations do not exceed 50 percent of the wall, ceiling, and door areas inside patient sleeping rooms having a capacity not exceeding four persons, in a smoke compartment that is protected throughout by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#).

**A.18.7.5.6(2)** The user should verify that the products meet the referenced test methods of NFPA 701, *Standard Methods of Fire Tests for Flame Propagation of Textile and Films*, and not the small-scale test procedure that was previously eliminated from NFPA 701.

**A.18.7.5.6(4)** The percentage of decorations should be measured against the area of any wall or ceiling, not the aggregate total of walls, ceilings, and doors. The door is considered part of the wall. The decorations must be located such that they do not interfere with the operation of any door, sprinkler, smoke detector, or any other life safety equipment. Other art might include hanging objects or three-dimensional items.

## CHAPTER 19 • Existing

**19.7.5.6** Combustible decorations shall be prohibited in any health care occupancy, unless one of the following criteria is met:

- (1) They are flame-retardant or are treated with approved fire-retardant coating that is listed and labeled for application to the material to which it is applied.
- (2)\* The decorations meet the flame propagation performance criteria contained in Test Method 1 or Test Method 2, as appropriate, of NFPA 701, *Standard Methods of Fire Tests for Flame Propagation of Textiles and Films*.
- (3) The decorations exhibit a heat release rate not exceeding 100 kW when tested in accordance with NFPA 289, *Standard Method of Fire Test for Individual Fuel Packages*, using the 20 kW ignition source.
- (4)\* The decorations, such as photographs, paintings, and other art, are attached directly to the walls, ceiling, and non-fire-rated doors in accordance with the following:
  - (a) Decorations on non-fire-rated doors do not interfere with the operation or any required latching of the door and do not exceed the area limitations of [19.7.5.6\(4\)\(b\)](#), (c), or (d).
  - (b) Decorations do not exceed 20 percent of the wall, ceiling, and door areas inside any room or space of a smoke compartment that is not protected throughout by an approved automatic sprinkler system in accordance with [Section 9.7](#).
  - (c) Decorations do not exceed 30 percent of the wall, ceiling, and door areas inside any room or space of a smoke compartment that is protected throughout by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#).
  - (d) Decorations do not exceed 50 percent of the wall, ceiling, and door areas inside patient sleeping rooms, having a capacity not exceeding four persons, in a smoke compartment that is protected throughout by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#).
- (5)\* They are decorations, such as photographs and paintings, in such limited quantities that a hazard of fire development or spread is not present.

**A.19.7.5.6(2)** The user should verify that the products meet the referenced test methods of NFPA 701, *Standard Methods of Fire Tests for Flame Propagation of Textiles and Films*, and not the small-scale test procedure that was previously eliminated from NFPA 701.

**A.19.7.5.6(4)** The percentage of decorations should be measured against the area of any wall or ceiling, not the aggregate total of walls, ceilings, and doors. The door is considered part of the wall. The decorations must be located such that they do not interfere with the operation of any door, sprinkler, smoke detector, or any other life safety equipment. Other art might include hanging objects or three-dimensional items.

## CHAPTER 18 • New

The provision of 18/19.7.5.1(4) offers some leniency from the fabric testing requirement for small drapery or curtain panels.

Cigarette ignition–resistance testing — as detailed in 10.3.2 — and rate of heat release testing — as detailed in 10.3.3 and 10.3.4 — are required by 18/19.7.5.2 and 18/19.7.5.4 for newly introduced upholstered furniture and newly introduced mattresses in health care occupancies, unless the building is fully sprinklered. However, these requirements would seldom apply in new health care occupancies, because 18.3.5.1 requires new health care occupancies to be sprinklered. Unlike new health care occupancies, which are required to be sprinklered, many existing facilities are not sprinklered. Yet, government regulations require that patients be permitted to take their own furniture with them to a nursing home, and such movement of existing furniture into the facility mandates the requirement that applies to newly introduced upholstered furniture and newly introduced mattresses. Paragraphs 19.7.5.3 and 19.7.5.5 offer nonsprinklered existing health care facilities another option — providing smoke detection within the patient room. If early warning is provided to staff, then an incipient-stage fire might be extinguished manually almost as quickly as would occur automatically in a room that is sprinklered.

The provisions of 18/19.7.5.6(4) permit furnishings that help to make the health care occupancy setting more homelike, especially for nursing home residents. Exhibit 18/19.101 shows

### 18.7.5.7 Soiled Linen and Trash Receptacles.

**18.7.5.7.1** Soiled linen or trash collection receptacles shall not exceed 32 gal (121 L) in capacity and shall meet all of the following requirements:

- (1) The average density of container capacity in a room or space shall not exceed 0.5 gal/ft<sup>2</sup> (20.4 L/m<sup>2</sup>).
- (2) A capacity of 32 gal (121 L) shall not be exceeded within any 64 ft<sup>2</sup> (6 m<sup>2</sup>) area.
- (3)\* Mobile soiled linen or trash collection receptacles with capacities greater than 32 gal (121 L) shall be located in a room protected as a hazardous area when not attended.
- (4) Container size and density shall not be limited in hazardous areas.

**A.18.7.5.7.1(3)** It is not the intent to permit collection receptacles with a capacity greater than 32 gal (121 L) to be positioned at or near a nurses' station based on the argument that such nurses' station is constantly attended. The large collection receptacle itself needs to be actively attended by staff. Staff might leave the large receptacle in the corridor outside a patient room

## CHAPTER 19 • Existing

**A.19.7.5.6(5)** When determining if the hazard for fire development or spread is present, consideration should be given to whether the building or area being evaluated is sprinklered.

limited decorations on the door to a nursing home resident's room. Note the furniture and furnishings that the resident has interspersed among the institutional-like furniture provided by the facility.

**Exhibit 18/19.101**

*Limited decorations on room door of nursing home resident.*

### 19.7.5.7 Soiled Linen and Trash Receptacles.

**19.7.5.7.1** Soiled linen or trash collection receptacles shall not exceed 32 gal (121 L) in capacity and shall meet all of the following requirements:

- (1) The average density of container capacity in a room or space shall not exceed 0.5 gal/ft<sup>2</sup> (20.4 L/m<sup>2</sup>).
- (2) A capacity of 32 gal (121 L) shall not be exceeded within any 64 ft<sup>2</sup> (6 m<sup>2</sup>) area.
- (3)\* Mobile soiled linen or trash collection receptacles with capacities greater than 32 gal (121 L) shall be located in a room protected as a hazardous area when not attended.
- (4) Container size and density shall not be limited in hazardous areas.

**A.19.7.5.7.1(3)** It is not the intent to permit collection receptacles with a capacity greater than 32 gal (121 L) to be positioned at or near a nurses' station based on the argument that such nurses' station is constantly attended. The large collection receptacle itself needs to be actively attended by staff. Staff might leave the large receptacle in the corridor outside a patient room

## CHAPTER 18 • New

while entering the room to collect soiled linen or trash, but staff is expected to return to the receptacle, move on to the next room, and repeat the collection function. Where staff is not actively collecting material for placement in the receptacle, the receptacle is to be moved to a room protected as a hazardous area.

**18.7.5.7.2\*** Containers used solely for recycling clean waste or for patient records awaiting destruction shall be permitted to be excluded from the requirements of **18.7.5.7.1** where all the following conditions are met:

- (1) Each container shall be limited to a maximum capacity of 96 gal (363 L), except as permitted by **18.7.5.7.2(2)** or (3).
- (2)\* Containers with capacities greater than 96 gal (363 L) shall be located in a room protected as a hazardous area when not attended.
- (3) Container size shall not be limited in hazardous areas.
- (4) Containers for combustibles shall be labeled and listed as meeting the requirements of FM Approval Standard 6921, *Containers for Combustible Waste*; however, such testing, listing, and labeling shall not be limited to FM Approvals.

**A.18.7.5.7.2** It is the intent that this provision permits recycling of bottles, cans, paper and similar clean items that do not contain grease, oil, flammable liquids, or significant plastic materials using larger containers or several adjacent containers and not require locating such containers in a room protected as a hazardous area. Containers for medical records awaiting shredding are often larger than 32 gal (121 L). These containers are not to be included in the calculations and limitations of **18.7.5.7.1**. There is no limit on the number of these containers, as FM Approval Standard 6921, *Containers for Combustible Waste*, ensures that the fire will not spread outside of the container. FM approval standards are written for use with FM Approvals. The tests can be conducted by any approved laboratory. The portions of the standard referring to FM Approvals are not included in this reference.

**A.18.7.5.7.2(2)** See **18.7.5.7.1(3)**.

**18.7.5.7.3** The provisions of **10.3.9**, applicable to containers for waste, or linen, shall not apply.

**Paragraph 18/19.7.5.7.1** establishes maximum trash container size and placement densities permitted within a room. Containers larger than that specified, or grouped containers exceeding the density-per-room criterion, present a hazard greater than that associated with the normal furnishings of a health care occupancy room.

Large, mobile soiled linen or trash receptacles can be moved along the corridor as collections occur but must be attended by

## CHAPTER 19 • Existing

while entering the room to collect soiled linen or trash, but staff is expected to return to the receptacle, move on to the next room, and repeat the collection function. Where staff is not actively collecting material for placement in the receptacle, the receptacle is to be moved to a room protected as a hazardous area.

**19.7.5.7.2\*** Containers used solely for recycling clean waste or for patient records awaiting destruction shall be permitted to be excluded from the requirements of **19.7.5.7.1** where all the following conditions are met:

- (1) Each container shall be limited to a maximum capacity of 96 gal (363 L), except as permitted by **19.7.5.7.2(2)** or (3).
- (2)\* Containers with capacities greater than 96 gal (363 L) shall be located in a room protected as a hazardous area when not attended.
- (3) Container size shall not be limited in hazardous areas.
- (4) Containers for combustibles shall be labeled and listed as meeting the requirements of FM Approval Standard 6921, *Containers for Combustible Waste*; however, such testing, listing, and labeling shall not be limited to FM Approvals.

**A.19.7.5.7.2** It is the intent that this provision permits recycling of bottles, cans, paper, and similar clean items that do not contain grease, oil, flammable liquids, or significant plastic materials, using larger containers or several adjacent containers, and not require locating such containers in a room protected as a hazardous area. Containers for medical records awaiting shredding are often larger than 32 gal (121 L). These containers are not to be included in the calculations and limitations of **19.7.5.7.1**. There is no limit on the number of these containers, as FM Approval Standard 6921, *Containers for Combustible Waste*, ensures that the fire will not spread outside of the container. FM approval standards are written for use with FM Approvals. The tests can be conducted by any approved laboratory. The portions of the standard referring to FM Approvals are not included in this reference.

**A.19.7.5.7.2(2)** See **19.7.5.7.1(3)**.

**19.7.5.7.3** The provisions of **10.3.9**, applicable to containers for waste, or linen, shall not apply.

staff. If housekeeping staff, for example, must leave the area, the container must be stored in a room designed and maintained as a hazardous area in accordance with **18/19.3.2.1**. **Exhibit 18/19.102** shows an aggregation of wheeled trash bins in a room protected as a hazardous area. The text of **A.18/A.19.7.5.7.1(3)** clarifies that receptacles positioned at nurses' stations are not to be considered as being attended. **Exhibit 18/19.103** illustrates the requirements of **18/19.7.5.7.1**.

## CHAPTER 18 • New

## CHAPTER 19 • Existing

Exhibit 18/19.102

Wheeled trash bins in room protected as hazardous area.

**18.7.6 Maintenance and Testing.** See 4.6.12.**18.7.7 Engineered Smoke Control Systems.**

**18.7.7.1** New engineered smoke control systems shall be designed, installed, tested, and maintained in accordance with NFPA 92, *Standard for Smoke Control Systems*.

**18.7.7.2** Test documentation shall be maintained on the premises at all times.

**18.7.8\* Portable Space-Heating Devices.** Portable space-heating devices shall be prohibited in all health care occupancies, unless both of the following criteria are met:

- (1) Such devices are permitted to be used only in nonsleeping staff and employee areas.
- (2) The heating elements of such devices do not exceed 212°F (100°C).

Exhibit 18/19.103

Allowable soiled linen or trash collection receptacles.

**19.7.6 Maintenance and Testing.** See 4.6.12.**19.7.7\* Engineered Smoke Control Systems.**

**A.19.7.7** A document that provides recognized engineering principles for the testing of smoke control systems is NFPA 92, *Standard for Smoke Control Systems*.

**19.7.7.1** Existing engineered smoke control systems, unless specifically exempted by the authority having jurisdiction, shall be tested in accordance with established engineering principles.

**19.7.7.2** Systems not meeting the performance requirements of the testing specified in 19.7.7.1 shall be continued in operation only with the specific approval of the authority having jurisdiction.

**19.7.8\* Portable Space-Heating Devices.** Portable space-heating devices shall be prohibited in all health care occupancies, unless both of the following criteria are met:

- (1) Such devices are used only in nonsleeping staff and employee areas.
- (2) The heating elements of such devices do not exceed 212°F (100°C).

## CHAPTER 18 • New

**A.18.7.8** Portable space heaters complying with **18.7.8** should be permitted to be located in office areas, nurses stations, and other similar nonpatient spaces within the same smoke compartment as patient sleeping rooms.

### 18.7.9 Construction, Repair, and Improvement Operations.

**18.7.9.1** Construction, repair, and improvement operations shall comply with **4.6.10**.

**18.7.9.2** The means of egress in any area undergoing construction, repair, or improvements shall be inspected daily for compliance with **7.1.10.1** and shall also comply with NFPA 241, *Standard for Safeguarding Construction, Alteration, and Demolition Operations*.

# New and Existing Ambulatory Health Care Occupancies

Chapters 20 and 21 address the needs of occupants of facilities that provide medical treatment on an outpatient basis. The patient treatment is not merely a routine medical visit, such as to a doctor's office, but rather a procedure that renders the patient incapable of self-preservation or a procedure that requires anesthesia that renders the patient incapable of self-preservation. Ambulatory health care occupancies also provide treatment to patients who arrive at the facility incapable of self-preservation, as might be rendered at an emergency care center that is not part of a hospital. Although these descriptions might seem to resemble a situation that is typically associated with a hospital, the major difference is that an ambulatory health care facility does not provide care for any individual for 24 hours or more. Rather, a patient receives treatment and then leaves the facility. Patients suffering complications that would prevent them from leaving the ambulatory health care facility would typically be transported and admitted to a hospital that provides care on a 24-hour basis. Patients requiring rehabilitation following a procedure or treatment would be admitted to a 24-hour rehabilitation facility.

There is also an important distinction concerning the number of occupants required to constitute classification as an ambulatory health care occupancy — that number being four or more (see the definition of the term *ambulatory health care occupancy* in 3.3.190.1). The Centers for Medicare and Medicaid Services (CMS) play an important role in the government financing

of health care services in the United States. CMS applies a stricter definition of an ambulatory health care occupancy than NFPA by requiring surgical centers and some other outpatient services facilities for one or more patients to be classified as an ambulatory health care occupancy. NFPA's four-person criterion applies to all forms of ambulatory health care occupancies.

The provisions of Chapters 20 and 21 for ambulatory health care occupancies were drawn from those applicable to hospitals and those applicable to business occupancies. If an outpatient medical facility does not meet the definition of the term *ambulatory health care occupancy*, it generally needs to be classified as, and comply with the requirements for, a business occupancy.

Commentary Table 20/21.1 differentiates among health care, ambulatory health care, and business occupancies on the basis of the patient load and care provided. Incapability of self-preservation might be the result of the use of general anesthesia, a treatment such as dialysis, or an injury or illness that brings the patient to the ambulatory health care facility for treatment. Based on the information in Commentary Table 20/21.1, if a dentist administers general anesthesia to not more than three patients simultaneously, the dentist's office would be classified as a business occupancy. If the dentist expands the simultaneous administration of general anesthesia to a fourth patient, then the more stringent requirements for ambulatory health care occupancies would apply.

**Commentary Table 20/21.1 Occupancy Classification Comparison**

Factor	Chapters 18/19 Health Care Occupancies	Chapters 20/21 Ambulatory Health Care Occupancies	Chapters 38/39 Business Occupancies
Number of patients rendered incapable of self-preservation	4 or more <sup>1</sup>	4 or more <sup>2</sup>	3 or fewer
Care provided on a 24-hour basis?	Yes	No	No

<sup>1</sup>Incapability of self-preservation might exist prior to admission and be unrelated to the treatment provided (see 18/19.1.1.1.5).

<sup>2</sup>Incapability of self-preservation might not exist prior to admission but be related to the treatment provided (see 3.3.190.1).

## CHAPTER 20 • New

**20.1 General Requirements****20.1.1 Application.****20.1.1.1 General.**

**20.1.1.1.1** The requirements of this chapter shall apply to new buildings or portions thereof used as ambulatory health care occupancies. (See 1.3.1.)

The provisions for new ambulatory health care occupancies are addressed in Chapter 20; the provisions for existing ambulatory health care occupancies (i.e., existing conditions in ambulatory health care occupancies) are addressed in Chapter 21.

Ambulatory health care facilities exhibit some of the occupancy characteristics of business occupancies and some of the characteristics of health care occupancies. Chapters 20 and 21 prescribe a level of life safety from fire that is greater than that typically specified for business occupancies but less than that typically found in hospitals, nursing homes, and limited care facilities.

Chapters 20 and 21 were rewritten for the 2015 edition of the Code so as to be self-contained and not require referencing

**20.1.1.1.2 Administration.** The provisions of Chapter 1, Administration, shall apply.

**20.1.1.1.3 General.** The provisions of Chapter 4, General, shall apply.

The provisions of 20/21.1.1.1.2 and 20/21.1.1.1.3 remind the user that the administrative provisions of Chapter 1 and the general provisions of Chapter 4 apply.

**20.1.1.1.4** Buildings, or sections of buildings, that primarily house patients who, in the opinion of the governing body of the facility and the governmental agency having jurisdiction, are capable of exercising judgment and appropriate physical action for self-preservation under emergency conditions shall be permitted to comply with chapters of this Code other than Chapter 20.

**20.1.1.1.5** It shall be recognized that, in buildings providing treatment for certain types of patients or having detention rooms or a security section, it might be necessary to lock doors and bar windows to confine and protect building inhabitants. In such instances, the authority having jurisdiction shall make appropriate modifications to those sections of this Code that would otherwise require means of egress to be kept unlocked.

**20.1.1.1.6\*** The requirements of this chapter shall apply based on the assumption that staff is available in all patient-occupied

## CHAPTER 21 • Existing

**21.1 General Requirements****21.1.1 Application.****21.1.1.1 General.**

**21.1.1.1.1** The requirements of this chapter shall apply to existing buildings or portions thereof currently occupied as an ambulatory health care occupancy.

provisions of Chapters 38 and 39 for business occupancies. For editions prior to 2015, ambulatory health care facilities were required to comply with the provisions of Chapters 38 and 39 pertaining to business occupancies and those contained within Chapters 20 and 21. Where Chapter 38 or Chapter 39 and Chapter 20 or Chapter 21 addressed a feature in different ways, the stricter application (typically that addressed by Chapter 20 or Chapter 21) governed. In using the 2015 edition, no comparison with the requirements of Chapters 38 and 39 is performed, as all applicable occupancy requirements reside in Chapters 20 and 21.

**21.1.1.1.2 Administration.** The provisions of Chapter 1, Administration, shall apply.

**21.1.1.1.3 General.** The provisions of Chapter 4, General, shall apply.

**21.1.1.1.4** Buildings, or sections of buildings, that primarily house patients who, in the opinion of the governing body of the facility and the governmental agency having jurisdiction, are capable of exercising judgment and appropriate physical action for self-preservation under emergency conditions shall be permitted to comply with chapters of this Code other than Chapter 21.

**21.1.1.1.5** It shall be recognized that, in buildings providing treatment for certain types of patients or having detention rooms or a security section, it might be necessary to lock doors and bar windows to confine and protect building inhabitants. In such instances, the authority having jurisdiction shall make appropriate modifications to those sections of this Code that would otherwise require means of egress to be kept unlocked.

**21.1.1.1.6\*** The requirements of this chapter shall apply based on the assumption that staff is available in all patient-occupied

## CHAPTER 20 • New

areas to perform certain fire safety functions as required in other paragraphs of this chapter.

**A.20.1.1.1.6** The *Code* recognizes that certain functions necessary for the life safety of building occupants, such as the closing of corridor doors, the operation of manual fire alarm devices, and the removal of patients from the room of fire origin, require the intervention of facility staff. It is not the intent of **20.1.1.1.6** to specify the levels or locations of staff necessary to meet this requirement.

**20.1.1.2\* Goals and Objectives.** The goals and objectives of **Sections 4.1** and **4.2** shall be met with due consideration for functional requirements, which are accomplished by limiting the development and spread of a fire emergency to the room of fire origin and reducing the need for occupant evacuation, except from the room of fire origin.

**A.20.1.1.2** This objective is accomplished in the context of the physical facilities, the type of activities undertaken, the provisions for the capabilities of staff, and the needs of all occupants through requirements directed at the following:

- (1) Prevention of ignition
- (2) Detection of fire
- (3) Control of fire development
- (4) Confinement of the effects of fire
- (5) Extinguishment of fire
- (6) Provision of refuge or evacuation facilities, or both
- (7) Staff reaction

**20.1.1.3 Total Concept.**

**20.1.1.3.1** All ambulatory health care facilities shall be designed, constructed, maintained, and operated to minimize the possibility of a fire emergency requiring the evacuation of occupants.

**20.1.1.3.2** Because the safety of ambulatory health care occupants cannot be ensured adequately by dependence on evacuation of the building, their protection from fire shall be provided by appropriate arrangement of facilities; adequate, trained staff; and development of operating and maintenance procedures composed of the following:

- (1) Design, construction, and compartmentation
- (2) Provision for detection, alarm, and extinguishment
- (3) Fire prevention and planning, training, and drilling programs for the isolation of fire, transfer of occupants to areas of refuge, or evacuation of the building

**20.1.1.4 Additions, Conversions, Modernization, Renovation, and Construction Operations.**

In editions of the *Code* prior to 2006, renovations, additions, and changes of occupancy were required to comply with the requirements for new construction. For ambulatory health care

## CHAPTER 21 • Existing

areas to perform certain fire safety functions as required in other paragraphs of this chapter.

**A.21.1.1.1.6** The *Code* recognizes that certain functions necessary for the life safety of building occupants, such as the closing of corridor doors, the operation of manual fire alarm devices, and the removal of patients from the room of fire origin, require the intervention of facility staff. It is not the intent of **21.1.1.1.6** to specify the levels or locations of staff necessary to meet this requirement.

**21.1.1.2\* Goals and Objectives.** The goals and objectives of **Sections 4.1** and **4.2** shall be met with due consideration for functional requirements, which are accomplished by limiting the development and spread of a fire emergency to the room of fire origin and reducing the need for occupant evacuation, except from the room of fire origin.

**A.21.1.1.2** This objective is accomplished in the context of the physical facilities, the type of activities undertaken, the provisions for the capabilities of staff, and the needs of all occupants through requirements directed at the following:

- (1) Prevention of ignition
- (2) Detection of fire
- (3) Control of fire development
- (4) Confinement of the effects of fire
- (5) Extinguishment of fire
- (6) Provision of refuge or evacuation facilities, or both
- (7) Staff reaction

**21.1.1.3 Total Concept.**

**21.1.1.3.1** All ambulatory health care facilities shall be designed, constructed, maintained, and operated to minimize the possibility of a fire emergency requiring the evacuation of occupants.

**21.1.1.3.2** Because the safety of ambulatory health care occupants cannot be ensured adequately by dependence on evacuation of the building, their protection from fire shall be provided by appropriate arrangement of facilities; adequate, trained staff; and development of operating and maintenance procedures composed of the following:

- (1) Design, construction, and compartmentation
- (2) Provision for detection, alarm, and extinguishment
- (3) Fire prevention and planning, training, and drilling programs for the isolation of fire, transfer of occupants to areas of refuge, or evacuation of the building

**21.1.1.4 Additions, Conversions, Modernization, Renovation, and Construction Operations.**

occupancies, such renovations, additions, and changes of occupancy were required to meet the provisions of **Chapter 20**, while existing conditions were subject to the provisions of **Chapter 21**.

## CHAPTER 20 • New

Since the 2006 edition of the *Code*, Chapter 43, Building Rehabilitation, has addressed the subject in a different way. The chapter was written to promote the adaptive reuse of existing buildings without sacrificing the needed level of life safety. The provisions of Chapter 43 blend the requirements for new construction with those for existing conditions, so as to require additional life safety features as the rehabilitation work category increases in complexity. The rehabilitation work categories are repair, renovation, modification, reconstruction, change of use or occupancy classification, and addition. See 4.6.7, 4.6.11 and Chapter 43.

Exhibit 20/21.1 presents a plan of a single-story, nonsprinklered, existing office building for which a change in tenants invokes the requirements of Chapter 43. Tenants C and D occupy a small portion of the floor. Most of the first-floor area (spaces A and B, located on opposite sides of the corridor) is available for leasing to one or more tenants. A kidney dialysis center (an ambulatory health care occupancy) plans to occupy space A; a multi-lawyer law practice (a business occupancy) plans to occupy space B. The previous tenants of both space A and space B used their leased space as offices (business occupancies).

Exhibit 20/21.1

*Occupancy classification dependent on tenant use.*

#### 20.1.1.4.1 Additions.

**20.1.1.4.1.1** Additions shall be separated from any existing structure not conforming to the provisions within Chapter 21 by a fire barrier having not less than a 2-hour fire resistance rating and constructed of materials as required for the addition. (See 4.6.5 and 4.6.7.)

**20.1.1.4.1.2** Doors in barriers required by 20.1.1.4.1.1 shall normally be kept closed, unless otherwise permitted by 20.1.1.4.1.3.

**20.1.1.4.1.3** Doors shall be permitted to be held open if they meet the requirements of 20.2.2.2.2.

**20.1.1.4.2 Changes of Occupancy.** A change from a hospital or nursing home to an ambulatory health care occupancy shall not be considered a change in occupancy or occupancy subclassification.

## CHAPTER 21 • Existing

The lawyers' office is classified as a business occupancy; and because its occupancy classification represents no change from that of the previous tenant, it is further classified as an existing business occupancy. The lawyers' office must, therefore, meet the requirements of Chapter 39, which apply to existing business occupancies.

The kidney dialysis center will render four or more patients simultaneously incapable of self-preservation [see 3.3.190.1, item (1)]; it is classified as an ambulatory health care occupancy. Because that occupancy classification represents a change of occupancy from that of the previous tenant, 43.7.2.1 requires that the hazard category of the new occupancy be compared against that of the previous occupancy. Per Table 43.7.3, both ambulatory health care and business occupancies are hazard category 3. So, per 43.7.2.1(1), the kidney dialysis center must meet the requirements of Chapter 21, which apply to existing ambulatory health care occupancies for everything but sprinklers, alarms, and hazardous areas, which must meet the requirements of Chapter 20. The requirement related to compliance with the provisions of Chapter 20 for sprinklers, alarms and hazardous areas has no real effect in this case, as the sprinkler, alarm and hazardous area provisions of Chapter 20 are not stricter than those of Chapter 21.

Commentary Table 20/21.2 contrasts some of the *Code* provisions that apply to the kidney dialysis center and the lawyers' office addressed in this commentary.

Paragraph 20/21.1.4.1 establishes separation criteria for additions to existing structures that do not conform to the provisions of Chapter 21. However, if an existing building meets the provisions of Chapter 21, the new addition that complies with Chapter 20 would not be required to be separated from the existing portion of the newly enlarged building.

Where additions are required to be separated from existing portions of buildings, barriers must be constructed of assemblies providing a minimum 2-hour fire resistance rating.

#### 21.1.1.4.1 Additions.

**21.1.1.4.1.1** Additions shall be separated from any existing structure not conforming to the provisions within Chapter 21 by a fire barrier having not less than a 2-hour fire resistance rating and constructed of materials as required for the addition. (See 4.6.5 and 4.6.7.)

**21.1.1.4.1.2** Doors in barriers required by 21.1.1.4.1.1 shall normally be kept closed, unless otherwise permitted by 21.1.1.4.1.3.

**21.1.1.4.1.3** Doors shall be permitted to be held open if they meet the requirements of 21.2.2.2.2.

**21.1.1.4.2 Changes of Occupancy.** A change from a hospital or nursing home to an ambulatory health care occupancy shall not be considered a change in occupancy or occupancy subclassification.

## CHAPTER 20 • New

## CHAPTER 21 • Existing

**Commentary Table 20/21.2 Comparison of Applicable Requirements for Occupancy**

<b>Building Feature</b>	<b>New Kidney Dialysis Center [existing ambulatory health care occupancy per 43.7.2.1(1)]</b>	<b>New Lawyers' Office [existing business occupancy]</b>
Egress door locking	Addressed by 21.1.1.1.5; doors permitted to be locked to confine and protect patients, but AHJ must make modifications to permit locked doors	Doors not permitted to be locked while space is occupied in accordance with 7.2.1.5.1
Minimum construction	Regulated by 21.1.6, but because building is one story in height, any NFPA 220 construction type is acceptable (see 21.1.6.1)	No regulation
Automatic door closing	In addition to release via methods of 7.2.1.8.2 (smoke detection, power failure, manual action), initiation of required fire alarm must release hold-open devices in accordance with 21.2.2.2.2	Hold-open devices released via methods of 7.2.1.8.2 (smoke detection, power failure, manual action)
Door width	Minimum 32 in. (810 mm) clear width or 34 in. (865 mm) in leaf width in accordance with 21.2.3.4	Minimum 28 in. (710 mm) door leaf width in accordance with 7.2.1.2.3.2(4)
Number of exits	Minimum of two in accordance with 21.2.4	Single exit permitted per 39.2.4 if conditions of one of the exemptions are met
Travel distance	Total travel limited to 150 ft (46 m) by 21.2.6.2.1	Total travel limited to 200 ft (61 m) by 39.2.6..2
Emergency lighting	Required by 21.2.9.1	Required by 39.2.9.1 only if single floor has occupant load of 1000 or more persons
Hazardous areas	Provisions of 20.3.2 [not 21.3.2 per 43.7.2.1(2)] apply; protection per 8.7, plus provisions for laboratories and medical gas	Protection per 8.7 by 39.3.2
Alarm system	Provisions of 20.3.4 [not 21.3.4 per 43.7.2.1(2)] apply; alarm system required within center by 20.3.4 (manual fire alarm boxes and required detection devices, automatic occupant notification, emergency forces notification)	Required by 39.3.4 only if single floor has occupant load of 1000 or more persons; if alarm system is required, automatic initiation permitted to substitute for all but one manual fire alarm box; occupant notification permitted to come from attended location; emergency forces notification not required
Automatic sprinklers	Provisions of 20.3.5 [not 21.3.5 per 43.7.2.1(2)] apply; sprinklers not required	Sprinklers not required, see 39.3.5
Smoke compartmentation	Required by 21.3.7; separation required from other tenants; subdivision by smoke barriers within center, unless <5000 ft <sup>2</sup> (<465 m <sup>2</sup> ) with smoke detection or <10,000 ft <sup>2</sup> (<929 m <sup>2</sup> ) with sprinklers	Not addressed, so no requirement
Evacuation and relocation plan	Required by 21.7.1	Not addressed, so no requirement
Staff procedures in case of fire	Required by 21.7.2	Not addressed, so no requirement
Control of furnishings	Required by 21.7.5 for curtains, upholstered furniture, mattresses, trash receptacles	Not addressed, so no requirement

## CHAPTER 20 • New

**20.1.1.4.3 Renovations, Alterations, and Modernizations.** (See 4.6.7.)

**20.1.1.4.4 Construction, Repair, and Improvement Operations.** (See 4.6.10.)

**20.1.2 Classification of Occupancy.** (See 6.1.6 and 20.1.4.2.)

### 20.1.3 Multiple Occupancies.

**20.1.3.1** Multiple occupancies shall be in accordance with 6.1.14.

**20.1.3.2\*** Atrium walls in accordance with 6.1.14.4.6 shall be permitted to serve as part of the separation required by 6.1.14.4.1 for creating separated occupancies on a story-by-story basis, provided both of the following are met:

- (1) The provision is not used for occupancy separations involving industrial and storage occupancies.
- (2) Smoke partitions serving as atrium walls are not permitted to serve as enclosures for hazardous areas.

**A.20.1.3.2** Doctors' offices and treatment and diagnostic facilities that are intended solely for outpatient care and are physically separated from facilities for the treatment or care of inpatients, but are otherwise associated with the management of an institution, might be classified as business occupancies rather than health care occupancies.

**20.1.3.3** Sections of ambulatory health care facilities shall be permitted to be classified as other occupancies, provided that they meet both of the following conditions:

- (1) They are not intended to serve ambulatory health care occupants for purposes of treatment or customary access by patients incapable of self-preservation.
- (2) They are separated from areas of ambulatory health care occupancies by construction having a minimum 1-hour fire resistance rating.

**20.1.3.4** All means of egress from ambulatory health care occupancies that traverse nonambulatory health care spaces shall conform to the requirements of this *Code* for ambulatory health care occupancies, unless otherwise permitted by 20.1.3.5.

**20.1.3.5** Exit through a horizontal exit into other contiguous occupancies that do not conform to ambulatory health care egress provisions but that do comply with requirements set forth in the

## CHAPTER 21 • Existing

**21.1.1.4.3 Renovations, Alterations, and Modernizations.** (See 4.6.7.)

**21.1.1.4.4 Construction, Repair, and Improvement Operations.** (See 4.6.10.)

**21.1.2 Classification of Occupancy.** (See 6.1.6 and 21.1.4.2.)

### 21.1.3 Multiple Occupancies.

**21.1.3.1** Multiple occupancies shall be in accordance with 6.1.14.

**21.1.3.2** Atrium walls in accordance with 6.1.14.4.6 shall be permitted to serve as part of the separation required by 6.1.14.4.1 for creating separated occupancies on a story-by-story basis, provided both of the following are met:

- (1) The provision is not used for occupancy separations involving industrial and storage occupancies.
- (2) Smoke partitions serving as atrium walls are not permitted to serve as enclosures for hazardous areas.

**21.1.3.3\*** Sections of ambulatory health care facilities shall be permitted to be classified as other occupancies, provided that they meet both of the following conditions:

- (1) They are not intended to serve ambulatory health care occupants for purposes of treatment or customary access by patients incapable of self-preservation.
- (2) They are separated from areas of ambulatory health care occupancies by construction having a minimum 1-hour fire resistance rating.

**A.21.1.3.3** Doctors' offices and treatment and diagnostic facilities that are intended solely for outpatient care and are physically separated from facilities for the treatment or care of inpatients, but that are otherwise associated with the management of an institution, might be classified as business occupancies rather than health care occupancies.

**21.1.3.4** All means of egress from ambulatory health care occupancies that traverse nonambulatory health care spaces shall conform to the requirements of this *Code* for ambulatory health care occupancies, unless otherwise permitted by 21.1.3.5.

**21.1.3.5** Exit through a horizontal exit into other contiguous occupancies that do not conform with ambulatory health care egress provisions but that do comply with requirements set forth

## CHAPTER 20 • New

appropriate occupancy chapter of this *Code* shall be permitted, provided that the occupancy does not contain high hazard contents.

**20.1.3.6** Egress provisions for areas of ambulatory health care facilities that correspond to other occupancies shall meet the corresponding requirements of this *Code* for such occupancies, and, where the clinical needs of the occupant necessitate the locking of means of egress, staff shall be present for the supervised release of occupants during all times of use.

**20.1.3.7** Any area with a hazard of contents classified higher than that of the ambulatory health care occupancy and located in the same building shall be protected as required in **20.3.3**.

**20.1.3.8** Non-health care–related occupancies classified as containing high hazard contents shall not be permitted in buildings housing ambulatory health care occupancies.

Paragraph 20/21.1.3.1 directs the user to the multiple occupancies provisions of 6.1.14, which permit protecting multiple occupancies either as mixed occupancies or as separated occupancies. Where the multiple occupancy is protected via the provisions of 6.1.14.4 for separated occupancies, the required number of hours of fire-rated separation is specified by Table 6.1.14.4.1(a) or Table 6.1.14.4.1(b). The most common occupancies that are likely to abut an ambulatory health care occupancy are health care occupancies and business occupancies. The required separation between an ambulatory health care occupancy and a health care occupancy is 2 hours; between an ambulatory health care occupancy and a business occupancy, the required separation is 1 hour.

The provisions of 20/21.1.3.2 through 20/21.1.3.8 have the effect of modifying those of 6.1.14 for the very specific situations described.

The provision of 20/21.1.3.2 is new to the 2015 edition of the *Code*, as it references the use of 6.1.14.4.6, which is also new to the 2015 edition of the *Code*. It permits the use of the provision of 6.1.14.4.6 relative to atrium walls being part of the separation that creates separated occupancies. However, 20/21.1.3.2 adds two criteria not found in 6.1.14.4.6. The occupancies being separated from the ambulatory health-care occupancy by the atrium walls must not be industrial or storage occupancies, as the smoke partition required by 6.1.14.4.6(1) might not afford the ambulatory health care occupancy — an occupancy that employs a defend in place strategy — with sufficient protection against the hazards of industrial and storage occupancy spaces. Further, the smoke partitions are not to serve as the enclosure of hazardous areas. See the commentary following 6.1.14.4.6.

Exhibit 20/21.2 helps to demonstrate the use of 20/21.1.3.3. The new, nonsprinklered, multiple occupancy building is divided into three tenant spaces — a restaurant (assembly occupancy) for

## CHAPTER 21 • Existing

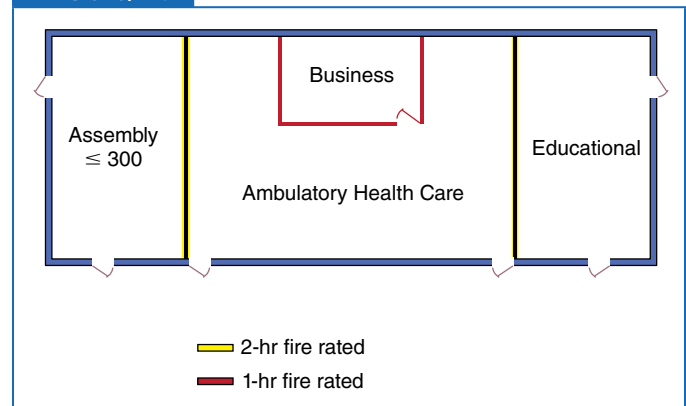

in the appropriate occupancy chapter of this *Code* shall be permitted, provided that the occupancy does not contain high hazard contents.

**21.1.3.6** Egress provisions for areas of ambulatory health care facilities that correspond to other occupancies shall meet the corresponding requirements of this *Code* for such occupancies, and, where the clinical needs of the occupant necessitate the locking of means of egress, staff shall be present for the supervised release of occupants during all times of use.

**21.1.3.7** Any area with a hazard of contents classified higher than that of the ambulatory health care occupancy and located in the same building shall be protected as required in **21.3.3**.

**21.1.3.8** Non-health care–related occupancies classified as containing high hazard contents shall not be permitted in buildings housing ambulatory health care occupancies.

Exhibit 20/21.2

Administrative offices within ambulatory health care occupancy permitted to be classified as business occupancy.

not more than 300 persons, an endoscopy center (ambulatory health care occupancy), and a private, grades 1 and 2 elementary school (educational occupancy). Each of the three tenants has direct exits to the exterior; there is no shared exit access. The multiple occupancy is to be protected as separated occupancies as permitted by 6.1.14.4.1 and not otherwise overridden by 6.1.14.1.2, as the three occupancies do not share exit access.

Given that the building is not sprinklered, Table 6.1.14.4.1(a) and Table 6.1.14.4.1(b) require a 2-hour fire resistance–rated barrier between the assembly occupancy and the ambulatory health care occupancy and between the ambulatory health care occupancy and the educational occupancy. Within the ambulatory health care occupancy there are administrative offices that are separated from the remainder of the endoscopy center. The administrative offices are not used for patient treatment or customary access of patients incapable of self-preservation.

## CHAPTER 20 • New

The provision of 20/21.1.3.3 is used to permit the administrative offices to be classified as a business occupancy, provided that the space they occupy is separated from the ambulatory health care facility by minimum 1-hour fire resistance-rated barriers. The separation is not subject to the 2-hour rated separation applied previously in this paragraph to the occupancies to each side of the ambulatory health care facility, as the provision of 20/21.1.3.3 overrides the requirement of 6.1.14.1.2. The example clarifies that the separation of ambulatory health care occupancies from other occupancies that occur within the ambulatory health care facility are treated differently than the separation of ambulatory health care occupancies from other occupancies that occur outside the ambulatory health care facility. The 1-hour fire-rated separation between the ambulatory health care occupancy and the business occupancy is consistent with a similar requirement in 20/21.3.7.1. See the commentary that follows 20.3.7.15.

Paragraph 20/21.1.3.4 specifies that the means of egress from ambulatory health care occupancies that traverse non-ambulatory health care spaces must conform to the requirements for ambulatory health care occupancies. However, an exemption is permitted by 20/21.1.3.5 where a 2-hour separating barrier is provided to meet the requirements for a horizontal exit (see 7.2.4.3.1). Where a 2-hour barrier serves as a horizontal exit, it is acceptable to exit from an ambulatory health care occupancy into a different occupancy, if the other occupancy complies with the *Code* provisions applicable to that occupancy and does not contain high hazard contents. For example, if a horizontal exit is provided between an endoscopy center and a business occupancy, outpatients are permitted to exit into the business occupancy through a horizontal exit. In this instance, corridor width, corridor partitions, stairway details, and similar features must conform to the provisions of either Chapter 38 or Chapter 39, which address business occupancies. However, the horizontal exit must comply with all the requirements of 7.2.4.

### 20.1.4 Definitions.

**20.1.4.1 General.** For definitions, see Chapter 3, Definitions.

**20.1.4.2 Definition — Ambulatory Health Care Occupancy.** (See 3.3.190.1.)

Prior to the 1981 edition of the *Code*, occupancies that offered medical services on an outpatient basis were regulated by the chapter covering business occupancies. The threat to life in an outpatient facility where four or more patients might be subject to medical procedures requiring general anesthesia, treatments such as hemodialysis, or freestanding emergency or urgent care is significantly greater than that typical of a business occupancy.

## CHAPTER 21 • Existing

Ambulatory health care occupancy patients are sometimes moved to nonmedical areas that typically do not meet the provisions applicable to ambulatory health care occupancies. Paragraph 20/21.1.3.6 permits such areas to be regulated by the provisions applicable to the corresponding occupancy. Paragraph 20/21.1.3.6 further adds the requirement that, where the clinical needs of the occupants necessitate the locking of doors, staff must be present for the supervised unlocking of doors and release of occupants. This additional requirement ensures that procedures are in place for the ready release of occupants. This is an example of an occupancy chapter — in this case ambulatory health care — imposing a requirement on another occupancy to help assure the safety of patients whose presence is the result of having left the ambulatory health care occupancy and moved into the nonambulatory health care occupancy.

Paragraph 20/21.1.3.7 regulates spaces in other occupancies in the same building as an ambulatory health care facility that, although comprising only a portion of the facility, contain more hazardous materials (in quantity or type) than are usually found in ambulatory health care occupancies. Spaces such as rooms used for the storage of combustible materials, trash collection rooms, gift shops, and paint shops must be protected in accordance with 20/21.3.2.

Paragraph 20/21.1.3.8 prohibits another occupancy, such as storage, that contains high hazard contents, such as flammable liquids, from being located in a building housing an ambulatory health care occupancy. This requirement limits use, based on occupancy classification, with regard to hazard of contents. For example, 20/21.1.3.8 does not intend to exclude laboratory operations from being part of an ambulatory health care facility. The intent is to prevent a portion of an ambulatory health care facility from being designed and used as a research facility — which would be classified as an industrial occupancy, or possibly a business occupancy — where a laboratory would use and store sizable quantities of flammable liquids.

### 21.1.4 Definitions.

**21.1.4.1 General.** For definitions, see Chapter 3, Definitions.

**21.1.4.2 Definition — Ambulatory Health Care Occupancy.** (See 3.3.190.1.)

Conversely, application of the requirements for health care facilities that contemplate 24-hour care would be unnecessarily restrictive. In establishing the occupancy classification of an ambulatory health care facility, the intent was to develop requirements that fall between the provisions applicable to business occupancies and those applicable to inpatient health care facilities so as to provide the needed level of life safety.

## CHAPTER 20 • New

**20.1.5 Classification of Hazard of Contents.** The classification of hazard of contents shall be as defined in [Section 6.2](#).

### 20.1.6 Minimum Construction Requirements.

**20.1.6.1** Ambulatory health care occupancies shall be limited to the building construction types specified in [Table 20.1.6.1](#), unless otherwise permitted by [20.1.6.6](#). (See [8.2.1](#).)

**20.1.6.2** Any level below the level of exit discharge shall be separated from the level of exit discharge by not less than

## CHAPTER 20 • New

Type II (111), Type III (211), or Type V (111) construction (*see 8.2.1*), unless both of the following criteria are met:

- (1) Such levels are under the control of the ambulatory health care facility.
- (2) Any hazardous spaces are protected in accordance with **Section 8.7**.

**20.1.6.3** Interior nonbearing walls in buildings of Type I or Type II construction shall be constructed of noncombustible or limited-combustible materials, unless otherwise permitted by **20.1.6.4**.

**20.1.6.4** Interior nonbearing walls required to have a fire resistance rating of 2 hours or less shall be permitted to be fire-retardant-treated wood enclosed within noncombustible or limited-combustible materials, provided that such walls are not used as shaft enclosures.

**20.1.6.5** All buildings with more than one level below the level of exit discharge shall have all such lower levels separated from the level of exit discharge by not less than Type II (111) construction.

**20.1.6.6** Where new ambulatory health care occupancies are located in existing buildings, the authority having jurisdiction shall be permitted to accept construction systems of lesser fire resistance than those required by **20.1.6.1** through **20.1.6.5**, provided that it can be demonstrated to the authority's satisfaction that prompt evacuation of the facility can be achieved in case of fire or that the exposing occupancies and materials of construction present no threat of fire penetration from such occupancy to the ambulatory health care facility or to the collapse of the structure.

**Table 20/21.1.6.1** is applied relative to building construction types and stories in height. See NFPA 220, *Standard on Types of Building Construction*,<sup>1</sup> and NFPA 5000®, *Building Construction and Safety Code*®,<sup>2</sup> for definitions of construction types. **Table A.8.2.1.2** summarizes the details associated with Type I through Type V construction.

**Table 20/21.1.6.1** establishes building construction type limitations based on the number of stories in height as established by **4.6.3**. **Table 20/21.1.6.1** is applied to ambulatory health care occupancies by starting the story count with the level of exit discharge and ending with the highest story used as an ambulatory health care occupancy. (Note that a building can have only one level of exit discharge, as defined in **3.3.85.1**.)

Although NFPA 220 does not set combustibility requirements for nonbearing interior walls and partitions, **20/21.1.6.3** adds requirements that exceed those of NFPA 220. Paragraph **20/21.1.6.3** adds that, in Type I and Type II construction, all nonbearing interior walls and partitions must be constructed of

## CHAPTER 21 • Existing

Type II (111), Type III (211), or Type V (111) construction (*see 8.2.1*), unless both of the following criteria are met:

- (1) Such levels are under the control of the ambulatory health care facility.
- (2) Any hazardous spaces are protected in accordance with **Section 8.7**.

**21.1.6.3** Interior nonbearing walls in buildings of Type I or Type II construction shall be constructed of noncombustible or limited-combustible materials, unless otherwise permitted by **21.1.6.4**.

**21.1.6.4** Interior nonbearing walls required to have a fire resistance rating of 2 hours or less shall be permitted to be fire-retardant-treated wood enclosed within noncombustible or limited-combustible materials, provided that such walls are not used as shaft enclosures.

**21.1.6.5** All buildings with more than one level below the level of exit discharge shall have all such lower levels separated from the level of exit discharge by not less than Type II (111) construction.

**21.1.6.6** In existing buildings, the authority having jurisdiction shall be permitted to accept construction systems of lesser fire resistance than those required by **21.1.6.1** through **21.1.6.5**, provided that it can be demonstrated to the authority's satisfaction that prompt evacuation of the facility can be achieved in case of fire or that the exposing occupancies and materials of construction present no threat of fire penetration from such occupancy to the ambulatory health care facility or to the collapse of the structure.

noncombustible or limited-combustible materials. The terms *noncombustible material* and *limited-combustible material* are addressed within NFPA 220 and in **4.6.13** and **4.6.14** of this Code.

**Paragraph 20/21.1.6.4** supplements **20/21.1.6.3** in permitting fire-retardant-treated wood (FRTW) to be used within the core of maximum 2-hour fire resistance-rated interior nonbearing walls where the sheathing of such walls is of noncombustible or limited-combustible materials. However, the recognition of FRTW in place of noncombustible or limited-combustible material does not apply to shaft enclosures. The effect is to hold shaft enclosures to a higher level of performance, given that the ambulatory health care occupancy provisions employ a defend-in-place strategy as well as the evacuation strategy used for many other occupancies.

**Paragraph 20/21.1.6.5** requires floor levels that are more than one level below the level of exit discharge (LED) to be separated from the LED by minimum Type II(111) construction. The uses of such levels below the LED are typically more hazardous

## CHAPTER 20 • New

than the uses of the floors above. For example, such floors might be used for building services including fuel-fired boilers. The minimum 1-hour fire resistance-rated construction helps to limit vertical fire spread to the LED.

Paragraph 20.1.6.6 permits flexibility in the construction requirements that apply to a new ambulatory health care facility

**20.1.7 Occupant Load.** The occupant load, in number of persons for whom means of egress and other provisions are required, shall be determined on the basis of the occupant load factors of Table 7.3.1.2 that are characteristic of the use of the space, or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

Subsection 20/21.1.7 references Table 7.3.1.2 for use in performing one of the two tasks undertaken in determining the occupant load of an ambulatory health care (AHC) occupancy. The occupant load factors of Table 7.3.1.2, applicable to the various use areas of an AHC occupancy, are used to perform an occupant load calculation for each use area. The resulting numbers are combined to arrive at the calculated occupant load. Next, the designers or operators are asked to report their educated estimate of the maximum number of persons who will occupy the space. The occupant load is then established as the larger of the two numbers — the calculated occupant load or the estimated maximum number of persons for whom the facility is intended to serve. In an AHC facility that uses its space so that

---

## 20.2 Means of Egress Requirements

**20.2.1 General.** Every aisle, passageway, corridor, exit discharge, exit location, and access shall be in accordance with Chapter 7, unless otherwise modified by 20.2.2 through 20.2.11.

### 20.2.2 Means of Egress Components.

**20.2.2.1 Components Permitted.** Means of egress components shall be limited to the types described in 20.2.2.2 through 20.2.2.12.

#### 20.2.2.2 Doors.

**20.2.2.2.1** Doors complying with 7.2.1 shall be permitted.

**20.2.2.2.2** Any door required to be self-closing shall be permitted to be held open only by an automatic release device that complies with 7.2.1.8.2. The required manual fire alarm system and the systems required by 7.2.1.8.2 shall be arranged to initiate the closing action of all such doors throughout the smoke compartment or throughout the entire facility.

## CHAPTER 21 • Existing

that is located in an existing building. Paragraph 21.1.6.6 provides similar flexibility for existing facilities. Adequate supporting data must be supplied to the authority having jurisdiction (AHJ) to justify a reduction in fire-rated construction.

**21.1.7 Occupant Load.** The occupant load, in number of persons for whom means of egress and other provisions are required, shall be determined on the basis of the occupant load factors of Table 7.3.1.2 that are characteristic of the use of the space, or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

more persons occupy an area than would be predicted by the calculation utilizing occupant load factors of Table 7.3.1.2, the actual number of persons occupying the space becomes the occupant load for purposes of applying Code provisions that utilize occupant load as a threshold for applicability and other requirements, such as sizing the means of egress system (i.e., capacity of means of egress). In an AHC facility that uses its space so that fewer persons occupy an area than would be predicted by the calculation utilizing occupant load factors of Table 7.3.1.2, the converse is not true; that is, if the actual occupant load is less than the calculated occupant load, the calculated occupant load establishes the occupant load for which egress capacity is calculated and other occupant load-based thresholds are applied.

---

## 21.2 Means of Egress Requirements

**21.2.1 General.** Every aisle, passageway, corridor, exit discharge, exit location, and access shall be in accordance with Chapter 7, unless otherwise modified by 21.2.2 through 21.2.11.

### 21.2.2 Means of Egress Components.

**21.2.2.1 Components Permitted.** Means of egress components shall be limited to the types described in 21.2.2.2 through 21.2.2.12.

#### 21.2.2.2 Doors.

**21.2.2.2.1** Doors complying with 7.2.1 shall be permitted.

**21.2.2.2.2** Any door required to be self-closing shall be permitted to be held open only by an automatic release device that complies with 7.2.1.8.2. The required manual fire alarm system and the systems required by 7.2.1.8.2 shall be arranged to initiate the closing action of all such doors throughout the smoke compartment or throughout the entire facility.

## CHAPTER 20 • New

**20.2.2.2.3** Where doors in a stair enclosure are held open by an automatic release device as permitted in **20.2.2.2.2**, initiation of a door-closing action on any level shall cause all doors at all levels in the stair enclosure to close.

**20.2.2.2.4\*** Locks complying with **7.2.1.5.5** shall be permitted only on principal entrance/exit doors.

**A.20.2.2.2.4** The words “principal entrance/exit doors” describe doors that the authority having jurisdiction can reasonably expect to be unlocked in order for the facility to do business.

**20.2.2.2.5 Reserved.**

**20.2.2.2.6** Delayed-egress locks complying with **7.2.1.6.1** shall be permitted.

**20.2.2.2.7** Access-controlled egress doors complying with **7.2.1.6.2** shall be permitted.

**20.2.2.2.8** Elevator lobby exit access door-locking arrangements in accordance with **7.2.1.6.3** shall be permitted.

**20.2.2.2.9** Horizontal or vertical security grilles or doors complying with **7.2.1.4.1(3)** shall be permitted to be used as part of the required means of egress from a tenant space.

**20.2.2.2.10 Reserved.**

**20.2.2.2.11** Revolving doors complying with **7.2.1.10** shall be permitted.

## CHAPTER 21 • Existing

**21.2.2.2.3** Where doors in a stair enclosure are held open by an automatic release device as permitted in **21.2.2.2.2**, initiation of a door-closing action on any level shall cause all doors at all levels in the stair enclosure to close.

**21.2.2.2.4\*** Locks complying with **7.2.1.5.5** shall be permitted only on principal entrance/exit doors.

**A.21.2.2.2.4** The words “principal entrance/exit doors” describe doors that the authority having jurisdiction can reasonably expect to be unlocked in order for the facility to do business.

**21.2.2.2.5** The re-entry provisions of **7.2.1.5.8** shall not apply to any of the following:

- (1) Existing ambulatory health care occupancies that are not in high-rise buildings
- (2) Existing high-rise buildings that are protected throughout by an approved automatic sprinkler system in accordance with **9.7.1.1(1)**
- (3) Existing high-rise buildings having approved existing means for providing stair re-entry

**21.2.2.2.6** Delayed-egress locks complying with **7.2.1.6.1** shall be permitted.

**21.2.2.2.7** Access-controlled egress doors complying with **7.2.1.6.2** shall be permitted.

**21.2.2.2.8** Elevator lobby exit access door-locking arrangements in accordance with **7.2.1.6.3** shall be permitted.

**21.2.2.2.9** Horizontal or vertical security grilles or doors complying with **7.2.1.4(3)** shall be permitted to be used as part of the required means of egress from a tenant space.

**21.2.2.2.10** Approved existing horizontal-sliding or vertical-rolling fire doors shall be permitted in the means of egress where they comply with all of the following conditions:

- (1) They are held open by fusible links.
- (2) The fusible links are rated at not less than 165°F (74°C).
- (3) The fusible links are located not more than 10 ft (3050 mm) above the floor.
- (4) The fusible links are in immediate proximity to the door opening.
- (5) The fusible links are not located above a ceiling.
- (6) The door is not credited with providing any protection under this *Code*.

**21.2.2.2.11** Revolving doors complying with **7.2.1.10** shall be permitted.

**21.2.2.2.12\*** A door in a horizontal exit shall not be required to swing in the direction of egress travel as specified in **7.2.4.3.8.1**.

**A.21.2.2.2.12** The waiver of the requirement for doors to swing in the direction of egress travel is based on the assumption that,

## CHAPTER 20 • New

It is desirable to keep doors in exit enclosures, stair enclosures, horizontal exits, smoke barriers, and hazardous areas closed to impede the spread of smoke and gases caused by a fire. However, some doors will be kept open for reasons of operating efficiency or comfort. Where doors in required fire or smoke barriers are to be held open, they must be equipped with automatic devices designed to close the doors by the methods described in 20/21.2.2.2.2 and 7.2.1.8.2.

The automatic device must cause the doors to close (either throughout the smoke compartment or throughout the facility) by operation of the manual fire alarm system. The doors must also be designed to close by actuation of smoke detectors installed for releasing service in the vicinity of the door opening. See 7.2.1.8.2.

It is especially important in facilities providing ambulatory health care to maintain floor-to-floor separation. Doors protecting openings in a stair enclosure are permitted to be held open by an automatic device only if arranged to close as detailed in 7.2.1.8.2. Initiation of any action that causes a door to close at one level must cause all doors protecting openings within a given stair enclosure to close in accordance with 20/21.2.2.2.3. Because the doors in the exit stair enclosure are rated fire door assemblies, they will latch when the closing device brings each door to its closed position.

Only the principal entrance/exit doors of an ambulatory health care (AHC) occupancy are permitted by 20/21.2.2.2.4 to be equipped with the special key-operated lock described by the provisions of 7.2.1.5.5. It must be easy to determine that the device is locked by using means such as a flag indicator that can be seen at the door. Exhibit 20/21.3 shows an example of the principal entrance/exit that is subject to locking by means of the lock addressed in 7.2.1.5.5. Note that the three other exit doors at the perimeter of the building are prohibited from being equipped with key-operated locks, because the probability is low that these doors will be consistently unlocked when the occupancy opens for business, whereas the principal entrance/exit doors must be unlocked each day to accommodate staff, patients, and other visitors.

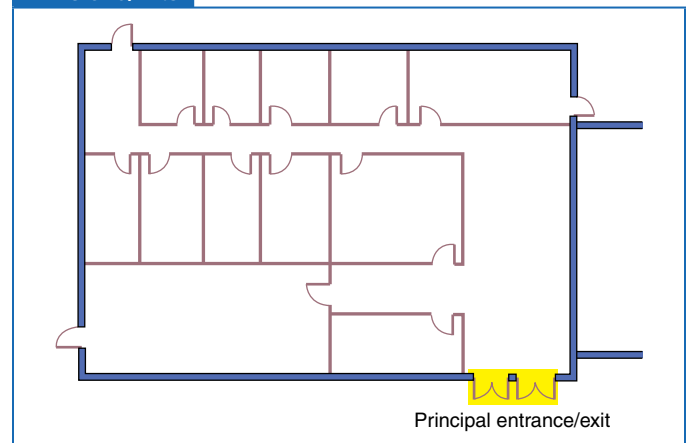

Delayed-egress locks, as permitted by 20/21.2.2.2.6, and access-controlled egress doors, as permitted by 20/21.2.2.2.7, are addressed in detail — complete with photo exhibits — in the commentary following 7.2.1.6.1.1(5) and A.7.2.1.6.2.

## CHAPTER 21 • Existing

in this occupancy, there is little possibility of a panic rush that might prevent the opening of doors that swing against egress travel.

A desirable arrangement, which is possible with corridors 6 ft (1830 mm) or more in width, is to have two 32 in. (810 mm) doors, normally closed, each swinging with the egress travel (in opposite directions).

Exhibit 20/21.3

Principal entrance/exit door permitted to be key-locked in accordance with 7.2.1.5.5.

Elevator lobbies are required by 7.4.1.6.1 to provide direct access to not less than one exit (typically an exit stair enclosure) without requiring occupants to pass through any space subject to locking. The 2009 edition of the Code introduced elevator lobby exit access door-locking arrangements in 7.2.1.6.3. These criteria permit elevators to open to lobbies that are secured from the remainder of the floor; to reach an exit, occupants in the elevator lobby are required to travel through the secured area. The requirements of 7.2.1.6.3, which include the installation of an approved, supervised automatic sprinkler system throughout the building, ensure that the doors will unlock to allow occupants to reach an exit in the event of a fire. The provisions of 7.2.1.6.3 are permitted to be used only where specifically referenced by the applicable occupancy chapter; such arrangement is permitted for AHC occupancies by 20/21.2.2.2.8. See 7.2.1.6.3 and its associated commentary for additional details on elevator lobby exit access door-locking arrangements.

The provision of 20/21.2.2.2.9 recognizes the use of horizontal or vertical security grilles or doors complying with 7.2.1.4.1(3) but only in an opening from the AHC space. The egress path used by an occupant of an AHC occupancy would not be permitted to include a horizontal or vertical security grille or door, for example, at a cross-corridor location encountered after the occupant

## CHAPTER 20 • New

leaves the AHC space, as it cannot be assured that the AHC occupancy has control over the locking of such grille or door.

Horizontal-sliding or vertical-rolling fire doors exist, for purposes of property protection, in some buildings housing an AHC facility. Although the *Code* normally does not recognize these doors in openings within the required means of egress, 21.2.2.2.10 provides a special exemption for existing horizontal-sliding or vertical-rolling fire doors. The requirement that the fusible link be positioned in immediate proximity to the door opening, rated 165°F (74°C) or higher, and located not more than 10 ft (3050 mm) above the floor helps to ensure that the door will remain open until rising temperatures make it unsafe to pass through the door opening. The door will not close early in the fire development; therefore, it cannot be credited for closing off the opening, as required of a fire door for life safety purposes. However the door opening associated with the horizontal-sliding or vertical-rolling door is recognized as part of an egress route. The door, itself, might be there for purposes of property protection. Exhibit 20/21.4 shows an example of an existing vertical-rolling fire door as permitted within the egress path by 21.2.2.2.10.

Paragraph 20/21.2.2.2.11 addresses revolving doors. The provisions of 7.2.1.10 specify that the use of a revolving door, regardless of whether it is permitted as part of the required means of egress, requires a conforming side-hinged swinging door to be positioned and usable within the same wall as, and to be located within 10 ft (3050 mm) of, the revolving door. This

### 20.2.2.3 Stairs.

20.2.2.3.1 Stairs complying with 7.2.2 shall be permitted.

20.2.2.3.2 Spiral stairs complying with 7.2.2.2.3 shall be permitted.

20.2.2.4 **Smokeproof Enclosures.** Smokeproof enclosures complying with 7.2.3 shall be permitted.

20.2.2.5 **Horizontal Exits.** Horizontal exits complying with 7.2.4 shall be permitted.

20.2.2.6 **Ramps.** Ramps complying with 7.2.5 shall be permitted.

20.2.2.7 **Exit Passageways.** Exit passageways complying with 7.2.6 shall be permitted.

20.2.2.8 **Reserved.**

20.2.2.9 **Reserved.**

## CHAPTER 21 • Existing

Exhibit 20/21.4

Existing vertical-rolling fire door permitted across egress path per 21.2.2.2.10.

requirement helps to ensure that, once people move toward the door, if the collapsibility and other safety features of the door fail and render it unusable, egress from the vicinity is still possible without retracing steps and requiring travel toward the fire.

### 21.2.2.3 Stairs.

21.2.2.3.1 Stairs complying with 7.2.2 shall be permitted.

21.2.2.3.2 Spiral stairs complying with 7.2.2.2.3 shall be permitted.

21.2.2.3.3 Winders complying with 7.2.2.2.4 shall be permitted.

21.2.2.4 **Smokeproof Enclosures.** Smokeproof enclosures complying with 7.2.3 shall be permitted.

21.2.2.5 **Horizontal Exits.** Horizontal exits complying with 7.2.4 shall be permitted.

21.2.2.6 **Ramps.** Ramps complying with 7.2.5 shall be permitted.

21.2.2.7 **Exit Passageways.** Exit passageways complying with 7.2.6 shall be permitted.

21.2.2.8 **Escalators and Moving Walks.** Escalators and moving walks complying with 7.2.7 shall be permitted.

21.2.2.9 **Fire Escape Stairs. (Reserved)**

## CHAPTER 20 • New

Note that fire escape stairs are not permitted as an egress component for new or existing ambulatory health care (AHC) occupancies. Fire escape stairs are permitted in one of the required means of egress for existing business occupancies. An AHC occupancy is often located within a multi-tenant building that includes business occupancies. Care needs to be taken before

**20.2.2.10 Fire Escape Ladders.** Fire escape ladders complying with 7.2.9 shall be permitted.

**20.2.2.11 Alternating Tread Devices.** Alternating tread devices complying with 7.2.11 shall be permitted.

**20.2.2.12 Areas of Refuge.**

**20.2.2.12.1** Areas of refuge complying with 7.2.12 shall be permitted.

**20.2.2.12.2** In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1), two rooms or spaces separated from each other by smoke-resistant partitions in accordance with the definition of area of refuge in 3.3.22 shall not be required.

The provision of 20/21.2.2.12.2 is similar to that of 38/39.2.2.12.2 applicable to business occupancies. A floor of a sprinklered building is considered to be an area of refuge, without having to provide occupants with access to a second space on the floor (see 3.3.22). Consider an example where an occupant who travels by wheelchair and does not have the capability of using stairs

**20.2.3 Capacity of Means of Egress.**

**20.2.3.1** The capacity of any required means of egress shall be determined in accordance with Section 7.3.

**20.2.3.2** The clear width of any corridor or passageway required for exit access shall be not less than 44 in. (1120 mm).

**20.2.3.3\*** Where minimum corridor width is 6 ft (1830 mm), projections not more than 6 in. (150 mm) from the corridor wall, above the handrail height, shall be permitted for the installation of hand-rub dispensing units in accordance with 20.4.3.

**A.20.2.3.3** Building codes and accessibility codes might require cane detection below projections that exceed 4 in. (102 mm).

**20.2.3.4** Doors in the means of egress from diagnostic or treatment areas, such as x-ray, surgical, or physical therapy, shall provide a clear width of not less than 32 in. (810 mm).

## CHAPTER 21 • Existing

leasing space for AHC use in such a multi-tenant building to ensure that the required egress system is comprised wholly of components permitted for AHC occupancies. No exemption similar to that offered to existing buildings by 21.1.6.6, relative to construction type, exists relative to the use of fire escape stairs.

**21.2.2.10 Fire Escape Ladders.** Fire escape ladders complying with 7.2.9 shall be permitted.

**21.2.2.11 Alternating Tread Devices.** Alternating tread devices complying with 7.2.11 shall be permitted.

**21.2.2.12 Areas of Refuge.**

**21.2.2.12.1** Areas of refuge complying with 7.2.12 shall be permitted.

**21.2.2.12.2** In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1), two rooms or spaces separated from each other by smoke-resistant partitions in accordance with the definition of area of refuge in 3.3.22 shall not be required.

is in the corridor and has no access to another room on the floor. If there is a fire affecting the corridor, the sprinkler system is designed to control the fire. The exemption from having to provide access to a second space on the floor is based on the belief that the occupant might be uncomfortable but not unsafe remaining in the corridor.

**21.2.3 Capacity of Means of Egress.**

**21.2.3.1** The capacity of any required means of egress shall be determined in accordance with the provisions of Section 7.3.

**21.2.3.2** The clear width of any corridor or passageway required for exit access shall be not less than 44 in. (1120 mm).

**21.2.3.3\*** Where minimum corridor width is 6 ft (1830 mm), projections not more than 6 in. (150 mm) from the corridor wall, above the handrail height, shall be permitted for the installation of hand-rub dispensing units in accordance with 21.4.3.

**A.21.2.3.3** Building codes and accessibility codes might require cane detection below projections that exceed 4 in. (102 mm).

**21.2.3.4** Doors in the means of egress from diagnostic or treatment areas, such as x-ray, surgical, or physical therapy, shall provide a clear width of not less than 32 in. (810 mm), unless such doors are existing 34 in. (865 mm) doors.

## CHAPTER 20 • New

The capacity of the means of egress in ambulatory health care facilities is determined in accordance with [Section 7.3](#), which requires the capacity of level exit components to be computed on the basis of 0.2 in. (5 mm) per person; stair capacity is computed using 0.3 in. (7.6 mm) per person. These capacities are the same as permitted within sprinklered hospitals, nursing homes, and limited care facilities. Even if the ambulatory health care facility is not sprinklered, these capacity factors are considered adequate, based on the assumption that the majority of occupants will be ambulatory.

Although greater corridor widths might be required for functional purposes, the minimum width for corridors used as common exit access in ambulatory health care facilities is 44 in. (1120 mm), in accordance with [20/21.2.3.2](#). This width, which is significantly less than that required in new hospitals, nursing homes, and limited care facilities (see [18.2.3.4](#) and [18.2.3.5](#)), and somewhat less than required in existing hospitals, nursing homes, and limited care facilities (see [19.2.3.4](#)), is specified on the assumption that most occupants will be ambulatory. The minimum 44 in. (1120 mm) corridor width specified by [20/21.2.3.2](#) is stricter than that of [38/39.2.3.2](#) for business occupancies in that business occupancies are required to have a minimum 44 in. (1120 mm) corridor width only where such corridor serves an occupant load of 50 or more.

[Paragraph 20/21.2.3.3](#) has been in the *Code* since the 2006 edition. It provides for hand-rub dispensing units, in accordance with [20/21.3.2.6](#), to project a maximum of 6 in. (150 mm) into corridors, above handrail height [i.e., above 38 in. (965 mm)], provided that such corridors are at least 6 ft (1830 mm) wide. See [20/21.3.2.6](#). The encroachment is permitted, provided that it does not exceed 6 in. (150 mm), without having to consider the clear width of the corridor as measuring less than its actual width.

The text of [A.20/A.21.2.3.3](#) is new to the 2015 edition of the *Code*. The *2010 ADA Standards for Accessible Design*<sup>3</sup> (aka, *2010 ADA Standards*) and ICC/ANSI A117.1, *Accessible Buildings and Usable Buildings and Facilities*,<sup>4</sup> limit protrusions from walls occurring within the 27 in. to 80 in. (685 mm to 2030 mm) height range to a maximum of 4 in. (102 mm). Protrusions of more than 4 in. (102 mm) within that height range are not readily detectable and avoidable by long-cane users. The provision of [20/21.2.3.3](#) permits maximum 6 in. (150 mm) projections in corridors. [Exhibit 20/21.5](#) depicts a corridor wall with a projection exceeding the 4 in. (102 mm) limitation of the *ADA Standards* and *ICC/ANSI A117.1* as might occur where the provision of [20/21.2.3.3](#) is used, as it requires the projection to be positioned not less than 38 in. (965 mm) above the floor. Note that the projection mounting height places it above cane detection height so that the projection is undetected and not avoided. The minimum 38 in. (965 mm) mounting height was established for the three reasons

## CHAPTER 21 • Existing

**Exhibit 20/21.5**

*Protrusion from wall is above cane detection height range.*

that follow: (1) to permit a wheelchair user to pass in close proximity to the wall, (2) to accommodate the placement of a handrail below the permitted obstruction, and (3) to elevate the protruding object so that its presence was readily apparent.

The corridor must be at least 6 ft (1830 mm) in width for the projection to be permitted in accordance with [20/21.2.3.3](#). The minimum 6 ft (1830 mm) corridor width is sufficient for travel without forcing the wheelchair user to be near a wall. A handrail is a helpful item on a corridor wall but is not a required feature. As a reasonable compromise that permits the requirements of the accessibility standards to be met and make the presence of the protruding object obvious, the AHJ could allow protrusions to be mounted within 27 in. (685 mm) of the floor and require that they extend to at least a 38 in. (965 mm) height. Such arrangement is depicted in [Exhibit 20/21.6](#). Note that the long-cane user is able to detect the projection and avoid it.

In many instances, doors wider than 32 in. (810 mm) clear width will be required for functional purposes. [Paragraph 20/21.2.3.4](#) addresses doors that provide access to common hallways and corridors. The 32 in. (810 mm) minimum clear width, which is significantly less than that required in new hospitals and nursing homes, is specified on the assumption that most occupants will be ambulatory or moving in wheelchairs. A 32 in. (810 mm) clear width door opening is sufficiently wide to accommodate a wheelchair user. Per [21.2.3.4](#), an existing 34 in. (865 mm) door [i.e., the door leaf width is 34 in. (865 mm)] is considered to provide the required 32 in. (810 mm) opening width, although there is no assurance that the existing door can be opened a full 90 degrees. See the commentary and exhibits that follow [7.2.1.2.2\(4\)](#).

Exhibit 20/21.6

*Protrusion from wall is within cane detection height range.*

## 20.2.4 Number of Means of Egress.

**20.2.4.1** The number of means of egress shall be in accordance with [Section 7.4](#).

**20.2.4.2** Not less than two exits of the types described in [20.2.2](#) that are remotely located from each other shall be provided for each floor or fire section of the building.

**20.2.4.3** Not less than two exits of the types described in [20.2.2](#) shall be accessible from each smoke compartment.

**20.2.4.4** Egress from smoke compartments addressed in [20.2.4.3](#) shall be permitted through adjacent compartments provided that the two required egress paths are arranged so that both do not pass through the same adjacent smoke compartment.

The provision of [20.2.4.1](#) requires new construction to comply with the provisions of [Section 7.4](#) for number of means of egress. For existing installations, the provision of [21.2.4.1](#) mandates the use of [Section 7.4](#), with the exception of the provision of [7.4.1.2](#), which requires three means of egress when the occupant load exceeds 500 and four when it exceeds 1000. It would not be practical to require an existing installation with adequate egress capacity but only two means of egress to install a third or fourth means of egress.

[Exhibit 20/21.7](#) can be used to illustrate the application of [20/21.2.4.2](#) and [20/21.2.4.3](#). The four exits depicted (i.e., exit stair 1, exit stair 2, horizontal exit 1, and horizontal exit 2) meet the requirement of [20/21.2.4.2](#) that not less than two exits be provided on the story. Occupants of all areas on the story have access to not less than two separate exits as required by

## 21.2.4 Number of Means of Egress.

**21.2.4.1** The number of means of egress shall be in accordance with [7.4.1.1](#) and [7.4.1.3](#) through [7.4.1.6](#).

**21.2.4.2** Not less than two exits of the types described in [21.2.2](#) that are remotely located from each other shall be provided for each floor or fire section of the building.

**21.2.4.3** Not less than two exits of the types described in [21.2.2](#) shall be accessible from each smoke compartment.

**21.2.4.4** Egress from smoke compartments addressed in [21.2.4.3](#) shall be permitted through adjacent compartments provided that the two required egress paths are arranged so that both do not pass through the same adjacent smoke compartment.

[20/21.2.4.3](#). For example, occupants of area A have access to exit stair 1 and horizontal exit 1. If horizontal exit 1 were replaced by a wall with no door openings, occupants of area A would have access to only one exit, which is in violation of the requirement of [20/21.2.4.3](#).

[Exhibit 20/21.8](#) can be used to illustrate the application of [20/21.2.4.4](#). Smoke barrier 1 and smoke barrier 2 divide the floor into three smoke compartments — area A, area B, and area C. Access to two exits is provided from each smoke compartment. For area A, exit stair 1 provides access to one exit, and traveling through smoke barrier 1 into area B provides access to the second exit, exit stair 2. For area B, exit stair 2 provides access to one exit, and traveling through smoke barrier 1 into area A provides access to the second exit, exit stair 1. For area C, the two remotely located pairs of doors in smoke barrier 2 provide

## CHAPTER 20 • New

Exhibit 20/21.7

Minimum of two exits accessible from all parts of floor.

access to exit stair 1 in area A and exit stair 2 in area B, but passage into area B is required. Area C is deficient in that both of its exit accesses require passage into area B, which might be the smoke compartment of fire origin. To satisfy the provision of 18/19.2.4.4 — that egress paths not require travel through the same smoke compartment — either an exit stair can be added to area C, or the door at Z can be relocated to position XX.

## 20.2.5 Arrangement of Means of Egress.

**20.2.5.1** Means of egress shall be arranged in accordance with Section 7.5.

**20.2.5.2** Dead-end corridors shall be permitted in accordance with 20.2.5.2.1 or 20.2.5.2.2.

**20.2.5.2.1** In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1), dead-end corridors shall not exceed 50 ft (15 m).

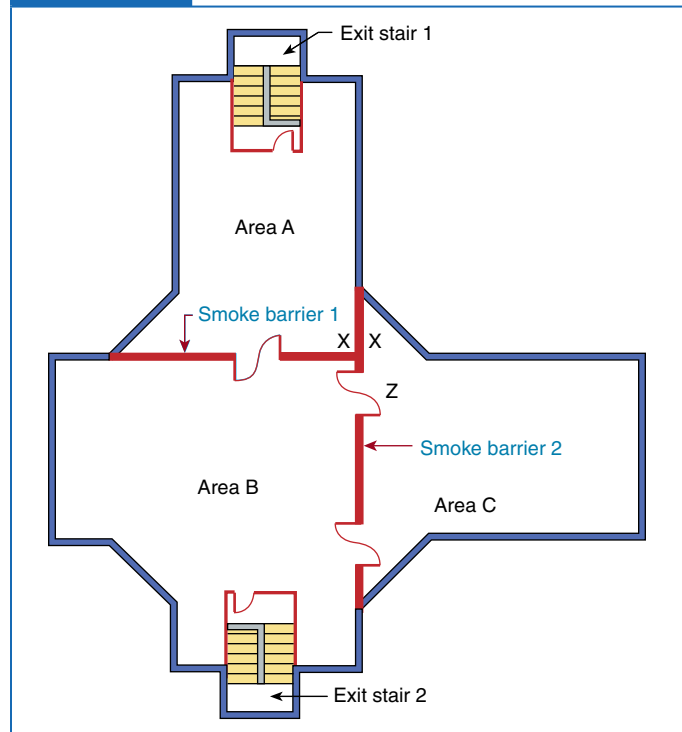

**20.2.5.2.2** In buildings other than those complying with 20.2.5.2.1, dead-end corridors shall not exceed 20 ft (6100 mm).

**20.2.5.3** Limitations on common path of travel shall be in accordance with 20.2.5.3.1, 20.2.5.3.2, and 20.2.5.3.3.

**20.2.5.3.1** Common path of travel shall not exceed 100 ft (30 m) in a building protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1).

## CHAPTER 21 • Existing

Exhibit 20/21.8

Arrangement of exits for smoke compartments formed by smoke barriers.

Note that the provisions of 20/21.2.4 do not permit ambulatory health care occupancies to have a single means of egress. The provisions of 38/39.2.4 for business occupancies permit a variety of single means of egress (i.e., single exit) exemptions.

## 21.2.5 Arrangement of Means of Egress.

**21.2.5.1** Means of egress shall be arranged in accordance with Section 7.5.

**21.2.5.2** Dead-end corridors shall not exceed 50 ft (15 m).

**21.2.5.3** Limitations on common path of travel shall be in accordance with 21.2.5.3.1, 21.2.5.3.2, and 21.2.5.3.3.

**21.2.5.3.1** Common path of travel shall not exceed 100 ft (30 m) on a story protected throughout by an approved automatic sprinkler system in accordance with 9.7.1.1(1).

## CHAPTER 20 • New

**20.2.5.3.2** Common path of travel shall not exceed 100 ft (30 m) within a single tenant space having an occupant load not exceeding 25 persons.

**20.2.5.3.3** In buildings other than those complying with 20.2.5.3.1 or 20.2.5.3.2, common path of travel shall not exceed 75 ft (23 m).

Because they have separate and distinct requirements, the *Code* separates dead-end corridors and common path of travel into distinct and separate subsections. Dead-end corridors are limited to 20 ft (6100 mm) in new ambulatory health care occupancies that are not protected throughout by an approved, supervised automatic sprinkler system in accordance with 20.2.5.2.2. The provision of 20.2.5.2.1 recognizes the additional level of safety to life that a complete automatic sprinkler system provides; it, therefore, allows added flexibility when designing the location of corridors and exits in buildings where approved sprinkler systems are installed by permitting the dead-end corridor pocket to be as long as 50 ft (15 m). Existing ambulatory health care occupancies are permitted a 50 ft (15 m) dead-end corridor, regardless of the presence of sprinklers in accordance with 21.2.5.2.

Three typical dead-end corridors are illustrated in Exhibit 20/21.9. Dead-end pockets are located in the corridor between points *B* and *C*, *F* and *G*, and *H* and *I*. They are limited to a maximum length of 20 ft (6100 mm) [50 ft (15 m) for existing business occupancies or sprinklered new business occupancies].

The restriction on common path of travel is separate and distinct from the restriction on dead-end corridors. A common path of travel might sometimes involve, in whole or in part, a dead-end corridor. The method for measuring common path of travel is similar to that for measuring travel distance (see Section 7.6). The starting point for measurement of common path of travel is the same as the starting point for travel distance measurement — the most remote point of any occupiable area. The difference is that, instead of terminating at the entrance to an exit, common path of travel measurement often ends before the exit, because it terminates at the point where the occupant has a choice of two distinct and separate paths to an exit (see the definition of the term *common path of travel* in 3.3.47). See rooms 1, 2, and 3 in Exhibit 20/21.9, where common paths of travel occur between points *A* and *C*, *D* and *E*, and *J* and *I*. At points *E*, *C*, and *I* the occupant has a choice of two directions, where each direction leads to an exit.

The provision of 20/21.2.5.3.1 permits the common path of travel to be extended from 75 ft (23 m) to 100 ft (30 m) if sprinklers are provided. For new business occupancies, the provision requires that the entire building be protected by an approved, supervised automatic sprinkler system to utilize the increase in common path of travel; for existing business occupancies, the

## CHAPTER 21 • Existing

**21.2.5.3.2** Common path of travel shall not be limited in a single-tenant space with an occupant load not exceeding 25 people.

**21.2.5.3.3** In buildings other than those complying with 21.2.5.3.1 or 21.2.5.3.2, common path of travel shall not exceed 75 ft (23 m).

sprinkler system is not required to be supervised and is not required to protect the entire building but only the floor on which the increased common path is located. This provision recognizes the additional level of safety to life that automatic sprinkler protection provides and allows added flexibility when designing the location of corridors and exits in buildings where approved sprinkler systems are installed.

The provision of 20/21.2.5.3.2 permits common path of travel in an ambulatory health care occupancy to be extended

Dead-end corridor pockets and common paths of travel.

## CHAPTER 20 • New

from 75 ft (23 m) to 100 ft (30 m), without requiring the sprinkler protection addressed in 20.2.5.3.1, provided that the common path of travel occurs wholly within a maximum 25-person single-tenant space, with no additional common path encountered once the common space, such as the corridor, is reached. In Exhibit 20/21.9, 20/21.2.5.3.2 could be applied to room 2 but not to room 1 or room 3, because, upon leaving those rooms, additional common path of travel is encountered within the corridor.

Exhibit 20/21.10 shows additional examples of common paths of travel in a business occupancy. Also see the commentary associated with Section 7.5 on arrangement of means of egress.

In suite A of Exhibit 20/21.10, the travel from point X to point A is a common path of travel; although there are two routes to reach the main corridor, they both merge at common point A. In suite B, the travel from point X to point B is common path of travel and does not appear to exceed the 75 ft (23 m) maximum; if it were in excess of 75 ft (23 m) but not more than 100 ft (30 m), it would be permitted by either 20/21.2.5.3.1 (involving sprinkler protection) or 20/25.2.5.3.2 (involving single-tenant space). Although suites C and D do not have common paths of travel (other than within the individual rooms, such as those lining the perimeter wall), the remoteness of the two exit access doors from each suite is questionable. See 7.5.1.3 for details on means of egress remoteness.

The common path of travel restriction regulates where a room or space requires a second exit access door. If the common path of travel is exceeded, a second door from the office space might solve the common path problem. The door must be positioned so that any resulting common path of travel complies with the allowable distances. In addition, the second door must be remotely located from the first door (see 7.5.1.3), and each door must lead to remote exits by means of remote paths. Therefore, in a single requirement, the Code regulates not only the

## 20.2.6 Travel Distance to Exits.

**20.2.6.1** Travel distance shall be measured in accordance with Section 7.6.

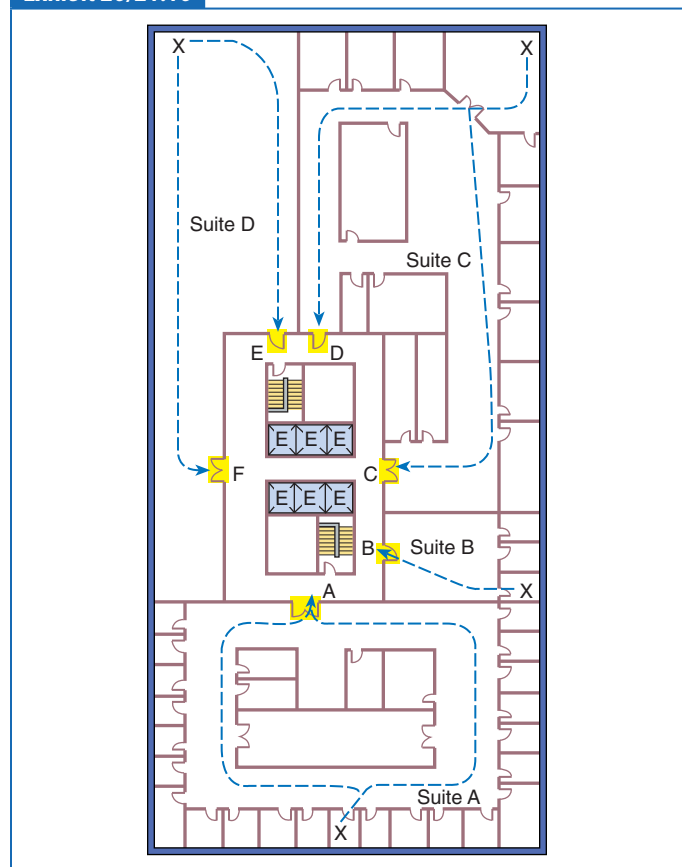

**20.2.6.2** Travel distance shall comply with 20.2.6.2.1 and 20.2.6.2.2.

**20.2.6.2.1** The travel distance between any point in a room and an exit shall not exceed 150 ft (46 m).

**20.2.6.2.2** The maximum travel distance in 20.2.6.2.1 shall be permitted to be increased by 50 ft (15 m) in buildings protected throughout by an approved automatic sprinkler system in accordance with Section 9.7.

## CHAPTER 21 • Existing

Exhibit 20/21.10

Additional common path of travel considerations.

number of exit access doors required from a room or area but also the arrangement of those doors. See the commentary associated with A.7.5.1.5 for a detailed discussion on common path of travel.

## 21.2.6 Travel Distance to Exits.

**21.2.6.1** Travel distance shall be measured in accordance with Section 7.6.

**21.2.6.2** Travel distance shall comply with 21.2.6.2.1 and 21.2.6.2.2.

**21.2.6.2.1** The travel distance between any point in a room and an exit shall not exceed 150 ft (46 m).

**21.2.6.2.2** The maximum travel distance in 21.2.6.2.1 shall be permitted to be increased by 50 ft (15 m) in buildings protected throughout by an approved automatic sprinkler system in accordance with Section 9.7.

## CHAPTER 20 • New

The provisions of 20/21.2.6 were revised for the 2012 edition of the *Code* so that travel distance is considered in one segment. In prior editions, travel distance was considered in two separate segments — (1) travel within the room to the room door, and (2) travel from the room door to the exit. Travel distance is measured only to the nearest exit, not to both exits. The requirements of 20/21.2.6.2 are illustrated in Exhibit 20/21.11.

**20.2.7 Discharge from Exits.** Exit discharge shall comply with Section 7.7.

**20.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with Section 7.8.

**20.2.9 Emergency Lighting and Essential Electrical Systems.**

**20.2.9.1** Emergency lighting shall be provided in accordance with Section 7.9.

**20.2.9.2** Where general anesthesia or life-support equipment is used, each ambulatory health care facility shall be provided with an essential electrical system in accordance with NFPA 99, *Health Care Facilities Code*, unless otherwise permitted by any of the following:

- (1) Where battery-operated equipment is provided and acceptable to the authority having jurisdiction
- (2) Where a facility uses life-support equipment for emergency purposes only

All ambulatory health care facilities are required to be equipped with emergency lighting. If medical procedures requiring general anesthesia are practiced, or if life-support equipment is used for other than emergency purposes only, ambulatory health care facilities are required to be served by electrical systems meeting the criteria for essential electrical systems, as detailed in NFPA 99, *Health Care Facilities Code*.<sup>5</sup>

A facility would not be required to have an emergency generator if the building is a freestanding unit and if, as a normal practice, the following conditions apply:

1. Management maintains policies that preclude the provision of care for any patient who might need to be sustained by

## CHAPTER 21 • Existing

Exhibit 20/21.11

Travel distance limitations for an ambulatory health care occupancy.

**21.2.7 Discharge from Exits.** Exit discharge shall comply with Section 7.7.

**21.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with Section 7.8.

**21.2.9 Emergency Lighting and Essential Electrical Systems.**

**21.2.9.1** Emergency lighting shall be provided in accordance with Section 7.9.

**21.2.9.2** Where general anesthesia or life-support equipment is used, each ambulatory health care facility shall be provided with an essential electrical system in accordance with NFPA 99, *Health Care Facilities Code*, unless otherwise permitted by one of the following:

- (1) Where battery-operated equipment is provided and acceptable to the authority having jurisdiction
- (2) Where a facility uses life-support equipment for emergency purposes only

electrical life-support equipment, such as respirators or suction apparatus.

2. No surgical treatment requiring general anesthesia is offered.
3. Battery-operated systems or equipment are provided that maintain power to exit lights and illumination for egress corridors, stairways, medical preparation areas, and the like for a minimum of 1½ hours, with battery power required to be supplied to all alarm systems.

## CHAPTER 20 • New

**20.2.10 Marking of Means of Egress.** Means of egress shall have signs in accordance with [Section 7.10](#).

**20.2.11 Special Means of Egress Features.**

**20.2.11.1 Reserved.**

**20.2.11.2 Lockups.** Lockups in ambulatory health care occupancies shall comply with the requirements of [22.4.5](#).

If an ambulatory health care occupancy is provided with a lockup for security purposes, it must meet the provisions of [22/23.4.5](#), as specified in [38/39.2.11.2](#). The lockup criteria require the application of some of the concepts of detention and correctional

---

## 20.3 Protection

### 20.3.1 Protection of Vertical Openings.

**20.3.1.1** Vertical openings shall be enclosed or protected in accordance with [Section 8.6](#), unless otherwise permitted by [20.3.1.2](#).

**20.3.1.2** Unenclosed vertical openings in accordance with [8.6.9.1](#) shall be permitted.

**20.3.1.3** Floors that are below the street floor and are used for storage or other than an ambulatory health care occupancy shall have no unprotected openings to ambulatory health care occupancy floors.

The provisions for vertical openings in [20/21.3.1.1](#) reference [Section 8.6](#). [Paragraph 8.6.6](#) permits the three-story communicating space (sometimes referred to as a “mini-atrium”), unless there is a prohibition on such use in the applicable occupancy chapter.

## CHAPTER 21 • Existing

**21.2.10 Marking of Means of Egress.** Means of egress shall have signs in accordance with [Section 7.10](#).

**21.2.11 Special Means of Egress Features.**

**21.2.11.1 Reserved.**

**21.2.11.2 Lockups.** Lockups in ambulatory health care occupancies, other than approved existing lockups, shall comply with the requirements of [23.4.5](#).

occupancies to other occupancies where persons might be detained for security purposes, without classifying the lockup as a detention and correctional occupancy. See [22/23.4.5](#) and related commentary for details on the lockup provisions.

---

## 21.3 Protection

### 21.3.1 Protection of Vertical Openings.

**21.3.1.1** Vertical openings shall be enclosed or protected in accordance with [Section 8.6](#), unless otherwise permitted by any of the following:

- (1) Unenclosed vertical openings in accordance with [8.6.9.1](#) shall be permitted.
- (2) Unprotected vertical openings shall be permitted in buildings complying with all of the following:
  - (a) Where protected throughout by an approved automatic sprinkler system in accordance with [9.7.1.1\(1\)](#)
  - (b) Where no unprotected vertical opening serves as any part of any required means of egress
  - (c) Where required exits consist of exit doors that discharge directly to the finished ground level in accordance with [7.2.1](#), outside stairs in accordance with [7.2.2](#), smoke-proof enclosures in accordance with [7.2.3](#), or horizontal exits in accordance with [7.2.4](#)

**21.3.1.2** Floors that are below the street floor and are used for storage or other than an ambulatory health care occupancy shall have no unprotected openings to ambulatory health care occupancy floors.

Neither [Chapter 20](#) nor [Chapter 21](#) prohibits the use of [8.6.6](#). Note that [8.6.6](#) requires that, if the communicating space (the vertical opening and all areas open to it) contains ordinary hazard contents, it must be protected by automatic sprinklers. It is

## CHAPTER 20 • New

difficult to limit contents of such space to low hazard contents (see 6.2.2.2), so sprinklers are, in effect, required as a condition of permitting a vertical opening in accordance with 8.6.6.

Paragraph 8.6.7 permits an atrium, unless there is a prohibition on such use in the applicable occupancy chapter. Neither Chapter 20 nor Chapter 21 prohibits the use of 8.6.7. Note that 8.6.7(4) requires that the entire building be protected by automatic sprinklers in order for the vertical openings created by an atrium to be present.

The provisions of 20.3.1.2 and 21.3.1.1(1) permit — via their reference to the convenience opening of 8.6.9.1 — two-levels to be open to each other within a tenant space, such as might be done for placement of a convenience stair or an opening to borrow light from the upper story.

Application of 21.3.1.1(2), which permits existing, unprotected vertical openings in existing ambulatory health care

### 20.3.2 Protection from Hazards.

**20.3.2.1\* General.** Hazardous areas including, but not limited to, areas used for general storage, boiler or furnace rooms, and maintenance shops that include woodworking and painting areas shall be protected in accordance with Section 8.7.

**A.20.3.2.1** It is not the intent of this provision that rooms inside individual tenant spaces that are used to store routine office supplies for that tenant be required to be either separated or sprinklered.

**20.3.2.2 Doors.** Doors to hazardous areas shall be self-closing or automatic-closing in accordance with 20.2.2.2.2.

**20.3.2.3\* High Hazard Contents Areas.** High hazard contents areas, as classified in Section 6.2, shall meet all of the following criteria:

- (1) The area shall be separated from other parts of the building by fire barriers having a minimum 1-hour fire resistance rating, with all openings therein protected by self-closing fire door assemblies having a minimum ¾-hour fire protection rating.
- (2) The area shall be protected by an automatic extinguishing system in accordance with 9.7.1.1(1) or 9.7.1.2.

**A.20.3.2.3** The requirement for separating high-hazard contents areas from other parts of the building is intended to isolate the hazard, and 8.2.3.3 is applicable.

**20.3.2.4 Laboratories.** Laboratories in which chemicals are handled or stored shall comply with NFPA 45, *Standard on Fire Protection for Laboratories Using Chemicals*.

**20.3.2.5 Medical Gas.** Areas where medical gas is stored or administered, and the operation, management, and maintenance

## CHAPTER 21 • Existing

occupancies, requires not only that the building be protected with complete automatic sprinkler protection, but also that all building exits be either smokeproof enclosures, outside stairs, horizontal exits, or doors leading directly to the outside at ground level. Otherwise, the unprotected vertical openings must be suitably enclosed.

The separation requirement of 20.3.1.2 or 21.3.1.2 helps to protect against a fire in a basement housing a hazardous area with a high fuel load (such as areas used for workshops, repairs, or storage of maintenance supplies, files, and records) directly exposing the floor of exit discharge through an unprotected vertical opening. A fire in a basement can quickly cause exits and exit discharges located on the street floor to become unusable when smoke and heat rise.

### 21.3.2 Protection from Hazards.

**21.3.2.1\* General.** Hazardous areas including, but not limited to, areas used for general storage, boiler or furnace rooms, and maintenance shops that include woodworking and painting areas shall be protected in accordance with Section 8.7.

**A.21.3.2.1** It is not the intent of this provision that rooms inside individual tenant spaces that are used to store routine office supplies for that tenant be required to be either separated or sprinklered.

**21.3.2.2 Doors.** Doors to hazardous areas shall be self-closing or automatic-closing in accordance with 21.2.2.2.2.

**21.3.2.3\* High Hazard Contents Areas.** High hazard contents areas, as classified in Section 6.2, shall meet all of the following criteria:

- (1) The area shall be separated from other parts of the building by fire barriers having a minimum 1-hour fire resistance rating, with all openings therein protected by self-closing fire door assemblies having a minimum ¾-hour fire protection rating.
- (2) The area shall be protected by an automatic extinguishing system in accordance with 9.7.1.1(1) or 9.7.1.2.

**A.21.3.2.3** The requirement for separating high-hazard contents areas from other parts of the building is intended to isolate the hazard, and 8.2.3.3 is applicable.

**21.3.2.4 Medical Gas.** Medical gas storage shall be in accordance with Section 8.7 and the provisions of NFPA 99, *Health Care Facilities Code*, applicable to operation, maintenance, and testing.

**21.3.2.5 Laboratories.**

## CHAPTER 20 • New

of medical gases shall be in accordance with NFPA 99, *Health Care Facilities Code*.

**20.3.2.6 Cooking Facilities.** Cooking facilities shall be protected in accordance with 9.2.3, unless otherwise permitted by 20.3.2.7.

**20.3.2.7 Domestic Cooking Equipment.** Where domestic cooking equipment is used for food warming or limited cooking, protection or separation of food preparation facilities shall not be required.

The provisions of 20/21.3.2 reflect the intent of Section 8.7, which requires one of the following:

1. Separation of an area housing combustible materials in quantities greater than that associated with the patient-occupied portions of an ambulatory health care occupancy from the remainder of the occupancy by means of fire-rated construction
2. Installation of automatic sprinklers in the area housing combustible materials in quantities greater than that associated with the patient-occupied portions of an ambulatory health care occupancy
3. Protection by both items 1 and 2 where the hazard posed by the combustible materials in quantities greater than that associated with the patient-occupied portions of an ambulatory health care occupancy is severe

### 20.3.3 Interior Finish.

**20.3.3.1 General.** Interior finish shall be in accordance with Section 10.2.

#### 20.3.3.2 Interior Wall and Ceiling Finish.

**20.3.3.2.1** Interior wall and ceiling finish material complying with Section 10.2 shall be Class A or Class B in exits and in exit access corridors.

**20.3.3.2.2** Interior wall and ceiling finishes shall be Class A, Class B, or Class C in areas other than those specified in 20.3.3.2.1.

#### 20.3.3.3 Interior Floor Finish.

**20.3.3.3.1** Interior floor finish shall comply with Section 10.2.

## CHAPTER 21 • Existing

**21.3.2.5.1** Laboratories in which chemicals are handled or stored shall comply with the operational requirements of NFPA 45, *Standard on Fire Protection for Laboratories Using Chemicals*.

**21.3.2.5.2** Laboratories employing quantities of flammable, combustible, or hazardous materials that are considered as a severe hazard shall be protected in accordance with 8.7.1.1.

**21.3.2.6 Cooking Facilities.** Cooking facilities shall be protected in accordance with 9.2.3, unless otherwise permitted by 21.3.2.7.

**21.3.2.7 Domestic Cooking Equipment.** Where domestic cooking equipment is used for food warming or limited cooking, protection or separation of food preparation facilities shall not be required.

Where a new hazardous area in an ambulatory health care occupancy is protected by automatic sprinklers, that area is required to be enclosed by walls and doors meeting the requirements for smoke partitions in Section 8.4. See 8.7.1.2.

Laboratories are addressed in 20.3.2.4 and 21.3.2.5. Note that the specialized protection provisions of NFPA 45, *Standard on Fire Protection for Laboratories Using Chemicals*,<sup>6</sup> are imposed if chemicals are handled or stored in the context and quantities in which chemicals are addressed in NFPA 45. Where chemicals in lesser amounts are handled or stored, laboratories would simply be considered hazardous contents areas and would require either 1-hour separation or automatic sprinkler protection.

### 21.3.3 Interior Finish.

**21.3.3.1 General.** Interior finish shall be in accordance with Section 10.2.

#### 21.3.3.2 Interior Wall and Ceiling Finish.

**21.3.3.2.1** Interior wall and ceiling finish materials complying with Section 10.2 shall be Class A or Class B in exits and in exit access corridors.

**21.3.3.2.2** Interior wall and ceiling finishes shall be Class A, Class B, or Class C in areas other than those specified in 21.3.3.2.1.

#### 21.3.3.3 Interior Floor Finish. (Reserved)

## CHAPTER 20 • New

**20.3.3.3.2** Interior floor finish in exit enclosures shall be Class I or Class II.

**20.3.3.3.3** Interior floor finish shall comply with 10.2.7.1 or 10.2.7.2, as applicable.

The provision of 20.3.3.3.2, applicable to new floor finish materials, requires that the interior floor finish be Class I or Class II (see 10.2.7) only in exit enclosures, such as enclosed exit stairs. The intent is that the interior floor finish materials used in exits are to resist the spread of fire if exposed to the radiant energy from a fully developed room fire by means of an open door. The provision of 10.2.8.2 permits a reduction of one class of interior floor finish (i.e., from Class I to Class II, or from Class II to no classification required) in sprinklered buildings.

### 20.3.4 Detection, Alarm, and Communications Systems.

**20.3.4.1 General.** Ambulatory health care facilities shall be provided with fire alarm systems in accordance with Section 9.6, except as modified by 20.3.4.2 through 20.3.4.4.

**20.3.4.2 Initiation.** Initiation of the required fire alarm systems shall be by manual means in accordance with 9.6.2 and by means of any detection devices or detection systems required.

**20.3.4.3 Notification.** Positive alarm sequence in accordance with 9.6.3.4 shall be permitted.

**20.3.4.3.1 Occupant Notification.** Occupant notification shall be accomplished automatically, without delay, in accordance with 9.6.3 upon operation of any fire alarm activating device.

#### 20.3.4.3.2 Emergency Forces Notification.

**20.3.4.3.2.1** Emergency forces notification shall be accomplished in accordance with 9.6.4.

#### 20.3.4.3.2.2 Reserved.

**20.3.4.4 Fire Safety Functions.** Operation of any activating device in the required fire alarm system shall be arranged to accomplish automatically, without delay, any control functions required to be performed by that device. (See 9.6.5.)

Paragraphs 20/21.3.4.1 through 20/21.3.4.4 address required fire alarm equipment. Reliability is of prime importance; therefore, electrical supervision of the system and system components is specified via the reference to Section 9.6. In the event of circuit

## CHAPTER 21 • Existing

In all cases, regardless of sprinkler protection, new carpet and carpet-like floor finishes must comply with ASTM D 2859, *Standard Test Method for Ignition Characteristics of Finished Textile Floor Covering Materials*,<sup>7</sup> as referenced in 10.2.7.1 via 20.3.3.3.3. New floor finish materials, other than carpet, must resist a minimum critical radiant flux of 0.1 W/cm<sup>2</sup> per 10.2.7.2 per the testing requirements described in 10.2.7.3.

### 21.3.4 Detection, Alarm, and Communications Systems.

**21.3.4.1 General.** Ambulatory health care facilities shall be provided with fire alarm systems in accordance with Section 9.6, except as modified by 21.3.4.2 through 21.3.4.4.

**21.3.4.2 Initiation.** Initiation of the required fire alarm systems shall be by manual means in accordance with 9.6.2 and by means of any detection devices or detection systems required.

**21.3.4.3 Notification.** Positive alarm sequence in accordance with 9.6.3.4 shall be permitted.

**21.3.4.3.1 Occupant Notification.** Occupant notification shall be accomplished automatically, without delay, in accordance with 9.6.3 upon operation of any fire alarm activating device.

#### 21.3.4.3.2 Emergency Forces Notification.

**21.3.4.3.2.1** Emergency forces notification shall be accomplished in accordance with 9.6.4.

**21.3.4.3.2.2** Smoke detection devices or smoke detection systems equipped with reconfirmation features shall not be required to automatically notify the fire department, unless the alarm condition is reconfirmed after a period not exceeding 120 seconds.

**21.3.4.4 Fire Safety Functions.** Operation of any activating device in the required fire alarm system shall be arranged to accomplish automatically, without delay, any control functions required to be performed by that device. (See 9.6.5.)

fault, component failure, or other trouble, a continuous trouble indication signal is required and should be provided at a constantly attended location.

## CHAPTER 20 • New

Paragraphs 20/21.3.4.1 and 20/21.3.4.2 require a manual fire alarm system. Manual fire alarm boxes should be located along the natural routes of egress and cover all portions of the building (see 9.6.2.3 and 9.6.2.5). They should be located so that those qualified to send an alarm can summon aid without having to leave their zone of ordinary activities or pass beyond the view and hearing of people immediately exposed to, or in direct view of, a fire. The operation of a manual fire alarm box should automatically summon attendants to assist in moving occupants.

Actuation of any required fire or smoke detector, activation of a required sprinkler system, or operation of a manual fire alarm box must automatically, without delay, initiate the alarm system and sound audible alarm devices within the building. Presignal systems are not permitted (see 9.6.3.3); positive alarm sequence is permitted (see 9.6.3.4).

The criteria for positive alarm sequence are detailed in *NFPA 72<sup>®</sup>, National Fire Alarm and Signaling Code*,<sup>8</sup> and include the following:

1. The signal from an automatic fire detection device selected for positive alarm sequence operation must be acknowledged at the control unit by trained personnel within 15 seconds of annunciation in order to initiate the alarm investigation phase.
2. If the signal is not acknowledged within 15 seconds, notification signals in accordance with the building evacuation or relocation plan and remote signals must be automatically and immediately activated (i.e., immediate occupant notification and emergency forces notification must occur).
3. If the signal is acknowledged within 15 seconds, trained personnel have up to 180 seconds during the alarm investigation phase to evaluate the fire condition and reset the system.
4. If the system is not reset during the investigation phase, notification signals in accordance with the building evac-

### 20.3.5 Extinguishment Requirements.

**20.3.5.1** Isolated hazardous areas shall be permitted to be protected in accordance with 9.7.1.2.

**20.3.5.2** Where more than two sprinklers are installed in a single area for protection in accordance with 9.7.1.2, waterflow detection shall be provided to sound the building fire alarm or to notify, by a signal, any constantly attended location, such as PBX, security, or emergency room, at which the necessary corrective action shall be taken.

**20.3.5.3** Portable fire extinguishers shall be provided in ambulatory health care facilities in accordance with Section 9.9.

Ambulatory health care occupancies are not required to be sprinklered by the provisions of 20/21.3.5. Sprinkler protection

## CHAPTER 21 • Existing

uation or relocation plan and remote signals must be automatically and immediately activated (i.e., immediate occupant notification and emergency forces notification must occur).

5. If a second automatic fire detector selected for positive alarm sequence is actuated during the alarm investigation phase, notification signals in accordance with the building evacuation or relocation plan and remote signals must be automatically and immediately activated (i.e., immediate occupant notification and emergency forces notification must occur).
6. If any other initiating device is actuated (e.g., a manual fire alarm box), notification signals in accordance with the building evacuation or relocation plan and remote signals must be automatically and immediately activated (i.e., immediate occupant notification and emergency forces notification must occur).

The alarm must automatically transmit to a point outside the facility. If automatic transmission of the alarm to the fire department legally committed to serve the facility is not permitted, arrangements need to be made for the prompt notification of the fire department or such other assistance as is available in the case of fire or other emergency. Paragraph 9.6.4.2 lists various methods acceptable for automatically notifying the fire department. The fire department should also be called manually to verify and confirm the automatic transmission of the alarm. In larger facilities, this might be the responsibility of the facility telephone operator. In smaller facilities, it might be the responsibility of the medical staff. Actuation of the fire alarm must initiate the operation of audible alerting devices that sound throughout the affected zone or building.

### 21.3.5 Extinguishment Requirements.

**21.3.5.1** Isolated hazardous areas shall be permitted to be protected in accordance with 9.7.1.2.

**21.3.5.2** For new installations in existing ambulatory health care facilities, where more than two sprinklers are installed in a single area for protection in accordance with 9.7.1.2, waterflow detection shall be provided to sound the building fire alarm or to notify, by a signal, any constantly attended location, such as PBX, security, or emergency room, at which the necessary corrective action shall be taken.

**21.3.5.3** Portable fire extinguishers shall be provided in ambulatory health care facilities in accordance with Section 9.9.

might be required for compliance with the minimum construction requirements of 20/21.1.6 based on building construction

## CHAPTER 20 • New

type and the number of stories in height. New high-rise ambulatory health care occupancy buildings are required to be sprinklered, as 20.4.2 mandates compliance with the high-rise building provisions of Section 11.8, which include a building

**20.3.6 Corridors.**

**20.3.6.1\*** Where access to exits is provided by corridors, such corridors shall be separated from use areas by fire barriers in accordance with Section 8.3 having a minimum 1-hour fire resistance rating, unless one of the following conditions exists:

- (1)\* Where exits are available from an open floor area
- (2)\* Within a space occupied by a single tenant
- (3) Within buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1)

**A.20.3.6.1** The intent of 38.3.6(1) through (3) is to permit spaces to be open to the exit access corridor without separation.

**A.20.3.6.1(1)** Where exits are available from an open floor area, such as open plan buildings, corridors are not required to be separated. An example of an open plan building is a building in which the work spaces and accesses to exits are delineated by the use of tables, desks, bookcases, or counters, or by partitions that are less than floor-to-ceiling height.

**A.20.3.6.1(2)** It is the intent of this provision that a single tenant be limited to an area occupied under a single management and work the same hours. The concept is that people under the same employ working the same hours would likely be familiar with their entire tenant space. It is not the intent to apply this provision simply because tenants are owned by the same organization. For example, in a government-owned office building, the offices of different federal agencies would be considered multiple tenants, because an employee normally works for one agency. The agencies might work various hours. Another example of multiple tenancy would be a classroom building of a university, because some classrooms might be in use at times when other classrooms are not being used.

**20.3.6.2** Openings in corridor walls required by 20.3.6.1 to have a fire resistance rating shall be protected in accordance with Section 8.3, except as otherwise permitted in 20.3.6.2.1 or 20.3.6.2.2.

**20.3.6.2.1** Miscellaneous openings, such as mail slots, pharmacy pass-through windows, laboratory pass-through windows, and cashier pass-through windows, shall be permitted to be installed in vision panels or doors without special protection, provided that both of the following criteria are met:

- (1) The aggregate area of openings per room does not exceed 20 in.<sup>2</sup> (0.015 m<sup>2</sup>).

## CHAPTER 21 • Existing

sprinkler requirement. Existing high-rise ambulatory health care occupancy buildings might be provided with sprinkler protection as one means of complying with the requirements of 21.4.2.1.

**21.3.6 Corridors. (Reserved)**

## CHAPTER 20 • New

- (2) The openings are installed at or below half the distance from the floor to the room ceiling.

**20.3.6.2.2** For rooms protected throughout by an approved, supervised automatic sprinkler system in accordance with **Section 9.7**, the aggregate area of openings per room, as otherwise limited by **20.3.6.2.1**, shall not exceed 80 in.<sup>2</sup> (0.05 m<sup>2</sup>).

Corridors in new ambulatory health care occupancies are addressed in **20.3.6**; no corridor requirements are specified for existing ambulatory health care occupancies. Where corridors are required, the barrier wall must have a minimum 1-hour fire resistance rating.

The provisions of **20.3.6.1(1)** through **20.3.6.1(3)** provide three exemptions under which the corridor wall need not be provided; if a corridor wall is provided, it does not need to be fire rated.

The provision of **20.3.6.1(1)** recognizes the inherent safety where an “open landscape” arrangement is provided. If there is direct access to exits from the open area, it is not necessary to provide corridors. This provision recognizes that a fire in an open space is subject to more rapid observation and response than a fire that develops in a room, initially goes unnoticed, and then spreads to affect egress routes.

The provision of **20.3.6.1(2)** recognizes that, in areas occupied by a single tenant, there is a high level of familiarity with the

### 20.3.7 Subdivision of Building Space.

**20.3.7.1** Ambulatory health care occupancies shall be separated from other tenants and occupancies and shall meet all of the following requirements:

- (1) Walls shall have not less than a 1-hour fire resistance rating and shall extend from the floor slab below to the floor or roof slab above.
- (2) Doors shall be constructed of not less than 1¾ in. (44 mm) thick, solid-bonded wood core or the equivalent and shall be equipped with positive latches.
- (3) Doors shall be self-closing and shall be kept in the closed position, except when in use.
- (4) Any windows in the barriers shall be of fixed fire window assemblies in accordance with **Section 8.3**.

**20.3.7.2** Every story of an ambulatory health care occupancy shall be divided into not less than two smoke compartments, unless otherwise permitted by one of the following:

- (1) This requirement shall not apply where the area of the ambulatory health care occupancy is less than 5000 ft<sup>2</sup> (465 m<sup>2</sup>) per story and that area is protected by an approved automatic smoke detection system.

## CHAPTER 21 • Existing

space, as the same people occupy it on a regular basis. It is believed that communication is good among the occupants of the space. Such spaces are exempt from corridor separation requirements.

The provision of **20.3.6.1(3)** recognizes the value of automatic sprinklers as a life safety feature that helps to control fire growth and, thus, maintains the exit access usable for evacuation or relocation. Such sprinklered ambulatory health care occupancies are exempt from the corridor requirements.

If any of the exemptions for rated corridors in ambulatory health care occupancies is utilized, there is no need to provide any barrier between corridors or corridor-like spaces and adjoining rooms. Other occupancy provisions (such as **19.3.6.2.3** and **19.3.6.2.4** for health care) exempt the fire rating of corridors in sprinklered areas but require the barrier to be present and to resist the passage or smoke. Other occupancy chapters require the barrier to be present and to be a smoke partition.

### 21.3.7 Subdivision of Building Space.

**21.3.7.1** Ambulatory health care occupancies shall be separated from other tenants and occupancies and shall meet all of the following requirements:

- (1) Walls shall have not less than a 1-hour fire resistance rating and shall extend from the floor slab below to the floor or roof slab above.
- (2) Doors shall be constructed of not less than 1¾ in. (44 mm) thick, solid-bonded wood core or the equivalent and shall be equipped with positive latches.
- (3) Doors shall be self-closing and shall be kept in the closed position, except when in use.
- (4) Any windows in the barriers shall be of fixed fire window assemblies in accordance with **Section 8.3**.

**21.3.7.2** Every story of an ambulatory health care occupancy shall be divided into not less than two smoke compartments, unless otherwise permitted by one of the following:

- (1) This requirement shall not apply where the area of the ambulatory health care occupancy is less than 5000 ft<sup>2</sup> (465 m<sup>2</sup>) per story and that area is protected by an approved automatic smoke detection system.

## CHAPTER 20 • New

- (2) This requirement shall not apply where the area of the ambulatory health care occupancy is less than 10,000 ft<sup>2</sup> (929 m<sup>2</sup>) per story and the building is protected throughout by an approved, supervised automatic sprinkler system installed in accordance with [Section 9.7](#).
- (3) An area in an adjoining occupancy shall be permitted to serve as a smoke compartment for an ambulatory health care occupancy if all of the following criteria are met:
  - (a) The separating wall and both compartments meet the requirements of [20.3.7](#).
  - (b) The ambulatory health care occupancy is less than 22,500 ft<sup>2</sup> (2100 m<sup>2</sup>).
  - (c) Access from the ambulatory health care occupancy to the other occupancy is unrestricted.

**20.3.7.3** Smoke compartments shall not exceed an area of 22,500 ft<sup>2</sup> (2100 m<sup>2</sup>), and the travel distance from any point to reach a door in a smoke barrier shall not exceed 200 ft (61 m).

**20.3.7.4** The area of an atrium separated in accordance with [8.6.7](#) shall not be limited in size.

**20.3.7.5** Required smoke barriers shall be constructed in accordance with [Section 8.5](#) and shall have a minimum 1-hour fire resistance rating, unless otherwise permitted by [20.3.7.7](#).

**20.3.7.6** Smoke barriers shall be permitted to terminate at the required occupancy separation where the ambulatory health care occupancy is constructed as a separated multiple occupancy in accordance with [6.1.14.4](#) and the separation also meets the requirements for a smoke barrier.

**20.3.7.7** Smoke dampers shall not be required in duct penetrations of smoke barriers in fully ducted heating, ventilating, and air-conditioning systems for buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#).

**20.3.7.8** Windows in the smoke barrier shall be of fixed fire window assemblies in accordance with [Section 8.3](#).

**20.3.7.9** Not less than 15 net ft<sup>2</sup> (1.4 net m<sup>2</sup>) per ambulatory health care facility occupant shall be provided within the aggregate area of corridors, patient rooms, treatment rooms, lounges, and other low hazard areas on each side of the smoke compartment for the total number of occupants in adjoining compartments.

**20.3.7.10\*** Doors in smoke barriers shall be not less than 1¾ in. (44 mm) thick, solid-bonded wood core or the equivalent and shall be self-closing or automatic-closing in accordance with [20.2.2.2.2](#).

**A.20.3.7.10** Smoke barriers might include walls having door openings other than cross-corridor doors. There is no restriction

## CHAPTER 21 • Existing

- (2) This requirement shall not apply where the area of the ambulatory health care occupancy is less than 10,000 ft<sup>2</sup> (929 m<sup>2</sup>) per story and the building is protected throughout by an approved, supervised automatic sprinkler system installed in accordance with [Section 9.7](#).
- (3) An area in an adjoining occupancy shall be permitted to serve as a smoke compartment for an ambulatory health care occupancy if all of the following criteria are met:
  - (a) The separating wall and both compartments meet the requirements of [21.3.7](#).
  - (b) The ambulatory health care occupancy is less than 22,500 ft<sup>2</sup> (2100 m<sup>2</sup>).
  - (c) Access from the ambulatory health care occupancy to the other occupancy is unrestricted.

**21.3.7.3** Reserved.

**21.3.7.4** Reserved.

**21.3.7.5** Required smoke barriers shall be constructed in accordance with [Section 8.5](#) and shall have a minimum ½-hour fire resistance rating, unless otherwise permitted by [21.3.7.7](#).

**21.3.7.6** Smoke barriers shall be permitted to terminate at the required occupancy separation where the ambulatory health care occupancy is constructed as a separated multiple occupancy in accordance with [6.1.14.4](#).

**21.3.7.7** Smoke dampers shall not be required in duct penetrations of smoke barriers in fully ducted heating, ventilating, and air-conditioning systems where adjacent smoke compartments are protected throughout by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#).

**21.3.7.8** Windows in the smoke barrier shall be of fixed fire window assemblies in accordance with [Section 8.3](#).

**21.3.7.9** Reserved.

**21.3.7.10\*** Doors in smoke barriers shall be not less than 1¾ in. (44 mm) thick, solid-bonded wood core or the equivalent and shall be self-closing or automatic-closing in accordance with [21.2.2.2.2](#).

**A.21.3.7.10** Smoke barriers might include walls having door openings other than cross-corridor doors. There is no restriction

## CHAPTER 20 • New

in the *Code* regarding which doors or how many doors form part of a smoke barrier. For example, doors from the corridor to individual rooms are permitted to form part of a smoke barrier.

**20.3.7.11** Latching hardware shall not be required on smoke barrier cross-corridor doors.

**20.3.7.12** A vision panel consisting of fire-rated glazing in approved frames shall be provided in each cross-corridor swinging door and at each cross-corridor horizontal-sliding door in a smoke barrier.

**20.3.7.13** Vision panels in doors in smoke barriers, if provided, shall be of fire-rated glazing in approved frames.

**20.3.7.14\*** Rabbits, bevels, or astragals shall be required at the meeting edges, and stops shall be required at the head and sides of door frames in smoke barriers.

**A.20.3.7.14** Split astragals (i.e., astragals installed on both door leaves) are also considered astragals.

**20.3.7.15** Center mullions shall be prohibited in smoke barrier door openings where pairs of cross-corridor doors are provided.

Ambulatory health care (AHC) facilities are frequently located within buildings used for a variety of purposes. Locating these facilities within buildings containing occupancies that typically present greater hazards should be avoided. If located within a multiple occupancy building or multi-tenant building, the AHC facility must be separated from adjacent occupancies and tenants by minimum 1-hour fire resistance-rated partitions in accordance with [20/21.3.7.1](#). Typically, the adjacent occupancy requiring separation from an AHC occupancy is a business occupancy. Typically, the adjacent tenant requiring separation from an AHC facility is another ambulatory health care facility. For multiple occupancy buildings, the provisions of [20/21.3.7.1](#) are applied in addition to those of [Section 6.1.14](#) (see [20/21.1.3.1](#)). For example, in a multiple occupancy building where the provisions for mixed occupancies are followed, the AHC facility still must be separated from other occupancies and other tenants in accordance with [20/21.3.7.1](#).

The provisions of [20/21.3.7.1](#) require an AHC facility to be separated from other occupancies and tenants without clearly stating whether the separation is to be provided only between spaces on the same floor or if the separation is also to include separation from spaces on a floor above or below the AHC facility. Given that [20/21.3.7.1\(1\)](#) addresses the separation only relative to walls, it is not the intent that [20/21.3.7.1](#) apply to the fire rating of floors where different occupancies or tenants are on a floor directly above or below the ambulatory health care facility. The floor assembly might need to be fire rated for compliance with [20/21.1.6](#) or for compliance with the provisions of [6.1.14.4](#),

## CHAPTER 21 • Existing

in the *Code* regarding which doors or how many doors form part of a smoke barrier. For example, doors from the corridor to individual rooms are permitted to form part of a smoke barrier.

**21.3.7.11** Latching hardware shall not be required on smoke barrier cross-corridor doors, and doors shall not be required to swing in the direction of egress travel.

where the separated occupancies form of protection is provided in a multiple occupancy building.

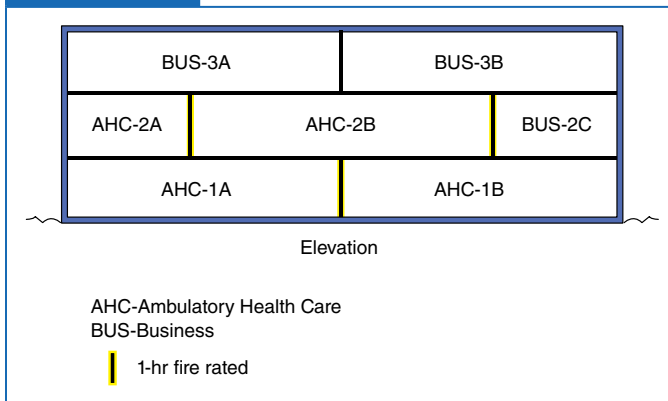

[Exhibit 20/21.12](#) illustrates the separation requirement of [20.3.7.1](#). The three-story building is to be built new, is to be sprinklered throughout, and will be occupied by business and AHC occupancies as shown in the exhibit. For purposes of applying the minimum construction requirements of [20.1.6](#), the building is two stories in height. Based on the presence of sprinklers, the building is to be of Type II(000) construction. The floor assemblies will have no fire resistance rating. The tenants on each floor share common exit access corridors, so the multiple occupancies will be protected as mixed occupancies as directed by [6.1.14.1.2](#). Protection via the provisions for mixed occupancies imposes no fire-rated separation requirements between occupancies. The provision of [20.3.7.1](#) requires that 1-hour fire resistance-rated walls be provided to separate each ambulatory health care facility from other occupancies and other tenants. First floor tenants AHC-1A and AHC-1B are separated from each other by a 1-hour fire resistance-rated barrier. Similarly, on the second floor, AHC-2A is separated from AHC-2B, and AHC-2B is separated from both BUS-2C and AHC-2A. The provision of [20.3.7.1](#) has no effect on the fire rating of the building floor assemblies. To complete the required separation, the corridor walls separating each ambulatory health care facility from the common corridors must meet the same separation requirements as the barriers between the AHC and other occupancies and tenants.

Where the 1-hour fire-rated barriers required by [20/21.3.7.1](#), and depicted in [Exhibit 20/21.12](#), also serve as the barriers

## CHAPTER 20 • New

## CHAPTER 21 • Existing

Exhibit 20/21.12

*Separation of AHC from other occupancies and tenants.*

required by 20/21.3.7.2 for creating smoke compartments, the barriers are required to be smoke barriers. Smoke barriers are addressed below in the commentary associated with the requirements of 20/21.3.7.2.

Doors protecting openings in 1-hour fire resistance-rated partitions required by 20/21.3.7.1 must be of at least 1¾ in. (44 mm) thick, solid-bonded wood core, or equivalent, construction; that is, a door that will resist fire for a minimum of 20 minutes. The doors must be equipped with positive latching hardware of a type that cannot be held in the retracted position. Roller latches are not a form of positive latching and, therefore, are not permitted. The doors must be self-closing and normally maintained in the closed position, or, if the doors are to be held open, an automatic closing device must be used as specified in 20/21.2.2.2.2.

Glazing within doors and partitions must be fire-rated glazing for new installations in accordance with 8.3.3. It must be installed in accordance with the manufacturer's instructions and listing. Existing glazing might involve fire-rated glazing as addressed in the previous paragraph. Existing glazing might include wired glass, as permitted by 8.3.3.6.

## 20.4 Special Provisions

**20.4.1 Limited Access or Underground Buildings.** (See Section 11.7.)

**20.4.2 High-Rise Buildings.** High-rise buildings shall comply with Section 11.8.

Partitions separating ambulatory health care facilities from other occupancies and other tenants must extend from the floor to the floor or roof deck above, extending completely through concealed spaces above suspended ceilings, for example. The partition must form a continuous barrier. Openings around penetrations involving building services are required to be adequately protected to maintain the 1-hour separation.

Subdivision of space by smoke barriers so as to create a minimum of two smoke compartments on any floor housing an ambulatory health care occupancy is required by 20/21.3.7.2. Smoke barriers are not required if the ambulatory health care center meets either of the following conditions:

1. Its area is less than 5000 ft<sup>2</sup> (465 m<sup>2</sup>), and it is protected by an automatic smoke detection system.
2. Its area is less than 10,000 ft<sup>2</sup> (929 m<sup>2</sup>), and it is protected by an automatic sprinkler system.

Further, 20/21.3.7.2(3) permits the smoke barrier to be located — under specific criteria — at the wall that separates the ambulatory health care center from a neighboring tenant space of some other occupancy classification. In other words, if the smoky condition is located within the ambulatory health care occupancy, patients can be moved to a safe smoke compartment in the neighboring space for which access is unrestricted.

During a fire, the emergency evacuation of patients in an ambulatory health care facility can be an inefficient, time-consuming process. Realistically, if nonambulatory patients must be moved, any number of occupants can be relocated, but only readily relocated through horizontal travel. Smoke barriers used to subdivide a building serve the following three purposes fundamental to the protection of patients:

1. They limit the spread of fire and fire-produced contaminants.
2. They limit the number of occupants exposed to a single fire.
3. They provide for horizontal relocation of patients by creating an area of refuge on the same floor level.

## 21.4 Special Provisions

**21.4.1 Limited Access or Underground Buildings.** (See Section 11.7.)

**21.4.2 High-Rise Buildings.**

**21.4.2.1** All high-rise buildings shall be provided with a reasonable degree of safety from fire, and such degree of safety shall be accomplished by one of the following means:

- (1) Installation of a complete, approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1)

## CHAPTER 20 • New

**20.4.3\* Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers shall be protected in accordance with 8.7.3.1, unless all of the following conditions are met:

- (1) Where dispensers are installed in a corridor, the corridor shall have a minimum width of 6 ft (1830 mm).
- (2) The maximum individual dispenser fluid capacity shall be as follows:
  - (a) 0.32 gal (1.2 L) for dispensers in rooms, corridors, and areas open to corridors
  - (b) 0.53 gal (2.0 L) for dispensers in suites of rooms
- (3) Where aerosol containers are used, the maximum capacity of the aerosol dispenser shall be 18 oz (0.51 kg) and shall be limited to Level 1 aerosols as defined in NFPA 30B, *Code for the Manufacture and Storage of Aerosol Products*.
- (4) Dispensers shall be separated from each other by horizontal spacing of not less than 48 in. (1220 mm).
- (5) Not more than an aggregate 10 gal (37.8 L) of alcohol-based hand-rub solution or 1135 oz (32.2 kg) of Level 1 aerosols, or a combination of liquids and Level 1 aerosols not to exceed, in total, the equivalent of 10 gal (37.8 L) or 1135 oz (32.2 kg), shall be in use outside of a storage cabinet in a

## CHAPTER 21 • Existing

- (2) Installation of an engineered life safety system complying with all of the following:
  - (a) The engineered life safety system shall be developed by a registered professional engineer experienced in fire and life safety systems design.
  - (b) The life safety system shall be approved by the authority having jurisdiction and shall be permitted to include any or all of the following systems:
    - i. Partial automatic sprinkler protection
    - ii. Smoke detection alarms
    - iii. Smoke control
    - iv. Compartmentation
    - v. Other approved systems

**21.4.2.2\*** A limited, but reasonable, time shall be permitted for compliance with any part of 21.4.2.1, commensurate with the magnitude of expenditure and the disruption of services.

**A.21.4.2.2** In some cases, appreciable cost might be involved in bringing an existing occupancy into compliance. Where this is true, it would be appropriate for the authority having jurisdiction to prescribe a schedule determined jointly with the facility, allowing suitable periods of time for the correction of the various deficiencies and giving due weight to the ability of the owner to secure the necessary funds.

**21.4.2.3** In addition to the requirements of 21.4.2.1 and 21.4.2.2, all buildings, regardless of height, shall comply with all other applicable provisions of this chapter.

**21.4.3\* Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers shall be protected in accordance with 8.7.3.1, unless all of the following conditions are met:

- (1) Where dispensers are installed in a corridor, the corridor shall have a minimum width of 6 ft (1830 mm).
- (2) The maximum individual dispenser fluid capacity shall be as follows:
  - (a) 0.32 gal (1.2 L) for dispensers in rooms, corridors, and areas open to corridors
  - (b) 0.53 gal (2.0 L) for dispensers in suites of rooms
- (3) Where aerosol containers are used, the maximum capacity of the aerosol dispenser shall be 18 oz (0.51 kg) and shall be limited to Level 1 aerosols as defined in NFPA 30B, *Code for the Manufacture and Storage of Aerosol Products*.
- (4) Dispensers shall be separated from each other by horizontal spacing of not less than 48 in. (1220 mm).
- (5) Not more than an aggregate 10 gal (37.8 L) of alcohol-based hand-rub solution or 1135 oz (32.2 kg) of Level 1 aerosols, or a combination of liquids and Level 1 aerosols not to exceed, in total, the equivalent of 10 gal (37.8 L) or 1135 oz (32.2 kg), shall be in use outside of a storage cabinet in a

## CHAPTER 20 • New

single smoke compartment, except as otherwise provided in 20.4.3(6).

- (6) One dispenser per room complying with 20.4.3(2) or (3), and located in the room, shall not be required to be included in the aggregated quantity specified in 20.4.3(5).
- (7) Storage of quantities greater than 5 gal (18.9 L) in a single smoke compartment shall meet the requirements of NFPA 30, *Flammable and Combustible Liquids Code*.
- (8) Dispensers shall not be installed in the following locations:
  - (a) Above an ignition source within a 1 in. (25 mm) horizontal distance from each side of the ignition source
  - (b) To the side of an ignition source within a 1 in. (25 mm) horizontal distance from the ignition source
  - (c) Beneath an ignition source within a 1 in. (25 mm) vertical distance from the ignition source
- (9) Dispensers installed directly over carpeted floors shall be permitted only in sprinklered smoke compartments.
- (10) The alcohol-based hand-rub solution shall not exceed 95 percent alcohol content by volume.
- (11) Operation of the dispenser shall comply with the following criteria:
  - (a) The dispenser shall not release its contents except when the dispenser is activated, either manually or automatically by touch-free activation.
  - (b) Any activation of the dispenser shall occur only when an object is placed within 4 in. (100 mm) of the sensing device.
  - (c) An object placed within the activation zone and left in place shall not cause more than one activation.
  - (d) The dispenser shall not dispense more solution than the amount required for hand hygiene consistent with label instructions.
  - (e) The dispenser shall be designed, constructed, and operated in a manner that ensures that accidental or malicious activation of the dispensing device is minimized.
  - (f) The dispenser shall be tested in accordance with the manufacturer's care and use instructions each time a new refill is installed.

**A.20.4.3** Extensive research, including fire modeling, has indicated that alcohol-based hand-rub solutions can be safely installed in corridors of health care facilities, provided that certain other precautions are taken. The total quantities of flammable liquids in any area should comply with the provisions of other recognized codes, including NFPA 1, *Fire Code*, and NFPA 30, *Flammable and Combustible Liquids Code*. In addition, special consideration should be given to the following:

- (1) Obstructions created by the installation of hand-rub solution dispensers

## CHAPTER 21 • Existing

single smoke compartment, except as otherwise provided in 21.4.3(6).

- (6) One dispenser per room complying with 21.4.3 (2) or (3), and located in the room, shall not be required to be included in the aggregated quantity specified in 21.4.3(5).
- (7) Storage of quantities greater than 5 gal (18.9 L) in a single smoke compartment shall meet the requirements of NFPA 30, *Flammable and Combustible Liquids Code*.
- (8) Dispensers shall not be installed in the following locations:
  - (a) Above an ignition source within a 1 in. (25 mm) horizontal distance from each side of the ignition source
  - (b) To the side of an ignition source within a 1 in. (25 mm) horizontal distance from the ignition source
  - (c) Beneath an ignition source within a 1 in. (25 mm) vertical distance from the ignition source
- (9) Dispensers installed directly over carpeted floors shall be permitted only in sprinklered smoke compartments.
- (10) The alcohol-based hand-rub solution shall not exceed 95 percent alcohol content by volume.
- (11) Operation of the dispenser shall comply with the following criteria:
  - (a) The dispenser shall not release its contents except when the dispenser is activated, either manually or automatically by touch-free activation.
  - (b) Any activation of the dispenser shall occur only when an object is placed within 4 in. (100 mm) of the sensing device.
  - (c) An object placed within the activation zone and left in place shall not cause more than one activation.
  - (d) The dispenser shall not dispense more solution than the amount required for hand hygiene consistent with label instructions.
  - (e) The dispenser shall be designed, constructed, and operated in a manner that ensures that accidental or malicious activation of the dispensing device is minimized.
  - (f) The dispenser shall be tested in accordance with the manufacturer's care and use instructions each time a new refill is installed.

**A.21.4.3** Extensive research, including fire modeling, has indicated that alcohol-based hand-rub solutions can be safely installed in corridors of health care facilities, provided that certain other precautions are taken. The total quantities of flammable liquids in any area should comply with the provisions of other recognized codes, including NFPA 1, *Fire Code*, and NFPA 30, *Flammable and Combustible Liquids Code*. In addition, special consideration should be given to the following:

- (1) Obstructions created by the installation of hand-rub solution dispensers

## CHAPTER 20 • New

- (2) Location of dispensers with regard to adjacent combustible materials and potential sources of ignition, especially where dispensers are mounted on walls of combustible construction
- (3) Requirements for other fire protection features, including complete automatic sprinkler protection, to be installed throughout the compartment
- (4) Amount and location of the flammable solutions, both in use and in storage, particularly with respect to potential for leakage or failure of the dispenser

The provisions of 20/21.4.3 have been in the Code since the 2006 edition. Prior to the inclusion of the provisions for alcohol-based hand-rub (ABHR) dispensers, the only option available was to treat the alcohol solutions as flammable liquids subject to the provisions of 8.7.3.1, which meant the dispensers were prohibited from being placed in patient areas, especially in corridors. The provisions of 20/21.4.3 permit limited use of such dispensers in corridors, rooms, and suites. Dispensers not meeting all the criteria of 20/21.4.3(1) through (11) are subject to regulation as flammable liquids in accordance with 8.7.3.1. Note that, in addition to the criteria of 20/21.4.3(1) through (11), the ABHR dispensers are limited to encroaching not more than 6 in. (150 mm) into the minimum 6 ft (1830 mm) width corridor, and such encroachment must be above handrail height [i.e., above 38 in. (965 mm)] in accordance with 20/21.2.3.3.

The provision of 20/21.4.3(8) was new to the 2009 edition of the Code and replaced a requirement that prohibited the dispenser from being positioned over or directly adjacent to an ignition source, as such language was too subjective to be enforced consistently. Exhibit 20/21.13 illustrates the area, above and to the side of an ignition source, from which ABHR dispensers are prohibited from being located.

## CHAPTER 21 • Existing

- (2) Location of dispensers with regard to adjacent combustible materials and potential sources of ignition, especially where dispensers are mounted on walls of combustible construction
- (3) Requirements for other fire protection features, including complete automatic sprinkler protection, to be installed throughout the compartment
- (4) Amount and location of the flammable solutions, both in use and in storage, particularly with respect to potential for leakage or failure of the dispenser

Exhibit 20/21.13

Prohibited location for alcohol-based hand-rub dispenser with respect to an ignition source.

## CHAPTER 20 • New

**20.5 Building Services**

**20.5.1 Utilities.** Utilities shall comply with the provisions of [Section 9.1](#).

**20.5.2 Heating, Ventilating, and Air-Conditioning.**

**20.5.2.1** Heating, ventilating, and air-conditioning shall comply with the provisions of [Section 9.2](#) and shall be installed in accordance with the manufacturer's specifications, unless otherwise modified by [20.5.2.2](#).

**20.5.2.2** If fuel-fired, heating devices shall comply with all of the following:

- (1) They shall be chimney connected or vent connected.
- (2) They shall take air for combustion directly from the outside.
- (3) They shall be designed and installed to provide for complete separation of the combustion system from the atmosphere of the occupied area.

**20.5.2.2.1** Any heating device shall have safety features to immediately stop the flow of fuel and shut down the equipment in case of either excessive temperature or ignition failure.

**20.5.2.2.2** Approved, suspended unit heaters shall be permitted in locations other than means of egress and patient treatment areas, provided that both of the following criteria are met:

- (1) Such heaters are located high enough to be out of the reach of persons using the area.
- (2) Such heaters are equipped with the safety features required by [20.5.2.2.1](#).

**20.5.3 Elevators, Escalators, and Conveyors.** Elevators, escalators, and conveyors shall comply with the provisions of [Section 9.4](#).

**20.5.4 Waste Chutes, Incinerators, and Laundry Chutes.** Waste chutes, incinerators, and laundry chutes shall comply with the provisions of [Section 9.5](#).

[Paragraphs 20/21.5.2.1](#) and [20/21.5.2.2](#) specify safeguards for air-conditioning, ventilating, heating, and other service equipment in order to minimize the possibility of such devices serving as a source of ignition. Fuel-fired heating devices, except central heating systems, must be designed to provide complete separation of the combustion system from the occupied spaces. Air for combustion must be taken directly from the outside.

## CHAPTER 21 • Existing

**21.5 Building Services**

**21.5.1 Utilities.**

**21.5.1.1** Utilities shall comply with the provisions of [Section 9.1](#).

**21.5.1.2** Existing installations shall be permitted to be continued in service, provided that the systems do not present a serious hazard to life.

**21.5.2 Heating, Ventilating, and Air-Conditioning.**

**21.5.2.1** Heating, ventilating, and air-conditioning shall comply with the provisions of [Section 9.2](#) and shall be in accordance with the manufacturer's specifications, unless otherwise modified by [21.5.2.2](#).

**21.5.2.2** If fuel-fired, heating devices shall comply with all of the following:

- (1) They shall be chimney connected or vent connected.
- (2) They shall take air for combustion directly from the outside.
- (3) They shall be designed and installed to provide for complete separation of the combustion system from the atmosphere of the occupied area.

**21.5.2.2.1** Any heating device shall have safety features to immediately stop the flow of fuel and shut down the equipment in case of either excessive temperature or ignition failure.

**21.5.2.2.2** Approved, suspended unit heaters shall be permitted in locations other than means of egress and patient treatment areas, provided that both of the following criteria are met:

- (1) Such heaters are located high enough to be out of the reach of persons using the area.
- (2) Such heaters are equipped with the safety features required by [21.5.2.2.1](#).

**21.5.3 Elevators, Escalators, and Conveyors.** Elevators, escalators, and conveyors shall comply with the provisions of [Section 9.4](#).

**21.5.4 Waste Chutes, Incinerators, and Laundry Chutes.** Waste chutes, incinerators, and laundry chutes shall comply with the provisions of [Section 9.5](#).

A major concern is preventing the ignition of clothing, bed-clothes, furniture, and other furnishings by a heating device. Therefore, [20/21.7.8](#) prohibits portable heating devices in areas used by patients.

[Paragraph 20/21.5.3](#) requires elevators to comply with [Section 9.4](#), which mandates the fire fighters' emergency operations features required in ASME A17.1/CSA B44, *Safety Code for*

## CHAPTER 20 • New

*Elevators and Escalators*,<sup>9</sup> for new elevator installations, and ASME A17.3, *Safety Code for Existing Elevators and Escalators*,<sup>10</sup> for existing elevator installations. Phase 1 of the fire fighters' emergency operations requires elevators to be recalled to a designated floor (e.g., the main entrance level lobby or, alternately, some other floor, if smoke is detected in the main entrance level lobby) upon detection of smoke in the elevator machine room, the elevator hoistway, or the elevator lobbies on each floor the elevators serve. Phase 1 recall helps to ensure that the elevators are called out of service, so as not to be misused by building occupants once smoke has reached an elevator lobby and its associated elevator shaft doors, or when smoke is present in the elevator machine room or hoistway. Phase 1 also provides for the elevators to be waiting at the designated floor for emergency service personnel use upon their arrival.

The ASME A17.1/CSA B44 and A17.3 codes prohibit elevators from being recalled by other than smoke detection in the elevator machine room, the hoistway, or the elevator lobbies. Therefore, the elevator should not be recalled upon initiation of the building fire alarm system. This is consistent with the provision of 9.6.3.2.1 of this Code, which does not require the elevator recall smoke detectors to activate the building evacuation alarm, provided that the smoke detectors initiate a supervisory signal at a constantly attended location. Therefore, elevators will remain in service in parts of the building not affected by the fire and might constitute a valuable, supplemental means for

## 20.6 Reserved

---

### 20.7\* Operating Features

**A.20.7** Ambulatory health care occupants have, in large part, varied degrees of physical disability, and their removal to the outside, or even their disturbance caused by moving, is inexpedient or impractical in many cases, except as a last resort. Similarly, recognizing that there might be an operating necessity for the restraint of the mentally ill, often by use of barred windows and locked doors, fire exit drills are usually extremely disturbing, detrimental, and frequently impracticable.

In most cases, fire exit drills, as ordinarily practiced in other occupancies, cannot be conducted in ambulatory health care occupancies. Fundamentally, superior construction, early discovery and extinguishment of incipient fires, and prompt notification need to be relied on to reduce the occasion for evacuation of buildings of this class to a minimum.

#### 20.7.1 Evacuation and Relocation Plan and Fire Drills.

**20.7.1.1** The administration of every ambulatory health care facility shall have, in effect and available to all supervisory

## CHAPTER 21 • Existing

evacuating patients from health care occupancies. In some cases, using an elevator might be the only feasible way to move patients who are unable to use the exit stairs. Such use is consistent with the provision of 7.14.1.2 that exempts occupant evacuation by elevators from the requirements of Section 7.14, where the use of elevators for evacuation is part of a formal evacuation strategy for the relocation or evacuation of patients.

Elevators, however, have many inherent weaknesses that tend to limit reliability. Elevator access doors are designed with operating tolerances that allow smoke transfer into the shaft. During a fire, a power failure might cause an elevator to stop between floors, trapping its passengers.

Many of these elevator weaknesses can be minimized by providing emergency power, separating the elevator lobby from other building spaces using fire-rated construction, providing an emergency smoke control system, and pressurizing the elevator shaft and adjacent lobbies. These countermeasures represent good fire protection judgment but are not requirements of this Code.

Through emergency planning and staff training, the potential problem of crowded elevators might be avoided. Emergency plans can make effective use of elevators by transferring patients through a horizontal exit, for example, to a separate fire area. Within the separate fire area, a staged evacuation program could be instituted, with the elevators taking patients to the ground level, allowing horizontal movement to the outside.

---

## 21.6 Reserved

---

### 21.7\* Operating Features

**A.21.7** Ambulatory health care occupants have, in large part, varied degrees of physical disability, and their removal to the outside, or even their disturbance caused by moving, is inexpedient or impractical in many cases, except as a last resort. Similarly, recognizing that there might be an operating necessity for the restraint of the mentally ill, often by use of barred windows and locked doors, fire exit drills are usually extremely disturbing, detrimental, and frequently impracticable.

In most cases, fire exit drills, as ordinarily practiced in other occupancies, cannot be conducted in ambulatory health care occupancies. Fundamentally, superior construction, early discovery and extinguishment of incipient fires, and prompt notification need to be relied on to reduce the occasion for evacuation of buildings of this class to a minimum.

#### 21.7.1 Evacuation and Relocation Plan and Fire Drills.

**21.7.1.1** The administration of every ambulatory health care facility shall have, in effect and available to all supervisory

## CHAPTER 20 • New

personnel, written copies of a plan for the protection of all persons in the event of fire, for their evacuation to areas of refuge, and for their evacuation from the building when necessary.

**20.7.1.2** All employees shall be periodically instructed and kept informed with respect to their duties under the plan required by **20.7.1.1**.

**20.7.1.3** A copy of the plan required by **20.7.1.1** shall be readily available at all times when the facility is open.

**20.7.1.4\*** Fire drills in ambulatory health care facilities shall include the simulation of emergency fire conditions.

**A.20.7.1.4** Many ambulatory health care occupancies conduct fire drills without disturbing patients by choosing the location of the simulated emergency in advance and by closing the doors in the vicinity prior to the initiation of the drill. The purpose of a fire drill is to test and evaluate the efficiency, knowledge, and response of personnel in implementing the facility fire emergency plan. Its purpose is not to disturb or excite patients. Fire drills should be scheduled on a random basis to ensure that personnel in ambulatory health care facilities are drilled not less than once in each 3-month period.

Drills should consider the ability to move patients to an adjacent smoke compartment. Relocation can be practiced using simulated patients or empty wheelchairs.

**20.7.1.5** Patients shall not be required to be moved during drills to safe areas or to the exterior of the building.

**20.7.1.6** Drills shall be conducted quarterly on each shift to familiarize facility personnel (including but not limited to nurses, interns, maintenance engineers, and administrative staff) with the emergency action required under varied conditions.

**20.7.1.7** Employees of ambulatory health care facilities shall be instructed in life safety procedures and devices.

## 20.7.2 Procedure in Case of Fire.

### 20.7.2.1\* Protection of Patients.

**A.20.7.2.1** Each facility has specific characteristics that vary sufficiently from other facilities to prevent the specification of a universal emergency procedure. The recommendations that follow, however, contain many of the elements that should be considered and adapted, as appropriate, to the individual facility.

Upon discovery of fire, personnel should immediately take the following action:

- (1) If any person is involved in the fire, the discoverer should go to the aid of that person, calling aloud an established code phrase, which provides for both the immediate aid of any endangered person and the transmission of an alarm.
- (2) Any person in the area, upon hearing the code called aloud, should activate the building fire alarm using the nearest manual fire alarm box.

## CHAPTER 21 • Existing

personnel, written copies of a plan for the protection of all persons in the event of fire, for their evacuation to areas of refuge, and for their evacuation from the building when necessary.

**21.7.1.2** All employees shall be periodically instructed and kept informed with respect to their duties under the plan required by **21.7.1.1**.

**21.7.1.3** A copy of the plan required by **21.7.1.1** shall be readily available at all times when the facility is open.

**21.7.1.4\*** Fire drills in ambulatory health care facilities shall include simulation of emergency fire conditions.

**A.21.7.1.4** Many ambulatory health care occupancies conduct fire drills without disturbing patients by choosing the location of the simulated emergency in advance and by closing the doors in the vicinity prior to initiation of the drill. The purpose of a fire drill is to test and evaluate the efficiency, knowledge, and response of personnel in implementing the facility fire emergency plan. Its purpose is not to disturb or excite patients. Fire drills should be scheduled on a random basis to ensure that personnel in ambulatory health care facilities are drilled not less than once in each 3-month period.

Drills should consider the ability to move patients to an adjacent smoke compartment. Relocation can be practiced using simulated patients or empty wheelchairs.

**21.7.1.5** Patients shall not be required to be moved during drills to safe areas or to the exterior of the building.

**21.7.1.6** Drills shall be conducted quarterly on each shift to familiarize facility personnel (including but not limited to nurses, interns, maintenance engineers, and administrative staff) with the emergency action required under varied conditions.

**21.7.1.7** Employees of ambulatory health care facilities shall be instructed in life safety procedures and devices.

## 21.7.2 Procedure in Case of Fire.

### 21.7.2.1\* Protection of Patients.

**A.21.7.2.1** Each facility has specific characteristics that vary sufficiently from other facilities to prevent the specification of a universal emergency procedure. The recommendations that follow, however, contain many of the elements that should be considered and adapted, as appropriate, to the individual facility.

Upon discovery of fire, personnel should immediately take the following action:

- (1) If any person is involved in the fire, the discoverer should go to the aid of that person, calling aloud an established code phrase, which provides for both the immediate aid of any endangered person and the transmission of an alarm.
- (2) Any person in the area, upon hearing the code called aloud, should activate the building fire alarm using the nearest manual fire alarm box.

## CHAPTER 20 • New

- (3) If a person is not involved in the fire, the discoverer should activate the building fire alarm using the nearest manual fire alarm box.
- (4) Personnel, upon hearing the alarm signal, should immediately execute their duties as outlined in the facility fire safety plan.
- (5) The telephone operator should determine the location of the fire as indicated by the audible signal.
- (6) In a building equipped with an uncoded alarm system, a person on the floor of fire origin should be responsible for promptly notifying the facility telephone operator of the fire location.
- (7) If the telephone operator receives a telephone alarm reporting a fire from a floor, the operator should regard that alarm in the same fashion as an alarm received over the fire alarm system and should immediately notify the fire department and alert all facility personnel of the place of fire and its origin.
- (8) If the building fire alarm system is out of order, any person discovering a fire should immediately notify the telephone operator by telephone, and the operator should then transmit this information to the fire department and alert the building occupants.

**20.7.2.1.1** For ambulatory health care facilities, the proper protection of patients shall require the prompt and effective response of ambulatory health care personnel.

**20.7.2.1.2** The basic response required of staff shall include the following:

- (1) Removal of all occupants directly involved with the fire emergency
- (2) Transmission of an appropriate fire alarm signal to warn other building occupants and summon staff
- (3) Confinement of the effects of the fire by closing doors to isolate the fire area
- (4) Relocation of patients as detailed in the facility's fire safety plan

**20.7.2.2 Fire Safety Plan.** A written fire safety plan shall provide for all of the following:

- (1) Use of alarms
- (2) Transmission of alarms to fire department
- (3) Response to alarms
- (4) Isolation of fire
- (5) Evacuation of immediate area
- (6) Evacuation of smoke compartment
- (7) Preparation of floors and building for evacuation
- (8) Extinguishment of fire

### 20.7.2.3 Staff Response.

**20.7.2.3.1** All personnel shall be instructed in the use of and response to fire alarms.

## CHAPTER 21 • Existing

- (3) If a person is not involved in the fire, the discoverer should activate the building fire alarm using the nearest manual fire alarm box.
- (4) Personnel, upon hearing the alarm signal, should immediately execute their duties as outlined in the facility fire safety plan.
- (5) The telephone operator should determine the location of the fire as indicated by the audible signal.
- (6) In a building equipped with an uncoded alarm system, a person on the floor of fire origin should be responsible for promptly notifying the facility telephone operator of the fire location.
- (7) If the telephone operator receives a telephone alarm reporting a fire from a floor, the operator should regard that alarm in the same fashion as an alarm received over the fire alarm system and should immediately notify the fire department and alert all facility personnel of the place of fire and its origin.
- (8) If the building fire alarm system is out of order, any person discovering a fire should immediately notify the telephone operator by telephone, and the operator should then transmit this information to the fire department and alert the building occupants.

**21.7.2.1.1** For ambulatory health care facilities, the proper protection of patients shall require the prompt and effective response of ambulatory health care personnel.

**21.7.2.1.2** The basic response required of staff shall include the following:

- (1) Removal of all occupants directly involved with the fire emergency
- (2) Transmission of an appropriate fire alarm signal to warn other building occupants and summon staff
- (3) Confinement of the effects of the fire by closing doors to isolate the fire area
- (4) Relocation of patients as detailed in the facility's fire safety plan

**21.7.2.2 Fire Safety Plan.** A written fire safety plan shall provide for all of the following:

- (1) Use of alarms
- (2) Transmission of alarms to fire department
- (3) Response to alarms
- (4) Isolation of fire
- (5) Evacuation of immediate area
- (6) Evacuation of smoke compartment
- (7) Preparation of floors and building for evacuation
- (8) Extinguishment of fire

### 21.7.2.3 Staff Response.

**21.7.2.3.1** All personnel shall be instructed in the use of and response to fire alarms.

## CHAPTER 20 • New

**20.7.2.3.2** All personnel shall be instructed in the use of the code phrase to ensure transmission of an alarm under either of the following conditions:

- (1) When the individual who discovers a fire must immediately go to the aid of an endangered person
- (2) During a malfunction of the building fire alarm system

**20.7.2.3.3** Personnel hearing the code announced shall first activate the building fire alarm using the nearest fire alarm box and then shall execute immediately their duties as outlined in the fire safety plan.

### 20.7.3 Maintenance of Exits.

**20.7.3.1** Proper maintenance shall be provided to ensure the dependability of the method of evacuation selected.

**20.7.3.2** Ambulatory health care occupancies that find it necessary to lock exits shall, at all times, maintain an adequate staff qualified to release locks and direct occupants from the immediate danger area to a place of safety in case of fire or other emergency.

**20.7.4\* Smoking.** Smoking regulations shall be adopted and shall include not less than the following provisions:

- (1) Smoking shall be prohibited in any room, ward, or compartment where flammable liquids, combustible gases, or oxygen is used or stored and in any other hazardous location, and such areas shall be posted with signs that read NO SMOKING or shall be posted with the international symbol for no smoking.
- (2) In ambulatory health care facilities where smoking is prohibited and signs are placed at all major entrances, secondary signs with language that prohibits smoking shall not be required.
- (3) Smoking by patients classified as not responsible shall be prohibited.
- (4) The requirement of 20.7.4(3) shall not apply where the patient is under direct supervision.
- (5) Ashtrays of noncombustible material and safe design shall be provided in all areas where smoking is permitted.
- (6) Metal containers with self-closing cover devices into which ashtrays can be emptied shall be readily available to all areas where smoking is permitted.

**A.20.7.4** The most rigid discipline with regard to prohibition of smoking might not be nearly as effective in reducing incipient fires from surreptitious smoking as the open recognition of smoking, with provision of suitable facilities for smoking. Proper education and training of the staff and attendants in the ordinary fire hazards and their abatement is unquestionably essential. The problem is a broad one, varying with different types and arrangements of buildings; the effectiveness of rules

## CHAPTER 21 • Existing

**21.7.2.3.2** All personnel shall be instructed in the use of the code phrase to ensure transmission of an alarm under either of the following conditions:

- (1) When the individual who discovers a fire must immediately go to the aid of an endangered person
- (2) During a malfunction of the building fire alarm system

**21.7.2.3.3** Personnel hearing the code announced shall first activate the building fire alarm using the nearest fire alarm box and then shall execute immediately their duties as outlined in the fire safety plan.

### 21.7.3 Maintenance of Exits.

**21.7.3.1** Proper maintenance shall be provided to ensure the dependability of the method of evacuation selected.

**21.7.3.2** Ambulatory health care occupancies that find it necessary to lock exits shall, at all times, maintain an adequate staff qualified to release locks and direct occupants from the immediate danger area to a place of safety in case of fire or other emergency.

**21.7.4\* Smoking.** Smoking regulations shall be adopted and shall include not less than the following provisions:

- (1) Smoking shall be prohibited in any room, ward, or compartment where flammable liquids, combustible gases, or oxygen is used or stored and in any other hazardous location, and such areas shall be posted with signs that read NO SMOKING or shall be posted with the international symbol for no smoking.
- (2) In ambulatory health care facilities where smoking is prohibited and signs are placed at all major entrances, secondary signs with language that prohibits smoking shall not be required.
- (3) Smoking by patients classified as not responsible shall be prohibited.
- (4) The requirement of 21.7.4(3) shall not apply where the patient is under direct supervision.
- (5) Ashtrays of noncombustible material and safe design shall be provided in all areas where smoking is permitted.
- (6) Metal containers with self-closing cover devices into which ashtrays can be emptied shall be readily available to all areas where smoking is permitted.

**A.21.7.4** The most rigid discipline with regard to prohibition of smoking might not be nearly as effective in reducing incipient fires from surreptitious smoking as the open recognition of smoking, with provision of suitable facilities for smoking. Proper education and training of the staff and attendants in the ordinary fire hazards and their abatement is unquestionably essential. The problem is a broad one, varying with different types and arrangements of buildings; the effectiveness of rules

## CHAPTER 20 • New

of procedure, which need to be flexible, depends in large part on the management.

### 20.7.5 Furnishings, Mattresses, and Decorations.

**20.7.5.1\*** Draperies, curtains, and other loosely hanging fabrics and films serving as furnishings or decorations in ambulatory health care occupancies shall be in accordance with the provisions of **10.3.1**, and the following also shall apply:

- (1) Such curtains shall include cubicle curtains.
- (2) Such curtains shall not include curtains at showers.

**A.20.7.5.1** In addition to the provisions of **10.3.1**, which deal with ignition resistance, additional requirements with respect to the location of cubicle curtains relative to sprinkler placement are included in NFPA 13, *Standard for the Installation of Sprinkler Systems*.

**20.7.5.2** Newly introduced upholstered furniture shall comply with **10.3.2.1** and one of the following provisions:

- (1) The furniture shall meet the criteria specified in **10.3.3**.
- (2) The furniture shall be in a building protected throughout by an approved, supervised automatic sprinkler system in accordance with **9.7.1.1(1)**.

**20.7.5.3** Newly introduced mattresses shall comply with **10.3.2.2** and one of the following provisions:

- (1) The mattresses shall meet the criteria specified in **10.3.4**.
- (2) The mattresses shall be in a building protected throughout by an approved, supervised automatic sprinkler system in accordance with **9.7.1.1(1)**.

**20.7.5.4** Combustible decorations shall be prohibited, unless one of the following criteria is met:

- (1) They are flame-retardant.
- (2) The decorations meet the flame propagation performance criteria contained in Test Method 1 or Test Method 2, as appropriate, of NFPA 701, *Standard Methods of Fire Tests for Flame Propagation of Textiles and Films*.
- (3) The decorations exhibit a heat release rate not exceeding 100 kW when tested in accordance with NFPA 289, *Standard Method of Fire Test for Individual Fuel Packages*, using the 20 kW ignition source.
- (4)\* The decorations, such as photographs, paintings, and other art, are attached directly to the walls, ceiling, and non-fire-rated doors in accordance with the following:
  - (a) Decorations on non-fire-rated doors do not interfere with the operation or any required latching of the door and do not exceed the area limitations of **20.7.5.4(4)(b)** or (c).
  - (b) Decorations do not exceed 20 percent of the wall, ceiling, and door areas inside any room or space of a

## CHAPTER 21 • Existing

of procedure, which need to be flexible, depends in large part on the management.

### 21.7.5 Furnishings, Mattresses, and Decorations.

**21.7.5.1\*** Draperies, curtains, and other loosely hanging fabrics and films serving as furnishings or decorations in ambulatory health care occupancies shall be in accordance with the provisions of **10.3.1**, and the following also shall apply:

- (1) Such curtains shall include cubicle curtains.
- (2) Such curtains shall not include curtains at showers.

**A.21.7.5.1** In addition to the provisions of **10.3.1**, which deal with ignition resistance, additional requirements with respect to the location of cubicle curtains relative to sprinkler placement are included in NFPA 13, *Standard for the Installation of Sprinkler Systems*.

**21.7.5.2** Newly introduced upholstered furniture shall comply with **10.3.2.1** and one of the following provisions:

- (1) The furniture shall meet the criteria specified in **10.3.3**.
- (2) The furniture shall be in a building protected throughout by an approved, supervised automatic sprinkler system in accordance with **9.7.1.1(1)**.

**21.7.5.3** Newly introduced mattresses shall comply with **10.3.2.2** and one of the following provisions:

- (1) The mattresses shall meet the criteria specified in **10.3.4**.
- (2) The mattresses shall be in a building protected throughout by an approved, supervised automatic sprinkler system in accordance with **9.7.1.1(1)**.

**21.7.5.4** Combustible decorations shall be prohibited, unless one of the following criteria is met:

- (1) They are flame-retardant.
- (2) The decorations meet the flame propagation performance criteria contained in Test Method 1 or Test Method 2, as appropriate, of NFPA 701, *Standard Methods of Fire Tests for Flame Propagation of Textiles and Films*.
- (3) The decorations exhibit a heat release rate not exceeding 100 kW when tested in accordance with NFPA 289, *Standard Method of Fire Test for Individual Fuel Packages*, using the 20 kW ignition source.
- (4)\* The decorations, such as photographs, paintings, and other art, are attached directly to the walls, ceiling, and non-fire-rated doors in accordance with the following:
  - (a) Decorations on non-fire-rated doors do not interfere with the operation or any required latching of the door and do not exceed the area limitations of **21.7.5.4(4)(b)** or (c).
  - (b) Decorations do not exceed 20 percent of the wall, ceiling, and door areas inside any room or space of a

## CHAPTER 20 • New

smoke compartment that is not protected throughout by an approved automatic sprinkler system in accordance with [Section 9.7](#).

- (c) Decorations do not exceed 30 percent of the wall, ceiling, and door areas inside any room or space of a smoke compartment that is protected throughout by an approved supervised automatic sprinkler system in accordance with [Section 9.7](#).

**A.20.7.5.4(4)** The percentage of decorations should be measured against the area of any wall or ceiling, not the aggregate total of walls, ceilings, and doors. The door is considered part of the wall. The decorations must be located such that they do not interfere with the operation of any door, sprinkler, smoke detector, or any other life safety equipment. Other art might include hanging objects or three-dimensional items.

#### 20.7.5.5 Soiled Linen and Trash Receptacles.

**20.7.5.5.1** Soiled linen or trash collection receptacles shall not exceed 32 gal (121 L) in capacity, and all of the following also shall apply:

- (1) The average density of container capacity in a room or space shall not exceed 0.5 gal/ft<sup>2</sup> (20.4 L/m<sup>2</sup>).
- (2) A capacity of 32 gal (121 L) shall not be exceeded within any 64 ft<sup>2</sup> (6 m<sup>2</sup>) area.
- (3) Mobile soiled linen or trash collection receptacles with capacities greater than 32 gal (121 L) shall be located in a room protected as a hazardous area when not attended.
- (4) Container size and density shall not be limited in hazardous areas.

**20.7.5.5.2\*** Containers used solely for recycling clean waste or for patient records awaiting destruction shall be permitted to be excluded from the requirements of [20.7.5.5.1](#) where all the following conditions are met:

- (1) Each container shall be limited to a maximum capacity of 96 gal (363 L), except as permitted by [20.7.5.5.2\(2\)](#) or (3).
- (2)\* Containers with capacities greater than 96 gal (363 L) shall be located in a room protected as a hazardous area when not attended.
- (3) Container size shall not be limited in hazardous areas.
- (4) Containers for combustibles shall be labeled and listed as meeting the requirements of FM Approval Standard 6921, *Containers for Combustible Waste*; however, such testing, listing, and labeling shall not be limited to FM Approvals.

**A.20.7.5.5.2** It is the intent that this provision permits recycling of bottles, cans, paper, and similar clean items that do not contain grease, oil, flammable liquids, or significant plastic materials using larger containers or several adjacent containers and not

## CHAPTER 21 • Existing

smoke compartment that is not protected throughout by an approved automatic sprinkler system in accordance with [Section 9.7](#).

- (c) Decorations do not exceed 30 percent of the wall, ceiling, and door areas inside any room or space of a smoke compartment that is protected throughout by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#).

**A.21.7.5.4(4)** The percentage of decorations should be measured against the area of any wall or ceiling, not the aggregate total of walls, ceilings, and doors. The door is considered part of the wall. The decorations must be located such that they do not interfere with the operation of any door, sprinkler, smoke detector, or any other life safety equipment. Other art might include hanging objects or three-dimensional items.

#### 21.7.5.5 Soiled Linen and Trash Receptacles.

**21.7.5.5.1** Soiled linen or trash collection receptacles shall not exceed 32 gal (121 L) in capacity, and all of the following also shall apply:

- (1) The average density of container capacity in a room or space shall not exceed 0.5 gal/ft<sup>2</sup> (20.4 L/m<sup>2</sup>).
- (2) A capacity of 32 gal (121 L) shall not be exceeded within any 64 ft<sup>2</sup> (6 m<sup>2</sup>) area.
- (3) Mobile soiled linen or trash collection receptacles with capacities greater than 32 gal (121 L) shall be located in a room protected as a hazardous area when not attended.
- (4) Container size and density shall not be limited in hazardous areas.

**21.7.5.5.2\*** Containers used solely for recycling clean waste or for patient records awaiting destruction shall be permitted to be excluded from the requirements of [21.7.5.5.1](#) where all the following conditions are met:

- (1) Each container shall be limited to a maximum capacity of 96 gal (363 L), except as permitted by [21.7.5.5.2\(2\)](#) or (3).
- (2)\* Containers with capacities greater than 96 gal (363 L) shall be located in a room protected as a hazardous area when not attended.
- (3) Container size shall not be limited in hazardous areas.
- (4) Containers for combustibles shall be labeled and listed as meeting the requirements of FM Approval Standard 6921, *Containers for Combustible Waste*; however, such testing, listing, and labeling shall not be limited to FM Approvals.

**A.21.7.5.5.2** It is the intent that this provision permits recycling of bottles, cans, paper, and similar clean items that do not contain grease, oil, flammable liquids, or significant plastic materials using larger containers or several adjacent containers and not

## CHAPTER 20 • New

require locating such containers in a room protected as a hazardous area. Containers for medical records awaiting shredding are often larger than 32 gal (121 L). These containers are not to be included in the calculations and limitations of 20.7.5.5.1. There is no limit on the number of these containers, as FM Approval Standard 6921, *Containers for Combustible Waste*, ensures that the fire will not spread outside of the container. FM approval standards are written for use with FM Approvals. The tests can be conducted by any approved laboratory. The portions of the standard referring to FM Approvals are not included in this reference.

**A.20.7.5.5.2(2)** See 20.7.5.5.1(3).

**20.7.5.5.3** The provisions of 10.3.9, applicable to containers for waste, or linen, shall not apply.

Cigarette ignition–resistance testing for newly introduced upholstered furniture and mattresses is required for ambulatory health care occupancies. Further, rate of heat release testing, as detailed in 10.3.3 and 10.3.4, is required by 20/21.7.5.2 and 20/21.7.5.3 for newly introduced upholstered furniture and newly introduced mattresses in ambulatory health care occupancies, unless the building is sprinklered throughout.

Paragraph 20/21.7.5.5.1 establishes maximum trash container sizes and placement densities permitted within a room. Containers larger than those specified, or grouped containers exceeding the density per room criterion, present a hazard greater than that associated with the normal furnishing of an ambulatory health care center room.

Large, mobile soiled linen or trash receptacles can be moved along the corridor as collections occur but must be attended by staff. If housekeeping staff, for example, must leave the area, the container must be stored in a room designed and maintained as a hazardous area in accordance with 20/21.3.2. Exhibit 20/21.14 illustrates the requirements of 20/21.7.5.5.

The provisions of 20/21.7.5.5.2 recognize the need for secure disposal of clean waste, such as paper, that might include patient information. Such waste is typically aggregated in containers larger than the 32 gal (121 L) limitation imposed by 20/21.7.5.5.1,

## 20.7.6 Maintenance and Testing. (See 4.6.12.)

### 20.7.7\* Engineered Smoke Control Systems.

**A.20.7.7** A document that provides recognized engineering principles for the testing of smoke control systems is NFPA 92, *Standard for Smoke Control Systems*.

**20.7.7.1** New engineered smoke control systems shall be tested in accordance with established engineering principles and shall meet the performance requirements of such testing prior to acceptance.

## CHAPTER 21 • Existing

require locating such containers in a room protected as a hazardous area. Containers for medical records awaiting shredding are often larger than 32 gal (121 L). These containers are not to be included in the calculations and limitations of 21.7.5.5.1. There is no limit on the number of these containers, as FM Approval Standard 6921, *Containers for Combustible Waste*, ensures that the fire will not spread outside of the container. FM approval standards are written for use with FM Approvals. The tests can be conducted by any approved laboratory. The portions of the standard referring to FM Approvals are not included in this reference.

**A.21.7.5.5.2(2)** See 21.7.5.5.1(3).

**21.7.5.5.3** The provisions of 10.3.9, applicable to containers for waste, or linen, shall not apply.

as it might not be feasible to have such materials removed and shredded as frequently as would be necessitated if smaller containers were used. The maximum 96 gal (363 L) container presents little fire challenge, as the container has been tested for fire performance. The larger, clean waste containers typically are outfitted with a tight-fitting lid and narrow slot in order to pass the required fire testing.

**Exhibit 20/21.14**

*Allowable soiled linen or trash collection receptacles.*

## 21.7.6 Maintenance and Testing. (See 4.6.12.)

### 21.7.7\* Engineered Smoke Control Systems.

**A.21.7.7** A document that provides recognized engineering principles for the testing of smoke control systems is NFPA 92, *Standard for Smoke Control Systems*.

**21.7.7.1** New engineered smoke control systems shall be tested in accordance with established engineering principles and shall meet the performance requirements of such testing prior to acceptance.

## CHAPTER 20 • New

**20.7.7.2** Following acceptance, all engineered smoke control systems shall be tested periodically in accordance with recognized engineering principles.

**20.7.7.3** Test documentation shall be maintained on the premises at all times.

**20.7.8 Portable Space-Heating Devices.** Portable space-heating devices shall be prohibited in all ambulatory health care occupancies, unless both of the following criteria are met:

- (1) Such devices are used only in nonsleeping staff and employee areas.
- (2) The heating elements of such devices do not exceed 212°F (100°C).

### 20.7.9 Construction, Repair, and Improvement Operations.

**20.7.9.1** Construction, repair, and improvement operations shall comply with **4.6.10**.

**20.7.9.2** The means of egress in any area undergoing construction, repair, or improvements shall be inspected daily for compliance with **7.1.10.1** and shall also comply with NFPA 241, *Standard for Safeguarding Construction, Alteration, and Demolition Operations*.

# New and Existing Detention and Correctional Occupancies

Detention and correctional occupancies apply the total concept approach to life safety — complete with a defend-in-place strategy — much as is done for health care occupancies. Unlike people in health care occupancies, whose incapability of self-preservation is due to medical conditions, those in detention and correctional occupancies are incapable of self-preservation because of security restrictions. Security restrictions prevent, to a large extent, free and customary movement and access to other areas of a building. In general, many of the normal features needed in a detention facility are nearly the exact opposite of what the Code attempts to provide for other occupancies. For example, the use of locked doors, often with key-operated locks (see 22/23.2.11.2 and 22/23.2.11.3); egress components for which use is restricted or traffic flow is constricted, such as a sally port (see 22/23.2.5.4); and discharge of exits onto other than public ways (see 22/23.2.7.1) are features not usually permitted in other occupancies.

Chapters 22 and 23 impose limitations on the degree of locking that can be used. These limits form a classification scheme based on the appropriate use condition. In general, the amount of restriction (e.g., Use Condition I is free egress and Use Condition V is contained; see 22/23.1.2.1) in the detention and correctional facility dictates the use of acceptable locking methods and means of egress features not permitted in other occupancies. As in a health care facility, those unique features necessary to protect the occupants *in place* include construction, compartmentation, alarm and detection, and staff facilitation to help lead or direct occupants to safe areas within the premises of the detention facility campus.

Section 22/23.7 provides routine operating requirements, such as 24-hour staffing; means for resident notification of staff in an emergency; preparation and maintenance of evacuation plans; staff training in the use of portable fire extinguishers; storage of combustible personal property; presence of heat-producing appliances; control of flammability of draperies, curtains, mattresses, and upholstered furniture; and visual and

tactile identification of keys necessary for unlocking doors within the means of egress. Because locking doors — which is necessary for the intended function of the facility — is contrary to the basic Code tenet that the means of egress system is under the control of building occupants, the presence of properly trained staff is paramount to providing a level of life safety equivalent to that provided in other occupancies. Section 22/23.7 requires the necessary staffing and training that — where combined with the Code requirements of the core chapters and the remainder of Chapter 22 or Chapter 23 — achieve the necessary level of life safety.

The twelve photographs used as exhibits in the Chapter 22/23 commentary are from the Lubbock County Detention Center, Lubbock, Texas. The facility is a detention center (i.e., a short-term prison) and not a long-term correctional facility. The facility, first occupied in 2010, was designed for more than 1500 residents but is outfitted to accommodate approximately 1200. Exhibit 22/23.1 shows the front entrance. For an aerial view of the facility, see Exhibit 22/23.3, which is part of the commentary following 22/23.1.3.8.

Exhibit 22/23.1

Detention facility, front entrance.

---

## 22.1 General Requirements

### 22.1.1 Application.

#### 22.1.1.1 General.

22.1.1.1.1 The requirements of this chapter shall apply to new buildings or portions thereof used as detention or correctional occupancies. (See 1.3.1.)

---

## 23.1 General Requirements

### 23.1.1 Application.

#### 23.1.1.1 General.

23.1.1.1.1 The requirements of this chapter shall apply to existing buildings or portions thereof currently occupied as detention or correctional occupancies.

## CHAPTER 22 • New

**22.1.1.1.2 Administration.** The provisions of [Chapter 1](#) shall apply.

**22.1.1.1.3 General.** The provisions of [Chapter 4](#) shall apply.

The provisions for new detention and correctional occupancies are addressed in [Chapter 22](#); the provisions for existing detention and correctional occupancies (i.e., existing conditions in detention and correctional occupancies) are addressed in [Chapter 23](#).

In editions of the *Code* prior to 2006, renovations, additions, and changes of occupancy were required to comply with the requirements for new construction. For detention and correctional occupancies, such renovations, additions, and changes of occupancy were required to meet the provisions of [Chapter 22](#), while existing conditions were subject to the provisions of [Chapter 23](#). Since the 2006 edition of the *Code*, [Chapter 43](#), Building Rehabilitation, has addressed the subject in a different way. The

**22.1.1.1.4** This chapter establishes life safety requirements that shall apply to the design of all new detention and correctional facilities, other than the following:

- (1) Use Condition I facilities protected as residential occupancies in accordance with [22.1.2.3](#)
- (2)\* Facilities determined to have equivalent safety provided in accordance with [Section 1.4](#)

**A.22.1.1.1.4(2)** In determining equivalency for conversions, modernizations, renovations, or unusual design concepts of detention and correctional facilities, the authority having jurisdiction is permitted to accept evaluations based on the detention and correctional occupancies fire safety evaluation system (FSES) of NFPA 101A, *Guide on Alternative Approaches to Life Safety*, utilizing the parameters for new construction.

**22.1.1.1.5** Detention and correctional occupancies shall include those used for purposes such as correctional institutions, detention facilities, community residential centers, training schools, work camps, and substance abuse centers where occupants are confined or housed under some degree of restraint or security.

**22.1.1.1.6\*** Detention and correctional occupancies shall include those that provide sleeping facilities for one or more residents and are occupied by persons who are generally prevented from taking self-preservation action because of security measures not under the occupants' control.

**A.22.1.1.1.6** It is not the intent to classify as detention and correctional occupancies the areas of health care occupancies in which doors are locked against patient egress where needed for the clinical needs of the patients. For example, a dementia treatment center can be adequately protected by the health care

## CHAPTER 23 • Existing

**23.1.1.1.2 Administration.** The provisions of [Chapter 1](#), Administration, shall apply.

**23.1.1.1.3 General.** The provisions of [Chapter 4](#), General, shall apply.

chapter was written to promote the adaptive reuse of existing buildings without sacrificing the needed level of life safety. The provisions of [Chapter 43](#) blend the requirements for new construction with those for existing conditions, so as to require additional life safety features as the rehabilitation work category increases in complexity. The rehabilitation work categories are repair, renovation, modification, reconstruction, change of use or occupancy classification, and addition. See [4.6.7](#), [4.6.11](#), and [Chapter 43](#).

The provisions of [22/23.1.1.1.2](#) and [22/23.1.1.1.3](#) remind the user that the administrative provisions of [Chapter 1](#) and the general provisions of [Chapter 4](#) apply.

**23.1.1.1.4** This chapter establishes life safety requirements that shall apply to all existing detention and correctional facilities, other than the following:

- (1) Use Condition I facilities protected as residential occupancies in accordance with [23.1.2.3](#)
- (2)\* Facilities determined to have equivalent safety provided in accordance with [Section 1.4](#)

**A.23.1.1.1.4(2)** In determining equivalency for existing detention and correctional facilities, the authority having jurisdiction is permitted to accept evaluations based on the detention and correctional occupancies fire safety evaluation system (FSES) of NFPA 101A, *Guide on Alternative Approaches to Life Safety*, utilizing the parameters for existing buildings.

**23.1.1.1.5** Detention and correctional occupancies shall include those used for purposes such as correctional institutions, detention facilities, community residential centers, training schools, work camps, and substance abuse centers where occupants are confined or housed under some degree of restraint or security.

**23.1.1.1.6\*** Detention and correctional occupancies shall include those that provide sleeping facilities for one or more residents and are occupied by persons who are generally prevented from taking self-preservation action because of security measures not under the occupants' control.

**A.23.1.1.1.6** It is not the intent to classify as detention and correctional occupancies the areas of health care occupancies in which doors are locked against patient egress where needed for the clinical needs of the patients. For example, a dementia treatment center can be adequately protected by the health care

## CHAPTER 22 • New

occupancies requirements of **Chapter 18**. [See *18.1.1.1.7, 18.2.2.2.2, 18.2.2.2.4(1), and 18.2.2.2.6.*]

The one-resident threshold requirement of **22.1.1.1.6** is not meant to force a residential occupancy, where security is imposed on one or more occupants, to be reclassified as a detention and correctional occupancy.

**22.1.1.1.7\*** Lockups in other than detention and correctional occupancies and health care occupancies shall comply with the requirements of **22.4.5**.

**A.22.1.1.1.7** Lockups in which persons are detained with some degree of security imposed on them are common in many occupancies. Examples include the following:

- (1) Immigration and naturalization facilities at border crossings
- (2) Customs facilities at international airports
- (3) Prisoner holding facilities at courthouses
- (4) Local police department holding areas
- (5) Security offices at sports stadia
- (6) Security offices at shopping mall complexes

Since the 2006 edition of the *Code*, the definition of the term *detention and correctional occupancy* has applied at the threshold of one or more persons (see *3.3.190.5, 6.1.7.1, and 22/23.1.1.1.6*). Formerly, the threshold was four or more persons. This change was made for correlation with the provisions for lockups in other than detention and correctional occupancies, as addressed in *22/23.1.1.1.7* and *22/23.4.5*, that have appeared in the *Code* since the 2006 edition. The provisions for lockups are needed for application, even when only one person is detained,

### 22.1.1.2 Total Concept.

**22.1.1.2.1** All detention and correctional facilities shall be designed, constructed, maintained, and operated to minimize the possibility of a fire emergency.

**22.1.1.2.2** Because the safety of all occupants in detention and correctional facilities cannot be adequately ensured solely by dependence on evacuation of the building, their protection from fire shall be provided by appropriate arrangement of facilities; adequate, trained staff; and development of operating, security, and maintenance procedures composed of the following:

- (1) Design, construction, and compartmentation
- (2) Provision for detection, alarm, and extinguishment
- (3) Fire prevention and planning, training, and drilling programs for the isolation of fire and the transfer of occupants to areas of refuge, for evacuation of the building, or for protection of the occupants in place
- (4) Provision of security to the degree necessary for the safety of the public and the occupants of the facility

## CHAPTER 23 • Existing

occupancies requirements of **Chapter 19**. [See *19.1.1.1.7, 19.2.2.2.2, 19.2.2.2.4(1), and 19.2.2.2.6.*]

The one-resident threshold requirement of **23.1.1.1.6** is not meant to force a residential occupancy, where security is imposed on one or more occupants, to be reclassified as a detention and correctional occupancy.

**23.1.1.1.7\*** Lockups, other than approved existing lockups, in other than detention and correctional occupancies and health care occupancies shall comply with the requirements of **23.4.5**.

**A.23.1.1.1.7** Lockups in which persons are detained with some degree of security imposed on them are common in many occupancies. Examples include the following:

- (1) Immigration and naturalization facilities at border crossings
- (2) Customs facilities at international airports
- (3) Prisoner holding facilities at courthouses
- (4) Local police department holding areas
- (5) Security offices at sports stadia
- (6) Security offices at shopping mall complexes

as the locked doors characteristic of such detention deny the occupant free egress as required by **7.2.1.5**. A lockup in an occupancy other than detention and correctional that detains any individual for more than 24 hours is required to be classified as a detention and correctional occupancy (see *22/23.4.5.1.2*) and is subject to the provisions of **Chapter 22** or **Chapter 23**. Thus, the provisions of **Chapters 22** and **23** needed to apply to one or more residents.

### 23.1.1.2 Total Concept.

**23.1.1.2.1** All detention and correctional facilities shall be designed, constructed, maintained, and operated to minimize the possibility of a fire emergency.

**23.1.1.2.2** Because the safety of all occupants in detention and correctional facilities cannot be adequately ensured solely by dependence on evacuation of the building, their protection from fire shall be provided by appropriate arrangement of facilities; adequate, trained staff; and development of operating, security, and maintenance procedures composed of the following:

- (1) Design, construction, and compartmentation
- (2) Provision for detection, alarm, and extinguishment
- (3) Fire prevention and planning, training, and drilling programs for the isolation of fire and the transfer of occupants to areas of refuge, for evacuation of the building, or for protection of the occupants in place
- (4) Provision of security to the degree necessary for the safety of the public and the occupants of the facility

## CHAPTER 22 • New

**22.1.1.3 Additions.** Additions shall be separated from any existing structure not conforming with the provisions of **Chapter 23** by a fire barrier having not less than a 2-hour fire resistance rating constructed to the requirements of the addition, and the following also shall apply:

- (1) Doors in such partitions shall normally be kept closed.
- (2) Doors in such partitions shall be permitted to be held open if they meet the requirements of **7.2.1.8.2**.

**22.1.1.4 Modernizations or Renovations.**

**22.1.1.4.1** Modernizations and renovations shall be in accordance with **4.6.7**, unless otherwise permitted by **22.1.1.4.2**.

**22.1.1.4.2** In nonsprinklered existing buildings, modernizations or renovations shall be permitted to comply with the nonsprinklered options contained in **22.4.4** in lieu of the sprinkler requirement of **22.3.5.2**.

Although **22/23.1.1.4** states that **Chapters 22** and **23** establish life safety requirements for detention and correctional facilities, the chapters focus primarily on life safety requirements for the residential portions of these occupancies.

**Paragraph 22/23.1.1.4(1)** exempts Use Condition I facilities from the requirements of **Chapters 22** and **23** if such facilities are protected as residential occupancies. In accordance with **22/23.1.2.1**, which defines the five resident user category groups, Use Condition I provides residents with free movement from sleeping areas and other spaces where access or occupancy is permitted to the exterior by a means of an egress system that meets the same requirements as would be provided for occupants of hotel, dormitory, apartment, or lodging or rooming house occupancies. Because locked doors have not been imposed on the residents of a Use Condition I detention or correctional occupancy, such a facility does not require the protect-in-place strategy and associated requirements of **Chapters 22** and **23**. For information on the protection of Use Condition I facilities, **22/23.1.1.4(1)** and **22/23.1.2.3(1)** refer the user to the residential occupancy chapters of the *Code* in lieu of the provisions of **Chapters 22** and **23**.

**Paragraph 22/23.1.1.4(2)** permits use of the equivalency provisions of **Section 1.4** for compliance with the intended level of life safety, rather than having to meet the requirements of **Chapters 22** and **23**. The 2013 edition of NFPA 101A, *Guide on Alternative Approaches to Life Safety*,<sup>1</sup> will provide information on one possible equivalency system for use in detention and correctional occupancies. The measurement system of the 2016 edition of NFPA 101A, which is to be published late in 2015, will be calibrated against the requirements of the 2015 edition of the *Life Safety Code*; the fire safety evaluation systems contained in the 2013 edition of NFPA 101A were calibrated against the requirements of the 2012 edition of the *Code*.

## CHAPTER 23 • Existing

**23.1.1.3 Additions.** Additions shall be separated from any existing structure not conforming with the provisions of this chapter by a fire barrier having not less than a 2-hour fire resistance rating constructed to the requirements of the addition, and the following also shall apply:

- (1) Doors in such partitions shall normally be kept closed.
- (2) Doors shall be permitted to be held open if they meet the requirements of **7.2.1.8.2**.

**23.1.1.4 Modernizations or Renovations.**

**23.1.1.4.1** Modernizations and renovations shall be in accordance with **4.6.7**, unless otherwise permitted by **23.1.1.4.2**.

**23.1.1.4.2** In nonsprinklered existing buildings, modernizations or renovations shall be permitted to comply with the nonsprinklered options contained in **22.4.4** in lieu of the sprinkler requirement of **22.3.5.2**.

The fire safety evaluation system (FSES) for detention and correctional occupancies contained in NFPA 101A provides a method in which the user assigns numerical values to various building parameters. The individual values are totaled and compared with established values. Using this system, alternative designs can be evaluated as options to literal *Code* compliance. The *Code* does not intend to limit acceptable equivalency evaluations solely to those based on the FSES in NFPA 101A. The authority having jurisdiction (AHJ) retains the discretion — in accordance with **Section 1.4** — to evaluate and approve alternative designs on the basis of appropriate supporting data. Also, **Section 4.4** of the *Code* permits the use of the performance-based option for the design of a complete life safety system in accordance with **Chapter 5**.

Both **A.6.1.7.1** and **22/23.1.1.1.5** reflect the current terminology for various forms of detention and correctional occupancies. The terms *adult correctional institutions*, *adult local detention facilities*, *adult community residential centers*, *juvenile detention facilities*, *juvenile training schools*, *adult and juvenile work camps*, and *adult and juvenile substance abuse centers* are used in place of terms such as *reformatories* and *houses of correction*.

Residents of detention and correctional occupancies and patients in health care occupancies are judged to be incapable of self-preservation during a fire emergency. In the case of a health care occupancy patient, incapability is due to physical or mental illness or infirmity. The detention and correctional occupancy resident, although most likely ambulatory or able-bodied, is incapable of self-preservation due to imposed security measures that are beyond the resident's control. In both cases, the occupants might have to await staff action before moving to an exit, another fire compartment, or another smoke compartment. Impediments to adequate egress are further compounded in detention and correctional occupancies by the reluctance of

## CHAPTER 22 • New

staff to unlock doors leading to the outside. Thus, horizontal movement within the facility to another fire compartment or smoke compartment might be the only means of egress system that the resident is allowed to use in a fire emergency, regardless of how many exit doors to the outside are installed. Therefore, use of the “total concept” described in 22/23.1.1.2 is critical.

The total concept, as used in 22/23.1.1.2, establishes a protect-in-place or defend-in-place strategy. This strategy mandates requirements that minimize the need for building evacuation by restricting the development and spread of a fire emergency to the room of fire origin. The total concept is desirable because safety cannot be ensured by relying on a means of egress system that is predicated on the use of evacuation but for which locks either cannot or will not be unlocked in a timely manner. The requirements (e.g., see Section 22/23.7) first try to prevent ignition and, when fires do occur, set out to detect them (e.g., see 22/23.3.4.4). Other requirements aim to control the speed with which a fire will develop (e.g., see 22/23.3.3), and still others serve to confine the effects of fire. Sprinkler, standpipe, and portable fire extinguisher requirements facilitate the extinguishment of fire. Provisions are made for refuge areas by encouraging the use of horizontal exits and by requiring smoke barriers. Heavy reliance is placed on staff reaction. All these requirements fit together to minimize the need for evacuation. This is the “total concept.”

Additions to existing facilities are addressed in 22/23.1.1.3. Buildings that comply with the requirements for existing detention and correctional occupancies in accordance with Chapter 23 do not require separation from new additions used as detention and correctional occupancies.

Note that, unlike similar requirements that apply to health care occupancies (see 18/19.1.1.4.1.1), the positioning of doors in the separating fire barriers is not restricted to cross-corridor locations. Doors must be kept closed, unless they meet the requirements for automatic closing found in 7.2.1.8.2.

Exhibit 22/23.2 illustrates the requirements of 22/23.1.1.3. If the existing portion of the building meets the requirements of Chapter 23, the new addition could be open to the existing building.

### 22.1.2 Classification of Occupancy. See 6.1.7.

**22.1.2.1\*** For application of the life safety requirements of this chapter, the resident user category shall be divided into the groups specified in 22.1.2.1.1 through 22.1.2.1.5.

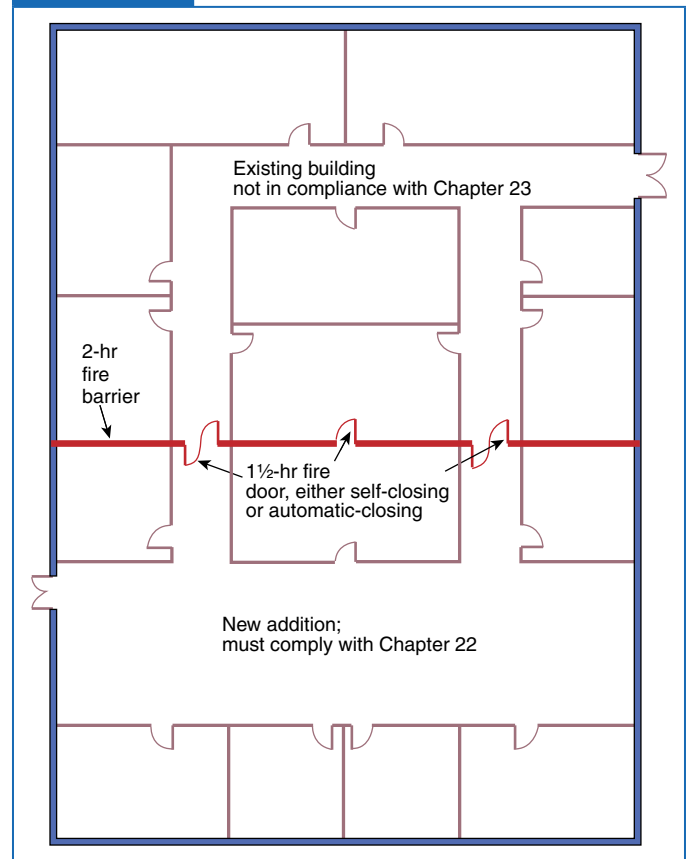

**A.22.1.2.1** Users and occupants of detention and correctional facilities at various times can be expected to include staff, visitors, and residents. The extent and nature of facility utilization vary according to the type of facility, its function, and its programs.

Figure A.22.1.2.1 illustrates the five use conditions.

**22.1.2.1.1 Use Condition I — Free Egress.** Use Condition I shall be defined as a condition under which free movement is

## CHAPTER 23 • Existing

Exhibit 22/23.2

Separation required between new addition complying with Chapter 22 and existing building not complying with requirements of Chapter 23.

### 23.1.2 Classification of Occupancy. See 6.1.7.

**23.1.2.1\*** For application of the life safety requirements that follow, the resident user category shall be divided into the groups specified in 23.1.2.1.1 through 23.1.2.1.5.

**A.23.1.2.1** Users and occupants of detention and correctional facilities at various times can be expected to include staff, visitors, and residents. The extent and nature of facility utilization will vary according to the type of facility, its function, and its programs.

Figure A.23.1.2.1 illustrates the five use conditions.

**23.1.2.1.1 Use Condition I — Free Egress.** Use Condition I shall be defined as a condition under which free movement is

CHAPTER 22 • New

CHAPTER 23 • Existing

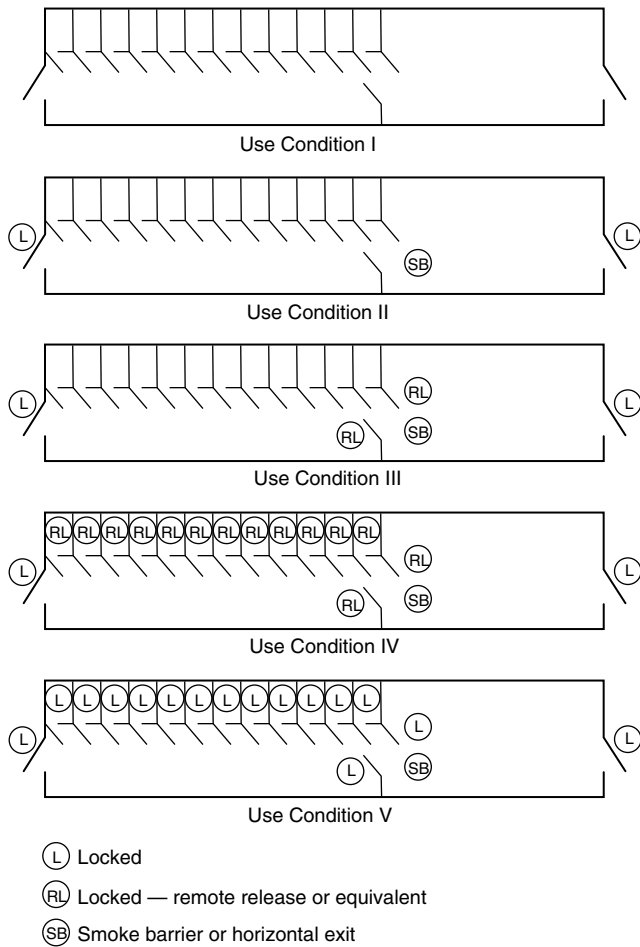

Figure A.22.1.2.1 Detention and Correctional Use Conditions.

allowed from sleeping areas and other spaces where access or occupancy is permitted to the exterior via means of egress that meet the requirements of the Code.

**22.1.2.1.2 Use Condition II — Zoned Egress.** Use Condition II shall be defined as a condition under which free movement is allowed from sleeping areas and any other occupied smoke compartment to one or more other smoke compartments.

**22.1.2.1.3 Use Condition III — Zoned Impeded Egress.** Use Condition III shall be defined as a condition under which free movement is allowed within individual smoke compartments, such as within a residential unit comprised of individual sleeping rooms and a group activity space, with egress impeded by remote-controlled release of means of egress from such a smoke compartment to another smoke compartment.

**22.1.2.1.4 Use Condition IV — Impeded Egress.** Use Condition IV shall be defined as a condition under which free move-

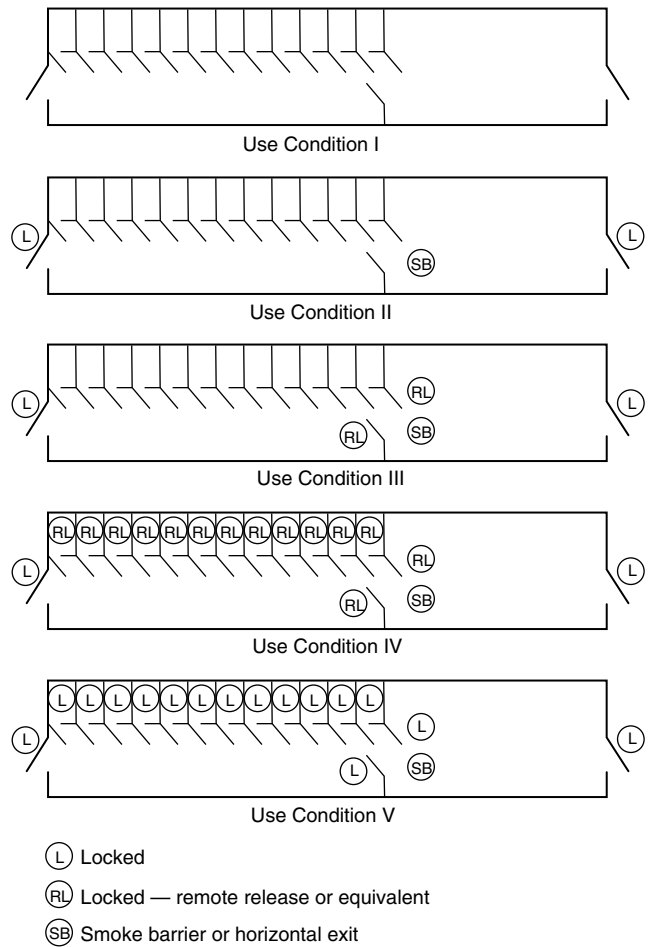

Figure A.23.1.2.1 Detention and Correctional Use Conditions.

allowed from sleeping areas and other spaces where access or occupancy is permitted to the exterior via means of egress meeting the requirements of this Code.

**23.1.2.1.2 Use Condition II — Zoned Egress.** Use Condition II shall be defined as a condition under which free movement is allowed from sleeping areas and any other occupied smoke compartment to one or more other smoke compartments.

**23.1.2.1.3 Use Condition III — Zoned Impeded Egress.** Use Condition III shall be defined as a condition under which free movement is allowed within individual smoke compartments, such as within a residential unit comprised of individual sleeping rooms and a group activity space, with egress impeded by remote-controlled release of means of egress from such a smoke compartment to another smoke compartment.

**23.1.2.1.4 Use Condition IV — Impeded Egress.** Use Condition IV shall be defined as a condition under which free move-

## CHAPTER 22 • New

ment is restricted from an occupied space, and remote-controlled release is provided to allow movement from all sleeping rooms, activity spaces, and other occupied areas within the smoke compartment to another smoke compartment.

**22.1.2.1.5 Use Condition V — Contained.** Use Condition V shall be defined as a condition under which free movement is restricted from an occupied space, and staff-controlled manual release at each door is provided to allow movement from all sleeping rooms, activity spaces, and other occupied areas within the smoke compartment to another smoke compartment.

**22.1.2.2\*** To be classified as Use Condition III or Use Condition IV, the arrangement, accessibility, and security of the release mechanism(s) used for emergency egress shall be such that the minimum available staff, at any time, can promptly release the locks.

**A.22.1.2.2** Prompt operation is intended to be accomplished in the period of time between detection of fire, either by the smoke detector(s) required by 22.3.4.4 or by other means, whichever occurs first, and the advent of intolerable conditions forcing emergency evacuation. Fire tests have indicated that the time available is a function of the volume and height of the space involved and the rate of fire development. In traditional one-story corridor arrangements, the time between detection by smoke detectors and the advent of lethal conditions down to head height can be as short as approximately 3 minutes. In addition, it should be expected that approximately 1 minute will be required to evacuate all the occupants of a threatened smoke compartment once the locks are released. In such a case, a prompt release time would be 2 minutes.

**22.1.2.3** Areas housing occupancies corresponding to Use Condition I shall conform to one of the following:

- (1) Requirements of residential occupancies under this *Code*
- (2)\* Requirements of this chapter for Use Condition II facilities, provided that the staffing requirements of Section 22.7 are met

**A.22.1.2.3(2)** If the Use Condition I facility conforms to the requirements of residential occupancies under this *Code*, there are no staffing requirements. If the Use Condition I facility conforms to the requirements of Use Condition II facilities as permitted by this provision, staffing is required in accordance with 22.7.1.

Use Condition I facilities have no physical restrictions, such as locks, on the means of egress. The occupants are capable of self-preservation. An example is a work release center in which the doors are not locked. See Figure A.22/A.23.1.2.1. Because the

## CHAPTER 23 • Existing

ment is restricted from an occupied space, and remote-controlled release is provided to allow movement from all sleeping rooms, activity spaces, and other occupied areas within the smoke compartment to another smoke compartment.

**23.1.2.1.5 Use Condition V — Contained.** Use Condition V shall be defined as a condition under which free movement is restricted from an occupied space, and staff-controlled manual release at each door is provided to allow movement from all sleeping rooms, activity spaces, and other occupied areas within the smoke compartment to another smoke compartment.

**23.1.2.2\*** To be classified as Use Condition III or Use Condition IV, the arrangement, accessibility, and security of the release mechanism(s) used for emergency egress shall be such that the minimum available staff, at any time, can promptly release the locks.

**A.23.1.2.2** Prompt operation is intended to be accomplished in the period of time between detection of fire, either by the smoke detector(s) required by 23.3.4.4 or by other means, whichever occurs first, and the advent of intolerable conditions forcing emergency evacuation. Fire tests have indicated that the time available is a function of the volume and height of the space involved and the rate of fire development. In traditional one-story corridor arrangements, the time between detection by smoke detectors and the advent of lethal conditions down to head height can be as short as approximately 3 minutes. In addition, it should be expected that approximately 1 minute will be required to evacuate all the occupants of a threatened smoke compartment once the locks are released. In such a case, a prompt release time would be 2 minutes.

**23.1.2.3** Areas housing occupancies corresponding to Use Condition I shall conform to one of the following:

- (1) Requirements of residential occupancies under this *Code*
- (2)\* Requirements of this chapter for Use Condition II facilities, provided that the staffing requirements of Section 23.7 are met

**A.23.1.2.3(2)** If the Use Condition I facility conforms to the requirements of residential occupancies under this *Code*, there are no staffing requirements. If the Use Condition I facility conforms to the requirements of Use Condition II facilities as permitted by this exception, staffing is required in accordance with 23.7.1.

means of egress system is kept unlocked, occupants are as free to escape a fire emergency as occupants of any other residential type of occupancy. Therefore, Use Condition I detention and correctional occupancies are exempted from the requirements of

## CHAPTER 22 • New

Chapters 22 and 23 if they meet the requirements of some other occupancy chapter, such as Chapter 28 or Chapter 29 for hotels and dormitories. See 22/23.1.2.3 and 22/23.1.1.4(1).

The residents of a Use Condition II facility have the freedom to move within the building, including the freedom to move from their rooms, across the smoke barrier, and into a separate smoke compartment. Locked doors that are permitted to be unlocked manually at the door impede movement through the exit door in the exterior wall to the outside. See Figure A.22/A.23.1.2.1.

The residents of a Use Condition III facility are free to move outside their rooms but are confined to the smoke compartment that contains their rooms. Locked doors within the smoke barrier that are equipped with remote-control release impede movement to an adjoining smoke compartment. Locked doors that are permitted to be unlocked manually at the door impede movement through the exit door in the exterior wall to the outside. See Figure A.22/A.23.1.2.1.

The residents of Use Condition IV facilities are locked in their sleeping rooms. Locks on sleeping room doors must be equipped with remote-control release. Locked doors within the smoke barrier that are equipped with remote-control release impede movement to an adjoining smoke compartment. Locked doors that are permitted to be unlocked manually at the door impede movement through the exit door in the exterior wall to the outside. See Figure A.22/A.23.1.2.1.

In Use Condition V facilities, all locks are manually operated at the individual door. See Figure A.22/A.23.1.2.1. The unlocking process places a heavy demand on staff to open doors in an emergency and severely restricts the movement of residents of Use Condition V facilities. Therefore, the most stringent requirements of Chapters 22 and 23 are applied to such facilities.

As part of the definitions of Use Condition II through Use Condition V, reference is made to smoke compartments and the type of locking (none, remote release, or manual operation) used for smoke barrier doors. A facility without a smoke barrier can still qualify as meeting the requirements for one of these use conditions by providing for movement to a location judged to be equivalent to a smoke compartment, such as (1) a public way, (2) a building separated from the space in question by either adequate fire resistance-rated construction or distance, or (3) an adequately sized outside holding area located at a safe distance. The locking operation of the door to this alternative location cannot be more stringent than that permitted for the smoke barrier door of the corresponding use condition — no locking for Use Condition II,

### 22.1.3\* Multiple Occupancies.

**A.22.1.3** Detention and correctional facilities are a complex of structures, each serving a definite and usually different purpose. In many institutions, all, or almost all, the occupancy-type

## CHAPTER 23 • Existing

remote release for Use Condition III and Use Condition IV, and manual operation for Use Condition V. See also 22/23.3.7.

Note that, in Figure A.22/A.23.1.2.1, “locked” designates that such doors are arranged to require a manual unlocking operation at the door.

The major requirements of 22/23.1.2.2, applicable to Use Condition III and Use Condition IV facilities, are that the area must be under continuous supervision and a sufficient number of staff must be present and have the necessary keys readily available to release the locks.

The intent of 22/23.1.2.3 is that detention and correctional occupancies in which the occupants are not locked in at any time are permitted to be classified as residential occupancies if they meet the requirements of Chapter 26, Chapter 28, Chapter 29, Chapter 30, or Chapter 31, as appropriate. Those buildings that permit free egress, although used as detention and correctional occupancies, are not classified as detention and correctional occupancies under this Code. A facility equipped with locking devices on its doors cannot be classified as Use Condition I, because the locks could be used in the future. Instead, depending on the locks’ mode of operation — remote or manual — the corresponding use condition should be assigned and the requirements of Chapter 22 or Chapter 23 followed. A facility should be classified as Use Condition I only if the locking devices are physically removed.

In lieu of following the requirements for a normal residential occupancy, as detailed in Chapter 26, Chapter 28, Chapter 29, Chapter 30, or Chapter 31, a Use Condition I facility is permitted to comply with the Chapter 22 or Chapter 23 provisions applicable to a Use Condition II facility. This exemption permits the entire facility, which might employ a variety of use conditions, to be measured against the requirements of Chapter 22 or Chapter 23 without having to make special use of the residential occupancy chapters. However, as A.22/A.23.1.2.3(2) advises, if the requirements applicable to Use Condition II are used, staffing is required. Proper protection would not be ensured by mixing the provisions of a residential occupancy chapter — Chapter 28 or Chapter 29, for example, for which the hotel provisions do not rely on staff action — with those of Chapters 22 and 23 applicable to Use Condition II facilities, for which heavy reliance is placed on staff action. In other words, the Code requires full compliance with either the requirements applicable to a residential occupancy or those applicable to a detention and correctional occupancy — not a self-prescribed mixing of options.

### 23.1.3\* Multiple Occupancies.

**A.23.1.3** Detention and correctional facilities are a complex of structures, each serving a definite and usually different purpose. In many institutions, all, or almost all, of the occupancy-type

## CHAPTER 22 • New

classifications found in this *Code* are represented. Means of egress and other features are governed by the type of occupancy classification and the hazard of occupancy, unless specific exemptions are made.

All buildings and structures are to be classified using **Chapter 22** and **Section 6.1** as a guide, subject to the ruling of the authority having jurisdiction where a question arises concerning the proper classification of any individual building or structure.

Use condition classification of the institution, as well as of individual areas within the complex, is always to be considered by the authority having jurisdiction.

**22.1.3.1** Multiple occupancies shall be in accordance with **6.1.14**.

**22.1.3.2** Egress provisions for areas of detention and correctional facilities that correspond to other occupancies shall meet the corresponding requirements of this *Code* for such occupancies as modified by **22.1.3.2.1** and **22.1.3.2.2**.

**22.1.3.2.1** Where security operations necessitate the locking of required means of egress, staff in the building shall be provided with a means for the supervised release of occupants during all times of use.

**22.1.3.2.2\*** Where security operations necessitate the locking of required means of egress, the following shall apply:

- (1) Detention-grade hardware meeting the requirements of ASTM F 1577, *Standard Test Methods for Detention Locks for Swinging Doors*, shall be provided on swinging doors within the required means of egress.
- (2) Sliding doors within the required means of egress shall be designed and engineered for detention and correctional use, and lock cylinders shall meet the cylinder test requirements of ASTM F 1577.

**A.22.1.3.2.2** Key-operated locking hardware of a lesser grade than institutional grade hardware might not be suitable for the heavy use to which such locks are expected to be subjected.

**22.1.3.3** Sections of detention and correctional facilities shall be permitted to be classified as other occupancies, provided that they meet both of the following conditions:

- (1) They are not intended to serve residents for sleeping purposes.
- (2) They are separated from areas of detention or correctional occupancies by construction having not less than a 2-hour fire resistance rating.

## CHAPTER 23 • Existing

classifications found in this *Code* are represented. Means of egress and other features are governed by the type of occupancy classification and the hazard of occupancy, unless specific exemptions are made.

All buildings and structures are to be classified using **Chapter 23** and **Section 6.1** as a guide, subject to the ruling of the authority having jurisdiction where there is a question as to the proper classification of any individual building or structure.

Use condition classification of the institution, as well as of individual areas within the complex, is always to be considered by the authority having jurisdiction.

**23.1.3.1** Multiple occupancies shall be in accordance with **6.1.14**.

**23.1.3.2** Egress provisions for areas of detention and correctional facilities that correspond to other occupancies shall meet the corresponding requirements of this *Code* for such occupancies as modified by **23.1.3.2.1**.

**23.1.3.2.1\*** Where security operations necessitate the locking of required means of egress, staff in the building shall be provided with the means for the supervised release of occupants during all times of use.

**A.23.1.3.2.1** Key-operated locking hardware should be of institutional grade. Lesser grade hardware might not be suitable for the heavy use to which such locks are expected to be subjected.

**23.1.3.2.2 Reserved.**

**23.1.3.3** Sections of detention and correctional facilities shall be permitted to be classified as other occupancies, provided that they meet both of the following conditions:

- (1) They are not intended to serve residents for sleeping purposes.
- (2) They are separated from areas of detention or correctional occupancies by construction having not less than a 2-hour fire resistance rating.

## CHAPTER 22 • New

**22.1.3.4** All means of egress from detention and correctional occupancies that traverse other use areas shall, as a minimum, conform to the requirements of this *Code* for detention and correctional occupancies, unless otherwise permitted by **22.1.3.5**.

**22.1.3.5** Egress through a horizontal exit into other contiguous occupancies that do not conform with detention and correctional occupancy egress provisions but that do comply with requirements set forth in the appropriate occupancy chapter of this *Code* shall be permitted, provided that both of the following criteria apply:

- (1) The occupancy shall not contain high hazard contents.
- (2) The horizontal exit shall comply with the requirements of **22.2.2.5**.

**22.1.3.6** Any area with a hazard of contents classified higher than that of the detention or correctional occupancy and located in the same building shall be protected as required in **22.3.2**.

**22.1.3.7** Nondetention- or noncorrectional-related occupancies classified as containing high hazard contents shall not be permitted in buildings housing detention or correctional occupancies.

**22.1.3.8** Atrium walls in accordance with **6.1.14.4.6** shall be permitted to serve as part of the separation required by **6.1.14.4.1** for creating separated occupancies on a story-by-story basis.

**Paragraph 22/23.1.3.1** directs the user to the multiple occupancies provisions of **6.1.14**, which permit protecting multiple occupancies either as mixed occupancies or as separated occupancies. Where the multiple occupancy is protected via the provisions of **6.1.14.4** for separated occupancies, the required number of hours of fire-rated separation is specified by **Table 6.1.14.4.1(a)** or **Table 6.1.14.4.1(b)**. Note that, per **Table 6.1.14.4.1(a)** and **Table 6.1.14.4.1(b)**, the 2-hour separation required between detention/correctional occupancies and other occupancies is not permitted to be reduced to a 1-hour separation due to the presence of sprinklers. The protect-in-place strategy being used needs to help ensure tenable conditions for more than 1 hour under fire conditions.

The provisions of **22/23.1.3.2** through **22/23.1.3.8** have the effect of modifying those of **6.1.14** for the very specific situations described.

**Paragraph 22/23.1.3.2** addresses areas of detention and correctional facilities that correspond to other occupancies. Yet, the detailed provisions of **Chapters 22** and **23** apply mainly to the sleeping and living areas of the detention and correctional facility. Similarly, the provisions of **22/23.1.1.6** mandate that detention and correctional occupancies provide sleeping facilities. **Exhibit 22/23.3** shows an aerial view of a 400,000 ft<sup>2</sup> (37,160 m<sup>2</sup>) detention facility where the six multi-sided pods comprise the sleeping and living areas addressed specifically by the provisions of **Chapters 22** and **23**.

## CHAPTER 23 • Existing

**23.1.3.4** All means of egress from detention and correctional occupancies that traverse other use areas shall, as a minimum, conform to the requirements of this *Code* for detention and correctional occupancies, unless otherwise permitted by **23.1.3.5**.

**23.1.3.5** Egress through a horizontal exit into other contiguous occupancies that do not conform to detention and correctional occupancy egress provisions but that do comply with requirements set forth in the appropriate occupancy chapter of this *Code* shall be permitted, provided that both of the following criteria apply:

- (1) The occupancy shall not contain high hazard contents.
- (2) The horizontal exit shall comply with the requirements of **23.2.2.5**.

**23.1.3.6** Any area with a hazard of contents classified higher than that of the detention or correctional occupancy and located in the same building shall be protected as required in **23.3.2**.

**23.1.3.7** Nondetention- or noncorrectional-related occupancies classified as containing high hazard contents shall not be permitted in buildings housing detention or correctional occupancies.

**23.1.3.8** Atrium walls in accordance with **6.1.14.4.6** shall be permitted to serve as part of the separation required by **6.1.14.4.1** for creating separated occupancies on a story-by-story basis.

**Exhibit 22/23.3** shows areas of the detention facility at the center of the building that line up so as to bisect the building such that three living units are to the left and three are to the right. The area at the center of the building includes spaces that are candidates for classification as occupancies other than detention and correctional, as they are not part of the sleeping and living areas. **Exhibit 22/23.4** shows an auditorium used only by staff or guests. **Exhibit 22/23.5** shows an arraignment room, and **Exhibit 22/23.6** shows a visitation area.

Exhibit 22/23.3

Exhibit 22/23.5

Arraignment room not located within resident sleeping and living area.

Exhibit 22/23.6

Visitation area not located within resident sleeping and living area.

Although the work areas related to a detention and correctional occupancy resemble a typical industrial occupancy, the requirements of **Chapter 40**, Industrial Occupancies, cannot be applied by themselves, because doors within the required means of egress of a detention and correctional occupancy are locked for security. Therefore, the concepts of **Chapters 22** and **23** should be implemented in locked industrial work areas to ensure that the necessary trained staff who control locks are present to facilitate immediate, supervised release of occupants in the event of fire or a similar emergency.

In addition, some areas of a large facility might correspond to another occupancy classification. For example, a gymnasium would be considered an assembly occupancy (**Chapters 12** and **13**). If locked doors are required, prompt unlocking and release are critical. Additionally, the requirement of **22.1.3.2.2** for detention-grade hardware increases the reliability of the hardware over that which would normally be installed in nondetention occupancies.

Release of locked doors is permitted to be achieved by a remotely activated system capable of unlocking all doors in the means of egress or by a sufficient number of attendants who are continuously on duty, provided with keys, and stationed in the immediate area of all locked means of egress doors. Continuous staff supervision is essential.

**Paragraph 22/23.1.3.3** permits portions of a detention and correctional occupancy to be classified as some other occupancy, provided that certain safeguards are implemented. For example, administrative offices or maintenance areas that are not customarily used by residents as sleeping areas and are separated by 2-hour fire resistance-rated construction could be classified as business or industrial occupancies. In many cases, “trustees” might be employed in these areas. Their presence in these areas would be permitted, provided that they have the freedom of egress found in an unlocked environment.

**Paragraph 22/23.1.3.3(2)** requires that, if a detention or correctional occupancy is located in a building of another classification, the detention or correctional occupancy must be separated from the other occupancy by construction having a fire resistance rating of 2 hours. This requirement would apply to a small detention facility in which detainees sleep that is located in a combination county courthouse/office/police building. In accordance with **22/23.7.1.1**, the detention area must be staffed 24 hours per day. The remainder of the building, especially office areas, might not be occupied at night. A fire that originates and develops in an unoccupied area will not threaten the occupants of the detention facility as readily, due to the protection provided by the required 2-hour fire resistance-rated barrier.

**Paragraph 22/23.1.3.4** addresses detention and correctional occupancy egress paths that traverse other use areas. The means of egress from detention and correctional occupancies that traverse other types of spaces must conform to the requirements for detention and correctional occupancies. However, if a 2-hour

## CHAPTER 22 • New

fire barrier and the associated opening protectives located between a detention or correctional occupancy and another occupancy (e.g., business) qualify as a horizontal exit (see 22/23.2.2.5 and 7.2.4), the means of egress system in the business occupancy needs to comply only with the appropriate requirements contained in Chapters 38 and 39. See 22/23.1.3.5.

Paragraph 22/23.1.3.6 regulates those spaces that have more hazardous contents — in quantity or type — than are usually found in a detention and correctional occupancy. Spaces, such as rooms used for the storage of highly combustible materials, trash collection rooms, and paint shops, must be protected in accordance with 22/23.3.2.

Paragraph 22/23.1.3.7 prohibits another occupancy with highly hazardous contents — such as flammable liquids storage — from being located in a building housing detention and cor-

### 22.1.4 Definitions.

**22.1.4.1 General.** For definitions, see Chapter 3, Definitions.

**22.1.4.2 Special Definitions.** A list of special terms used in this chapter follows:

- (1) **Detention and Correctional Residential Housing Area.** See 3.3.21.1.
- (2) **Sally Port (Security Vestibule).** See 3.3.238.

**22.1.5 Classification of Hazard of Contents.** The classification of hazard of contents shall be as defined in Section 6.2.

### 22.1.6 Minimum Construction Requirements.

**22.1.6.1** Detention and correctional occupancies shall be limited to the building construction types specified in Table 22.1.6.1 (See 8.2.1.)

**22.1.6.2** All interior walls and partitions in Type I or Type II construction shall be of noncombustible or limited-combustible materials.

Table 22/23.1.6.1 is applied relative to building construction types. See NFPA 220, *Standard on Types of Building Construction*,<sup>2</sup> and NFPA 5000®, *Building Construction and Safety Code*,<sup>3</sup> for definitions of construction types. Table A.8.2.1.2 summarizes the details associated with Type I through Type V construction.

Table 22/23.1.6.1 establishes building construction type limitations based on the number of “stories in height,” as established by 4.6.3. Table 22/23.1.6.1 is applied to detention and correctional occupancies by starting the story count with the level of exit discharge and ending with the highest story used as a detention and correctional occupancy. (Note that a building can have only one level of exit discharge, as defined in 3.3.85.1.)

## CHAPTER 23 • Existing

rectional occupancies. The intent of this paragraph is not to exclude normal storage but to prevent the conversion of a portion of a detention and correctional facility into a warehouse that contains a larger quantity (or a more hazardous type) of combustible material than normally would be expected in a detention and correctional occupancy. This requirement applies principally to residential areas. For example, industrial areas that are part of the overall detention and correctional facility but are located in a nonresidential-use building can have flammable liquids as part of the industrial process.

The provision of 22/23.1.3.8 is new to the 2015 edition of the Code. It permits use of the provision of 6.1.14.4.6 relative to atrium walls being part of the separation that creates separated occupancies on a floor-by-floor, but not side-to-side, basis. See the commentary following 6.1.14.4.6.

### 23.1.4 Definitions.

**23.1.4.1 General.** For definitions, see Chapter 3, Definitions.

**23.1.4.2 Special Definitions.** A list of special terms used in this chapter follows:

- (1) **Detention and Correctional Residential Housing Area.** See 3.3.21.1.
- (2) **Sally Port (Security Vestibule).** See 3.3.238.

**23.1.5 Classification of Hazard of Contents.** The classification of hazard of contents shall be as defined in Section 6.2.

### 23.1.6 Minimum Construction Requirements.

**23.1.6.1** Detention and correctional occupancies shall be limited to the building construction types specified in Table 23.1.6.1. (See 8.2.1.)

**23.1.6.2** A residential housing area complying with 23.3.1.2 shall be considered as one story in height for purposes of applying 23.1.6.1.

Table 22/23.1.6.1 prohibits certain building construction types from being constructed and occupied for detention and correctional occupancy use, even if protected by automatic sprinklers. The automatic sprinkler requirements contained in Table 22/23.1.6.1 are based on construction type. Automatic sprinkler protection also is required for new construction by 22.3.5.2. New high-rise detention and correctional occupancy buildings are required to be sprinklered, as 22.4.3 requires compliance with the high-rise building provisions of Section 11.8, which include a mandate for automatic sprinklers. Note also that new detention and correctional occupancies, regardless of building height but excluding Use Condition I, are required to be

<sup>‡</sup>See 4.6.3.

sprinklered by 22.3.5.2. Existing high-rise detention and correctional occupancy buildings are required to be sprinklered directly by 23.4.3 without reference to the high-rise building provisions of Section 11.8.

Maintaining the integrity of building construction under fire conditions is mandated, because detention and correctional facility residents are incapable of self-preservation due to security requirements imposed by the facility. Thus, although NFPA 220 does not regulate the combustibility of interior nonbearing walls and partitions, 22.1.6.2 permits credit to be taken for Type I

or Type II construction in new detention and correctional occupancies only if such interior walls and partitions are of noncombustible or limited-combustible construction. The terms *noncombustible material* and *limited-combustible material* are addressed in 4.6.13 and 4.6.14.

The provisions of 22.4.4.6 and 23.3.1.2 address multilevel housing areas for which the vertical separation between the lowest floor level and the uppermost floor level does not exceed 13 ft (3960 mm), without limiting the number of levels. See Figure A.22.4.4.6.4 and Figure A.23.3.1.2.3. A multilevel housing

<sup>a</sup>Entire building is protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1). (See 23.3.5.)

<sup>b</sup>See 4.6.3.

<sup>c</sup>Any building of Type I, Type II(222), or Type II(111) construction is permitted to include roofing systems involving combustible or steel supports, decking, or roofing, provided that all of the following are met:

(1) The roof covering meets not less than Class C requirements in accordance with ASTM E 108, *Standard Test Methods for Fire Tests of Roof Coverings*, or ANSI/UL 790, *Test Methods for Fire Tests of Roof Coverings*.

(2) The roof is separated from all occupied portions of the building by a noncombustible floor assembly that includes not less than 2½ in. (64 mm) of concrete or gypsum fill, and the attic or other space so developed meets one of the following requirements:

(a) It is unoccupied.

(b) It is protected throughout by an approved automatic sprinkler system.

<sup>d</sup>In determining building construction type, exposed steel roof members located 16 ft (4875 mm) or more above the floor of the highest cell are permitted to be disregarded.

## CHAPTER 22 • New

area meeting all the requirements of 22.4.4.6 and 23.3.1.2 is treated as being one story in height for purposes of determining required building construction type in accordance with 22/23.1.6.1, as permitted by 22.4.4.2.2 and 23.1.6.2.

The *Code* recognizes that locked doors to the outside will be reluctantly unlocked, slowly unlocked, or never unlocked. Therefore, the *Code* relies on the defend-in-place or protect-in-place

**22.1.7 Occupant Load.** The occupant load, in number of persons for whom means of egress and other provisions are required, either shall be determined on the basis of the occupant load factors of Table 7.3.1.2 that are characteristic of the use of the space or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

Paragraph 22/23.1.7 references the use of the occupant load factors of Table 7.3.1.2, from which an occupant load can be determined. The means of egress system must be sized to handle whichever of the following is larger: the number of persons intended to occupy the space or the number of persons calculated by using the occupant load factors.

The *Code* intends that the occupant load factors be used only for sizing the means of egress, not for limiting the number

## 22.2 Means of Egress Requirements

**22.2.1 General.** Means of egress shall comply with Chapter 7, unless otherwise provided or modified by Section 22.2.

### 22.2.2 Means of Egress Components.

**22.2.2.1 Components Permitted.** Components of means of egress shall be limited to the types described in 22.2.2.2 through 22.2.2.11.

**22.2.2.2 Doors.** Doors complying with 7.2.1 shall be permitted, unless otherwise provided by 22.2.11.

#### 22.2.2.3 Stairs.

**22.2.2.3.1** Stairs shall be permitted as follows:

- (1) Stairs complying with 7.2.2 shall be permitted.
- (2) Noncombustible grated stair treads and landing floors shall be permitted.

**22.2.2.3.2** Spiral stairs complying with 7.2.2.2.3 shall be permitted for access to and between staff locations.

**22.2.2.4 Smokeproof Enclosures.** Smokeproof enclosures complying with 7.2.3 shall be permitted.

## CHAPTER 23 • Existing

strategy addressed in the commentary on 22/23.1.1.2, which follows 22/23.1.1.4.2. Paragraph 22/23.1.6.1 establishes minimum construction requirements to help ensure the structural integrity of the building for the time required to release residents to the outside or hold them in a safe fire compartment or smoke compartment.

**23.1.7 Occupant Load.** The occupant load, in number of persons for whom means of egress and other provisions are required, either shall be determined on the basis of the occupant load factors of Table 7.3.1.2 that are characteristic of the use of the space or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

of persons within a space. If a means of egress can accommodate an occupant load larger than that calculated using the occupant load factor characteristic of the use of the space, the *Code* does not prohibit such a load. In a facility with excess means of egress capacity, other considerations, such as plumbing codes or sanitary codes, sociological factors, and common sense, will help determine the maximum occupant load.

## 23.2 Means of Egress Requirements

**23.2.1 General.** Means of egress shall comply with Chapter 7, unless otherwise provided or modified by Section 23.2.

### 23.2.2 Means of Egress Components.

**23.2.2.1 Components Permitted.** Components of means of egress shall be limited to the types described in 23.2.2.2 through 23.2.2.11.

**23.2.2.2 Doors.** Doors complying with 7.2.1 shall be permitted, unless otherwise provided in 23.2.11.

#### 23.2.2.3 Stairs.

**23.2.2.3.1** Stairs shall be permitted as follows:

- (1) Stairs complying with 7.2.2 shall be permitted.
- (2) Noncombustible grated stair treads and landing floors shall be permitted.

**23.2.2.3.2** Spiral stairs complying with 7.2.2.2.3 shall be permitted for access to and between staff locations.

**23.2.2.4 Smokeproof Enclosures.** Smokeproof enclosures complying with 7.2.3 shall be permitted.

## CHAPTER 22 • New

**22.2.2.5 Horizontal Exits.** Horizontal exits complying with 7.2.4 and the modifications of 22.2.2.5.1 and 22.2.2.5.2 shall be permitted.

**22.2.2.5.1** Not less than 6 ft<sup>2</sup> (0.55 m<sup>2</sup>) of accessible space per occupant shall be provided on each side of the horizontal exit for the total number of people in adjoining compartments.

**22.2.2.5.2\*** Horizontal exits shall be permitted to comprise 100 percent of the exits required, provided that an exit, other than a horizontal exit, located in another (not necessarily adjacent) fire compartment is accessible without returning through the compartment of fire origin.

**A.22.2.2.5.2** An exit is not necessary from each individual fire compartment or smoke compartment if there is access to an exit through other fire compartments or smoke compartments without passing through the fire compartment or smoke compartment of fire origin.

**22.2.2.6 Ramps.** Ramps complying with 7.2.5 shall be permitted.

**22.2.2.7 Exit Passageways.** Exit passageways complying with 7.2.6 shall be permitted.

**22.2.2.8 Reserved.**

**22.2.2.9 Fire Escape Ladders.** Fire escape ladders complying with 7.2.9 shall be permitted.

**22.2.2.10 Alternating Tread Devices.** Alternating tread devices complying with 7.2.11 shall be permitted.

**22.2.2.11 Areas of Refuge.** Areas of refuge complying with 7.2.12 shall be permitted.

## CHAPTER 23 • Existing

**23.2.2.5 Horizontal Exits.** Horizontal exits complying with 7.2.4 and the modifications of 23.2.2.5.1 through 23.2.2.5.4 shall be permitted.

**23.2.2.5.1** Not less than 6 ft<sup>2</sup> (0.55 m<sup>2</sup>) of accessible space per occupant shall be provided on each side of the horizontal exit for the total number of people in adjoining compartments.

**23.2.2.5.2\*** Horizontal exits shall be permitted to comprise 100 percent of the exits required, provided that an exit, other than a horizontal exit, located in another (not necessarily adjacent) fire compartment is accessible without returning through the compartment of fire origin.

**A.23.2.2.5.2** An exit is not necessary from each individual fire compartment if there is access to an exit through other fire compartments without passing through the fire compartment of fire origin.

**23.2.2.5.3\*** Ducts shall be permitted to penetrate horizontal exits in accordance with 7.2.4.3.5(3) if protected by combination fire dampers/smoke leakage-rated dampers that meet the smoke damper actuation requirements of 8.5.5.

**A.23.2.2.5.3** This provision is intended to promote the use of horizontal exits in detention and correctional occupancies. Horizontal exits provide an especially effective egress system for an occupancy in which the occupants, due to security concerns, are not commonly released to the outside. This provision offers a Code-specified equivalent alternative to the requirement of 7.2.4.3.5 that horizontal exits are not to be penetrated by ducts. The intended continuity of the fire resistance-rated and smoke-resisting barrier is maintained by requiring that duct penetrations of horizontal exits be protected by combination fire damper/smoke leakage-rated dampers that close upon activation of a smoke detector and a heat-actuated mechanism before the barrier's ability to resist the passage of smoke and fire is compromised.

**23.2.2.5.4** A door in a horizontal exit shall not be required to swing with egress travel as specified in 7.2.4.3.8(1).

**23.2.2.6 Ramps.** Ramps complying with 7.2.5 shall be permitted.

**23.2.2.7 Exit Passageways.** Exit passageways complying with 7.2.6 shall be permitted.

**23.2.2.8 Fire Escape Stairs.** Fire escape stairs complying with 7.2.8 shall be permitted.

**23.2.2.9 Fire Escape Ladders.** Fire escape ladders complying with 7.2.9 shall be permitted.

**23.2.2.10 Alternating Tread Devices.** Alternating tread devices complying with 7.2.11 shall be permitted.

**23.2.2.11 Areas of Refuge.** Areas of refuge complying with 7.2.12 shall be permitted.

## CHAPTER 22 • New

Chapters 22 and 23 recognize the following means of egress components, as described in Chapter 7:

1. Doors (7.2.1)
2. Stairs (7.2.2)
3. Smokeproof enclosures (7.2.3)
4. Horizontal exits (7.2.4)
5. Ramps (7.2.5)
6. Exit passageways (7.2.6)
7. Fire escape ladders (7.2.9)
8. Alternating tread devices (7.2.11)
9. Areas of refuge (7.2.12)

Chapter 23 also recognizes existing fire escape stairs (7.2.8). However, Chapters 22 and 23 often modify the provisions of Chapter 7 applicable to those means of egress components. For example, although the Chapter 7 provisions that apply to horizontal exits would limit a horizontal exit to providing a maximum of 50 percent of the number of exits or 50 percent of the total egress capacity, Chapters 22 and 23 encourage the voluntary use of horizontal exits by permitting up to 100 percent of the exits to be reached by way of horizontal exits if additional criteria can be met.

Chapter 7 considers escalators and moving walks as acceptable means of egress only if they are part of an existing occupancy and are specifically recognized by an occupancy chapter. They are not permitted in the means of egress system of a detention and correctional occupancy. Chapters 22 and 23 do not recognize slide escapes as part of an egress system. Areas of refuge (see 7.2.12) might be used to provide accessible means of egress as required for new facilities in accordance with the provisions of 7.5.4.

Older editions of the Code contained a provision in Chapters 22 and 23 that exempted handrails and guards from the requirement for intermediate rails designed to keep children from falling through the spaces between rails. The exemption still applies to detention and correctional occupancies [see 7.2.2.4.6.3(2)]. The rationale for this exemption is that only adults or older juveniles use these facilities, and intermediate railings might impact functional requirements by interfering with visual observation by staff.

Grated stair treads and grated landing floors are recognized as usable in detention and correctional occupancies, because occupant reluctance to walk on such surfaces is not expected. Similarly, the potential for small shoe heels getting caught in the grated surfaces is greatly reduced in detention and correctional occupancies.

Paragraph 22/23.2.2.3.2 permits spiral stairs conforming to 7.2.2.2.3 for staff use only. These provisions prohibit a spiral stair from being part of the required means of egress system within areas occupied by residents.

Paragraph 22/23.2.2.4 permits a smokeproof enclosure to serve as part of the means of egress system in detention and correctional occupancies if that enclosure meets the requirements

## CHAPTER 23 • Existing

of 7.2.3. However, the smokeproof enclosure is not required. An example of an occupancy requiring a smokeproof enclosure can be found in 31.2.11.1, in which nonsprinklered, existing high-rise apartment buildings are required to be provided with smokeproof enclosures in accordance with 7.2.3.

Horizontal exits are addressed in 22/23.2.2.5. Although 7.2.4 requires only 3 ft<sup>2</sup> (0.28 m<sup>2</sup>) of accessible space per occupant on each side of the horizontal exit, 22/23.2.2.5.1 requires 6 ft<sup>2</sup> (0.55 m<sup>2</sup>) per occupant. The reasons for this requirement include the possible conflicts among the residents, the anticipated extended time spent in the refuge area, and the fact that horizontal exits are permitted to comprise 100 percent of required exits in detention and correctional occupancies in accordance with 22/23.2.2.5.2.

Paragraph 22/23.2.2.5.2 permits horizontal exits to comprise 100 percent of the exits from any fire compartment, provided that it is not necessary to travel through the compartment of fire origin to reach a door to the outside — that is, the compartment is not “dead ended.”

In Exhibit 22/23.7, horizontal exits correctly comprise 100 percent of the total exits from fire compartments B, C, and D. Compartment F would require the addition of an exit door that opens directly to the outside in order to reach the outside of the building without traveling through fire compartment E. Compartments A and E comply with the Code, using one horizontal exit and one exit door directly to the exterior of the building.

Exhibit 22/23.7

Horizontal exit fire compartment arrangement.

Due to the practical difficulties of using vertical exit travel to the outside in detention and correctional occupancies, including the reluctance of staff to unlock doors, special recognition is given to horizontal travel and the use of horizontal exits. As previously explained, 100 percent of the total required egress capacity for a given fire area is permitted to be provided by horizontal exits. In the event a horizontal exit also serves as a smoke barrier, refer to 22/23.2.4.3 and 22/23.3.7.

Paragraph 7.2.4.3.5 states that fire barriers used in creating a horizontal exit are prohibited from penetration by ducts. To promote the use of horizontal exits in detention and correctional

## CHAPTER 22 • New

occupancies, without burdening a facility with regard to duct penetrations, 22.4.4.3 and 23.2.2.5.3 and the corresponding exemption in 7.2.4.3.5(3) were developed. If smoke detection is used to shut a combination fire damper/smoke leakage-rated damper early in a fire, the fire- and smoke-resisting features of the horizontal exit can be reestablished at points where ducts penetrate the barrier.

Paragraphs 22/23.2.2.6, 22/23.2.2.7, 22/23.2.2.9, and 22/23.2.2.10 do not mandate the use of ramps, exit passageways, fire escape ladders, or alternating tread devices. Rather, these paragraphs recognize ramps, exit passageways, fire escape ladders, or alternating tread devices as part of the means of egress system only if they meet the applicable requirements of 7.2.5, 7.2.6, 7.2.9, or 7.2.11. Further, 23.2.2.8 recognizes the use of

### 22.2.3 Capacity of Means of Egress.

**22.2.3.1** The capacity of any required means of egress shall be in accordance with Section 7.3.

**22.2.3.2** Aisles, corridors, and ramps required for egress shall be not less than 48 in. (1220 mm) in width.

**22.2.3.3** Residents' sleeping room door widths shall be permitted to comply with 22.2.11.4.

### 22.2.4 Number of Means of Egress.

**22.2.4.1** The number of means of egress shall be in accordance with Section 7.4.

**22.2.4.2** Not less than two separate exits shall meet both of the following criteria:

- (1) They shall be provided on every story.
- (2) They shall be accessible from every part of every story, fire compartment, or smoke compartment; however, exit access travel shall be permitted to be common for the distances permitted as common path of travel by 22.2.5.3.

**22.2.4.3** Not less than one approved exit shall be accessible from each fire compartment and each required smoke compartment into which residents are potentially moved in a fire emergency, with the exits arranged so that egress is possible without returning through the zone of fire origin.

## CHAPTER 23 • Existing

existing fire escape stairs in accordance with 7.2.8. Note that 7.2.9 and 7.2.11 restrict the use of fire escape ladders and alternating tread devices, respectively, to spaces such as normally unoccupied roofs and equipment platforms. In addition, use is restricted to a maximum of three persons who are all capable of using the ladder or device.

Paragraph 22/23.2.2.11 does not mandate the use of areas of refuge but does recognize an area of refuge as part of the means of egress system only if it meets the requirements of 7.2.12. Areas of refuge will often be used to meet the requirements for accessible means of egress mandated for new facilities by 7.5.4 in areas accessible to persons with severe mobility impairments.

### 23.2.3 Capacity of Means of Egress.

**23.2.3.1** The capacity of any required means of egress shall be in accordance with Section 7.3.

**23.2.3.2** Aisles, corridors, and ramps required for egress shall be not less than 36 in. (915 mm) in width.

**23.2.3.3** Residents' sleeping room door widths shall be permitted to comply with 23.2.11.4.

### 23.2.4 Number of Means of Egress.

**23.2.4.1** The number of means of egress shall be in accordance with 7.4.1.1 and 7.4.1.3 through 7.4.1.6.

**23.2.4.2\*** Not less than two separate exits shall meet both of the following criteria:

- (1) They shall be provided on every story.
- (2) They shall be accessible from every part of every story, fire compartment, or smoke compartment; however, exit access travel shall be permitted to be common for the distances permitted as common path of travel by 23.2.5.3.

**A.23.2.4.2** Multilevel and multitiered residential housing areas meeting the requirements of 23.3.1.2 and 23.3.1.3 are considered one story. Therefore, two exits are not required from each level; only access to two exits is required.

**23.2.4.3\*** Not less than one approved exit shall be accessible from each fire compartment and each required smoke compartment into which residents are potentially moved in a fire emergency, with the exits arranged so that egress is possible without returning through the zone of fire origin.

**A.23.2.4.3** An exit is not necessary from each individual fire compartment and smoke compartment if there is access to an exit through other fire compartments or smoke compartments without passing through the fire compartment or smoke compartment of fire origin.

## CHAPTER 22 • New

**22.2.5 Arrangement of Means of Egress.** See also [Section 7.5](#).

**22.2.5.1** Every sleeping room shall have a door leading directly to an exit access corridor, unless otherwise permitted by one of the following:

- (1) The requirement of [22.2.5.1](#) shall not apply if there is an exit door opening directly to the outside from a room at the finished ground level.
- (2) One adjacent room, such as a day room, a group activity space, or other common space, shall be permitted to intervene, and the following also shall apply:
  - (a) Where sleeping rooms directly adjoin a day room or group activity space that is used for access to an exit, such sleeping rooms shall be permitted to open directly to the day room or space.
  - (b) Sleeping rooms permitted to open directly to the day room or space shall be permitted to be separated in elevation by a one-half story or full story height.

**22.2.5.2** No exit or exit access shall contain a corridor, a hallway, or an aisle having a pocket or dead end exceeding 50 ft (15 m) for Use Condition II, Use Condition III, or Use Condition IV and 20 ft (6100 mm) for Use Condition V.

**22.2.5.3** A common path of travel shall not exceed 100 ft (30 m).

**22.2.5.4** A sally port shall be permitted in a means of egress where there are provisions for continuous and unobstructed travel through the sally port during an emergency egress condition.

## CHAPTER 23 • Existing

**23.2.5 Arrangement of Means of Egress.** See also [Section 7.5](#).

**23.2.5.1** Every sleeping room shall have a door leading directly to an exit access corridor, unless otherwise permitted by one of the following:

- (1) The requirement of [23.2.5.1](#) shall not apply if there is an exit door opening directly to the outside from a room at the finished ground level.
- (2) One adjacent room, such as a day room, a group activity space, or other common space, shall be permitted to intervene, and the following also shall apply:
  - (a) Where sleeping rooms directly adjoin a day room or group activity space that is used for access to an exit, such sleeping rooms shall be permitted to open directly to the day room or space.
  - (b) Sleeping rooms permitted to open directly to the day room or space shall be permitted to be separated in elevation by a one-half story or full story height.

**23.2.5.2\*** Existing dead-end corridors are undesirable and shall be altered wherever possible so that exits are accessible in not less than two different directions from all points in aisles, passageways, and corridors.

**A.23.2.5.2** Every exit or exit access should be arranged, if feasible, so that no corridor or aisle has a pocket or dead end exceeding 50 ft (15 m) for Use Conditions II, III, and IV and 20 ft (6100 mm) for Use Condition V.

**23.2.5.3** A common path of travel shall not exceed 50 ft (15 m), unless otherwise permitted by one of the following:

- (1) A common path of travel shall be permitted for the first 100 ft (30 m) in smoke compartments protected throughout by an approved automatic sprinkler system in accordance with [23.3.5.3](#).
- (2) A common path of travel shall be permitted to exceed 50 ft (15 m) in multilevel residential housing units in which each floor level, considered separately, has not less than one-half of its individual required egress capacity accessible by exit access leading directly out of that level without traversing another communicating floor level.
- (3)\* Approved existing common paths of travel that exceed 50 ft (15 m) shall be permitted to continue to be used.

**A.23.2.5.3(3)** In determining whether to approve the existing common path of travel that exceeds 50 ft (15 m), the authority having jurisdiction should ensure that the common path is not in excess of the travel distance permitted by [23.2.6](#).

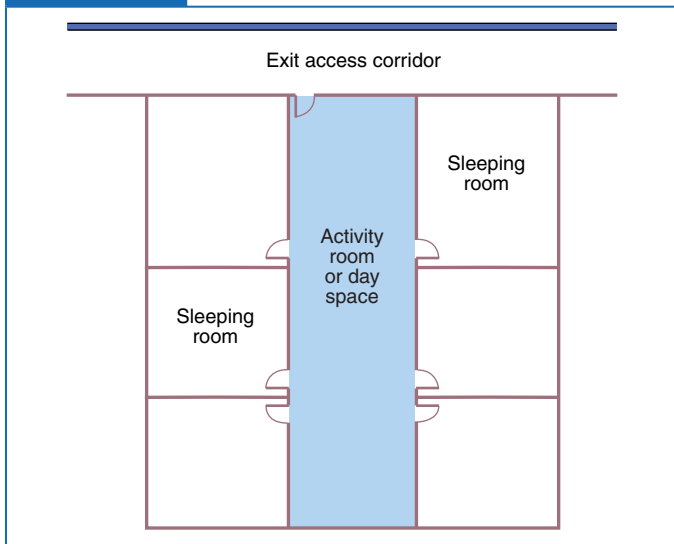

**23.2.5.4** A sally port shall be permitted in a means of egress where there are provisions for continuous and unobstructed travel through the sally port during an emergency egress condition.

CHAPTER 22 • New

**Exhibit 22/23.8** illustrates the use of 22/23.2.5.1(2), which permits one adjacent room to intervene between a sleeping room and the exit access corridor. Sleeping rooms are permitted to be separated in elevation from the day room by one-half to one story. See 22/23.2.5.1(2)(b).

**Exhibit 22/23.9** illustrates the dead-end corridor requirements of 22.2.5.2 applicable to new detention and correctional

**Exhibit 22/23.8**

One intervening room between sleeping room and exit access corridor.

**Exhibit 22/23.9**

Maximum dead-end corridor for new construction.

CHAPTER 23 • Existing

facilities. In Use Condition V, resident room doors are individually key-locked, and the allowable dead-end corridor length is reduced from 50 ft (15 m) to 20 ft (6100 mm). For existing facilities, 23.2.5.2 advises that dead-end corridors are undesirable but sets no maximum depth for existing dead ends.

**Exhibit 22/23.10** illustrates a common path of travel as addressed in 22/23.2.5.3. If distance X to C exceeds 50 ft (15 m) [100 ft (30 m), if the smoke compartment is sprinklered as is required for new construction], a second exit access is required for the upper level. If the multilevel housing area is large, the common path of travel limitation might require a second, remote exit access door to the corridor. **Exhibit 22/23.11** shows a common path of travel, as described in this paragraph, from the upper level of a two-story open dormitory with day space and with one stair.

Paragraphs 23.2.5.3(2) and (3) introduce criteria that recognize existing common paths of travel that exceed the 50 ft (15 m) limitation contained in the base paragraph and the 100 ft (30 m) limitation permitted in sprinklered smoke compartments by

**Exhibit 22/23.10**

Common path of travel from upper level with one stair.

**Exhibit 22/23.11**

Common path of travel from upper level of open dormitory.

## CHAPTER 22 • New

**23.2.5.3(1).** Paragraph 23.2.5.3(2) offers some relief to existing facilities with lengthy common paths of travel on individual levels of multilevel residential housing units, provided that at least half the occupant load of any level can be accommodated by exit access leading directly from that level without traveling on any other level that is open to that housing unit. This exemption affords the residents of any level with an exit access that leads to an exit without being exposed to the fire on another level of the housing unit. Paragraph 23.2.5.3(3) permits existing, excessively long common paths of travel to continue to be used only if specifically approved by the authority having jurisdiction.

A security vestibule, called a *sally port*, is addressed in 22/23.2.5.4. A sally port is designed so that, during routine and non-fire emergency conditions, the door at one end of the vestibule is securely locked whenever the door at the opposite end is open. When one door is opened, the door through which entrance is made is closed and locked; the door at the opposite end is then unlocked and opened to provide egress from the vestibule. The sally port acts as a security device that prevents a continuous flow of people from “storming” the exits. Under fire conditions, a sally port would severely restrict the egress flow of

**22.2.6 Travel Distance to Exits.** Travel distance shall comply with 22.2.6.1 through 22.2.6.7.

**22.2.6.1** Travel distance shall be measured in accordance with Section 7.6.

**22.2.6.2** The travel distance between any room door required as an exit access and an exit shall not exceed 150 ft (46 m).

**22.2.6.3 Reserved.**

**22.2.6.4** The travel distance between any point in a room and an exit shall not exceed 200 ft (61 m).

**22.2.6.5 Reserved.**

**22.2.6.6** The travel distance between any point in a sleeping room to the door in that room shall not exceed 50 ft (15 m), unless otherwise permitted by 22.2.6.7.

**22.2.6.7** The maximum travel distance limitation of 22.2.6.6 shall be permitted to be increased to 100 ft (30 m) in open dormitories, provided that both of the following criteria are met:

- (1) The enclosing walls of the dormitory space shall be of smoke-tight construction.

## CHAPTER 23 • Existing

Exhibit 22/23.12

A sally port or security vestibule.

occupants and prevent hose lines from being run through the openings. Therefore, if a sally port is to be permitted as part of a required means of egress, the door controls must be capable of being overridden to allow continuous and unobstructed passage in accordance with 22/23.2.5.4. Exhibit 22/23.12 depicts a sally port.

**23.2.6 Travel Distance to Exits.** Travel distance shall comply with 23.2.6.1 through 23.2.6.7.

**23.2.6.1** Travel distance shall be measured in accordance with Section 7.6.

**23.2.6.2** The travel distance between any room door required as an exit access and an exit or smoke barrier shall not exceed 100 ft (30 m), unless otherwise permitted by 23.2.6.3.

**23.2.6.3** The maximum travel distance limitations of 23.2.6.2 shall be permitted to be increased by 50 ft (15 m) in buildings protected throughout by an approved automatic sprinkler system in accordance with 23.3.5.3 or a smoke control system.

**23.2.6.4** The travel distance between any point in a room and an exit or smoke barrier shall not exceed 150 ft (46 m), unless otherwise permitted by 23.2.6.5.

**23.2.6.5** The maximum travel distance limitations of 23.2.6.4 shall be permitted to be increased by 50 ft (15 m) in buildings protected throughout by an approved automatic sprinkler system in accordance with 23.3.5.3 or a smoke control system.

**23.2.6.6** The travel distance between any point in a sleeping room to the door of that room shall not exceed 50 ft (15 m), unless otherwise permitted by 23.2.6.7.

**23.2.6.7** The maximum travel distance limitations of 23.2.6.6 shall be permitted to be increased to 100 ft (30 m) in open dormitories, provided that both of the following criteria are met:

- (1) The enclosing walls of the dormitory space shall be of smoke-tight construction.

## CHAPTER 22 • New

- (2) Not less than two exit access doors remotely located from each other shall be provided where travel distance to the exit access door from any point within the dormitory exceeds 50 ft (15 m).

**Exhibit 22/23.13** illustrates the travel distance requirements of 22/23.2.6. Travel distance is measured to the closest exit only, not to both of the exits required by 22/23.2.4. Travel distance is measured along the natural path of travel [see 7.6.1(1)]. The term *sprinklered*, as used in the exhibit, means that the entire building is protected by a complete, approved automatic extinguishing system. New detention and correctional occupancies are required to be sprinklered; thus, they are permitted the longer travel distances. The term *smoke control*, as used in the exhibit, means that the entire building is equipped with a system to control the movement of smoke in accordance with Section 9.3.

### 22.2.7 Discharge from Exits.

**22.2.7.1** Exits shall be permitted to discharge into a fenced or walled courtyard, provided that not more than two walls of the courtyard are the building walls from which egress is being made.

**22.2.7.2** Enclosed yards or courts used for exit discharge in accordance with 22.2.7.1 shall be of sufficient size to accommodate all occupants at a distance of not less than 50 ft (15 m) from the building while providing a net area of 15 ft<sup>2</sup> (1.4 m<sup>2</sup>) per person.

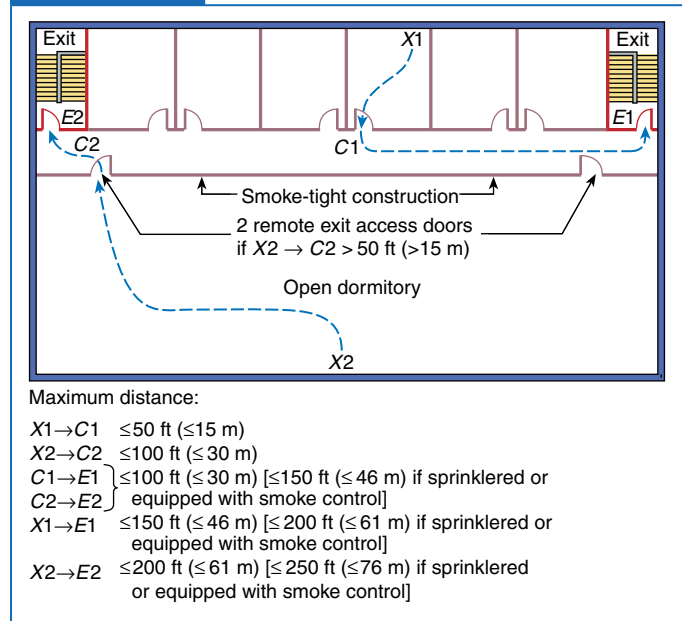

**22.2.7.3** All exits shall be permitted to discharge through the level of exit discharge.

**22.2.7.4** The requirements of 7.7.2 shall be waived, provided that not more than 50 percent of the exits discharge into a single fire compartment separated from other compartments by construction having not less than a 1-hour fire resistance rating.

## CHAPTER 23 • Existing

- (2) Not less than two exit access doors remotely located from each other shall be provided where travel distance to the exit access door from any point within the dormitory exceeds 50 ft (15 m).

**Exhibit 22/23.13**

*Travel distance to exits in detention and correctional occupancies.*

### 23.2.7 Discharge from Exits.

**23.2.7.1** Exits shall be permitted to discharge into a fenced or walled courtyard, provided that not more than two walls of the courtyard are the building walls from which egress is being made.

**23.2.7.2** Enclosed yards or courts used for exit discharge in accordance with 23.2.7.1 shall be of sufficient size to accommodate all occupants at a distance of not less than 50 ft (15 m) from the building while providing a net area of 15 ft<sup>2</sup> (1.4 m<sup>2</sup>) per person.

**23.2.7.3** All exits shall be permitted to discharge through the level of exit discharge.

**23.2.7.4** The requirements of 7.7.2 shall be waived, provided that not more than 50 percent of the exits discharge into a single fire compartment separated from other compartments by construction having not less than a 1-hour fire resistance rating.

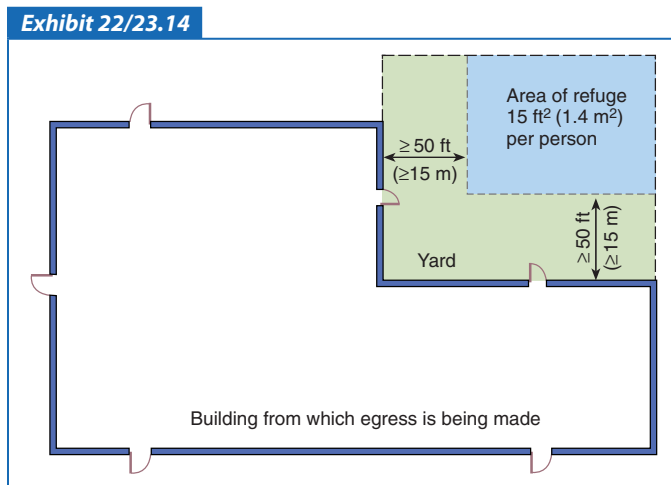

**23.2.7.5** Where all exits are permitted to discharge through areas on the level of discharge, all of the following criteria shall be met:

- (1) A smoke barrier shall be provided to divide that level into not less than two compartments, with not less than one exit discharging into each compartment.

## CHAPTER 22 • New

Exhibit 22/23.14 and Exhibit 22/23.15 illustrate the requirements of 22/23.2.7.1 and 22/23.2.7.2.

The provisions of 7.7.2 establish criteria under which up to 50 percent of the required exits, in either number or capacity, are permitted to discharge through the level of exit discharge, with the other 50 percent required to discharge directly to the outside. Because of security concerns and the belief that doors to the exterior will not be readily unlocked in detention and correctional occupancies, 22/23.2.7.3 and 22/23.2.7.4 permit 100 percent of the exits to discharge through the level of exit discharge. This exemption is permitted if a minimum 1-hour fire

Exit discharge into fenced yard with minimum separation distance from building.

**22.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with Section 7.8.

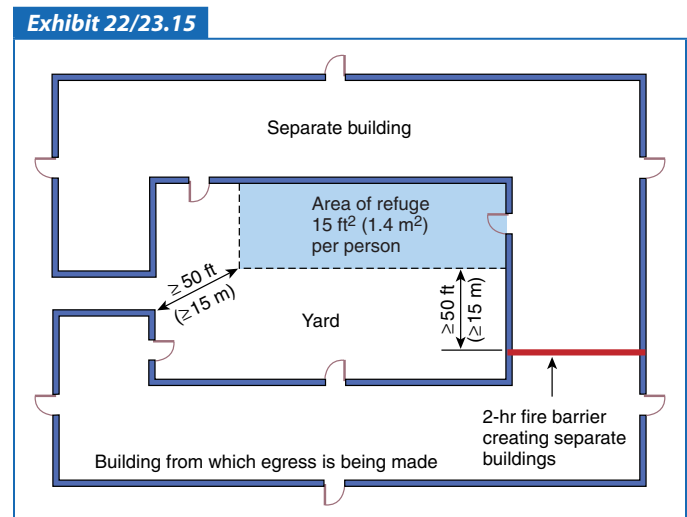

**22.2.9 Emergency Lighting.** Emergency lighting shall be provided in accordance with Section 7.9.

## CHAPTER 23 • Existing

- (2) Each smoke compartment shall have an exit discharge to the building exterior.
- (3) The level of discharge shall be provided with automatic sprinkler protection.
- (4) Any other portion of the level of discharge with access to the discharge area shall be provided with automatic sprinkler protection or shall be separated from the discharge area in accordance with the requirements for the enclosure of exits. (See 7.1.3.2.1.)

resistance-rated separation that creates at least two fire compartments is provided on the level of exit discharge. Not more than one-half of the exits is permitted to discharge into any one fire compartment.

Paragraph 23.2.7.5 permits a smoke barrier to be substituted for a fire barrier in an existing facility if certain conditions can be met. The travel route along the level of exit discharge must be sprinklered, and the route must be separated from non-sprinklered portions of the level of exit discharge by fire barriers meeting the fire resistance rating requirements applicable to exit enclosures.

Exit discharge into an enclosed yard with minimum separation distance from "building" from which egress is being made.

**23.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with Section 7.8.

**23.2.9 Emergency Lighting.**

**23.2.9.1** Emergency lighting shall be provided in accordance with Section 7.9, unless otherwise permitted by 23.2.9.2.

**23.2.9.2** Emergency lighting of not less than a 1-hour duration shall be permitted to be provided.

## CHAPTER 22 • New

**22.2.10 Marking of Means of Egress.** Exit marking shall be provided as follows:

- (1) Exit signs shall be provided in areas accessible to the public in accordance with [Section 7.10](#).
- (2) Exit signs shall not be required in detention and correctional residential housing areas. (*See 3.3.21.1.*)

The exemption for the provision of exit signs in sleeping areas of detention and correctional occupancies recognizes that persons occupying such areas are familiar with those portions of the facility and know the location of exits. Other portions of

**22.2.11 Special Features.**

**22.2.11.1** Doors within means of egress shall be in accordance with [Chapter 7](#), unless otherwise provided in [22.2.11.2](#) through [22.2.11.12](#).

**22.2.11.2** Doors shall be permitted to be locked in accordance with the applicable use condition.

**22.2.11.3** Where egress doors are locked with key-operated locks, the provisions of [22.7.6](#) shall apply.

**22.2.11.4\*** Doors to resident sleeping rooms shall be not less than 28 in. (710 mm) in clear width.

**A.22.2.11.4** It might be necessary to provide a certain number of resident sleeping rooms with doors providing a clear width of not less than 32 in. (810 mm) (*see 7.2.1.2*) in order to comply with the requirements for the physically handicapped. Such sleeping rooms should be located where there is a direct accessible route to the exterior or to an area of safe refuge. (*See 22.3.7.*)

**22.2.11.5 Reserved.**

**22.2.11.6** Doors in a means of egress shall be permitted to be of the horizontal-sliding type, provided that the force necessary to slide the door to its fully open position does not exceed 50 lbf (222 N) where a force of 50 lbf (222 N) is simultaneously applied perpendicular to the door.

**22.2.11.7** Doors from areas of refuge to the exterior shall be permitted to be locked with key locks in lieu of locking methods described in [22.2.11.8](#), the keys to unlock such doors shall be maintained and available at the facility at all times, and the locks shall be operable from the outside.

**22.2.11.8\*** Any remote-control release used in a means of egress shall be provided with a reliable means of operation to release locks on all doors and shall be remotely located from the resident living areas, unless otherwise permitted by [22.2.11.8.2](#).

## CHAPTER 23 • Existing

**23.2.10 Marking of Means of Egress.** Exit marking shall be provided as follows:

- (1) Exit signs shall be provided in areas accessible to the public in accordance with [Section 7.10](#).
- (2) Exit signs shall not be required in detention and correctional residential housing areas. (*See 3.3.21.1.*)

the facility might not be as familiar to residents and visitors and, thus, must have proper exit marking in accordance with [22/23.2.10](#).

**23.2.11 Special Features.**

**23.2.11.1** Doors within means of egress shall be in accordance with [Chapter 7](#), unless otherwise provided in [23.2.11.2](#) through [23.2.11.10](#).

**23.2.11.2** Doors shall be permitted to be locked in accordance with the applicable use condition.

**23.2.11.3** Where egress doors are locked with key-operated locks, the provisions of [23.7.6](#) shall apply.

**23.2.11.4\*** Doors to resident sleeping rooms shall be not less than 28 in. (710 mm) in clear width.

**A.23.2.11.4** It might be necessary to provide a certain number of resident sleeping rooms with doors providing a clear width of not less than 32 in. (810 mm) (*see 7.2.1.2*) in order to comply with the requirements for the physically handicapped. Such sleeping rooms should be located where there is a direct accessible route to the exterior or to an area of safe refuge. (*See 23.3.7.*)

**23.2.11.5** Existing doors to resident sleeping rooms housing four or fewer residents shall be permitted to be not less than 19 in. (485 mm) in clear width.

**23.2.11.6** Doors in a means of egress shall be permitted to be of the horizontal-sliding type, provided that the force necessary to slide the door to its fully open position does not exceed 50 lbf (222 N) where a force of 50 lbf (222 N) is simultaneously applied perpendicular to the door.

**23.2.11.7** Doors from areas of refuge to the exterior shall be permitted to be locked with key locks in lieu of locking methods described in [23.2.11.8](#), the keys to unlock such doors shall be maintained and available at the facility at all times, and the locks shall be operable from the outside.

**23.2.11.8\*** Any remote-control release used in a means of egress shall be provided with a reliable means of operation to release locks on all doors and shall be remotely located from the resident living area, unless otherwise permitted by [23.2.11.8.2](#).

## CHAPTER 22 • New

**A.22.2.11.8** A remote position is generally a control point where a number of doors can be unlocked simultaneously, either mechanically or electrically. In areas where there are a number of sleeping rooms, it is impractical for attendants to unlock doors individually. Doors in an exit should be unlocked prior to unlocking sleeping room doors. Sight and sound supervision of resident living areas can be by means of camera and communications systems.

This section of the *Code* does not intend to prohibit Use Condition V facilities, nor does it intend to limit Use Condition V facilities to 10 manually released locks.

**22.2.11.8.1** The remote location of a remote-control release used in a means of egress shall provide sight and sound supervision of the resident living areas.

**22.2.11.8.2** Remote-control locking and unlocking of occupied rooms in Use Condition IV shall not be required, provided that both of the following criteria are met:

- (1) Not more than 10 locks need to be unlocked to relocate all occupants from one smoke compartment to an area of refuge as promptly as is required where remote-control unlocking is used. (See 22.3.7.9 for requirements for smoke barrier doors.)
- (2) Unlocking of all necessary locks is accomplished with not more than two separate keys.

**22.2.11.9 Remote-Control Release–Operated Doors.**

**22.2.11.9.1** All remote-control release–operated doors shall be provided with a redundant means of operation as follows:

- (1) Power-operated sliding doors or power-operated locks shall be constructed so that, in the event of power failure, a manual mechanical means to release and open the doors is provided at each door, and either emergency power arranged in accordance with 22.2.11.9.2 is provided for the power operation or a remote-control manual mechanical release is provided.
- (2) Mechanically operated sliding doors or mechanically operated locks shall be provided with a manual mechanical means at each door to release and open the door.

**22.2.11.9.2** The emergency power required by 23.2.11.9.1(1) shall be arranged to provide the required power automatically in the event of any interruption of normal power due to any of the following:

- (1) Failure of a public utility or other outside electrical power supply
- (2) Opening of a circuit breaker or fuse
- (3) Manual act(s), including accidental opening of a switch controlling normal lighting facilities

## CHAPTER 23 • Existing

**A.23.2.11.8** A remote position is generally a control point where a number of doors can be unlocked simultaneously, either mechanically or electrically. In areas where there are a number of sleeping rooms, it is impractical for attendants to unlock doors individually. Doors in an exit should be unlocked prior to unlocking sleeping room doors. Sight and sound supervision of resident living areas can be by means of camera and communications systems.

This section of the *Code* does not intend to prohibit Use Condition V facilities, nor does it intend to limit Use Condition V facilities to 10 manually released locks.

**23.2.11.8.1** The remote location of a remote-control release used in a means of egress shall provide sight and sound supervision of the resident living areas.

**23.2.11.8.2** Remote-control locking and unlocking of occupied rooms in Use Condition IV shall not be required, provided that both of the following criteria are met:

- (1) Not more than 10 locks need to be unlocked to relocate all occupants from one smoke compartment to an area of refuge as promptly as is required where remote-control unlocking is used. (See 23.3.7.9 for requirements for smoke barrier doors.)
- (2) Unlocking of all necessary locks is accomplished with not more than two separate keys.

**23.2.11.9 Remote-Control Release–Operated Doors.**

**23.2.11.9.1** All remote-control release–operated doors shall be provided with a redundant means of operation as follows:

- (1) Power-operated sliding doors or power-operated locks shall be constructed so that, in the event of power failure, a manual mechanical means to release and open the doors is provided at each door, and either emergency power arranged in accordance with 23.2.11.9.2 is provided for the power operation or a remote-control manual mechanical release is provided.
- (2) A combination of the emergency power–operated release of selected individual doors and remote-control manual mechanical ganged release specified in 23.2.11.9.1(1) shall be permitted without mechanical release means at each door.
- (3) Mechanically operated sliding doors or mechanically operated locks shall be provided with a manual mechanical means at each door to release and open the door.

**23.2.11.9.2** The emergency power required by 23.2.11.9.1(1) shall be arranged to provide the required power automatically in the event of any interruption of normal power due to any of the following:

- (1) Failure of a public utility or other outside electrical power supply
- (2) Opening of a circuit breaker or fuse
- (3) Manual act(s), including accidental opening of a switch controlling normal lighting facilities

## CHAPTER 22 • New

**22.2.11.10** The provisions of [7.2.1.5.8](#) for stairway re-entry shall not apply.

**22.2.11.11** Doors unlocked by means of remote control under emergency conditions shall not automatically relock when closed, unless specific action is taken at the remote-control location to enable doors to relock.

**22.2.11.12** Emergency power shall be provided for all electric power-operated sliding doors and electric power-operated locks, unless otherwise permitted by [22.2.11.12.2](#).

**22.2.11.12.1** The emergency power shall be arranged to automatically operate within 10 seconds upon failure of normal power and to maintain the necessary power source for a minimum of 1½ hours.

**22.2.11.12.2** The emergency power specified in [22.2.11.12](#) shall not be required in facilities with 10 or fewer locks complying with [22.2.11.8.2](#).

The provision of [22/23.2.11.2](#) overrides the [Chapter 7](#) requirement that all doors within the required means of egress be unlocked from the side from which egress is to be made and that they be under full control of the building occupants. It recognizes that, to function as intended, a detention and correctional occupancy uses various means of locking. [Paragraph 22/23.2.11.2](#) permits only that degree of locking that is appropriate to a specific use condition. Therefore, a Use Condition II facility, which has more lenient life safety requirements than a Use Condition V facility, cannot contain sleeping rooms that must be individually locked by key. A Use Condition V facility must comply with a more stringent set of requirements than a Use Condition II facility and is permitted to have individual doors manually locked by key.

[Paragraph 22/23.2.11.3](#) references the use of the door inspection provisions of [22/23.7.7](#). The requirement recognizes that inspection is needed for doors with key-operated locks, especially if the operation of such locks does not occur on a regular basis.

[Paragraphs 22/23.2.11.4](#) and [23.2.11.5](#) permit door-opening widths smaller than the 32 in. (810 mm) clear width required by [7.2.1.2.3.2](#) as an operational-based need. Wider door openings make it difficult for staff to prevent residents from “storming” the opening.

[Paragraph 7.2.1.4.1](#) requires that all doors in a means of egress be side-hinged or pivoted-swinging. [Paragraph 7.2.1.4.1\(4\)\(c\)](#) permits horizontal-sliding door assemblies serving a room or area with an occupant load of fewer than 10, unless prohibited by the applicable occupancy chapter. Although [Chapters 22](#) and [23](#) do not prohibit the use of

## CHAPTER 23 • Existing

**23.2.11.10** The provisions of [7.2.1.5.8](#) for stairway re-entry shall not apply.

[7.2.1.4.1\(4\)\(c\)](#), the provision of [22/23.2.11.6](#) has the effect of modifying the criteria of [7.2.1.4.1\(4\)\(c\)](#). [Paragraph 22/23.2.11.6](#) permits the use of sliding doors, without the 10-person threshold of [7.2.1.4.1\(4\)\(c\)](#), but limits the force required to slide the door to its fully open position to not more than 50 lbf (222 N) where a force of 50 lbf (222 N) is simultaneously applied perpendicular to the door. The requirement is based on helping to ensure that the door can be opened when someone is trying to bind the door in its track by applying a force perpendicular to the door so as to make the door inoperative. The force criteria of [22/23.2.11.6](#) are meant to be applied to the sliding door addressed by [7.2.1.4.1\(4\)\(c\)](#). In addition, [7.2.1.4.1\(4\)\(b\)](#) recognizes the limited use of other horizontal-sliding doors in accordance with the provisions of [7.2.1.14](#). Sliding doors are more desirable, from an operations standpoint, than swinging doors, because residents can use swinging doors as weapons.

[Paragraph 22/23.2.11.7](#) requires that keys be maintained and available. The word “available” means that keys are readily accessible to staff for use at any time for evacuation of occupants. It is important that the following requirements are met:

1. The keys needed to evacuate occupants are accessible at all times.
2. The staff is trained in the location and use of keys.
3. The staff has authorization and standing orders to immediately unlock doors that lead from smoke compartments to the exterior during fire emergency conditions.

Authorizing staff to unlock doors avoids time lost awaiting authorization from administrative authorities before doors are unlocked.

## CHAPTER 22 • New

In 22/23.2.11.8, use of the term *remotely located* means outside the area where occupants are restrained. It is not necessary to locate the remote unlocking mechanism in a separate fire area, although doing so might be beneficial. Doors within the exit should be unlocked prior to unlocking sleeping room doors. This precaution prevents jamming of the exit door caused by several people exerting pressure on it.

Paragraph 22/23.2.11.8.2 serves as an exemption to 22/23.2.11.8. It applies to facilities that are seeking classification as Use Condition IV but that have a need for up to 10 locks that must be manually released at the door. Where Use Condition IV requires remote locking, it must be provided, except as addressed by the exemption. The exemption permits up to 10 manual locks to allow occupants to move to another fire compartment or smoke compartment while permitting the facility to qualify as having provided remote release. The use of a limited number of manual locks (a maximum of 10), in addition to the possibility of the use of hundreds of remotely released locks within the same facility, does not impose a Use Condition V classification. This exemption might apply in situations involving fewer than 10 doors if a door is secured with more than 1 lock.

Exhibit 22/23.16 and Exhibit 22/23.17 depict two typical arrangements that illustrate the exemption of 22/23.2.11.8.2. In Exhibit 22/23.16, each door is equipped with a single key-operated lock. In Exhibit 22/23.17, a door with a single key-operated lock secures multiple door areas. One manual lock, in addition to the 9 shown in the exhibit, would be permitted, but the lock cannot be located on the smoke barrier door if the smoke compartment contains more than 20 persons, in accordance with 22/23.3.7.9.

Exhibit 22/23.16

Example of manually unlocked locks permitted within smoke compartment of Use Condition IV facility.

## CHAPTER 23 • Existing

The provisions of 22/23.2.11.8.2 have been misinterpreted as meaning that a Use Condition V detention/correctional facility (which, by definition, requires manual unlocking of each door) is limited to a maximum of 10 such manual locks. A Use Condition V facility is permitted to have an unlimited number of manual locks. In fact, 22/23.2.11.8.2 applies only to Use Condition IV facilities and permits a facility to retain its classification as Use Condition IV (i.e., remote release), provided that there are 10 or fewer manually released locks and that unlocking can be achieved with a maximum of two keys.

The speed with which the doors can be unlocked and the occupants moved to a safe location is critical. If the 10 locks cannot be rapidly released by manual unlocking due to staffing restrictions or for any other reason, remote unlocking must be used. If doors are equipped with locking devices, it is assumed that the locks will be used, and they must be counted as part of the total number of locks.

Paragraph 22.2.11.11, applicable to new facilities, requires that, once doors are remotely unlocked under emergency conditions, they cannot automatically relock if they reclose, unless deliberate action is taken to lock them. This deliberate action can be taken at the individual door or at the remote location. This safety measure prevents occupants from being mistakenly locked into a room during emergency egress.

Exhibit 22/23.17

Another example of manually unlocked locks permitted within smoke compartment of Use Condition IV facility.

## CHAPTER 22 • New

**22.3 Protection**

**22.3.1 Protection of Vertical Openings.** Any vertical opening shall be enclosed or protected in accordance with **Section 8.6**, unless otherwise permitted by one of the following:

- (1) Unprotected vertical openings in accordance with **8.6.9.1** shall be permitted.
- (2)\* In residential housing area smoke compartments, unprotected vertical openings shall be permitted in accordance with the conditions of **8.6.6**, provided that the height between the lowest and highest finished floor levels does not exceed 23 ft (7010 mm), and the following also shall be permitted:
  - (a) The number of levels shall not be restricted.
  - (b) Residential housing areas subdivided in accordance with **22.3.8** shall be permitted to be considered as part of the communicating space.
  - (c) The separation shall not be required to have a fire resistance rating. [See **8.6.6(4)(b)**.]

**A.22.3.1(2)** For purposes of providing control valves and water-flow devices, multilevel residential housing areas complying with this provision are considered to be one story.

## CHAPTER 23 • Existing

**23.3 Protection**

**23.3.1 Protection of Vertical Openings.**

**23.3.1.1** Any vertical opening shall be enclosed or protected in accordance with **Section 8.6**, unless otherwise permitted by one of the following:

- (1) Unprotected vertical openings in accordance with **8.6.9.1** shall be permitted.
- (2) In residential housing area smoke compartments protected throughout by an approved automatic sprinkler system in accordance with **23.3.5.3**, unprotected vertical openings shall be permitted in accordance with the conditions of **8.6.6**, provided that the height between the lowest and highest finished floor levels does not exceed 23 ft (7010 mm), and the following also shall be permitted:
  - (a) The number of levels shall not be restricted.
  - (b) Residential housing areas subdivided in accordance with **23.3.8** shall be permitted to be considered as part of the communicating space.
  - (c) The separation shall not be required to have a fire resistance rating. [See **8.6.6(4)(b)**.]
- (3) The requirement of **23.3.1.1** shall not apply to multilevel residential housing areas in accordance with **23.3.1.2**.
- (4) Where full enclosure is impractical, the required enclosure shall be permitted to be limited to that necessary to prevent a fire originating in any story from spreading to any other story.
- (5) Enclosures in detention and correctional occupancies shall have a minimum 1-hour fire resistance rating and shall be protected throughout by an approved automatic sprinkler system in accordance with **23.3.5.3**.

**23.3.1.2** Multilevel residential housing areas without enclosure protection between levels shall be permitted, provided that the conditions of **23.3.1.2.1** through **23.3.1.2.3** are met.

**23.3.1.2.1\*** The entire normally occupied area, including all communicating floor levels, shall be sufficiently open and unobstructed so that a fire or other dangerous condition in any part is obvious to the occupants or supervisory personnel in the area.

**A.23.3.1.2.1** It is not the intent of this requirement to restrict room face separations, which restrict visibility from the common space into individual sleeping rooms.

**23.3.1.2.2** Egress capacity shall simultaneously accommodate all occupants of all communicating levels and areas, with all communicating levels in the same fire area considered as a single floor area for purposes of determining required egress capacity.

**23.3.1.2.3\*** The height between the highest and lowest finished floor levels shall not exceed 13 ft (3960 mm). The number of levels shall not be restricted.

Figure A.23.3.1.2.3 Vertical Height Measurement.

**A.23.3.1.2.3** The vertical separation between the lowest floor level and the uppermost floor level is not to exceed 13 ft (3960 mm). Figure A.23.3.1.2.3 illustrates how the height is to be determined.

**23.3.1.3\*** A multitiered, open cell block shall be considered as a one-story building where one of the following criteria is met:

- (1) A smoke control system is provided to maintain the level of smoke from potential cell fires at not less than 60 in. (1525 mm) above the floor level of any occupied tier involving space that is classified as follows:
  - (a) Use Condition IV or Use Condition V
  - (b) Use Condition III, unless all persons housed in such space can pass through a free access smoke barrier or freely pass below the calculated smoke level with not more than 50 ft (15 m) of travel from their cells
- (2) The entire building, including cells, is provided with complete automatic sprinkler protection in accordance with 23.3.5.3.

**A.23.3.1.3** A recommended method of calculating the expected level of smoke in a smoke removal–equipped cell block follows.

This method for calculating the expected level of smoke has been developed from data experimentally produced in full-scale burnouts of test cells. The test cells were sized, loaded with fuel, and constructed to represent severe conditions of heavily fuel-loaded [approximately 6 lb/ft<sup>2</sup> (29 kg/m<sup>2</sup>)] cells as found in prison locations. The filling rate and temperature of the effluent gas and smoke have been calculated using the data from these tests and established formulae from plume dynamics.

The application of the method described in A.23.3.1.3 should be limited to situations where there is not less than 10 ft (3050 mm) from the floor level to the lowest acceptable level of smoke accumulation (*Z*); the reservoir above the lowest acceptable level for *Z* is at least 20 percent of the *Z* dimension; the length of the cell block is not less than *Z*; and the fan is not less than 10 ft (3050 mm) higher than the floor of the highest cell.

The determination of smoke removal requirements is based on the dimensions of the cell opening. Where more than one cell

opening is involved, the larger size on the level being calculated should be used.

The fan size, temperature rating, and operations means can be determined by the procedure that follows.

**Acceptable Smoke Level.** Determine the lowest acceptable level of smoke accumulation in accordance with 23.3.1.3. The vertical distance between that level and the floor level of the lowest open cell is the value of  $Z$  to be used in connection with Figure A.23.3.1.3(a).

**Characteristic Cell Opening.** Determine the opening of the cell face. Where there is more than one size of cell opening, use the largest. Match the actual opening to those shown in Figure A.23.3.1.3(b), and use the corresponding curve from Figure A.23.3.1.3(a). If there is no match between the size and shape of the opening and Figure A.23.3.1.3(a), interpolate between the curves. If the opening exceeds 6 ft × 6 ft (1.8 m × 1.8 m), use the curve for a 6 ft × 6 ft (1.8 m × 1.8 m) opening. This curve represents the maximum burning situation, and increasing the size of the opening will not increase the actual burning rate.

**Exhaust Fan Rate.** Determine the exhaust fan capacity needed to extract smoke at a rate that will maintain the smoke level at a point higher than  $Z$ . This is the rate shown on the

For SI units, 1 ft = 0.3048 m; 1 in. = 25.4 mm;  
 $(^{\circ}\text{F} - 32) \div 1.8 = ^{\circ}\text{C}$ ; 1 ft<sup>3</sup>/min = 0.00047 m<sup>3</sup>/s

$\Delta T$  = Temperature of upper layer gases above ambient

$Z_{\text{Clear}}$  = Distance from cell floor to smoke layer

$V_{\text{Fan}}$  = Fan discharge capacity (as installed)

Solid lines: Ventilation rate curves

Dashed lines: Constant temperature rise curves

**Figure A.23.3.1.3(a)** Cell Block Smoke Control Ventilation Curves.

**Figure A.23.3.1.3(b)** Typical Cell Openings.

baseline of [Figure A.23.3.1.3\(a\)](#) corresponding to the level of Z on the vertical axis for the solid line (ventilation rate) curve appropriate to the cell door size. This exhaust capability needs to be provided at a point higher than Z.

**Intake Air.** Provide intake air openings that either exist or are automatically provided at times of emergency smoke removal. These openings are to be located at or near the baseline of the cell block to allow for intake air at the rate to be vented by the fan. The openings provided shall be sufficient to avoid a friction load that can reduce the exhaust efficiency. Standard air-handling design criteria are used in making this calculation.

**Fan Temperature Rating.** Determine the potential temperature of gases that the fan might be required to handle by measuring the distance from the floor of the highest cell to the centerline of the fan, or fan ports if the fan is in a duct or similar arrangement. Determine the intersection of the new Z value with the appropriate ventilation rate curve (solid line) from [Figure A.23.3.1.3\(a\)](#). Estimate the temperature rise by interpolating along the appropriate ventilation rate curve and between the constant temperature rise curves (dashed lines) from [Figure A.23.3.1.3\(a\)](#). Provide all elements of the exhaust system that are to be above the acceptable smoke level with the capability to effectively operate with the indicated increase in temperature.

**Operation of Exhaust System.** Arrange the emergency exhaust system to initiate automatically on detection of smoke, on operation of a manual fire alarm system, or by direct manual operation. The capability to manually start the automatic exhaust system should be provided in a guard post in the cell block, at another control location, or both. Where appropriate, the emergency exhaust fans are permitted to be used for comfort ventilation as well as for serving their emergency purposes.

CHAPTER 22 • New

**Subsection 22/23.3.1** specifies the protection required to maintain floor-to-floor separation, which helps to prevent the products of combustion from moving vertically through a building.

The convenience stair addressed by **8.6.9.1**, and recognized by **22.3.1(1)** and **23.3.1.1(1)**, is illustrated in **Exhibit 22/23.18** and **Exhibit 22/23.19**.

**Paragraph 8.6.6(1)** addresses a vertical opening that is permitted to connect not more than three floor levels. **Paragraphs 22.3.1(2)** and **23.3.1.1(2)** address typical multilevel housing areas that use staggered, partial levels, as depicted in **Exhibit 22/23.20**. The exemption modifies the three-floor restriction of **8.6.6(1)** by permitting a 23 ft (7010 mm) height limitation between the lowest and highest finished floor levels to allow greater flexibility in

Exhibit 22/23.18

Plan view of unenclosed convenience stair.

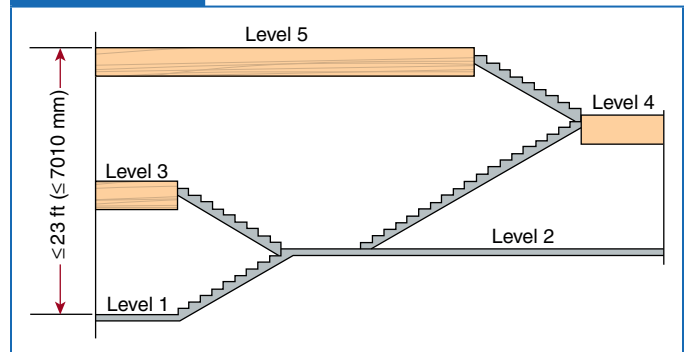

Exhibit 22/23.19

Elevation view of convenience stair.

CHAPTER 23 • Existing

Exhibit 22/23.20

Unprotected vertical openings in sprinklered housing area.

the design and use of detention and correctional occupancies. The exemption applies only to facilities with residential housing areas that are protected throughout by automatic sprinklers.

**Paragraphs 22.3.1(2)(b)** and **23.3.1.1(2)(b)** clarify that a residential housing unit that complies with the requirements of **Table 22/23.3.8** is considered to be part of the communicating space addressed by **8.6.6**. This clarification prevents the *Code* user from needlessly complying with **8.6.6(4)**, which would require a fully sprinklered residential area to be separated from all rooms abutting a communicating space (e.g., a day room with a high ceiling) by means of a smoke barrier. If this clarification were not made, all openings, including doors, from resident sleeping rooms to the day space would be required to have smoke-resistant opening protectives. Such a requirement would place an undue burden on such residential housing units. Instead of requiring smoke barriers between each resident sleeping room and the day space, the *Code* judges that adequate life safety is provided if the residential housing unit is subdivided in accordance with the provisions of **22/23.3.8**. Also, compliance with **8.6.6(8)** would then be impractical. **Paragraph 8.6.6(4)(b)** prevents **22.3.1(2)(b)** and **23.3.1.1(2)(b)** from conflicting with the provisions of **8.6.6(4)**.

Whereas **22.3.1(2)** and **23.3.1.1(2)** permit multilevel housing areas with a maximum 23 ft (7010 mm) height between the lowest and the highest finished floor levels if the housing areas are fully sprinklered, **23.3.1.2** permits similar vertical openings in nonsprinklered, existing multilevel housing areas but limits the height of the area served by the openings to 13 ft (3960 mm).

**Paragraph 23.3.1.3** addresses an existing multi-tiered open cell block. A multi-tiered open cell block in excess of 23 ft (7010 mm) in height, measured between the lowest and highest finished floor levels [see **23.3.1.1(2)**], could not be built in compliance with the *Life Safety Code*. However, the provisions of **23.3.1.3** continue to recognize existing, multi-tiered open cell blocks if (1) smoke control is provided to deal with the limited amount of smoke that a sprinkler-controlled fire generates or (2) automatic

## CHAPTER 22 • New

sprinkler protection is provided. In addition to the information on smoke control provided in A.23.3.1.3, see the detailed commentary following A.8.6.7(6) on the subject of atrium smoke

### 22.3.2 Protection from Hazards.

**22.3.2.1\*** Any hazardous area shall be protected in accordance with Section 8.7. The areas described in Table 22.3.2.1 shall be protected as indicated.

**A.22.3.2.1** Combustible loading in any room opening onto a residential housing area should be limited to reduce the potential for room flashover. Rooms in which fuel loads are not controlled, thereby creating a potential for flashover, should be considered hazardous areas. Where fire-rated separation is provided, doors to such rooms, including sleeping rooms, should be self-closing.

It is strongly recommended that padded cells not be used due to their fire record. However, recognizing that they will be used in some cases, provisions for the protection of padded cells are provided. It is recognized that the minimum ¾-hour fire

**Table 22.3.2.1 Hazardous Area Protection**

Hazardous Area Description	Separation/Protection <sup>†</sup>
Areas not incidental to resident housing	2 hours
Boiler and fuel-fired heater rooms	1 hour
Commercial cooking equipment	In accordance with 9.2.3
Commissaries	Smoke resistant
Employee locker rooms	Smoke resistant
Hobby/handicraft shops	Smoke resistant
Laundries >100 ft <sup>2</sup> (>9.3 m <sup>2</sup> )	1 hour
Maintenance shops	Smoke resistant
Padded cells	1 hour
Soiled linen rooms	1 hour
Storage rooms >50 ft <sup>2</sup> (>4.6 m <sup>2</sup> ) but ≤100 ft <sup>2</sup> (≤9.3 m <sup>2</sup> ) storing combustible material	Smoke resistant
Storage rooms >100 ft <sup>2</sup> (>9.3 m <sup>2</sup> ) storing combustible materials	1 hour
Trash collection rooms	1 hour

<sup>†</sup>Minimum fire resistance rating.

## CHAPTER 23 • Existing

control. The physics associated with smoke development, spread, and control in a multi-tiered open cell block is similar to that of an atrium.

### 23.3.2 Protection from Hazards.

**23.3.2.1\*** Any hazardous area shall be protected in accordance with Section 8.7. The areas described in Table 23.3.2.1 shall be protected as indicated.

**A.23.3.2.1** It is strongly recommended that padded cells not be used due to their fire record. However, recognizing that they will be used in some cases, provisions for the protection of padded cells are provided. It is recognized that the minimum ¾-hour fire

**Table 23.3.2.1 Hazardous Area Protection**

Hazardous Area Description	Separation/Protection <sup>†</sup>
Areas not incidental to resident housing	2 hours
Boiler and fuel-fired heater rooms	1 hour or sprinklers
Central or bulk laundries >100 ft <sup>2</sup> (>9.3 m <sup>2</sup> )	1 hour or sprinklers
Commercial cooking equipment	In accordance with 9.2.3
Commissaries	1 hour or sprinklers
Employee locker rooms	1 hour or sprinklers
Hobby/handicraft shops	1 hour or sprinklers
Maintenance shops	1 hour or sprinklers
Padded cells	1 hour and sprinklers
Soiled linen rooms	1 hour or sprinklers
Storage rooms >50 ft <sup>2</sup> (>4.6 m <sup>2</sup> ) storing combustible material	1 hour or sprinklers
Trash collection rooms	1 hour or sprinklers

<sup>†</sup>Minimum fire resistance rating.

## CHAPTER 22 • New

protection-rated fire door will be violated with the “plant on” of the padding, but a minimum ¾-hour fire protection-rated fire door should be the base of the assembly.

**22.3.2.2** Where [Table 22.3.2.1](#) requires separations to be smoke resistant, the provision of [8.7.1.2](#) shall not apply.

**22.3.2.3** Hazardous areas determined by the authority having jurisdiction as not incidental to residents’ housing shall be separated by 2-hour fire resistance-rated barriers in conjunction with automatic sprinkler protection.

**22.3.2.4** Where cooking facilities are protected in accordance with [9.2.3](#), kitchens shall not be required to be provided with roomwide protection.

**22.3.2.5** Waste chutes, incinerators, and linen chutes shall be protected in accordance with [Section 9.5](#).

Hazardous areas in detention and correctional occupancies are spaces with contents that, due to their nature — as in the case of flammable liquids — or because of the quantity of combustible materials involved, represent a significantly higher hazard than would otherwise be typical of detention and correctional occupancies. [Paragraph 22/23.3.2.1](#) requires hazardous areas to be protected. The protection required by [Table 22.3.2.1](#) for hazardous areas in new facilities was specified in recognition of the fact that new facilities must be sprinklered. Thus, where [Table 22.3.2.1](#) requires smoke-resistant separation — for example, for employee locker rooms — the actual protection is that provided by both the sprinkler system and the smoke-resistant walls. Similarly, where [Table 22.3.2.1](#) requires 1-hour fire resistance-rated separation, the actual protection is that provided by both the sprinkler system and the fire-rated walls. For existing facilities, the areas listed in [Table 23.3.2.1](#) must be protected by the specified fire resistance-rated separation, by sprinklering, or by a combination of separation and sprinklering.

[Exhibit 22/23.21](#) shows a property room where residents’ clothing and personal items taken at time of entry into the facility are stored. The room looks clean and uncluttered, as the residents’ property is stored, in significant quantities, at ceiling level via a conveyor system such as is found in a dry cleaning establishment. The storage room creates a hazardous area requiring protection in accordance with the provisions of [Table 22.3.2.1](#) and [Table 23.3.2.1](#) for storage rooms.

[Paragraph 22.3.2.2](#) specifies that, where [Table 22.3.2.1](#) requires hazardous area separations to be smoke resistant, it is not the intent to provide a smoke partition in accordance with [8.7.1.2](#). Rather, a qualitative, lesser level of performance is expected of the required smoke-resistant separation. Such performance is to be judged by the authority having jurisdiction.

Padded cells are considered to be severe hazard areas due to high heat release, high rate of combustion, and the quantity

## CHAPTER 23 • Existing

protection-rated fire door will be violated with the “plant on” of the padding, but a minimum ¾-hour fire protection-rated fire door should be the base of the assembly.

**23.3.2.2 Reserved.**

**23.3.2.3** Hazardous areas determined by the authority having jurisdiction as not incidental to residents’ housing shall be separated by 2-hour fire resistance-rated barriers in conjunction with automatic sprinkler protection.

**23.3.2.4** Where cooking facilities are protected in accordance with [9.2.3](#), kitchens shall not be required to be provided with roomwide protection.

**23.3.2.5** Waste chutes, incinerators, and linen chutes shall be protected in accordance with [Section 9.5](#).

**Exhibit 22/23.21**

*Hazardous area room with residents’ property stored at ceiling level.*

of smoke produced by padding materials. Therefore, padded cells must be protected by automatic sprinklers and be separated by 1-hour construction.

Where flammable liquids are handled or stored, NFPA 30, *Flammable and Combustible Liquids Code*,<sup>4</sup> should be consulted to establish the minimum criteria necessary to mitigate this hazard. See also [8.7.3](#).

Even typical housing area furnishings can provide the combustible loading that will allow room flashover to occur. The potential for flashover should be considered, particularly for nonsprinklered multilevel housing areas permitted by [23.3.1.2](#). Flashover on a lower level could rapidly deteriorate the tenability of conditions on upper levels, as the products of combustion bank down from the ceiling of the housing area, affecting residents of the upper levels before they can use the means of egress system.

## CHAPTER 22 • New

The provision of [22/23.3.2.5](#) is new to the 2015 edition of the Code. It recognizes that waste chutes, incinerators, and linen chutes can pose a challenge in addition to that presented by a

### 22.3.3 Interior Finish.

**22.3.3.1 General.** Interior finish shall be in accordance with [Section 10.2](#).

**22.3.3.2 Interior Wall and Ceiling Finish.** Interior wall and ceiling finish materials complying with [Section 10.2](#) shall be Class A or Class B in corridors, in exits, and in any space not separated from corridors and exits by partitions capable of retarding the passage of smoke; and Class A, Class B, or Class C in all other areas. The provisions of [10.2.8.1](#) shall not apply.

#### 22.3.3.3 Interior Floor Finish.

**22.3.3.3.1** Interior floor finish shall comply with [Section 10.2](#).

**22.3.3.3.2** Interior floor finish in exit enclosures and exit access corridors shall be not less than Class II. The provisions of [10.2.8.2](#) shall not apply.

**22.3.3.3.3** Interior floor finish shall comply with [10.2.7.1](#) or [10.2.7.2](#), as applicable.

Compliance with the interior wall and ceiling finish provisions within resident rooms is typically easily accomplished given the construction materials and finishes used for security reasons. Painted masonry often meets the requirements for Class A interior wall and ceiling finish. Code-compliant interior wall and ceiling finish in resident rooms might be compromised by combustible decorations applied to the walls and ceiling, and that issue is addressed by [22/23.7.4.4](#). [Exhibit 22/23.22](#) shows a resident room after construction and before resident occupancy. The interior wall and ceiling finishes appear not to pose a flame spread problem.

[Paragraph 22/23.3.3.2](#) imposes stricter interior wall and ceiling finish requirements in exits, corridors, and spaces not separated from the corridor than it does in other use areas. To apply the less stringent requirements within the use areas, the required separation need be only a partition capable of retarding the passage of smoke. The partition must be of substantial construction but is not required to have a fire resistance rating.

[Paragraph 23.3.3.3.2](#) recognizes existing interior floor finish materials that have been tested in accordance with the test procedures specified in [10.2.3.4](#) for wall and ceiling finish materials (i.e., ASTM E 84, *Standard Test Method for Surface Burning Characteristics of Building Materials*,<sup>5</sup> or ANSI/UL 723, *Standard for Test*

## CHAPTER 23 • Existing

vertical opening. The combustibles that travel through these vertical shafts create a situation that requires the specialized protection of [Section 9.5](#).

### 23.3.3 Interior Finish.

**23.3.3.1 General.** Interior finish shall be in accordance with [Section 10.2](#).

**23.3.3.2 Interior Wall and Ceiling Finish.** Interior wall and ceiling finish materials complying with [Section 10.2](#) shall be Class A or Class B in corridors, in exits, and in any space not separated from corridors and exits by partitions capable of retarding the passage of smoke; and Class A, Class B, or Class C in all other areas.

#### 23.3.3.3 Interior Floor Finish.

**23.3.3.3.1** Interior floor finish complying with [Section 10.2](#) shall be Class I or Class II in corridors and exits.

**23.3.3.3.2** Existing floor finish material of Class A or Class B in nonsprinklered smoke compartments and Class A, Class B, or Class C in sprinklered smoke compartments shall be permitted to be continued to be used, provided that it has been evaluated based on tests performed in accordance with [10.2.3](#).

**Exhibit 22/23.22**

*Resident room with interior wall and ceiling finishes that do not pose a fire spread problem.*

## CHAPTER 22 • New

for *Surface Burning Characteristics of Building Materials*<sup>6</sup>) as an exemption to the requirement of 10.2.7 that testing of floor finish materials be performed per NFPA 253, *Standard Method of Test for Critical Radiant Flux of Floor Covering Systems Using a Radiant Heat Energy Source*.<sup>7</sup> ASTM E 84 and ANSI/UL 723 contain the flame spread and smoke development measurement method

### 22.3.4 Detection, Alarm, and Communications Systems.

**22.3.4.1 General.** Detention and correctional occupancies shall be provided with a fire alarm system in accordance with Section 9.6, except as modified by 22.3.4.2 through 22.3.4.4.3.

**22.3.4.2 Initiation.** Initiation of the required fire alarm system shall be by manual means in accordance with 9.6.2, by means of any required detection devices or detection systems, and by means of waterflow alarm in the sprinkler system required by 22.3.5.2, unless otherwise permitted by the following:

- (1) Manual fire alarm boxes shall be permitted to be locked, provided that staff is present within the area when it is occupied and staff has keys readily available to unlock the boxes.
- (2) Manual fire alarm boxes shall be permitted to be located in a staff location, provided that both of the following criteria are met:
  - (a) The staff location is attended when the building is occupied.
  - (b) The staff attendant has direct supervision of the sleeping area.

#### 22.3.4.3 Notification.

**22.3.4.3.1 Occupant Notification.** Occupant notification shall be accomplished automatically in accordance with 9.6.3, and the following also shall apply:

- (1) A positive alarm sequence shall be permitted in accordance with 9.6.3.4.
- (2)\* Any smoke detectors required by this chapter shall be permitted to be arranged to alarm at a constantly attended location only and shall not be required to accomplish general occupant notification.

**A.22.3.4.3.1(2)** The staff at the constantly attended location should have the capability to promptly initiate the general alarm function and contact the fire department or have direct communication with a control room or other location that can initiate the general alarm function and contact the fire department.

#### 22.3.4.3.2 Emergency Forces Notification.

**22.3.4.3.2.1** Fire department notification shall be accomplished in accordance with 9.6.4, unless otherwise permitted by one of the following:

- (1) A positive alarm sequence shall be permitted in accordance with 9.6.3.4.

## CHAPTER 23 • Existing

currently used to evaluate interior wall and ceiling finish materials in accordance with the requirements of Section 10.2. Prior to the 1981 edition of the Code, floor finish was tested in accordance with ASTM E 84. Paragraph 23.3.3.3.2 permits material that was tested and approved by this method to remain in use.

### 23.3.4 Detection, Alarm, and Communications Systems.

**23.3.4.1 General.** Detention and correctional occupancies shall be provided with a fire alarm system in accordance with Section 9.6, except as modified by 23.3.4.2 through 23.3.4.4.4.

**23.3.4.2 Initiation.** Initiation of the required fire alarm system shall be by manual means in accordance with 9.6.2 and by means of any required detection devices or detection systems, unless otherwise permitted by the following:

- (1) Manual fire alarm boxes shall be permitted to be locked, provided that staff is present within the area when it is occupied and staff has keys readily available to unlock the boxes.
- (2) Manual fire alarm boxes shall be permitted to be located in a staff location, provided that both of the following criteria are met:
  - (a) The staff location is attended when the building is occupied.
  - (b) The staff attendant has direct supervision of the sleeping area.

#### 23.3.4.3 Notification.

**23.3.4.3.1 Occupant Notification.** Occupant notification shall be accomplished automatically in accordance with 9.6.3, and the following also shall apply:

- (1) A positive alarm sequence shall be permitted in accordance with 9.6.3.4.
- (2)\* Any smoke detectors required by this chapter shall be permitted to be arranged to alarm at a constantly attended location only and shall not be required to accomplish general occupant notification.

**A.23.3.4.3.1(2)** The staff at the constantly attended location should have the capability to promptly initiate the general alarm function and contact the fire department or have direct communication with a control room or other location that can initiate the general alarm function and contact the fire department.

#### 23.3.4.3.2 Emergency Forces Notification.

**23.3.4.3.2.1** Fire department notification shall be accomplished in accordance with 9.6.4, unless otherwise permitted by one of the following:

- (1) A positive alarm sequence shall be permitted in accordance with 9.6.3.4.

## CHAPTER 22 • New

- (2) Any smoke detectors required by this chapter shall not be required to transmit an alarm to the fire department.
- (3) This requirement shall not apply where staff is provided at a constantly attended location that meets one of the following criteria:
  - (a) It has the capability to promptly notify the fire department.
  - (b) It has direct communication with a control room having direct access to the fire department.

**22.3.4.3.2.2** Where the provision of **22.3.4.3.2.1(3)** is utilized, the fire plan, as required by **22.7.1.3**, shall include procedures for logging of alarms and immediate notification of the fire department.

**22.3.4.4\* Detection.** An approved automatic smoke detection system shall be in accordance with **Section 9.6**, as modified by **22.3.4.4.1** through **22.3.4.4.3**, throughout all resident sleeping areas and adjacent day rooms, activity rooms, or contiguous common spaces.

**A.22.3.4.4** Examples of contiguous common spaces are galleries and corridors.

**22.3.4.4.1** Smoke detectors shall not be required in sleeping rooms with four or fewer occupants.

**22.3.4.4.2** Other arrangements and positioning of smoke detectors shall be permitted to prevent damage or tampering, or for other purposes.

**22.3.4.4.2.1** Other arrangements, as specified in **22.3.4.4.2**, shall be capable of detecting any fire, and the placement of detectors shall be such that the speed of detection is equivalent to that provided by the spacing and arrangements required by the installation standards referenced in **Section 9.6**.

**22.3.4.4.2.2** Detectors shall be permitted to be located in exhaust ducts from cells, behind grilles, or in other locations.

**22.3.4.4.2.3** The equivalent performance of the design permitted by **22.3.4.4.2.2** shall be acceptable to the authority having jurisdiction in accordance with the equivalency concepts specified in **Section 1.4**.

**22.3.4.4.3\*** Smoke detectors shall not be required in Use Condition II open dormitories where staff is present within the dormitory whenever the dormitory is occupied.

**A.22.3.4.4.3** An open dormitory is a dormitory that is arranged to allow staff to observe the entire dormitory area at one time.

## CHAPTER 23 • Existing

- (2) Any smoke detectors required by this chapter shall not be required to transmit an alarm to the fire department.
- (3) This requirement shall not apply where staff is provided at a constantly attended location that meets one of the following criteria:
  - (a) It has the capability to promptly notify the fire department.
  - (b) It has direct communication with a control room having direct access to the fire department.

**23.3.4.3.2.2** Where the provision of **23.3.4.3.2.1(3)** is utilized, the fire plan, as required by **23.7.1.3**, shall include procedures for logging of alarms and immediate notification of the fire department.

**23.3.4.4 Detection.** An approved automatic smoke detection system shall be in accordance with **Section 9.6**, as modified by **23.3.4.4.1** through **23.3.4.4.4**, throughout all resident housing areas.

**23.3.4.4.1** Smoke detectors shall not be required in sleeping rooms with four or fewer occupants in Use Condition II or Use Condition III.

**23.3.4.4.2** Other arrangements and positioning of smoke detectors shall be permitted to prevent damage or tampering, or for other purposes.

**23.3.4.4.2.1** Other arrangements, as specified in **23.3.4.4.2**, shall be capable of detecting any fire, and the placement of detectors shall be such that the speed of detection is equivalent to that provided by the spacing and arrangements required by the installation standards referenced in **Section 9.6**.

**23.3.4.4.2.2** Detectors shall be permitted to be located in exhaust ducts from cells, behind grilles, or in other locations.

**23.3.4.4.2.3** The equivalent performance of the design permitted by **23.3.4.4.2.2** shall be acceptable to the authority having jurisdiction in accordance with the equivalency concepts specified in **Section 1.4**.

**23.3.4.4.3\*** Smoke detectors shall not be required in Use Condition II open dormitories where staff is present within the dormitory whenever the dormitory is occupied and the building is protected throughout by an approved, supervised automatic sprinkler system in accordance with **23.3.5.3**.

**A.23.3.4.4.3** An open dormitory is a dormitory that is arranged to allow staff to observe the entire dormitory area at one time.

**23.3.4.4.4** In smoke compartments protected throughout by an approved automatic sprinkler system in accordance with **23.3.5.3**, smoke detectors shall not be required, except in corridors, common spaces, and sleeping rooms with more than four occupants.

## CHAPTER 22 • New

Given that new detention and correctional facilities must be sprinklered, 22.3.4.2(1) requires a waterflow alarm as one of the means for initiating the fire alarm system.

Paragraph 9.6.3.3 requires specific occupancy chapter permission for a presignal system to be used. The provision of 22/23.3.4.3.1 has the effect of prohibiting the use of presignal systems by not specifically allowing them. Rather, notification must be provided without delay in accordance with 9.6.3, or the more reliable form of presignal — called positive alarm sequence — can be used if complying with 9.6.3.4. However, to avoid numerous nuisance alarms, smoke detectors are exempted from sounding a general alarm.

Where the fire department is not equipped to receive alarms or where direct transmission to the fire department is not permitted, the provisions of 22/23.3.4.3.2 require that arrangements be made for the prompt notification of the fire department. One

### 22.3.5 Extinguishment Requirements.

22.3.5.1 High-rise buildings shall comply with 22.4.3.

22.3.5.2 All buildings classified as Use Condition II, Use Condition III, Use Condition IV, or Use Condition V shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with 22.3.5.3.

22.3.5.3 The automatic sprinkler system required by 22.3.5.2 shall meet all of the following criteria:

- (1) It shall be in accordance with Section 9.7.
- (2) It shall be installed in accordance with 9.7.1.1(1).
- (3) It shall be electrically connected to the fire alarm system.
- (4) It shall be fully supervised.

22.3.5.4 Portable fire extinguishers shall be provided in accordance with Section 9.9, unless otherwise permitted by the following:

- (1)\* Access to portable fire extinguishers shall be permitted to be locked.
- (2)\* Portable fire extinguishers shall be permitted to be located at staff locations only.

A.22.3.5.4(1) Where access to portable fire extinguishers is locked, staff should be present on a 24-hour basis and should have keys readily available to unlock access to the extinguishers.

## CHAPTER 23 • Existing

means of notification is by an approved central station alarm system. Subsection 9.6.4 provides several options for notifying the fire department automatically. Where smoke detectors are provided, they are not required to sound the fire alarm or to transmit a signal to the fire department, but they are required to sound an alarm at a constantly attended location, unless otherwise specified.

Paragraph 22/23.3.4.4.3 is an exemption to the smoke detection system requirement. It applies to Use Condition II open dormitories where staff are present within the dormitory whenever the dormitory is occupied. Note that Use Condition II facilities must allow free movement from sleeping areas to another smoke compartment. The concept employed is one of relying on awake and alert staff within the dormitory to act as human fire detectors, provide early warning, and allow residents to move into a safe smoke compartment.

### 23.3.5 Extinguishment Requirements.

23.3.5.1 High-rise buildings shall comply with 23.4.3.

23.3.5.2\* Where required by Table 23.1.6.1, facilities shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with 23.3.5.3.

A.23.3.5.2 Where the openings in ceilings or partitions are ¼ in. (6.3 mm) or larger in the smallest dimension, where the thickness or depth of the material does not exceed the smallest dimension of the openings, and where such openings constitute not less than 70 percent of the area of the ceiling or partition material, the disruption of sprinkler spray patterns is permitted to be disregarded.

23.3.5.3 Where this Code permits exceptions for fully sprinklered detention and correctional occupancies or sprinklered smoke compartments, the sprinkler system shall meet all of the following criteria:

- (1) It shall be in accordance with Section 9.7.
- (2) It shall be installed in accordance with 9.7.1.1(1).
- (3) It shall be electrically connected to the fire alarm system.
- (4) It shall be fully supervised.

23.3.5.4 Portable fire extinguishers shall be provided in accordance with Section 9.9, unless otherwise permitted by the following:

- (1)\* Permitted to be locked.
- (2)\* Portable fire extinguishers shall be permitted to be located at staff locations only.

A.23.3.5.4(1) Where access to portable fire extinguishers is locked, staff should be present on a 24-hour basis and should have keys readily available to unlock access to the extinguishers.

## CHAPTER 22 • New

Where supervision of sleeping areas is from a 24-hour attended staff location, portable fire extinguishers are permitted to be provided at the staff location in lieu of the sleeping area.

**A.22.3.5.4(2)** It is recognized that locating portable fire extinguishers only at staff locations might result in travel distances to extinguishers being in excess of those permitted by NFPA 10, *Standard for Portable Fire Extinguishers*.

**22.3.5.5** Standpipe and hose systems shall be provided in accordance with **Section 9.10** as follows, unless otherwise permitted by **22.3.5.6**:

- (1) Class I standpipe systems shall be provided for any building three or more stories in height.
- (2) Class III standpipe and hose systems shall be provided for all nonsprinklered buildings three or more stories in height.

**22.3.5.6** The requirements of **22.3.5.5** shall not apply where otherwise permitted by the following:

- (1) Formed hose, 1 in. (25 mm) in diameter, on hose reels shall be permitted to provide Class II service.
- (2) Separate Class I and Class II systems shall be permitted in lieu of a Class III system.

**Paragraph 22.3.5.1**, applicable to new facilities in high-rise buildings, refers to **22.4.3**, which, in turn, mandatorily references **Section 11.8** — which includes provisions for automatic sprinkler systems and standpipes. **Paragraph 23.3.5.1**, applicable to existing facilities in high-rise buildings, refers to **23.4.3**, which, in turn, mandates an automatic sprinkler system, but not standpipes. For both new and existing facilities, a sprinkler control valve and waterflow device must be provided for each floor. The control valve allows other zones of the sprinkler system to be kept operative when one zone is being serviced. The waterflow device provides staff with an indication of where sprinkler water is flowing in the building.

**Paragraph 22.3.5.2** requires that new detention and correctional occupancies — other than Use Condition I — be protected throughout by approved, supervised automatic sprinkler systems. However, in establishing the sprinkler requirement, the Technical Committee on Detention and Correctional Occupancies realized that rehabilitation, modernizations, and renovations might take place in nonsprinklered existing buildings. Thus, **22.4.4** provides additional criteria needed for the proper protection of nonsprinklered existing building renovations.

Where automatic sprinklers are installed to comply with the *Code*, the system must be a complete, approved automatic sprinkler system installed in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*.<sup>8</sup> The use of manually operated sprinklers is not recognized by the *Code*. Informal surveys of detention and correctional occupancy staff indicate no signi-

## CHAPTER 23 • Existing

Where supervision of sleeping areas is from a 24-hour attended staff location, portable fire extinguishers are permitted to be provided at the staff location in lieu of the sleeping area.

**A.23.3.5.4(2)** It is recognized that locating portable fire extinguishers only at staff locations might result in travel distances to extinguishers being in excess of those permitted by NFPA 10, *Standard for Portable Fire Extinguishers*.

**23.3.5.5** Standpipe and hose systems shall be provided in accordance with **Section 9.10** as follows, unless otherwise permitted by **23.3.5.6**:

- (1) Class I standpipe systems shall be provided for any building three or more stories in height.
- (2) Class III standpipe and hose systems shall be provided for all nonsprinklered buildings three or more stories in height.

**23.3.5.6** The requirements of **23.3.5.5** shall not apply where otherwise permitted by the following:

- (1) Formed hose, 1 in. (25 mm) in diameter, on hose reels shall be permitted to provide Class II service.
- (2) Separate Class I and Class II systems shall be permitted in lieu of a Class III system.

ficant problems with the installation, maintenance, and use of automatic sprinkler systems in detention and correctional facilities. The system must also be supervised in accordance with the requirements of **9.7.2** to comply with the *Code*.

**Exhibit 22/23.23** illustrates a typical institutional sprinkler. The sprinkler body and frame are designed to prevent residents from hanging items or themselves from the sprinkler.

Exhibit 22/23.23

Typical institutional sprinkler.

## CHAPTER 22 • New

Paragraph 22/23.3.5.4(1) permits portable fire extinguishers to be locked away. Time is critical when using extinguishers; therefore, keys must be carried by the staff or be readily accessible.

The requirements of 22/23.3.5.5 for standpipes intend that 2½ in. (63 mm) hose connections be available for fire department use in any detention and correctional occupancy more

### 22.3.6 Corridors. See 22.3.8.

### 22.3.7 Subdivision of Building Spaces.

**22.3.7.1** Smoke barriers shall be provided to divide every story used for sleeping by residents, or any other story having an occupant load of 50 or more persons, into not less than two compartments, unless otherwise permitted by one of the following:

- (1) Protection shall be permitted to be accomplished using horizontal exits. (See 7.2.4.)
- (2)\* The requirement for subdivision of building space shall be permitted to be fulfilled by one of the following:
  - (a) Smoke compartments having exit to a public way, where such exit serves only one area and has no openings to other areas
  - (b) Building separated from the resident housing area by a 2-hour fire resistance rating or 50 ft (15 m) of open space
  - (c) Secured, open area having a holding space located 50 ft (15 m) from the housing area that provides 15 ft<sup>2</sup> (1.4 m<sup>2</sup>) or more of refuge area for each person (resident, staff, visitors) potentially present at the time of a fire

**A.22.3.7.1(2)** A door to the outside, by itself, does not meet the intent of this provision if emergency operating procedures do not provide for the door to be unlocked when needed. In cases where use of the door is not ensured, a true smoke barrier per the base requirement of 22.3.7.1 would be needed.

**22.3.7.2** Doors used to access the areas specified in 22.3.7.1(2)(a), (b), and (c) shall meet the requirements for doors at smoke barriers for the applicable use condition.

**22.3.7.3** Where smoke barriers are required by 22.3.7.1, they shall be provided in accordance with both of the following criteria:

## CHAPTER 23 • Existing

than two stories in height. In addition, if such buildings are non-sprinklered, 1½ in. (38 mm) connections and hose for staff and resident use are also required.

Paragraph 22/23.3.5.6(1) permits the use of 1 in. (25 mm) formed rubber hose in place of the fabric-jacketed, rubber-lined hose normally required in standpipe systems. The rubber hose is normally stored on reels and is easier to use.

### 23.3.6 Corridors. See 23.3.8.

### 23.3.7 Subdivision of Building Spaces.

**23.3.7.1\*** Smoke barriers shall be provided to divide every story used for sleeping by 10 or more residents, or any other story having an occupant load of 50 or more persons, into not less than two compartments, unless otherwise permitted by one of the following:

- (1) Protection shall be permitted to be accomplished using horizontal exits. (See 7.2.4.)
- (2)\* The requirement for subdivision of building space shall be permitted to be fulfilled by one of the following:
  - (a) Smoke compartments having exit to a public way, where such exit serves only one area and has no openings to other areas
  - (b) Building separated from the resident housing area by a 2-hour fire resistance rating or 50 ft (15 m) of open space
  - (c) Secured, open area having a holding space located 50 ft (15 m) from the housing area that provides 15 ft<sup>2</sup> (1.4 m<sup>2</sup>) or more of refuge area for each person (resident, staff, visitors) potentially present at the time of a fire

**A.23.3.7.1** Consideration can be given for large open areas that might be permitted to function as smoke sinks as an alternative to the installation of more than one smoke barrier as required by 23.3.7.1. Vertical movement downward to an area of refuge might be permitted by the authority having jurisdiction in lieu of horizontal movement.

**A.23.3.7.1(2)** A door to the outside, by itself, does not meet the intent of this provision if emergency operating procedures do not provide for the door to be unlocked when needed. In cases where use of the door is not ensured, a true smoke barrier per the base requirement of 23.3.7.1 would be needed.

**23.3.7.2** Doors used to access the areas specified in 23.3.7.1(2)(a), (b), and (c) shall meet the requirements for doors at smoke barriers for the applicable use condition.

**23.3.7.3** Where smoke barriers are required by 23.3.7.1, they shall be provided in accordance with both of the following criteria:

## CHAPTER 22 • New

- (1) They shall limit the occupant load to not more than 200 residents in any smoke compartment.
- (2) They shall limit the travel distance to a door in a smoke barrier in accordance with both of the following criteria:
  - (a) The distance from any room door required as exit access shall not exceed 150 ft (46 m).
  - (b) The distance from any point in a room shall not exceed 200 ft (61 m).

**22.3.7.4 Reserved.**

**22.3.7.5\*** Any required smoke barrier shall be constructed in accordance with [Section 8.5](#), shall be of substantial construction, and shall have structural fire resistance.

**A.22.3.7.5** Structural fire resistance is defined as the ability of the assembly to stay in place and maintain structural integrity without consideration of heat transmission. Twelve-gauge steel plate suitably framed and stiffened meets this requirement.

**22.3.7.6** Openings in smoke barriers shall be protected in accordance with [Section 8.5](#), unless otherwise permitted by the following:

- (1)\* The total number of vision panels in any barrier shall not be restricted.
- (2) Sliding doors in smoke barriers that are designed to normally be kept closed and are remotely operated from a continuously attended location shall not be required to be self-closing.

**A.22.3.7.6(1)** As an example, a smoke barrier is permitted to consist of fire-rated glazing panels mounted in a security grille arrangement.

**22.3.7.7** Not less than 6 net ft<sup>2</sup> (0.55 net m<sup>2</sup>) per occupant shall be provided on each side of the smoke barrier for the total number of occupants in adjoining compartments, and this space shall be readily available wherever occupants are moved across the smoke barrier in a fire emergency.

**22.3.7.8** Doors in smoke barriers shall meet all of the following criteria:

- (1) The doors shall provide resistance to the passage of smoke.
- (2) Swinging doors shall be self-latching, or the opening resistance of the door shall be not less than 5 lbf (22 N).

## CHAPTER 23 • Existing

- (1) They shall limit the occupant load to not more than 200 residents in any smoke compartment.
- (2)\* They shall limit the travel distance to a door in a smoke barrier, unless otherwise permitted by [23.3.7.4](#), in accordance with both of the following criteria:
  - (a) The distance from any room door required as exit access shall not exceed 100 ft (30 m).
  - (b) The distance from any point in a room shall not exceed 150 ft (46 m).

**A.23.3.7.3(2)** Consideration should be given to increasing the travel distance to a smoke barrier to coincide with existing range lengths and exits.

**23.3.7.4** The maximum travel distance to a door in a smoke barrier shall be permitted to be increased by 50 ft (15 m) in smoke compartments protected throughout by an approved automatic sprinkler system in accordance with [23.3.5.3](#) or an automatic smoke control system.

**23.3.7.5\*** Any required smoke barrier shall be constructed in accordance with [Section 8.5](#), shall be of substantial construction, and shall have structural fire resistance.

**A.23.3.7.5** Structural fire resistance is defined as the ability of the assembly to stay in place and maintain structural integrity without consideration of heat transmission. Twelve-gauge steel plate suitably framed and stiffened meets this requirement.

**23.3.7.6** Openings in smoke barriers shall be protected in accordance with [Section 8.5](#), unless otherwise permitted by the following:

- (1)\* The total number of vision panels in any barrier shall not be restricted.
- (2) Sliding doors in smoke barriers that are designed to normally be kept closed and are remotely operated from a continuously attended location shall not be required to be self-closing.

**A.23.3.7.6(1)** As an example, a smoke barrier is permitted to consist of fire-rated glazing panels mounted in a security grille arrangement.

**23.3.7.7** Not less than 6 net ft<sup>2</sup> (0.55 net m<sup>2</sup>) per occupant shall be provided on each side of the smoke barrier for the total number of occupants in adjoining compartments, and this space shall be readily available wherever occupants are moved across the smoke barrier in a fire emergency.

**23.3.7.8** Doors in smoke barriers shall meet all of the following criteria:

- (1) The doors shall provide resistance to the passage of smoke.
- (2) Swinging doors shall be self-latching, or the opening resistance of the door shall be not less than 5 lbf (22 N).

## CHAPTER 22 • New

- (3) Sliding doors shall be exempt from the latching requirement of 8.5.4.3.

**22.3.7.9** Doors in smoke barriers shall conform with the requirements for doors in means of egress as specified in Section 22.2 and shall have locking and release arrangements according to the applicable use condition. The provisions of 22.2.11.8.2 shall not be used for smoke barrier doors serving a smoke compartment containing more than 20 persons.

**22.3.7.10** Vision panels shall be provided in smoke barriers at points where the barrier crosses an exit access corridor.

**22.3.7.11** Smoke dampers shall be provided in accordance with 8.5.5, unless otherwise permitted by 22.3.7.12.

**22.3.7.12** Arrangements and positioning of smoke detectors required by 22.3.7.11 shall be permitted to prevent damage or tampering, or for other purposes, provided that both of the following criteria are met:

- (1) Such arrangements shall be capable of detecting any fire.
- (2) The placement of detectors shall be such that the speed of detection is equivalent to that provided by the spacing and arrangement required by *NFPA 72, National Fire Alarm and Signaling Code*, as referenced in 8.5.5.7.1.

Smoke barriers and horizontal exits used to subdivide a building serve the following three purposes that are fundamental to the protection of occupants:

1. They limit the spread of fire and fire-produced contaminants.
2. They limit the number of occupants exposed to a single fire.
3. They provide for horizontal relocation of occupants by creating a safe area on the same floor.

The requirements of 22/23.3.7.1 and 22/23.3.7.3 for subdividing building spaces are illustrated in Exhibit 22/23.24. Exhibit 22/23.25 illustrates the requirements of 22/23.3.7.1(2). In Exhibit 22/23.25, the door from the resident housing building to the yard can be locked only to the degree that a smoke barrier door can be locked for the applicable use condition.

Although it does not specify a required fire resistance rating, 22/23.3.7.5 requires smoke barriers to have structural fire resistance. The intent is to eliminate the use of highly combustible or flimsy materials, such as plastic sheeting, that might possibly limit smoke movement but that have little structural integrity.

The doors in the required smoke barriers must resist the passage of smoke for the same reason that smoke barriers must resist the passage of smoke. The door constructed of materials that resist the passage of smoke will stop smoke from traveling

## CHAPTER 23 • Existing

- (3) Sliding doors shall be exempt from the latching requirement of 8.5.4.3.
- (4) The doors shall not be required to swing in the direction of egress travel.

**23.3.7.9** Doors in smoke barriers shall conform with the requirements for doors in means of egress as specified in Section 23.2 and shall have locking and release arrangements according to the applicable use condition. The provisions of 23.2.11.8.2 shall not be used for smoke barrier doors serving a smoke compartment containing more than 20 persons.

**23.3.7.10** Vision panels shall be provided in smoke barriers at points where the barrier crosses an exit access corridor.

**23.3.7.11** Smoke dampers shall be provided in accordance with 8.5.5, unless otherwise permitted by 23.3.7.12.

**23.3.7.12** Arrangements and positioning of smoke detectors required by 23.3.7.11 shall be permitted to prevent damage or tampering, or for other purposes, provided that both of the following criteria are met:

- (1) Such arrangements shall be capable of detecting any fire.
- (2) The placement of detectors shall be such that the speed of detection is equivalent to that provided by the spacing and arrangement required by *NFPA 72, National Fire Alarm and Signaling Code*, as referenced in 8.5.5.7.1.

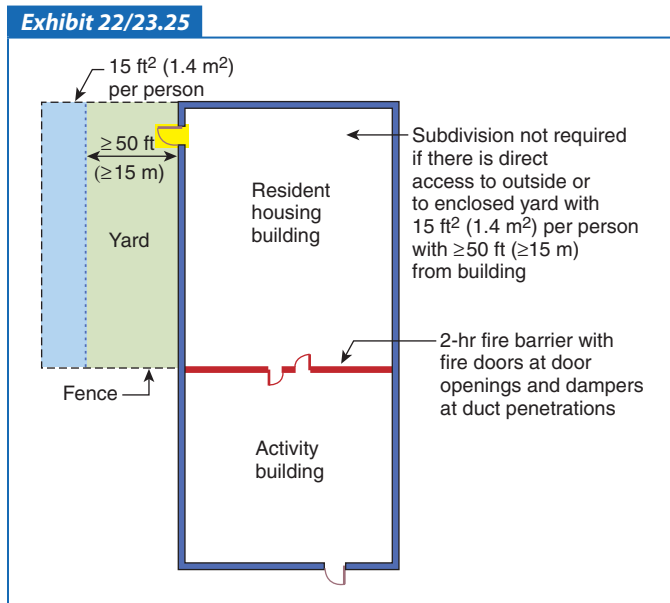

Exhibit 22/23.24

Subdivision of building spaces into smoke compartments using smoke barriers.

## CHAPTER 22 • New

## CHAPTER 23 • Existing

Alternatives to subdivision by smoke barriers.

**22.3.8\* Special Protection Features — Subdivision of Resident Housing Spaces.** Subdivision of facility spaces shall comply with [Table 22.3.8](#).

**A.22.3.8** The requirements in [Table 22.3.8](#) for smoke-resistant separations include taking the necessary precautions to restrict the spread of smoke through the air-handling system. However, the intent is not that smoke dampers are required to be provided for each opening. Smoke dampers would be one acceptable method; however, other techniques, such as allowing the fans to continue to run with 100 percent supply and 100 percent exhaust, would be acceptable.

[Paragraph 22/23.3.8](#) provides for the separation of areas where residents are housed. This separation serves two basic needs: (1) it keeps a fire and its products confined to the area of origin, and (2) it protects those occupants located outside the area of origin. [Table 22/23.3.8](#) establishes individual requirements based on the use condition involved. [Exhibit 22/23.26](#) shows a six-resident sleeping room in a newly constructed Use Condition V facility. The resident room faces onto a common space. Per the requirements of [Table 22/23.3.8](#), the room to common space separation need only be smoke resistant without any fire resistance rating. [Exhibit 22/23.27](#) shows a two-story residential housing unit complete with resident sleeping rooms and

across the door opening only if the door remains tightly closed. Therefore, [22/23.3.7.8](#) requires that the door, which [8.5.4.4](#) requires to be either self-closing or automatic-closing, also must be self-latching or must provide a 5 lbf (22 N) resistance to opening, as a minimum. This combination of requirements should help to ensure that the door will be closed under smoke conditions and remain closed, even under the pressures generated by a fire, to resist the passage of smoke.

The provisions of [22/23.2.11.8.2](#) permit up to 10 locks that require manual unlocking in a timely fashion to be considered as providing the degree of remote unlocking necessary to satisfy the requirements of a Use Condition IV facility — as opposed to a Use Condition V facility. However, [22/23.3.7.9](#) does not permit locks on smoke barrier doors to be part of the maximum 10 manually unlocked locks where a smoke compartment houses more than 20 persons. This limitation emphasizes the importance of maintaining a means of egress system within a Use Condition IV facility (i.e., where remote release is required) housing more than 20 persons per smoke compartment that allows resident movement to another smoke compartment without having to manually release the lock on the smoke barrier door. A manually released lock on the smoke barrier door would force a reclassification of the facility to Use Condition V and mandate compliance with the more stringent requirements applicable to that classification.

**23.3.8\* Special Protection Features — Subdivision of Resident Housing Spaces.** Subdivision of facility spaces shall comply with [Table 23.3.8](#).

**A.23.3.8** The requirements in [Table 23.3.8](#) or smoke-resistant and fire-rated separations include taking the necessary precautions to restrict the spread of smoke through the air-handling system. However, the intent is not that smoke dampers are required to be provided for each opening. Smoke dampers would be one acceptable method; however, other techniques, such as allowing the fans to continue to run with 100 percent supply and 100 percent exhaust, would be acceptable.

common space. The various walls fit the varying categories listed in the feature column of [Table 22/23.3.8](#).

If a common wall is used for different purposes, such as “room face to corridor” and “common space to corridor,” the most restrictive requirement needs to be applied to the entire wall. [Table 22/23.3.8](#) and its notes specify a wide variety of options in addition to the locking options previously detailed in [Chapters 22 and 23](#). Note 2 to [Table 22.3.8](#) and note 3 to [Table 23.3.8](#) also permit space that has been subdivided to be treated as a single room. In combination with the various locking options, this exemption can facilitate day-to-day operations.

## CHAPTER 22 • New

## CHAPTER 23 • Existing

Table 22.3.8 Subdivision of Resident Housing Spaces

Feature	Use Condition			
	II	III	IV	V
Room to room separation	NR	NR	NR	SR
Room face to corridor separation	NR	NR	NR	SR
Room face to common space separation	NR	NR ≤50 ft (≤15 m) <sup>†</sup> SR >50 ft (>15 m) <sup>†</sup>	NR ≤50 ft (≤15 m) <sup>†</sup> SR >50 ft (>15 m) <sup>†</sup>	SR
Common space to corridor separation	NR	NR	NR	SR
Total openings in solid room face where room face is required to be smoke resistant or fire rated <sup>‡</sup>	0.85 ft <sup>2</sup> (0.08 m <sup>2</sup> )	0.85 ft <sup>2</sup> (0.08 m <sup>2</sup> )	0.85 ft <sup>2</sup> (0.08 m <sup>2</sup> )	0.85 ft <sup>2</sup> (0.08 m <sup>2</sup> ) where meeting one of the following: (1) Kept in closed position, except when in use by staff (2) Closable from the inside (3) Provided with smoke control

NR: No requirement. SR: Smoke resistant.

Notes:

(1) Doors in openings in partitions required to be smoke resistant (SR) in accordance with Table 22.3.8 are required to be substantial doors of construction that resists the passage of smoke. Latches and door closers are not required on cell doors.

(2) Under Use Condition II, Use Condition III, or Use Condition IV, a space subdivided by open construction (any combination of grating doors and grating walls or solid walls) is permitted to be considered one room if housing not more than 16 persons. The perimeter walls of such space are required to be of smoke-resistant construction. Smoke detection is required to be provided in such space. Under Use Condition IV, common walls between sleeping areas within the space are required to be smoke resistant, and grating doors and fronts are permitted to be used. Under Use Condition II and Use Condition III, open dormitories are permitted to house more than 16 persons, as permitted by other sections of this chapter.

(3) Where barriers are required to be smoke resistant (SR), the provisions of Sections 8.4 and 8.5 do not apply.

<sup>†</sup>Travel distance through the common space to the exit access corridor.

<sup>‡</sup>“Total openings in solid room face” include all openings (e.g., undercuts, food passes, grilles), the total of which is not to exceed 0.85 ft<sup>2</sup> (0.08 m<sup>2</sup>). All openings are required to be 36 in. (915 mm) or less above the floor.

Table 23.3.8 Subdivision of Resident Housing Spaces

Feature	Use Condition										
	II		III				IV		V		
	NS	AS	NS		AS		NS	AS	NS	AS	
Room to room separation	NR	NR	NR		NR		SR	NR	SR	SR <sup>a</sup>	
Room face to corridor separation	NR	NR	SR <sup>b</sup>		NR		SR <sup>b</sup>	NR	FR <sup>b</sup>	SR <sup>a</sup>	
Room face to common space separation	NR	NR	NR ≤50 ft (≤15 m) <sup>c</sup>	SR <sup>b</sup> >50 ft (>15 m) <sup>c</sup>	NR ≤50 ft (≤15 m) <sup>c</sup>	SR <sup>b</sup> >50 ft (>15 m) <sup>c</sup>	SR <sup>b</sup>	NR ≤50 ft (≤15 m) <sup>c</sup>	SR <sup>a</sup> >50 ft (>15 m) <sup>c</sup>	SR <sup>b</sup>	SR <sup>a</sup>
Common space to corridor separation	SR	NR	SR		NR		SR	NR	FR	SR <sup>a</sup>	
Total openings in solid room face where room face is required to be smoke resistant or fire rated <sup>d</sup>	0.85 ft <sup>2</sup> (0.08 m <sup>2</sup> )		0.85 ft <sup>2</sup> (0.08 m <sup>2</sup> )				0.85 ft <sup>2</sup> (0.08 m <sup>2</sup> )		0.85 ft <sup>2</sup> (0.08 m <sup>2</sup> ) where meeting one of the following: (1) Kept in closed position, except when in use by staff (2) Closable from the inside (3) Provided with smoke control		

NS: Not protected by automatic sprinklers. AS: Protected by automatic sprinklers. NR: No requirement. SR: Smoke resistant. FR: Minimum 1-hour fire resistance rating.

Notes:

(1) Doors in openings in partitions required to be fire rated (FR) in accordance with Table 23.3.8, in other than required enclosures of exits or hazardous areas, are required to be substantial doors of construction that resists fire for a minimum of 20 minutes. Vision panels with wired glass or glass with not less than 45-minute fire-rated glazing are permitted. Latches and door closers are not required on cell doors.

(2) Doors in openings in partitions required to be smoke resistant (SR) in accordance with Table 23.3.8 are required to be substantial doors of construction that resists the passage of smoke. Latches and door closers are not required on cell doors.

(3) Under Use Condition II, Use Condition III, or Use Condition IV, a space subdivided by open construction (any combination of grating doors and grating walls or solid walls) is permitted to be considered one room if housing not more than 16 persons. The perimeter walls of such space are required to be of smoke-resistant construction. Smoke detection is required to be provided in such space. Under Use Condition IV, common walls between sleeping areas within the space are required to be smoke resistant, and grating doors and fronts are permitted to be used. Under Use Condition II and Use Condition III, open dormitories are permitted to house more than 16 persons, as permitted by other sections of this chapter.

(4) Where barriers are required to be smoke resistant (SR), the provisions of Sections 8.4 and 8.5 do not apply.

<sup>a</sup>Might be no requirement (NR) where one of the following is provided:

(1) Approved automatic smoke detection system installed in all corridors and common spaces

(2) Multitiered cell blocks meeting the requirements of 23.3.1.3

<sup>b</sup>Might be no requirement (NR) in multitiered, open cell blocks meeting the requirements of 23.3.1.3.

<sup>c</sup>Travel distance through the common space to the exit access corridor.

<sup>d</sup>“Total openings in solid room face” include all openings (e.g., undercuts, food passes, grilles), the total of which is not to exceed 0.85 ft<sup>2</sup> (0.08 m<sup>2</sup>). All openings are required to be 36 in. (915 mm) or less above the floor.

## CHAPTER 22 • New

Exhibit 22/23.26

Resident sleeping room fronting onto common space.

## 22.4 Special Provisions

**22.4.1 Limited Access Structures.** The provisions of [Section 11.7](#) for limited access structures shall not apply.

**22.4.2 Underground Buildings.** See [Section 11.7](#) for requirements for underground buildings.

## CHAPTER 23 • Existing

Exhibit 22/23.27

Two-story residential housing unit.

## 23.4 Special Provisions

**23.4.1 Limited Access Structures.**

**23.4.1.1** Limited access structures used as detention and correctional occupancies shall comply with [23.4.1.2](#), unless otherwise permitted by one of the following:

- (1) The provisions of [Section 11.7](#) for limited access structures shall not apply.
- (2) The requirement of [23.4.1.1](#) shall not apply to buildings protected throughout by an approved automatic sprinkler system in accordance with [23.3.5.3](#).

**23.4.1.2** Any one of the following means shall be provided to evacuate smoke from the smoke compartment of fire origin:

- (1) Operable windows on not less than two sides of the building, spaced not more than 30 ft (9.1 m) apart, that provide openings with dimensions of not less than 22 in. (560 mm) in width and 24 in. (610 mm) in height
- (2)\* Manual or automatic smoke vents
- (3) Engineered smoke control system
- (4) Mechanical exhaust system providing not less than six air changes per hour
- (5) Other method acceptable to the authority having jurisdiction

**A.23.4.1.2(2)** The automatic smoke venting should be in accordance with NFPA 204, *Standard for Smoke and Heat Venting*, for light hazard occupancies.

**23.4.2 Underground Buildings.** See [Section 11.7](#) for requirements for underground buildings.

## CHAPTER 22 • New

**22.4.3 High-Rise Buildings.** High-rise buildings shall comply with [Section 11.8](#).

[Paragraph 23.4.1.2](#) provides a variety of options for evacuating smoke from the smoke compartment of fire origin in limited access buildings.

The provision of [22.4.3](#) was revised for the 2015 edition of the *Code*. In prior editions it referenced only the sprinkler and standpipe provisions of [Section 11.8](#). It now requires new high-rise buildings to comply with the full complement of high-rise building provisions of [Section 11.8](#).

[Paragraph 23.4.3](#) retroactively requires existing, high-rise detention and correctional occupancy buildings to be protected

#### 22.4.4 Nonsprinklered Existing Building Renovations.

**22.4.4.1 General.** Modernizations or renovations of nonsprinklered existing buildings shall be permitted to meet the requirements of this chapter, as modified by [22.4.4.2](#) through [22.4.4.13](#), in lieu of the sprinkler requirement of [22.3.5.2](#).

[Chapter 22](#) requires that new detention and correctional occupancies be protected throughout by approved, supervised automatic sprinkler systems. However, in establishing the sprinkler requirement, the Technical Committee on Detention and Correctional Occupancies realized that rehabilitation often might take place in nonsprinklered existing buildings. Thus, [22.4.4](#) provides additional criteria needed for the proper protection of nonsprinklered existing building renovations. For example, for nonsprinklered buildings, [22.4.4.5.2](#) establishes a maximum travel distance of 150 ft (46 m) between any point in a room and an exit. If a renovation in a nonsprinklered building were to be predicated on the provisions of [22.2.6.4](#), the travel distance limitation would mistakenly be interpreted to be 200 ft (61 m) between any point in a room and an exit. The 200 ft (61 m) allowance is intended to apply only to sprinklered buildings.

#### 22.4.4.2 Minimum Construction Requirements (Nonsprinklered Buildings).

**22.4.4.2.1** Detention and correctional occupancies in nonsprinklered buildings shall be limited to the building construction types specified in [Table 22.4.4.2.1](#). (*See 8.2.1.*)

## CHAPTER 23 • Existing

**23.4.3 High-Rise Buildings.** Existing high-rise buildings shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with [23.3.5.3](#). A sprinkler control valve and a waterflow device shall be provided for each floor.

throughout by approved, supervised automatic sprinkler systems. Additionally, a sprinkler control valve and waterflow device must be provided for each floor. The control valve facilitates keeping other zones of the sprinkler system operative when one zone is being serviced. The waterflow device provides staff with an indication of where sprinkler water is flowing in the building. Levels of a high-rise multilevel housing area complying with [23.3.1.2](#) and [23.3.1.3](#) do not constitute multiple floors and, thus, are not required to be provided with individual control valves and waterflow devices on each level.

#### 23.4.4 Reserved.

[Subsection 22.4.4](#) serves as a repository for provisions that were contained in [Chapter 22](#) before sprinklers were mandated for new construction. Its provisions remind the user that the requirements interspersed throughout [Chapter 22](#) are predicated on the presence of sprinkler protection. If sprinklers are not installed, additional requirements must be met in an attempt to achieve a level of life safety approaching that provided in a sprinklered building. However, even if all the former specifications for nonsprinklered buildings are met, the overall level of life safety will not necessarily be the same as that provided in a sprinklered facility. When the 1997 edition of the *Code* presented the first requirement for sprinklering of all new detention and correctional occupancies, the overall level of life safety was elevated from that provided by compliance with the nonsprinklered building option.

Table 22.4.4.2.1 Construction Type Limitations — Nonsprinklered Buildings

NA: Not applicable. NP: Not permitted.

X: Permitted for Use Conditions II, III, IV, and V. (See 22.1.2.3 for Use Condition I.)

X1: Permitted for Use Conditions II, III, and IV. Use Condition V not permitted. (See 22.1.2.3 for Use Condition I.)

†See 4.6.3.

**22.4.4.2.2** A residential housing area complying with 22.4.4.6 shall be considered as one story in height for purposes of applying Table 22.4.4.2.1.

**22.4.4.3\* Horizontal Exit Duct Penetrations (Nonsprinklered Buildings).** Ducts shall be permitted to penetrate horizontal exits in accordance with 7.2.4.3.5(3) if protected by combination fire dampers/smoke leakage-rated dampers that meet the smoke damper actuation requirements of 8.5.5.

**A.22.4.4.3** This provision is intended to promote the use of horizontal exits in detention and correctional occupancies.

Horizontal exits provide an especially effective egress system for an occupancy in which the occupants, due to security concerns, are not commonly released to the outside. This provision offers a *Code*-specified equivalent alternative to the requirement of 7.2.4.3.5 that horizontal exits are not to be penetrated by ducts in nonsprinklered buildings. The intended continuity of the fire resistance-rated and smoke-resisting barrier is maintained by requiring that duct penetrations of horizontal exits be protected by combination fire damper/smoke leakage-rated dampers that will close upon activation of a smoke detector and a heat-actuated mechanism before the barrier's ability to resist the passage of smoke and fire is compromised.

**22.4.4.4 Common Path of Travel (Nonsprinklered Buildings).** A common path of travel shall not exceed 50 ft (15 m).

**22.4.4.5 Travel Distance to Exits (Nonsprinklered Buildings).**

**22.4.4.5.1** The travel distance between any room door required as an exit access and an exit shall not exceed 100 ft (30 m).

**22.4.4.5.2** The travel distance between any point in a room and an exit shall not exceed 150 ft (46 m).

**22.4.4.6 Protection of Vertical Openings (Nonsprinklered Buildings).**

**22.4.4.6.1** Multilevel residential housing areas without enclosure protection between levels shall be permitted, provided that the conditions of 22.4.4.6.2 through 22.4.4.6.4 are met.

**22.4.4.6.2\*** The entire normally occupied area, including all communicating floor levels, shall be sufficiently open and unobstructed so that a fire or other dangerous condition in any part is obvious to the occupants or supervisory personnel in the area.

**A.22.4.4.6.2** It is not the intent of this requirement to restrict room face separations, which restrict visibility from the common space into individual sleeping rooms.

**22.4.4.6.3** Egress capacity shall simultaneously accommodate all occupants of all communicating levels and areas, with all communicating levels in the same fire area considered as a single floor area for purposes of determining required egress capacity.

**22.4.4.6.4\*** The height between the highest and lowest finished floor levels shall not exceed 13 ft (3960 mm). The number of levels shall not be restricted.

**A.22.4.4.6.4** The vertical separation between the lowest floor level and the uppermost floor level is not to exceed 13 ft (3960 mm). **Figure A.22.4.4.6.4** illustrates how the height is to be determined.

Figure A.22.4.4.6.4 Vertical Height Measurement.

**22.4.4.7 Hazardous Areas (Nonsprinklered Buildings).** Any hazardous area shall be protected in accordance with [Section 8.7](#). The areas described in [Table 22.4.4.7](#) shall be protected as indicated.

**22.4.4.8 Interior Finish (Nonsprinklered Buildings).**

**22.4.4.8.1 Interior Wall and Ceiling Finish.** Interior wall and ceiling finish materials complying with [Section 10.2](#) shall be

Table 22.4.4.7 Hazardous Area Protection — Nonsprinklered Buildings

Hazardous Area Description	Separation/Protection <sup>†</sup>
Areas not incidental to resident housing	2 hours
Boiler and fuel-fired heater rooms	2 hours or 1 hour and sprinklers
Central or bulk laundries >100 ft <sup>2</sup> (>9.3 m <sup>2</sup> )	2 hours or 1 hour and sprinklers
Commercial cooking equipment	In accordance with 9.2.3
Commissaries	1 hour or sprinklers
Employee locker rooms	1 hour or sprinklers
Hobby/handicraft shops	1 hour or sprinklers
Maintenance shops	1 hour or sprinklers
Padded cells	2 hours or 1 hour and sprinklers
Soiled linen rooms	2 hours or 1 hour and sprinklers
Storage rooms >50 ft <sup>2</sup> (>4.6 m <sup>2</sup> ) but ≤100 ft <sup>2</sup> (≤9.3 m <sup>2</sup> ) storing combustible material	1 hour or sprinklers
Storage rooms >100 ft <sup>2</sup> (>9.3 m <sup>2</sup> ) storing combustible materials	2 hours or 1 hour and sprinklers
Trash collection rooms	2 hours or 1 hour and sprinklers

<sup>†</sup>Minimum fire resistance rating.

## CHAPTER 22 • New

## CHAPTER 23 • Existing

Class A in corridors, in exits, and in any space not separated from corridors and exits by partitions capable of retarding the passage of smoke; and Class A, Class B, or Class C in all other areas.

**22.4.4.8.2 Interior Floor Finish.**

**22.4.4.8.2.1** Interior floor finish shall comply with [Section 10.2](#).

**22.4.4.8.2.2** Interior floor finish in exit enclosures and exit access corridors shall be not less than Class I.

**22.4.4.8.2.3** Interior floor finish shall comply with [10.2.7.1](#) or [10.2.7.2](#), as applicable.

**22.4.4.9 Detection, Alarm, and Communications Systems (Nonsprinklered Buildings).**

**22.4.4.9.1 Initiation.** Initiation of the fire alarm system required by [22.3.4.1](#) shall be by manual means in accordance with [9.6.2](#) and by means of any required detection devices or detection systems, unless otherwise permitted by the following:

- (1) Manual fire alarm boxes shall be permitted to be locked, provided that staff is present within the area when it is occupied and staff has keys readily available to unlock the boxes.
- (2) Manual fire alarm boxes shall be permitted to be located in a staff location, provided that both of the following criteria are met:
  - (a) The staff location is attended when the building is occupied.
  - (b) The staff attendant has direct supervision of the sleeping area.

**22.4.4.9.2 Detection.** An approved automatic smoke detection system shall be in accordance with [Section 9.6](#), as modified by [22.4.4.9.2.1](#) and [22.4.4.9.2.2](#), throughout all resident sleeping areas and adjacent day rooms, activity rooms, or contiguous common spaces.

**22.4.4.9.2.1** Smoke detectors shall not be required in sleeping rooms with four or fewer occupants in Use Condition II or Use Condition III.

**22.4.4.9.2.2** Other arrangements and positioning of smoke detectors shall be permitted to prevent damage or tampering, or for other purposes. Such arrangements shall be capable of detecting any fire, and the placement of detectors shall be such that the speed of detection is equivalent to that provided by the spacing and arrangements required by the installation standards referenced in [Section 9.6](#). Detectors shall be permitted to be located in exhaust ducts from cells, behind grilles, or in other locations. The equivalent performance of the design, however, shall be acceptable to the authority having jurisdiction in accordance with the equivalency concepts specified in [Section 1.4](#).

## CHAPTER 22 • New

## CHAPTER 23 • Existing

**22.4.4.10 Subdivision of Building Spaces (Nonsprinklered Buildings).** Where smoke barriers are required by [22.3.7.1](#), they shall be provided in accordance with both of the following criteria:

- (1) They shall limit the occupant load to not more than 200 residents in any smoke compartment.
- (2) They shall limit the travel distance to a door in a smoke barrier in accordance with both of the following criteria:
  - (a) The distance from any room door required as exit access shall not exceed 100 ft (30 m).
  - (b) The distance from any point in a room shall not exceed 150 ft (46 m).

**22.4.4.11\* Subdivision of Resident Housing Spaces (Nonsprinklered Buildings).** Subdivision of facility spaces shall comply with [Table 22.4.4.11](#).

**Table 22.4.4.11 Subdivision of Resident Housing Spaces — Nonsprinklered Buildings**

Feature	Use Condition			
	II	III	IV	V
Room to room separation	NR	NR	SR	FR(½)
Room face to corridor separation	SR	SR	SR	FR
Room face to common space separation	NR	NR ≤50 ft (≤15 m) <sup>†</sup>	SR >50 ft (>15 m) <sup>†</sup>	FR
Common space to corridor separation	FR	FR	FR	FR
Total openings in solid room face where room face is required to be smoke resistant or fire rated <sup>‡</sup>	0.85 ft <sup>2</sup> (0.08 m <sup>2</sup> )	0.85 ft <sup>2</sup> (0.08 m <sup>2</sup> )	0.85 ft <sup>2</sup> (0.08 m <sup>2</sup> )	0.85 ft <sup>2</sup> (0.08 m <sup>2</sup> ) where meeting one of the following: (1) Kept in closed position, except when in use by staff (2) Closable from the inside (3) Provided with smoke control

NR: No requirement. SR: Smoke resistant.

Notes:

(1) Doors in openings in partitions required to be fire rated [FR(½), FR] in accordance with [Table 22.4.4.11](#), in other than required enclosures of exits or hazardous areas, are required to be substantial doors of construction that resist fire for a minimum of 20 minutes. Vision panels with an existing installation of wired glass or glass with not less than 45-minute fire-rated glazing are permitted. Latches and door closers are not required on cell doors.

(2) Doors in openings in partitions required to be smoke resistant (SR) in accordance with [Table 22.4.4.11](#) are required to be substantial doors of construction that resists the passage of smoke. Latches and door closers are not required on cell doors.

(3) Under Use Condition II, Use Condition III, or Use Condition IV, a space subdivided by open construction (any combination of grating doors and grating walls or solid walls) is permitted to be considered one room if housing not more than 16 persons. The perimeter walls of such space are required to be of smoke-resistant construction. Smoke detection is required to be provided in such space. Under Use Condition IV, common walls between sleeping areas within the space are required to be smoke resistant, and grating doors and fronts are permitted to be used. In Use Condition II and Use Condition III, open dormitories are permitted to house more than 16 persons, as permitted by other sections of this chapter.

(4) Where barriers are required to be smoke resistant (SR), the provisions of [Sections 8.4](#) and [8.5](#) do not apply.

<sup>†</sup>Travel distance through the common space to the exit access corridor.

<sup>‡</sup>“Total openings in solid room face” include all openings (e.g., undercuts, food passes, grilles), the total of which is not to exceed 0.85 ft<sup>2</sup> (0.08 m<sup>2</sup>). All openings are required to be 36 in. (915 mm) or less above the floor.

## CHAPTER 22 • New

## CHAPTER 23 • Existing

**A.22.4.4.11** The requirements in **Table 22.4.4.11** for smoke-resistant and fire-rated separations include taking the necessary precautions to restrict the spread of smoke through the air-handling system. However, the intent is that smoke dampers are required to be provided for each opening. Smoke dampers would be one acceptable method; however, other techniques, such as allowing the fans to continue to run with 100 percent supply and 100 percent exhaust, would be acceptable.

**22.4.4.12 Limited Access Structures (Nonsprinklered Buildings).**

**22.4.4.12.1** Limited access structures used as detention and correctional occupancies shall comply with **22.4.4.12.2**. The provisions of **Section 11.7** for limited access structures shall not apply.

**22.4.4.12.2** Any one of the following means shall be provided to evacuate smoke from the smoke compartment of fire origin:

- (1) Operable windows on not less than two sides of the building, spaced not more than 30 ft (9.1 m) apart, that provide openings with dimensions of not less than 22 in. (560 mm) in width and 24 in. (610 mm) in height
- (2)\* Manual or automatic smoke vents
- (3) Engineered smoke control system
- (4) Mechanical exhaust system providing not less than six air changes per hour
- (5) Other method acceptable to the authority having jurisdiction

**A.22.4.4.12.2(2)** The automatic smoke venting should be in accordance with NFPA 204, *Standard for Smoke and Heat Venting*, for light hazard occupancies.

**22.4.4.13 Furnishings, Mattresses, and Decorations (Nonsprinklered Buildings).**

**22.4.4.13.1** Newly introduced upholstered furniture within detention and correctional occupancies shall meet the criteria specified in **10.3.2.1(2)** and **10.3.3**.

**22.4.4.13.2\*** Newly introduced mattresses within detention and correctional occupancies shall meet the criteria specified in **10.3.2.2** and **10.3.4**.

**A.22.4.4.13.2** Mattresses used in detention and correctional facilities should be evaluated with regard to the fire hazards of the environment. The potential for vandalism and excessive wear and tear also should be taken into account when evaluating the fire performance of the mattress. ASTM F 1870, *Standard Guide for Selection of Fire Test Methods for the Assessment of Upholstered Furnishings in Detention and Correctional Facilities*, provides guidance for this purpose.

## CHAPTER 22 • New

**22.4.5 Lockups.****22.4.5.1 General.**

**22.4.5.1.1** Lockups in occupancies, other than detention and correctional occupancies and health care occupancies, where the holding area has capacity for more than 50 detainees shall be classified as detention and correctional occupancies and shall comply with the requirements of **Chapter 22**.

**22.4.5.1.2** Lockups in occupancies, other than detention and correctional occupancies and health care occupancies, where any individual is detained for 24 or more hours shall be classified as detention and correctional occupancies and shall comply with the requirements of **Chapter 22**.

**22.4.5.1.3** Lockups in occupancies, other than detention and correctional occupancies and health care occupancies, where the holding area has capacity for not more than 50 detainees, and where no individual is detained for 24 hours or more, shall comply with **22.4.5.1.4** or **22.4.5.1.5**.

**22.4.5.1.4** The lockup shall be permitted to comply with the requirements for the predominant occupancy in which the lockup is placed, provided that all of the following criteria are met:

- (1)\* Doors and other physical restraints to free egress by detainees can be readily released by staff within 2 minutes of the onset of a fire or similar emergency.
- (2) Staff is in sufficient proximity to the lockup so as to be able to effect the 2-minute release required by **22.4.5.1.4(1)** whenever detainees occupy the lockup.
- (3) Staff is authorized to effect the release required by **22.4.5.1.4(1)**.
- (4) Staff is trained and practiced in effecting the release required by **22.4.5.1.4(1)**.
- (5) Where the release required by **22.4.5.1.4(1)** is effected by means of remote release, detainees are not to be restrained from evacuating without the assistance of others.

**A.22.4.5.1.4(1)** The term *other physical restraints* is meant to include the use of personal restraint devices, such as handcuffs or shackles, where occupants are secured to the structure or furnishings to restrict movement.

**22.4.5.1.5** Where the lockup does not comply with all the criteria of **22.4.5.1.4**, the requirements of **22.4.5.2** shall be met.

**22.4.5.1.6** The fire department with responsibility for responding to a building that contains a lockup shall be notified of the presence of the lockup.

**22.4.5.2 Alternate Provisions.**

**22.4.5.2.1** The requirements applicable to the predominant occupancy in which the lockup is placed shall be met.

## CHAPTER 23 • Existing

**23.4.5 Lockups.****23.4.5.1 General.**

**23.4.5.1.1** Lockups in occupancies, other than detention and correctional occupancies and health care occupancies, where the holding area has capacity for more than 50 detainees shall be classified as detention and correctional occupancies and shall comply with the requirements of **Chapter 23**.

**23.4.5.1.2** Lockups in occupancies, other than detention and correctional occupancies and health care occupancies, where any individual is detained for 24 or more hours shall be classified as detention and correctional occupancies and shall comply with the requirements of **Chapter 23**.

**23.4.5.1.3** Lockups in occupancies, other than detention and correctional occupancies and health care occupancies, where the holding area has capacity for not more than 50 detainees, and where no individual is detained for 24 hours or more, shall comply with **23.4.5.1.4** or **23.4.5.1.5**.

**23.4.5.1.4** The lockup shall be permitted to comply with the requirements for the predominant occupancy in which the lockup is placed, provided that all of the following criteria are met:

- (1)\* Doors and other physical restraints to free egress by detainees can be readily released by staff within 2 minutes of the onset of a fire or similar emergency.
- (2) Staff is in sufficient proximity to the lockup so as to be able to effect the 2-minute release required by **23.4.5.1.4(1)** whenever detainees occupy the lockup.
- (3) Staff is authorized to effect the release required by **23.4.5.1.4(1)**.
- (4) Staff is trained and practiced in effecting the release required by **23.4.5.1.4(1)**.
- (5) Where the release required by **23.4.5.1.4(1)** is effected by means of remote release, detainees are not to be restrained from evacuating without the assistance of others.

**A.23.4.5.1.4(1)** The term *other physical restraints* is meant to include the use of personal restraint devices, such as handcuffs or shackles, where occupants are secured to the structure or furnishings to restrict movement.

**23.4.5.1.5** Where the lockup does not comply with all the criteria of **23.4.5.1.4**, the requirements of **23.4.5.2** shall be met.

**23.4.5.1.6** The fire department with responsibility for responding to a building that contains a lockup shall be notified of the presence of the lockup.

**23.4.5.2 Alternate Provisions.**

**23.4.5.2.1** The requirements applicable to the predominant occupancy in which the lockup is placed shall be met.

## CHAPTER 22 • New

**22.4.5.2.2** Where security operations necessitate the locking of required means of egress, the following shall apply:

- (1) Detention-grade hardware meeting the requirements of ASTM F 1577, *Standard Test Methods for Detention Locks for Swinging Doors*, shall be provided on swinging doors within the required means of egress.
- (2) Sliding doors within the required means of egress shall be designed and engineered for detention and correctional use, and lock cylinders shall meet the cylinder test requirements of ASTM F 1577.

**22.4.5.2.3** The lockup shall be provided with a complete smoke detection system in accordance with [9.6.2.9](#).

**22.4.5.2.4** Where the requirements applicable to the predominant occupancy do not mandate a fire alarm system, the lockup shall be provided with a fire alarm system meeting all of the following criteria:

- (1) The alarm system shall be in accordance with [Section 9.6](#).
- (2) Initiation of the alarm system shall be accomplished by all of the following:
  - (a) Manual fire alarm boxes in accordance with [9.6.2](#)
  - (b) Smoke detection system required by [22.4.5.2.3](#)
  - (c) Automatic sprinkler system required by the provisions applicable to the predominant occupancy
- (3) Staff and occupant notification shall be provided automatically in accordance with [9.6.3](#).
- (4) Emergency force notification shall be provided in accordance with [9.6.4](#).

As stated in [A.22/A.23.1.1.1.7](#), lockups in which persons are detained with some degree of security imposed on them are common in many types of occupancies. Examples include the following:

1. Immigration and naturalization facilities at border crossings
2. Customs facilities at international airports
3. Prisoner holding facilities at courthouses
4. Local police department holding areas
5. Security offices at sports stadia
6. Security offices at shopping mall complexes

[Exhibit 22/23.28](#) shows a processing/holding area in a detention and correctional occupancy, but such an area is located outside the residential housing units. A similar holding area in a courthouse would constitute a lockup.

Most of the occupancy chapters were written to provide life safety for the ambulatory and unrestrained occupant population characteristic of the occupancy, and not for those who are detained. The health care occupancy chapters utilize a defend-in-place strategy that addresses door locking and staff inter-

## CHAPTER 23 • Existing

**23.4.5.2.2** Where security operations necessitate the locking of required means of egress, the following shall apply:

- (1) Detention-grade hardware meeting the requirements of ASTM F 1577, *Standard Test Methods for Detention Locks for Swinging Doors*, shall be provided on swinging doors within the required means of egress.
- (2) Sliding doors within the required means of egress shall be designed and engineered for detention and correctional use, and lock cylinders shall meet the cylinder test requirements of ASTM F 1577.

**23.4.5.2.3** The lockup shall be provided with a complete smoke detection system in accordance with [9.6.2.9](#).

**23.4.5.2.4** Where the requirements applicable to the predominant occupancy do not require a fire alarm system, the lockup shall be provided with a fire alarm system meeting all of the following criteria:

- (1) The alarm system shall be in accordance with [Section 9.6](#).
- (2) Initiation of the alarm system shall be accomplished by all of the following:
  - (a) Manual fire alarm boxes in accordance with [9.6.2](#)
  - (b) Smoke detection system required by [23.4.5.2.3](#)
  - (c) Automatic sprinkler system required by the provisions applicable to the predominant occupancy
- (3) Staff and occupant notification shall be provided automatically in accordance with [9.6.3](#).
- (4) Emergency force notification shall be provided in accordance with [9.6.4](#).

**Exhibit 22/23.28**

*Processing and holding area.*

action, so as to obviate the need for any additional criteria for areas where occupants might be detained. Other occupancy chapters (such as those applicable to dwellings, lodging or rooming houses, and small residential board and care facilities) address buildings that are sufficiently limited in size, so that the

## CHAPTER 22 • New

presence of a lockup is rare. The occupancies that mandate use of the provisions of 22/23.4.5 are as follows:

1. Assembly occupancies (12.2.11.2, 13.2.11.2)
2. Educational occupancies (14.2.11.2, 15.2.11.2)
3. Day-care occupancies (16.2.11.2, 17.2.11.2)
4. Ambulatory health care occupancies (20.2.11.2, 21.2.11.2)
5. Hotels and dormitories (28.2.11.2, 29.2.11.2)
6. Apartment buildings (30.2.11.2, 31.2.11.2)
7. Residential board and care occupancies (large) (32.3.2.11.2, 33.3.2.11.2)
8. Mercantile occupancies (36.2.11.2, 37.2.11.2)
9. Business occupancies (38.2.11.2, 39.2.11.2)
10. Industrial occupancies (40.2.11.2)
11. Storage occupancies (42.2.11.2)

Where the occupancy chapters applicable to existing conditions reference the requirements of 23.4.5, an exemption is provided for approved existing lockups. If the authority having jurisdiction approves the existing arrangement as meeting the Code's intent, further upgrading is not required.

The provisions of 22/23.4.5 for lockups were written to serve as a bridge between the rigorous, defend-in-place provisions applicable to detention and correctional occupancy residential housing areas, as detailed in Chapters 22 and 23, and the provisions applicable to the predominant occupancy in which the lockup is located. The provisions for lockups are meant to apply to holding areas of limited capacity in which no individual is detained for 24 or more hours. Paragraph 22/23.4.5.1.1 establishes that, if the holding area has capacity for more than 50 detainees, it must be classified as a detention and correctional occupancy. Similarly, 22/23.4.5.1.2 mandates that, if any individual is detained for 24 or more hours, the holding area must be classified as a detention and correctional occupancy. Once classified as a detention and correctional occupancy, the holding area is subject to the provisions of Section 22/23.1 through 22/23.4.4 and Sections 22/23.5 through 22/23.7. Therefore, the holding area is classified as a lockup and is subject to the provisions of 22/23.4.5.1.4 through 22/23.4.5.2.4 only if it has capacity for not more than 50 detainees and no individual is detained for 24 hours or more.

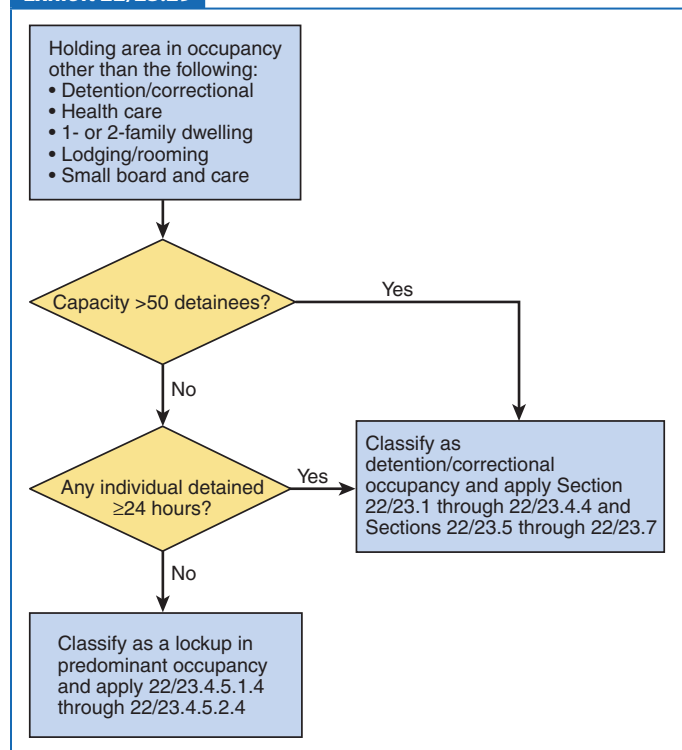

The provision of 22/23.4.5.1.6 was added for the 2012 edition of the Code. The fire department that will respond to a building that contains a lockup needs to be aware of the presence of the lockup so resources can be assigned to the detainees.

Exhibit 22/23.29 outlines the test for determining occupancy classification and the applicable set of requirements for lockups (other than approved existing lockups) in any of the 11 occupancies listed previously in this commentary.

The provisions of 22/23.4.5.2 are often mistakenly believed to be an equivalent to, or a substitute for, the provisions of 22/23.4.5.1.4. Had the technical committee intended the

## CHAPTER 23 • Existing

## Exhibit 22/23.29

Flowchart for lockup occupancy classification and applicable provisions.

provisions of 22/23.4.5.2 to be a substitute or an equivalent form of protection, the introduction to 22/23.4.5.1.4 would have been formatted to instruct the user to follow one requirement or the other (i.e., 22/23.4.5.1.4 or 22/23.4.5.2). The user first encounters 22/23.4.5.1.4 and is told to meet the detailed criteria of 22/23.4.5.1.4(1) through (5). The provision of 22/23.4.5.1.5 allows use of 22/23.4.5.2 only if all the criteria of 22/23.4.5.1.4 are not met. The criterion most commonly not met is 22/23.4.5.1.4(2), relative to staff being able to effect a 2-minute release. The provisions of 22/23.4.5.2 might be used where the criteria of 22/23.4.5.1.4(1), (3), (4), and (5) are met but the facility is deficient with respect to the provision of 22/23.4.5.1.4(2). The title of 22.4.5.2, Alternate Provisions, could be the cause of some confusion and misuse.

Paragraph 22/23.4.5.1.4 requires a system of safeguards so that doors and physical restraints to free egress by detainees can be readily released by trained staff, who have the authority to effect such release, within 2 minutes of the onset of a fire or similar emergency. This requires the holding area (1) to be staffed at all times when detainees are present or (2) to have staff in close proximity and to have the detection and notification technology needed to summon such staff immediately upon the onset of an emergency. Note that 22/23.4.5.1.4(5) does not prohibit the

## CHAPTER 22 • New

remote release of doors, but, in such cases, detainees are not permitted to be restrained, as might be the case where a detainee is handcuffed to a post.

Paragraph 22/23.4.5.1.5 offers the use of the provisions of 22/23.4.5.2, but only where all the criteria of the 2-minute release option of 22/23.4.5.1.4 are not satisfied. This alternate set of provisions relies heavily on the presence of a complete smoke detection system within the lockup and its use to summon staff

**22.4.6\* Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers shall be permitted where both of the following criteria are met:

- (1) The detention and correction facility permits their use.
- (2) The installation meets the requirements in 8.7.3.3.

**A.22.4.6** The health, security, and fire safety implications should be reviewed by the detention and correction facility prior to installation.

The provision of 22.4.6 permitting alcohol-based hand-rub (ABHR) dispensers is new for the 2015 edition of the Code. Chapter 8 was revised to include ABHR dispenser provisions for referencing by

---

## 22.5 Building Services

### 22.5.1 Utilities.

**22.5.1.1** Utilities shall comply with the provisions of Section 9.1.

**22.5.1.2** Alarms, emergency communications systems, and the illumination of generator set locations shall be provided with emergency power in accordance with *NFPA 70, National Electrical Code*.

### 22.5.2 Heating, Ventilating, and Air-Conditioning.

**22.5.2.1** Heating, ventilating, and air-conditioning equipment shall comply with the provisions of Section 9.2 and shall be installed in accordance with the manufacturer's specifications, unless otherwise modified by 22.5.2.2.

## CHAPTER 23 • Existing

and emergency forces personnel via the alarm system, which is required even if otherwise exempted for the predominant occupancy. If the Code provisions applicable to the predominant occupancy require sprinkler protection, waterflow in the sprinkler system must initiate the required alarm system, but this provision, by itself, does not mandate sprinkler protection. The option also imposes requirements for detention-grade door hardware for reliability concerns.

**23.4.6\* Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers shall be permitted where both of the following criteria are met:

- (1) The detention and correction facility permits their use.
- (2) The installation meets the requirements in 8.7.3.3.

**A.23.4.6** The health, security, and fire safety implications should be reviewed by the detention and correction facility prior to installation.

the occupancy chapters. Had Chapters 22 and 23 not recognized the provisions of 8.7.3.3, ABHR dispensers would have to be treated as flammable liquids in accordance with 8.7.3.1.

---

## 23.5 Building Services

### 23.5.1 Utilities.

**23.5.1.1** Utilities shall comply with the provisions of Section 9.1.

**23.5.1.2** Alarms, emergency communications systems, and the illumination of generator set installations shall be provided with emergency power in accordance with *NFPA 70, National Electrical Code*, unless otherwise permitted by 23.5.1.3.

**23.5.1.3** Systems complying with earlier editions of *NFPA 70, National Electrical Code*, and not presenting a life safety hazard shall be permitted to continue to be used.

### 23.5.2 Heating, Ventilating, and Air-Conditioning.

**23.5.2.1** Heating, ventilating, and air-conditioning equipment shall comply with the provisions of Section 9.2 and shall be installed in accordance with the manufacturer's specifications, unless otherwise permitted by one of the following:

- (1) The requirement of 23.5.2.1 shall not apply where otherwise modified by 23.5.2.2.
- (2) Systems complying with earlier editions of the applicable codes and not presenting a life safety hazard shall be permitted to continue to be used.

## CHAPTER 22 • New

**22.5.2.2** Portable space-heating devices shall be prohibited, unless otherwise permitted by [22.5.2.4](#).

**22.5.2.3** Any heating device, other than a central heating plant, shall be designed and installed so that combustible material cannot be ignited by the device or its appurtenances, and both of the following requirements also shall apply:

- (1) If fuel-fired, such heating devices shall comply with all of the following:
  - (a) They shall be chimney connected or vent connected.
  - (b) They shall take air for combustion directly from outside.
  - (c) They shall be designed and installed to provide for complete separation of the combustion system from the atmosphere of the occupied area.
- (2) The heating system shall have safety devices to immediately stop the flow of fuel and shut down the equipment in case of either excessive temperatures or ignition failure.

**22.5.2.4** Approved, suspended unit heaters shall be permitted in locations other than means of egress and sleeping areas, provided that both of the following criteria are met:

- (1) Such heaters are located high enough to be out of the reach of persons using the area.
- (2) Such heaters are vent connected and equipped with the safety devices required by [22.5.2.3\(2\)](#).

**22.5.2.5** Combustion and ventilation air for boiler, incinerator, or heater rooms shall be taken directly from, and discharged directly to, the outside.

**22.5.3 Elevators, Escalators, and Conveyors.** Elevators, escalators, and conveyors shall comply with the provisions of [Section 9.4](#).

#### **22.5.4 Waste Chutes, Incinerators, and Laundry Chutes.**

**22.5.4.1** Waste chutes, incinerators, and laundry chutes shall comply with the provisions of [Section 9.5](#).

**22.5.4.2** Waste chutes and linen chutes, including pneumatic waste and linen systems, shall be provided with automatic extinguishing protection in accordance with [Section 9.7](#).

**22.5.4.3** Waste chutes shall discharge into a chute discharge room used for no purpose other than collection of waste and shall be protected in accordance with [Sections 8.7](#) and [9.5](#).

**22.5.4.4** Incinerators shall not be directly flue-fed, and floor chutes shall not directly connect with the combustion chamber.

## CHAPTER 23 • Existing

**23.5.2.2** Portable space-heating devices shall be prohibited, unless otherwise permitted by [23.5.2.4](#).

**23.5.2.3** Any heating device, other than a central heating plant, shall be designed and installed so that combustible material cannot be ignited by the device or its appurtenances, and both of the following requirements also shall apply:

- (1) If fuel-fired, such heating devices shall comply with all of the following:
  - (a) They shall be chimney connected or vent connected.
  - (b) They shall take air for combustion directly from outside.
  - (c) They shall be designed and installed to provide for complete separation of the combustion system from the atmosphere of the occupied area.
- (2) The heating system shall have safety devices to immediately stop the flow of fuel and shut down the equipment in case of either excessive temperatures or ignition failure.

**23.5.2.4** Approved, suspended unit heaters shall be permitted in locations other than means of egress and sleeping areas, provided that both of the following criteria are met:

- (1) Such heaters are located high enough to be out of the reach of persons using the area.
- (2) Such heaters are vent connected and equipped with the safety devices required by [23.5.2.3\(2\)](#).

**23.5.2.5** Combustion and ventilation air for boiler, incinerator, or heater rooms shall be taken directly from, and discharged directly to, the outside.

**23.5.3 Elevators, Escalators, and Conveyors.** Elevators, escalators, and conveyors shall comply with the provisions of [Section 9.4](#).

#### **23.5.4 Waste Chutes, Incinerators, and Laundry Chutes.**

**23.5.4.1** Waste chutes, incinerators, and laundry chutes shall comply with the provisions of [Section 9.5](#).

**23.5.4.2** Waste chutes and linen chutes, including pneumatic waste and linen systems, shall be provided with automatic extinguishing protection in accordance with [Section 9.7](#).

**23.5.4.3** Waste chutes shall discharge into a chute discharge room used for no purpose other than collection of waste and protected in accordance with [Sections 8.7](#) and [9.5](#).

**23.5.4.4** Incinerators shall not be directly flue-fed, and floor chutes shall not directly connect with the combustion chamber.

## CHAPTER 22 • New

**22.6 Reserved****22.7 Operating Features****22.7.1 Attendants, Evacuation Plan, and Fire Drills.**

**22.7.1.1** Detention and correctional facilities, or those portions of facilities having such occupancy, shall be provided with 24-hour staffing, and the following requirements also shall apply:

- (1) Staff shall be within three floors or a 300 ft (91 m) horizontal distance of the access door of each resident housing area.
- (2) For Use Condition III, Use Condition IV, and Use Condition V, the arrangement shall be such that the staff involved starts the release of locks necessary for emergency evacuation or rescue and initiates other necessary emergency actions within 2 minutes of alarm.
- (3) The following shall apply to areas in which all locks are unlocked remotely in compliance with 22.2.11.8:
  - (a) Staff shall not be required to be within three floors or 300 ft (91 m) of the access door.
  - (b) The 10-lock, manual key exemption of 22.2.11.8.2 shall not be permitted to be used in conjunction with the alternative requirement of 22.7.1.1(3)(a).

**22.7.1.2\*** Provisions shall be made so that residents in Use Condition III, Use Condition IV, and Use Condition V shall be able to notify staff of an emergency.

**A.22.7.1.2** This requirement is permitted to be met by electronic or oral monitoring systems, visual monitoring, call signals, or other means.

**22.7.1.3\*** The administration of every detention or correctional facility shall have, in effect and available to all supervisory personnel, written copies of a plan for the protection of all persons in the event of fire, for their evacuation to areas of refuge, and for evacuation from the building when necessary.

**A.22.7.1.3** Periodic, coordinated training should be conducted and should involve detention and correctional facility personnel and personnel of the fire department legally committed to serving the facility.

**22.7.1.3.1** All employees shall be instructed and drilled with respect to their duties under the plan.

**22.7.1.3.2** The plan shall be coordinated with, and reviewed by, the fire department legally committed to serve the facility.

## CHAPTER 23 • Existing

**23.6 Reserved****23.7 Operating Features****23.7.1 Attendants, Evacuation Plan, and Fire Drills.**

**23.7.1.1** Detention and correctional facilities, or those portions of facilities having such occupancy, shall be provided with 24-hour staffing, and the following requirements also shall apply:

- (1) Staff shall be within three floors or a 300 ft (91 m) horizontal distance of the access door of each resident housing area.
- (2) For Use Condition III, Use Condition IV, and Use Condition V, the arrangement shall be such that the staff involved starts the release of locks necessary for emergency evacuation or rescue and initiates other necessary emergency actions within 2 minutes of alarm.
- (3) The following shall apply to areas in which all locks are unlocked remotely in compliance with 23.2.11.8:
  - (a) Staff shall not be required to be within three floors or 300 ft (91 m) of the access door.
  - (b) The 10-lock, manual key exemption of 23.2.11.8.2 shall not be permitted to be used in conjunction with the alternative requirement of 23.7.1.1(3)(a).

**23.7.1.2\*** Provisions shall be made so that residents in Use Condition III, Use Condition IV, and Use Condition V shall be able to notify staff of an emergency.

**A.23.7.1.2** This requirement is permitted to be met by electronic or oral monitoring systems, visual monitoring, call signals, or other means.

**23.7.1.3\*** The administration of every detention or correctional facility shall have, in effect and available to all supervisory personnel, written copies of a plan for the protection of all persons in the event of fire, for their evacuation to areas of refuge, and for evacuation from the building when necessary.

**A.23.7.1.3** Periodic, coordinated training should be conducted and should involve detention and correctional facility personnel and personnel of the fire department legally committed to serving the facility.

**23.7.1.3.1** All employees shall be instructed and drilled with respect to their duties under the plan.

**23.7.1.3.2** The plan shall be coordinated with, and reviewed by, the fire department legally committed to serve the facility.

## CHAPTER 22 • New

**22.7.1.4** Employees of detention and correctional occupancies shall be instructed in the proper use of portable fire extinguishers and other manual fire suppression equipment.

**22.7.1.4.1** The training specified in **22.7.1.4** shall be provided to new staff promptly upon commencement of duty.

**22.7.1.4.2** Refresher training shall be provided to existing staff at not less than annual intervals.

**22.7.2\* Combustible Personal Property.** Books, clothing, and other combustible personal property allowed in sleeping rooms shall be stored in closable metal lockers or an approved fire-resistant container.

**A.22.7.2** Personal property provides combustible contents for fire development. Therefore, adequate controls are needed to limit the quantity and combustibility of the fuels available to burn to reduce the probability of room flashover. The provisions of **22.7.4** will not, by themselves, prevent room flashover if personal property controls are not provided.

**22.7.3 Heat-Producing Appliances.** The number of heat-producing appliances, such as toasters and hot plates, and the overall use of electrical power within a sleeping room shall be controlled by facility administration.

**22.7.4\* Furnishings, Mattresses, and Decorations.**

**A.22.7.4** The type, quantity, and arrangement of furniture and other combustibles are important factors in determining how fast the fire will develop. Furnishings, including upholstered items and wood items, such as wardrobes, desks, and bookshelves, might provide sufficient fuel to result in room flashover, which is the full fire involvement of all combustibles within a room once sufficient heat has been built up within the room.

**22.7.4.1** Draperies and curtains, including privacy curtains, in detention and correctional occupancies shall be in accordance with the provisions of **10.3.1**.

**22.7.4.2** Newly introduced upholstered furniture within detention and correctional occupancies shall be tested in accordance with the provisions of **10.3.2.1(2)**.

**22.7.4.3** Newly introduced mattresses within detention and correctional occupancies shall be tested in accordance with the provisions of **10.3.2.2**.

## CHAPTER 23 • Existing

**23.7.1.4** Employees of detention and correctional occupancies shall be instructed in the proper use of portable fire extinguishers and other manual fire suppression equipment.

**23.7.1.4.1** The training specified in **23.7.1.4** shall be provided to new staff promptly upon commencement of duty.

**23.7.1.4.2** Refresher training shall be provided to existing staff at not less than annual intervals.

**23.7.2\* Combustible Personal Property.** Books, clothing, and other combustible personal property allowed in sleeping rooms shall be stored in closable metal lockers or an approved fire-resistant container.

**A.23.7.2** Personal property provides combustible contents for fire development. Therefore, adequate controls are needed to limit the quantity and combustibility of the fuels available to burn to reduce the probability of room flashover. The provisions of **23.7.4** will not, by themselves, prevent room flashover if personal property controls are not provided.

**23.7.3 Heat-Producing Appliances.** The number of heat-producing appliances, such as toasters and hot plates, and the overall use of electrical power within a sleeping room shall be controlled by facility administration.

**23.7.4 Furnishings, Mattresses, and Decorations.**

**23.7.4.1** Draperies and curtains, including privacy curtains, in detention and correctional occupancies shall be in accordance with the provisions of **10.3.1**.

**23.7.4.2** Newly introduced upholstered furniture within detention and correctional occupancies shall meet the criteria specified in **10.3.2.1(2)** and **10.3.3**.

**23.7.4.3\*** Newly introduced mattresses within detention and correctional occupancies shall meet the criteria specified in **10.3.2.2** and **10.3.4**.

**A.23.7.4.3** Mattresses used in detention and correctional facilities should be evaluated with regard to the fire hazards of the environment. The potential for vandalism and excessive wear and tear also should be taken into account when evaluating the fire performance of the mattress. ASTM F 1870, *Standard Guide for Selection of Fire Test Methods for the Assessment of Upholstered Furnishings in Detention and Correctional Facilities*, provides guidance for this purpose.

## CHAPTER 22 • New

**22.7.4.4** Combustible decorations shall be prohibited in any detention or correctional occupancy unless flame-retardant.

**22.7.4.5** Wastebaskets and other waste containers shall be of noncombustible or other approved materials. Waste containers with a capacity exceeding 20 gal (76 L) shall be provided with a noncombustible lid or lid of other approved material.

**22.7.5 Keys.** All keys necessary for unlocking doors installed in a means of egress shall be individually identified by both touch and sight.

**22.7.6 Portable Space-Heating Devices.** Portable space-heating devices shall be prohibited in all detention and correctional occupancies.

**22.7.7 Door Inspection.** Doors and door hardware in means of egress shall be inspected monthly by an appropriately trained person. The inspection shall be documented.

Paragraph 22/23.7.1.1 requires 24-hour staffing. Staffing is typically accomplished from control rooms that provide staff with visibility of large spaces or multiple areas, including those on more than one level. Such control rooms are often walled in glass or other glazing material. Exhibit 22/23.30 shows a glass-enclosed control room.

Paragraph 22/23.7.1.2 requires that residents in Use Condition III, Use Condition IV, and Use Condition V facilities be able to notify staff of an emergency. Use Condition IV and Use Condition

Exhibit 22/23.30

Glass-enclosed control room.

## CHAPTER 23 • Existing

**23.7.4.4** Combustible decorations shall be prohibited in any detention or correctional occupancy unless flame-retardant.

**23.7.4.5** Wastebaskets and other waste containers shall be of noncombustible or other approved materials. Waste containers with a capacity exceeding 20 gal (76 L) shall be provided with a noncombustible lid or lid of other approved material.

**23.7.5 Portable Space-Heating Devices.** Portable space-heating devices shall be prohibited in all detention and correctional occupancies.

**23.7.6 Door Inspection.** Doors and door hardware in means of egress shall be inspected monthly by an appropriately trained person. The inspection shall be documented.

V facilities rely on staff action to release locks to allow residents to leave their rooms; Use Condition III, Use Condition IV, and Use Condition V facilities rely on staff action to release locks to allow residents to move to an adjacent smoke compartment. The staff needs to be made aware of fire conditions early in a fire. Thus, in case residents discover a fire before automatic detection devices are initiated, they need a means of notifying staff.

A properly designed and well-tested fire emergency plan, as required by 22/23.7.1.3, is important in detention and correctional occupancies where residents depend heavily on staff performance for safety under fire conditions.

The provisions of 22/23.7.4 make use of the menu of provisions in Section 10.3 that apply to furnishings and contents, particularly those that address upholstered furniture and mattresses. Nevertheless, the control of combustible personal property is needed to limit fire development in sprinklered facilities and prevent the occurrence of room flashover in nonsprinklered facilities. Paragraph 22/23.7.2 provides staff with the authority to regulate the quantities of personal property in sleeping rooms.

The provisions of 22/23.7.4.1 through 22/23.7.4.5 are the most rigorous regulations of contents and furnishings provided by this Code. It is appropriate that these provisions be applied to detention and correctional occupancies in consideration of the protect-in-place strategy required of these occupancies by the Code and the reluctance of staff to unlock doors to allow residents to move to the outside.

Draperies and curtains must be flame resistant in accordance with 10.3.1, which requires flame propagation performance criteria in accordance with NFPA 701, *Standard Methods of Fire Tests for Flame Propagation of Textiles and Films*.<sup>9</sup>

Paragraphs 22/23.7.4.2 and 22/23.7.4.3 require newly introduced upholstered furniture and mattresses to be resistant to

## CHAPTER 22 • New

cigarette ignition, regardless of whether the facility is sprinklered. Paragraphs 23.7.4.2 and 23.7.4.3 also have the effect of limiting the rate of heat release for newly introduced upholstered furniture and mattresses in existing, nonsprinklered detention and correctional facilities.

The provision of 22/23.7.7 recognizes that detention and correctional occupancies make extensive use of doors — especially locked doors — for security reasons, and such doors need inspection. It is particularly important that doors and door hardware be inspected regularly in these occupancies.

# One- and Two-Family Dwellings

Although most people feel safest in their homes, fire deaths in the home account for some 80 percent of all fatalities attributable to fire in the United States. **Chapter 24** highlights a number of factors that significantly mitigate the fire problem. A key and unique component that is addressed in this chapter, and that is selectively applied to the other residential chapters, is *means of escape* (see **Section 24.2**). The concept of means of escape focuses on providing a second way out of an occupied room or space within a living unit, regardless of whether it is a single-family home or a dwelling unit within an apartment building. Means of escape features do not need to meet the high standards and criteria that apply to means of egress, as described in **Chapter 7**. In short, means of escape is an important yet broadly applied concept that is intended to reduce the chance of occupants becoming trapped in a room or space if the primary escape route is unavailable.

Recognizing that the greatest number of fire fatalities occurs in what has historically been the least regulated occupancy, the *Code* has required, since the 2006 edition, all new one- and two-family dwellings to be protected by automatic sprinkler systems. Residential sprinkler systems have a phenomenal record of success in preventing fire deaths and injuries. Although residential sprinkler systems are designed exclusively to protect life, and not necessarily property, many homes and personal possessions have, in fact, been saved from the devastating effects of fire thanks to their installation.

While the 2006 edition of the *Code*, along with the 2006 edition of *NFPA 5000*<sup>®</sup>, *Building Construction and Safety Code*<sup>®</sup>,<sup>1</sup> were the first model codes in the United States to require sprinklers in new one- and two-family dwellings, numerous communities paved the way by enacting local sprinkler legislation. For example, Scottsdale, Arizona, was among the first cities in the United States to mandate sprinklers in new homes effective January 1, 1986. Ten years later, a report titled “Automatic Sprinklers: A 10 Year Study — A Detailed History of the Effects of the Automatic Sprinkler Code in Scottsdale, Arizona”<sup>2</sup> (commonly known as the *Scottsdale Report*), was published. The report provides compelling data to support the economic feasibility of mandating automatic sprinklers in dwellings. See the commentary following **24.3.5.1** for further discussion of the *Scottsdale Report*.

Prince Georges County, Maryland, is another community that is largely recognized as a leader for its residential sprinkler mandate, which became effective on January 1, 1992.

In addition to requiring automatic sprinklers in new one- and two-family dwellings, **Chapter 24** regulates interior wall and ceiling finish and mandates the installation of smoke alarms.

**Chapter 24** also mandates the installation of carbon monoxide (CO) detection equipment in new dwellings. As is the case in other residential occupancies, these features work together to greatly improve the safety of occupants.

---

## 24.1 General Requirements

### 24.1.1 Application.

**24.1.1.1** This chapter shall apply to one- and two-family dwellings.

**24.1.1.2\*** One- and two-family dwellings shall be limited to buildings containing not more than two dwelling units in which each dwelling unit is occupied by members of a single family with not more than three outsiders, if any, accommodated in rented rooms.

**A.24.1.1.2** The *Code* specifies that, wherever there are three or more living units in a building, the building is considered an apartment building and is required to comply with either **Chapter 30** or **Chapter 31**, as appropriate. A townhouse unit is considered to be an apartment building if there are three or more units in the building. The type of wall required between units in order to consider them as separate buildings is normally established by the authority having jurisdiction. If the units are separated by a wall of sufficient fire resistance and structural integrity to be considered as separate buildings, the provisions of **Chapter 24** apply to each townhouse. Condominium status is a form of ownership, not occupancy; for example, there are condominium warehouses, condominium apartments, and condominium offices.

The provisions of **24.1.1.2** state that, in one- and two-family dwellings, each dwelling unit can be “occupied by members of a single family with not more than three outsiders.” The *Code* does not define the term *family*. The definition of *family* is subject to federal, state, and local regulations and might not be restricted to a person or a couple (two people) and their children. The following examples aid in differentiating between a single-family dwelling and a lodging or rooming house:

- (1) An individual or a couple (two people) who rent a house from a landlord and then sublease space for up to three individuals should be considered a family renting to a maximum of three outsiders, and the house should be regulated as a single-family dwelling in accordance with **Chapter 24**.

- (2) A house rented from a landlord by an individual or a couple (two people) in which space is subleased to 4 or more individuals, but not more than 16, should be considered and regulated as a lodging or rooming house in accordance with [Chapter 26](#).
- (3) A residential building that is occupied by 4 or more individuals, but not more than 16, each renting from a landlord, without separate cooking facilities, should be considered and regulated as a lodging or rooming house in accordance with [Chapter 26](#).

Considerable debate has centered on the meaning of the term *family*. It is not the intent of [24.1.1.2](#) to define the term; however, [A.24.1.1.2](#) provides assistance in determining where the use of the term is inappropriate and another chapter of the *Code* should be applied. If more than three outsiders are accommodated in rented rooms within a dwelling unit, the occupancy should be classified as a lodging or rooming house and should meet the requirements of [Chapter 26](#). The reasoning behind this classification guideline is that outsiders do not tend to keep each other as informed as family members do with regard to conditions within the building. In addition, when occupying their rooms, outsiders keep their room doors closed more often than do family members. The lack of communication and reduced openness and awareness justify the additional alarm system, vertical opening, and corridor wall and door requirements that apply to lodging or rooming houses.

**24.1.1.3** The requirements of this chapter shall apply to new buildings and to existing or modified buildings used as a one- or two-family dwelling according to the provisions of [1.3.1](#).

**24.1.1.4 Administration.** The provisions of [Chapter 1](#) shall apply.

**24.1.1.5 General.** The provisions of [Chapter 4](#) shall apply.

**24.1.2 Classification of Occupancy.** See [6.1.8](#) and [24.1.1.1](#).

**24.1.3 Multiple Occupancies.**

**24.1.3.1** Multiple occupancies shall be in accordance with [6.1.14](#).

**24.1.3.2** No dwelling unit of a residential occupancy shall have its sole means of egress pass through any nonresidential occupancy in the same building, unless otherwise permitted by [24.1.3.2.1](#) or [24.1.3.2.2](#).

**24.1.3.2.1** In buildings that are protected by an automatic sprinkler system in accordance with [Section 9.7](#), dwelling units of a residential occupancy shall be permitted to have their sole means of egress pass through a nonresidential occupancy in the same building, provided that all of the following criteria are met:

- (1) The dwelling unit of the residential occupancy shall comply with [Chapter 24](#).

- (2) The sole means of egress from the dwelling unit of the residential occupancy shall not pass through a high hazard contents area, as defined in [6.2.2.4](#).

**24.1.3.2.2** In buildings that are not protected by an automatic sprinkler system in accordance with [Section 9.7](#), dwelling units of a residential occupancy shall be permitted to have their sole means of egress pass through a nonresidential occupancy in the same building, provided that all of the following criteria are met:

- (1) The sole means of egress from the dwelling unit of the residential occupancy to the exterior shall be separated from the remainder of the building by fire barriers having a minimum 1-hour fire resistance rating.
- (2) The dwelling unit of the residential occupancy shall comply with [Chapter 24](#).
- (3) The sole means of egress from the dwelling unit of the residential occupancy shall not pass through a high hazard contents area, as defined in [6.2.2.4](#).

**24.1.3.3** Multiple dwelling units of a residential occupancy shall be permitted to be located above a nonresidential occupancy only where one of the following conditions exists:

- (1) Where the dwelling unit of the residential occupancy and exits therefrom are separated from the nonresidential occupancy by construction having a minimum 1-hour fire resistance rating
- (2) Where the nonresidential occupancy is protected throughout by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#)
- (3) Where the nonresidential occupancy is protected by an automatic fire detection system in accordance with [Section 9.6](#)

One- and two-family dwellings are commonly found above stores, offices, and restaurants. Locating these occupancies in proximity to each other presents a life safety challenge for the occupants of the residential dwellings. The typical configuration of these buildings creates the potential for a significant time lapse before occupants of the residential dwellings become aware of an emergency in another part of the building and take the necessary action. The provisions of [24.1.3.2](#) and [24.1.3.3](#) are intended to provide added protection for the residential occupancy during that time lapse. Therefore, these requirements are intended to apply wherever such a mixture of occupancies exists, whether in new construction or existing buildings.

**24.1.3.4** Atrium walls in accordance with [6.1.14.4.6](#) shall be permitted to serve as part of the separation required by [6.1.14.4.1](#) for creating separated occupancies on a story-by-story basis.

The provision of [24.1.3.4](#) permits a one- and two-family dwelling that is part of a separated, multiple occupancy building to utilize an atrium as a portion of the occupancy separation in accordance with [6.1.14.4.6](#). These criteria are new to the 2015 edition of the *Code*. See the commentary following [6.1.14.4.6](#) for additional details on the use of an atrium as an occupancy separation.

#### 24.1.4 Definitions.

**24.1.4.1 General.** For definitions, see [Chapter 3](#), Definitions.

**24.1.4.2 Special Definitions.** Special terms applicable to this chapter are defined in [Chapter 3](#) of this *Code*. Where necessary, other terms are defined in the text.

**24.1.5 Classification of Hazard of Contents.** The contents of residential occupancies shall be classified as ordinary hazard in accordance with [6.2.2](#).

NFPA 13, *Standard for the Installation of Sprinkler Systems*,<sup>3</sup> classifies the contents of a dwelling as light hazard for the purpose of designing automatic sprinkler systems. NFPA 13 classifies hazard on the basis of the challenge to the extinguishing capability of the automatic sprinkler system (light); hazard classification in this *Code* is based on the threat to life or life safety (ordinary).

**24.1.6 Minimum Construction Requirements. (Reserved)**

**24.1.7 Occupant Load. (Reserved)**

### 24.2\* Means of Escape Requirements

**A.24.2** The phrase “means of escape” indicates a way out of a residential unit that does not conform to the strict definition of means of egress but does meet the intent of the definition by providing an alternative way out of a building. (See the definition of means of escape in [3.3.173](#).)

**24.2.1 General.** The provisions of [Chapter 7](#) shall not apply to means of escape, unless specifically referenced in this chapter.

In [24.2.1](#), the term *means of escape* is used in contrast to the usual term, *means of egress*, because the escape paths required for a dwelling need not be the true exit access, exit, and exit discharge required for buildings intended to be occupied by the general public. The concept of means of escape is fully developed in [Section 24.2](#). The intent is that at least one means of escape (primary) be of a high degree of quality that is similar to the means of egress components described in [Chapter 7](#). Homes rarely have an egress arrangement complying with [Chapter 7](#). The door through which occupants normally enter and leave the dwelling can typically serve as the primary means of escape. Another way out of the dwelling, such as through a large, operable window, might be needed as the secondary means of escape. A secondary means of escape needs to be available for use if the route involving the primary means of escape becomes unusable during a fire or similar emergency.

Only the means of escape requirements of [Chapter 24](#) are required to be met, unless [Chapter 24](#) specifically references a means of egress provision of [Chapter 7](#). For example, [24.2.5.1](#)

mandatorily references the provisions of [7.2.2](#) and [7.2.5](#) for stairs, ramps, and their associated guards and handrails.

#### 24.2.2 Number and Types of Means of Escape.

##### 24.2.2.1 Number of Means of Escape.

**24.2.2.1.1** In dwellings or dwelling units of two rooms or more, every sleeping room and every living area shall have not less than one primary means of escape and one secondary means of escape.

See the definition of *living area* in [3.3.21.5](#)

The benefit of providing a primary and a secondary means of escape is based on the same concept as the requirements for two means of egress in other occupancies. The presence of two independent means of escape reduces the probability of a person becoming trapped by fire.

**24.2.2.1.2** A secondary means of escape shall not be required where one of the following conditions is met:

- (1) The bedroom or living area has a door leading directly to the outside of the building at or to the finished ground level.
- (2) The dwelling unit is protected throughout by an approved automatic sprinkler system in accordance with [24.3.5](#).

The sprinkler system referred to in [24.2.2.1.2\(2\)](#) must be installed in accordance with one of the following standards:

1. NFPA 13, *Standard for the Installation of Sprinkler Systems*
2. NFPA 13D, *Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes*<sup>4</sup>
3. NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*<sup>5</sup>

The sprinkler provision in [24.2.2.1.2\(2\)](#) is probably the most practical and common way to avoid providing secondary means of escape. The sprinkler provision might be used, for example, in an underground dwelling without windows or in a dwelling where the windows do not comply with [24.2.2.3.3](#). Since new one- and two-family dwellings are required to be sprinklered per [24.3.5.1](#), they are exempt from the requirement for secondary means of escape; it is assumed that the presence of an automatic sprinkler system will negate the need for occupants to escape via windows because the fire will be controlled or extinguished by the sprinklers.

**24.2.2.2 Primary Means of Escape.** The primary means of escape shall be a door, stairway, or ramp providing a means of unobstructed travel to the outside of the dwelling unit at street or the finished ground level.

A door, stairway, or ramp providing a means of unobstructed travel to the outside is usually provided for the functional purposes of entering and leaving the dwelling. Therefore, the requirement for a primary means of escape is usually automatically met in a typical dwelling.

Where an attic bedroom is accessible only by means of a trap door or folding ladder, the room does not meet the *Code* requirements for primary means of escape. Such bedrooms must be provided with direct stair access. See 24.2.5.6.

The primary means of escape from a dwelling unit in an apartment building, or from a guest room or guest suite in a hotel, is permitted to lead to a means of egress, such as a corridor leading to exit stairs complying with Chapter 7.

**24.2.2.3 Secondary Means of Escape.** The secondary means of escape, other than an existing approved means of escape, shall be one of the means specified in 24.2.2.3.1 through 24.2.2.3.4.

**24.2.2.3.1** It shall be a door, stairway, passage, or hall providing a way of unobstructed travel to the outside of the dwelling at street or the finished ground level that is independent of and remote from the primary means of escape.

**24.2.2.3.2** It shall be a passage through an adjacent nonlockable space, independent of and remote from the primary means of escape, to any approved means of escape.

**24.2.2.3.3\*** It shall be an outside window or door operable from the inside without the use of tools, keys, or special effort and shall provide a clear opening of not less than 5.7 ft<sup>2</sup> (0.53 m<sup>2</sup>). The width shall be not less than 20 in. (510 mm), and the height shall be not less than 24 in. (610 mm). The bottom of the opening shall be not more than 44 in. (1120 mm) above the floor. Such means of escape shall be acceptable where one of the following criteria is met:

- (1) The window shall be within 20 ft (6100 mm) of the finished ground level.
- (2) The window shall be directly accessible to fire department rescue apparatus as approved by the authority having jurisdiction.
- (3) The window or door shall open onto an exterior balcony.
- (4) Windows having a sill height below the adjacent finished ground level shall be provided with a window well meeting all of the following criteria:
  - (a) The window well shall have horizontal dimensions that allow the window to be fully opened.
  - (b) The window well shall have an accessible net clear opening of not less than 9 ft<sup>2</sup> (0.82 m<sup>2</sup>) with a length and width of not less than 36 in. (915 mm).
  - (c) A window well with a vertical depth of more than 44 in. (1120 mm) shall be equipped with an approved permanently affixed ladder or with steps meeting both of the following criteria:
    - i. The ladder or steps shall not encroach more than 6 in. (150 mm) into the required dimensions of the window well.
    - ii. The ladder or steps shall not be obstructed by the window.

**A.24.2.2.3.3** A window with dimensions of 20 in. × 24 in. (510 mm × 610 mm) has an opening of 3.3 ft<sup>2</sup> (0.31 m<sup>2</sup>), which

is less than the required 5.7 ft<sup>2</sup> (0.53 m<sup>2</sup>). Therefore, either the height or width needs to exceed the minimum requirement to provide the required clear area (see Figure A.24.2.2.3.3). The current minimum width and height dimensions, as well as the minimum clear opening, became a requirement of this *Code* in the 1976 edition and were based on tests conducted to determine the minimum size of the wall opening required to allow a fire fighter wearing complete turnout gear and a self-contained breathing apparatus entry to the room from the exterior to effect search and rescue. Prior editions of the *Code* limited the width or height, or both, to not less than 22 in. (560 mm) and a clear opening of 5 ft<sup>2</sup> (0.47 m<sup>2</sup>). For existing window frames and sash of steel construction, adherence to these dimensional criteria is essential to allow fire fighter entry. For existing window frames and sash of wood construction that can easily be removed prior

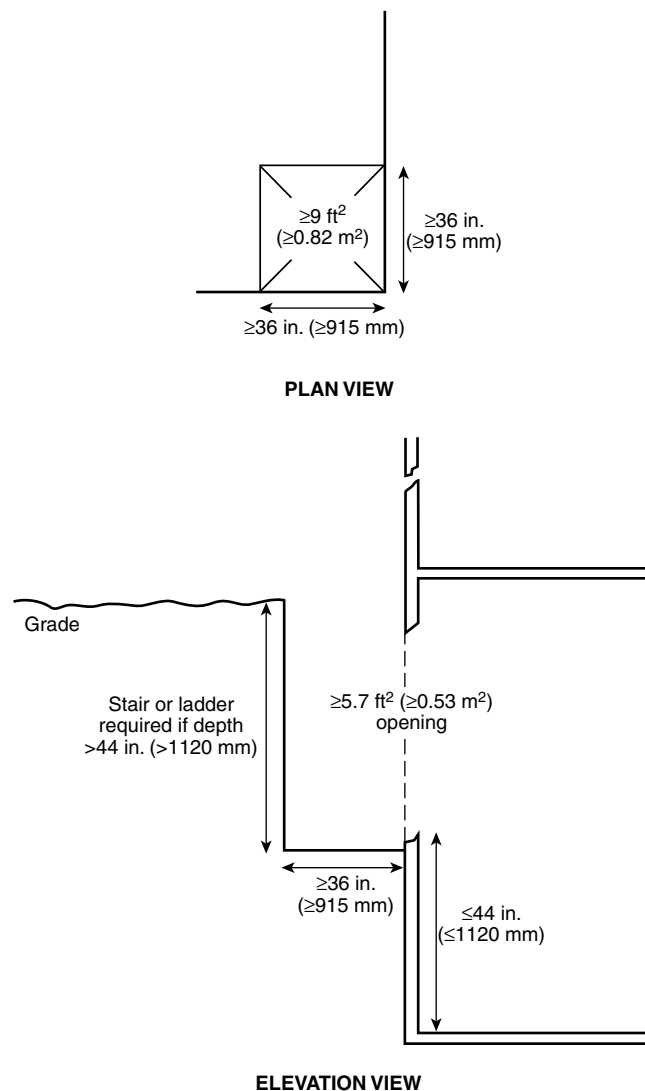

Figure A.24.2.2.3.3 Escape Window Utilizing a Window Well.

to entry by fire fighters to achieve the 5 ft<sup>2</sup> (0.47 m<sup>2</sup>) hole in the wall, the clear opening created by the occupant upon opening the window from the interior room side is required only to provide an opening measuring not less than 20 in. × 24 in. (510 mm × 610 mm) or 3.3 ft<sup>2</sup> (0.31 m<sup>2</sup>).

The purpose of the secondary means of escape is to provide an occupant with an alternate escape route when fire or smoke blocks the primary means of escape from the dwelling unit. The three types of secondary means of escape permitted by 24.2.2.3 are outlined in paragraphs 1 through 3, which follow:

1. As stated in 24.2.2.3.1, the door, stairway, passage, or hall serving as the secondary means of escape must be independent of, and remote from, the primary means of escape required by 24.2.2.2. Exhibit 24.1 illustrates a dwelling unit where none of the windows complies with the requirements of 24.2.2.3.3 and a nonlockable door is located between bedrooms 2 and 3. As a result, both the primary and secondary means of escape from

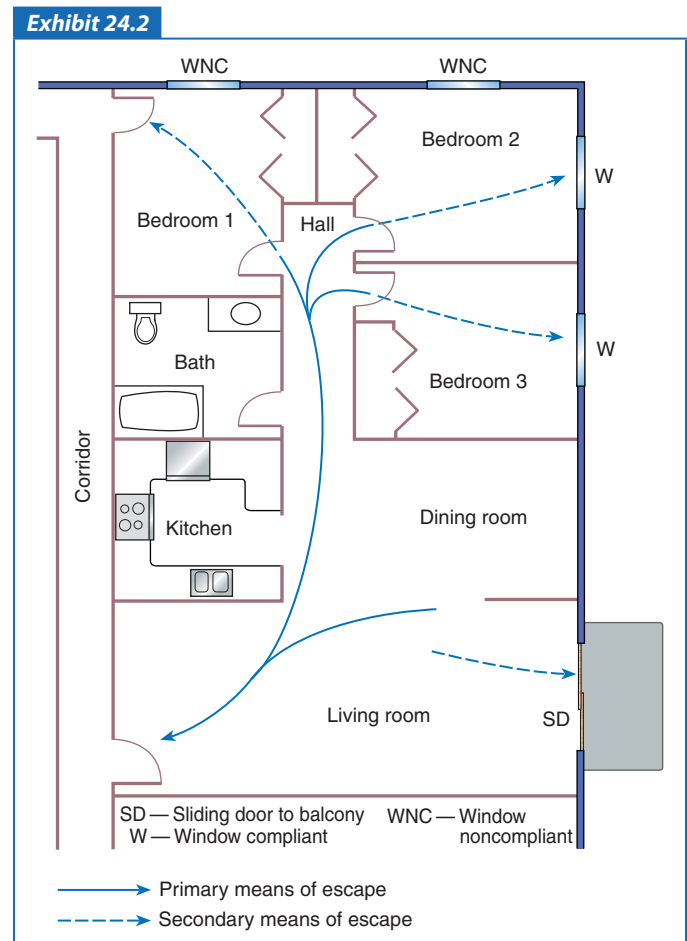

Noncomplying secondary means of escape arrangement.

bedrooms 2 and 3 lead into the same hallway. A fire in or near this hallway would affect both means of escape from these rooms. Note that if the hallway within the dwelling unit is separated from all living spaces and leads to two separate ways out of the dwelling unit, it might be judged that the hallway does, in fact, lead to two separate, independent, and remote means of escape.

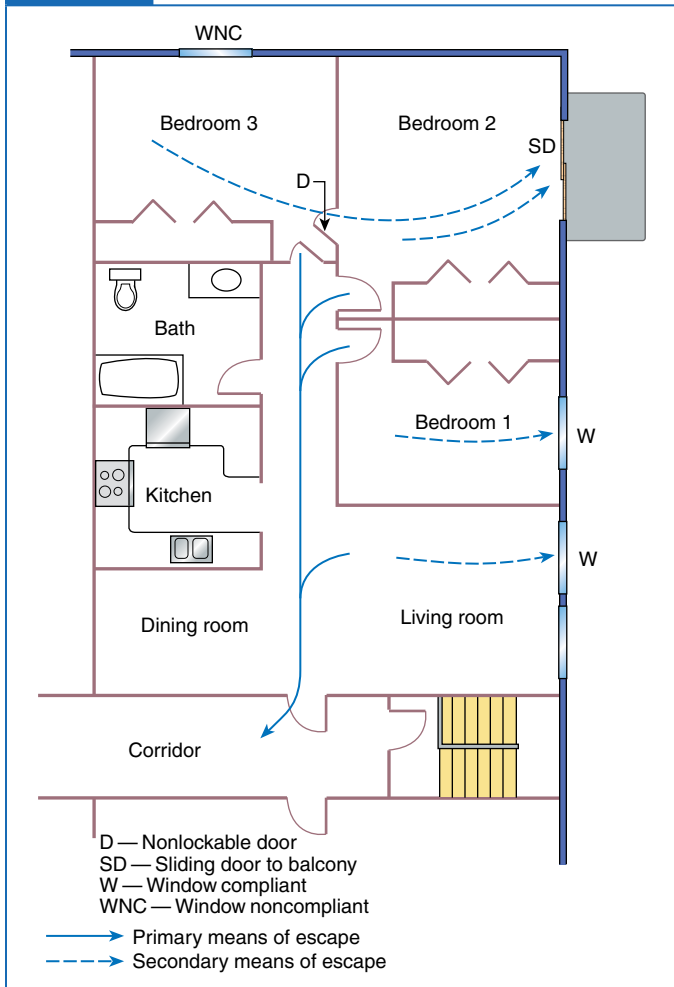

Two doors leading out of a sleeping room might not be practical or effective in most single-family dwellings. In the apartment illustrated in Exhibit 24.2, bedrooms 1 and 2 each have a window that does not comply (WNC) as a secondary means of escape. In bedroom 1, a door that meets the criteria of being independent and remote from the main door provides the secondary means of escape. Bedrooms 2 and 3 are provided with compliant windows (W) as their secondary means of escape, and the living space has a compliant sliding glass door to the balcony.

2. Passage through an adjacent nonlockable space, as addressed by 24.2.2.3.2, is illustrated in Exhibit 24.3. In this exhibit, bedroom 3 has a window that does not comply with the provisions of 24.2.2.3.3; however, there is a compliant door between

Secondary means of escape arrangement complying with 24.2.2.3.

Exhibit 24.3

Alternative secondary means of escape arrangement complying with 24.2.2.3.

bedrooms 3 and 2 that provides a secondary means of escape to the balcony using the compliant sliding door in bedroom 2.

3. The use of an operable window providing an opening of the minimum dimensions specified in 24.2.2.3.3 is the secondary means of escape most often provided. Exhibit 24.4 illustrates the minimum dimensions required for escape windows. Note that a window providing only the minimum width and minimum height dimensions specified by 24.2.2.3.3 does not provide the required minimum area; if either the minimum width or minimum height dimension is used, the other dimension must be increased to achieve the minimum area requirement. This requirement also is illustrated in Exhibit 24.4.

The outside window addressed in 24.2.2.3.3 must comply with one of the four accessibility arrangements outlined in paragraphs 1 through 4, which follow.

1. The first arrangement makes it possible for an occupant to drop from the window, because the window must be within 20 ft (6100 mm) of the finished ground level.

Exhibit 24.4

Escape window minimum opening dimensions.

2. The second arrangement relies on the fire department to rescue an occupant from a window that is within reach of rescue apparatus. Such rescue can be achieved by means of truck-mounted aerial ladders, by ground ladders, or by other means acceptable to the authority having jurisdiction (AHJ).

3. The third arrangement allows an occupant to reach an exterior balcony to breathe fresh air while awaiting either rescue or fire extinguishment. This method could be used where the balcony is not within reach of rescue apparatus. See [Exhibit 24.2](#) and [Exhibit 24.3](#) for examples of secondary means of escape utilizing balconies.

4. The fourth arrangement recognizes the increasing trend of developing or converting basements into living space, such as home offices, playrooms, or sleeping areas. Fire in these areas or the areas above them could easily block the primary means of escape, which is usually a single stair to the upper level. This option provides requirements for the size of the window well, in addition to the window size, to provide sufficient space to operate the window and move up to grade level.

Existing secondary means of escape — such as existing windows that do not meet the strict dimensional requirements of [24.2.2.3.3](#) — are permitted by [24.2.2.3](#) to continue to be used subject to the approval of the AHJ. This provision limits the impact on existing buildings, unless the means of escape is of extremely poor quality. Detailed guidance for determining the adequacy of existing means of escape windows is provided in [A.24.2.2.3.3](#).

**24.2.2.3.4** It shall be a bulkhead complying with [24.2.7](#) and meeting the minimum area requirements of [24.2.2.3](#).

The provision of [24.2.2.3.4](#) clarifies that bulkheads complying with [24.2.7](#) are permitted to serve as *secondary* means of escape from living areas and sleeping rooms located, for example, in a finished basement. [Exhibit 24.5](#) depicts a typical bulkhead enclosure.

**Exhibit 24.5**

Bulkhead serving as secondary means of escape from a basement living area. (Photo courtesy of Bulkhead Doors, Inc.)

**24.2.2.3.5** Ladders or steps that comply with the requirements of [24.2.2.3.3\(4\)\(c\)](#) shall be exempt from the requirements of [7.2.2](#).

**24.2.2.4 Two Primary Means of Escape.** In buildings, other than existing buildings and other than those protected throughout by an approved, supervised automatic sprinkler system in accordance with [24.3.5](#), every story more than 2000 ft<sup>2</sup> (185 m<sup>2</sup>) in area within the dwelling unit shall be provided with two primary means of escape remotely located from each other.

**24.2.3 Arrangement of Means of Escape.** Any required path of travel in a means of escape from any room to the outside shall not pass through another room or apartment not under the immediate control of the occupant of the first room or through a bathroom or other space subject to locking.

A means of escape that relies on travel through an adjacent space might not be usable if the door separating the spaces is locked against escape. One- and two-family dwellings might have rooms occupied by up to three outsiders or could be arranged so that a second family must escape through the living space of the first family. This arrangement is often found in older homes that were not originally built as duplexes but that were later converted to such an arrangement. Any spaces through which escape will occur must be under the control of the person escaping.

#### 24.2.4 Doors.

**24.2.4.1** Doors in the path of travel of a means of escape, other than bathroom doors in accordance with [24.2.4.2](#) and doors serving a room not exceeding 70 ft<sup>2</sup> (6.5 m<sup>2</sup>), shall be not less than 28 in. (710 mm) wide.

**24.2.4.2** Bathroom doors and doors serving a room not exceeding 70 ft<sup>2</sup> (6.5 m<sup>2</sup>) shall be not less than 24 in. (610 mm) wide.

Although [Chapter 7](#) requires 32 in. (810 mm) clear width doors in new construction and 28 in. (710 mm) wide doors in existing buildings, [24.2.4.1](#) permits the use of 28 in. (710 mm) wide doors [24 in. (610 mm) for bathrooms per [24.2.4.2](#)] in both new and existing one- and two-family dwellings. This measurement, as illustrated in [Exhibit 24.6](#), is a leaf width measurement of the

**Exhibit 24.6**

Minimum width of doors within a dwelling unit.

door, not a clear width measurement of the door opening. In addition to one- and two-family dwellings, this requirement applies to doors within the guest rooms and guest suites of lodging or rooming houses, hotels and dormitories, and dwelling units of apartment buildings.

The 28 in. (710 mm) wide doors specified in 24.2.4.1 are used in some dwelling designs, but ease of access and the need to move furniture and appliances usually dictate a larger size.

**24.2.4.3** Doors shall be not less than 6 ft 6 in. (1980 mm) in nominal height.

**24.2.4.4** Every closet door latch shall be such that children can open the door from inside the closet.

**24.2.4.5** Every bathroom door shall be designed to allow opening from the outside during an emergency when locked.

During a fire, children will often seek refuge in bathrooms and closets. The provisions of 24.2.4.4 and 24.2.4.5 for releasing the latch from the inside and the lock from the outside of closet and bathroom doors allow for escape and facilitate rescue by parents or emergency responders.

**24.2.4.6 Doors shall be swinging or sliding.**

**24.2.4.7\*** No door in any means of escape shall be locked against egress when the building is occupied. All locking devices that impede or prohibit egress or that cannot be easily disengaged shall be prohibited.

**A.24.2.4.7** It is the intent of this requirement that security measures, where installed, do not prevent egress.

Dwelling units are prohibited from having any door locked against egress while the dwelling unit is occupied in accordance with 24.2.4.7. This requirement permits a door to have a locking device that allows the door to be opened from within the building for the purpose of escape but that does not allow the door to be opened from outside the building. Ordinary double-cylinder locks and key-operated chain locks do not meet this requirement. Multiple-death fires have occurred when a door lock could not be released because the key could not be found.

The prohibition on locking applies only to doors or windows that are part of the required means of escape system. Often, the rear door of a dwelling is not part of the required escape system, and, therefore, such a door is permitted to be equipped with a double-cylinder key-operated lock.

**24.2.4.8** Floor levels at doors in the primary means of escape shall comply with 7.2.1.3, unless otherwise permitted by any of the following:

- (1) In existing buildings, where the door discharges to the outside or to an exterior balcony or exterior exit access, the floor level outside the door shall be permitted to be one step lower than the inside, but shall not be in excess of 8 in. (205 mm).

- (2) In new buildings, where the door discharges to the outside or to an exterior exit access, an exterior landing with not more than a 7 in. (180 mm) drop below the door threshold and a minimum dimension of 36 in. (915 mm) or the width of the door leaf, whichever is smaller, shall be permitted.
- (3) A door at the top of an interior stair shall be permitted to open directly onto a stair, provided that the door does not swing over the stair and the door serves an area with an occupant load of fewer than 50 persons.

**24.2.4.9** Forces to open doors shall comply with 7.2.1.4.5.

**24.2.4.10** Latching devices for doors shall comply with 7.2.1.5.10.

**24.2.5 Stairs, Ramps, Guards, and Handrails.**

**24.2.5.1** Stairs, ramps, guards, and handrails shall be in accordance with 7.2.2 for stairs, 7.2.5 for ramps, and 7.2.2.4 for guards and handrails, as modified by 24.2.5.1.1 through 24.2.5.1.3.

**24.2.5.1.1** The provisions of 7.2.2.5, 7.2.5.5, and 7.7.3 shall not apply to stairs and ramps.

**24.2.5.1.2** If serving as a secondary means of escape, stairs complying with the fire escape requirements of Table 7.2.8.4(a) or Table 7.2.8.4(b) shall be permitted.

**24.2.5.1.3** If serving as a secondary means of escape, ramps complying with the existing ramp requirements of Table 7.2.5.3(b) shall be permitted.

Prior to the 2003 edition of the *Code*, stairs in dwelling units were permitted to have a geometry modified from that required in Chapter 7; new stairs were previously permitted to have maximum riser heights of 7¾ in. (195 mm) and minimum tread depths of 10 in. (255 mm). The provision to allow for modified tread and riser geometry for new stairs in dwelling units was removed from the *Code* on the basis of data that suggests stairs not meeting the dimensional criteria in Chapter 7 are less safe to navigate than those that do, under both normal and emergency egress conditions. As such, all new stairs in dwelling units must meet the Chapter 7 dimensional criteria: maximum 7 in. (180 mm) risers and minimum 11 in. (280 mm) treads. Existing stairs are permitted to meet the criteria in Table 7.2.2.2.1.1(b).

It is important to keep in mind that carpeting might be installed on the stairs following construction of the stair itself, and after the home is occupied. Carpeting might have an adverse impact on the stair's effective tread depth. Exhibit 24.7 illustrates the effect of carpeting on the stepping surface of the stair. Designing the stairs to the minimum geometry is insufficient; consideration must be given to floor coverings. If carpeting is to be installed on stairs, the determination of compliance with the dimensional requirements of the *Code* should be made after it is installed.

Exhibit 24.7

Effect of carpeting on tread depth.

**24.2.5.2** Interior stairways shall be provided with means capable of providing artificial light at the minimum level specified by [7.8.1.3](#) for exit stairs, measured at the center of treads and on landing surfaces within 24 in. (610 mm) of step nosings.

**24.2.5.3** For interior stairways, manual lighting controls shall be reachable and operable without traversing any step of the stair.

**24.2.5.4** The clear width of stairs, landings, ramps, balconies, and porches shall be not less than 36 in. (915 mm), measured in accordance with [7.3.2](#).

**24.2.5.5** Spiral stairs and winders in accordance with [7.2.2.2.3](#) and [7.2.2.2.4](#) shall be permitted within a single dwelling unit.

**24.2.5.6** No sleeping rooms or living areas shall be accessible only by a ladder, a stair ladder, an alternating tread device or folding stairs, or through a trap door.

### 24.2.6 Hallways.

**24.2.6.1** The width of hallways, other than existing approved hallways, which shall be permitted to continue to be used, shall be not less than 36 in. (915 mm).

**24.2.6.2** The height of hallways, other than existing approved hallways, which shall be permitted to continue to be used, shall be not less than 7 ft (2135 mm) nominal, with clearance below projections from the ceiling of not less than 6 ft 8 in. (2030 mm) nominal.

Within the dwelling unit, headroom clearance is regulated only in the hallways. Such regulation helps to ensure that the space above head height can accumulate smoke early in the fire to allow safe escape via the hallway, which will help to prevent the need for occupants to crawl near floor level to avoid the descending smoke layer.

### 24.2.7 Bulkheads.

**24.2.7.1 Bulkhead Enclosures.** Where provided, bulkhead enclosures shall provide direct access to the basement from the exterior.

**24.2.7.2 Bulkhead Enclosure Stairways.** Stairways serving bulkhead enclosures that are not part of the required primary means of escape, and that provide access from the outside finished ground level to the basement, shall be exempt from the provisions of [24.2.5.1](#) when the maximum height from the basement finished floor level to the finished ground level adjacent to the stairway does not exceed 8 ft (2440 mm), and the finished ground level opening to the stairway is covered by a bulkhead enclosure with hinged doors or other approved means.

## 24.3 Protection

### 24.3.1 Protection of Vertical Openings. (Reserved)

### 24.3.2 Protection from Hazards. (Reserved)

### 24.3.3 Interior Finish.

**24.3.3.1 General.** Interior finish shall be in accordance with [Section 10.2](#).

**24.3.3.2 Interior Wall and Ceiling Finish.** Interior wall and ceiling finish materials complying with [Section 10.2](#) shall be Class A, Class B, or Class C.

### 24.3.3.3 Interior Floor Finish. (Reserved)

**24.3.3.4 Contents and Furnishings.** Contents and furnishings shall not be required to comply with [Section 10.3](#).

### 24.3.4 Detection, Alarm, and Communications Systems.

**24.3.4.1** Smoke alarms or a smoke detection system shall be provided in accordance with either [24.3.4.1.1](#) or [24.3.4.1.2](#), as modified by [24.3.4.1.3](#).

**24.3.4.1.1\*** Smoke alarms shall be installed in accordance with [9.6.2.10](#) in all of the following locations:

- (1) All sleeping rooms
- (2)\* Outside of each separate sleeping area, in the immediate vicinity of the sleeping rooms
- (3) On each level of the dwelling unit, including basements

**A.24.3.4.1.1** Paragraph 11.5.1.3 of *NFPA 72, National Fire Alarm and Signaling Code*, contains related requirements. They specify that, where the interior floor area for a given level of a dwelling unit, excluding garage areas, is greater than 1000 ft<sup>2</sup> (93 m<sup>2</sup>), smoke alarms are to be installed as follows:

- (1) All points on the ceiling are to have a smoke alarm within a distance of 30 ft (9.1 m), measured along a path of travel,

or to have one smoke alarm per 500 ft<sup>2</sup> (46.5 m<sup>2</sup>) of floor area, which is calculated by dividing the total interior floor area per level by 500 ft<sup>2</sup> (46.5 m<sup>2</sup>).

- (2) Where dwelling units include great rooms or vaulted/cathedral ceilings extending over multiple floors, smoke alarms located on the upper floor that are intended to protect the aforementioned area are permitted to be considered as part of the lower floor(s) protection scheme used to meet the requirements of A.24.3.4.1.1(1).

**A.24.3.4.1.1(2)** Paragraphs 11.5.1.1(2) and 11.5.1.2 of *NFPA 72, National Fire Alarm and Signaling Code*, contain related requirements. The requirement of 11.5.1.1(2) specifies that an alarm is to be installed outside of each separate dwelling unit sleeping area, within 21 ft (6.4 m) of any door to a sleeping room, with the distance measured along a path of travel. The requirement in 11.5.1.2 specifies that, where the area addressed in 11.5.1.1(2) is separated from the adjacent living areas by a door, a smoke alarm is to be installed in the area between the door and the sleeping rooms, and additional alarms are to be installed on the living area side of the door.

**24.3.4.1.2** Dwelling units shall be protected by an approved smoke detection system in accordance with **Section 9.6** and equipped with an approved means of occupant notification.

**24.3.4.1.3** In existing one- and two-family dwellings, approved smoke alarms powered by batteries shall be permitted.

The reference to 9.6.2.10 in 24.3.4.1.1 requires smoke alarms to be hard-wired into the electrical system of the home or to be plug-in alarms, or to meet the other power requirements of *NFPA 72*, *National Fire Alarm and Signaling Code*.<sup>6</sup> The provision of 24.3.4.1.3, which permits replaceable battery-powered smoke alarms in existing dwellings, gives dwelling occupants relief from retrofit requirements while providing needed protection. However, occupants of dwellings that use battery-operated smoke alarms must ensure that those alarms are tested and maintained properly. NFPA analysis has shown that 30 percent of smoke alarms were inoperative in homes that had smoke alarms and that had experienced fire. The primary reason for smoke alarm failure is that the battery was removed to avoid nuisance alarms. NFPA public education programs, such as the *Learn Not to Burn*® program, are effective tools for promoting proper smoke alarm maintenance.

Regardless of the power source, it is important that smoke alarms be properly located. **Exhibit 24.8** and **Exhibit 24.9** illustrate the required locations of the smoke alarms per 24.3.4. Further information on the mounting, location, spacing, and performance of smoke alarms is found in A.24.3.4.1.1 of this *Code* and Chapter 29 of *NFPA 72*®.

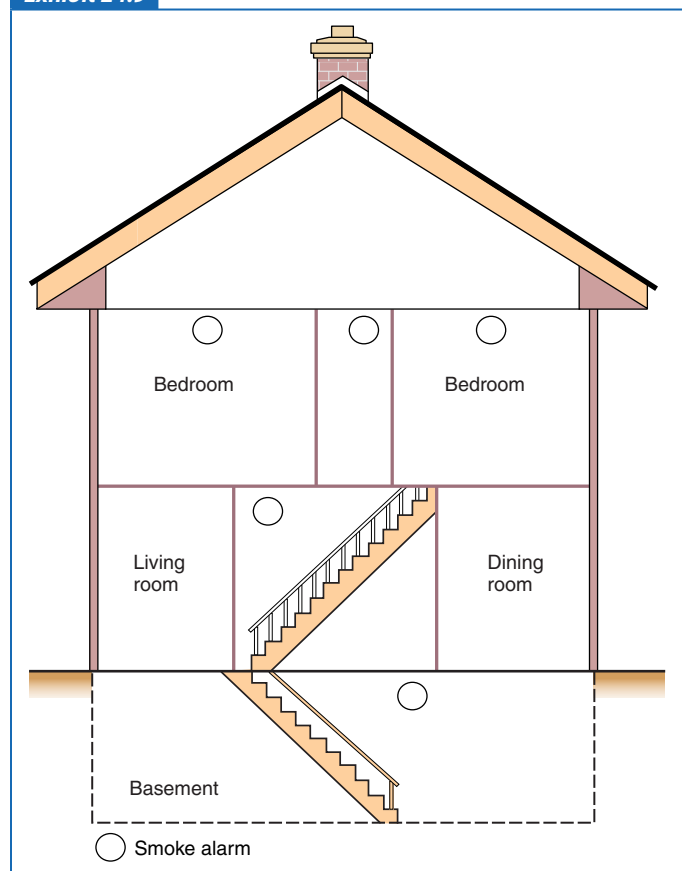

Note that the *Code* requires smoke alarms to be located in sleeping rooms of both new and existing one- and two-family dwellings. In existing buildings, the smoke alarms are permitted to be powered by replaceable batteries as indicated by 24.3.4.1.3.

**Exhibit 24.8**

*Required smoke alarm locations.*

**Exhibit 24.9**

*Required smoke alarm placement per level.*

#### 24.3.4.2 Carbon Monoxide Alarms and Carbon Monoxide-Detection Systems.

**24.3.4.2.1** Carbon monoxide alarms or carbon monoxide detectors in accordance with **Section 9.12** and 24.3.4.2 shall be provided in new one- and two-family dwellings where either of the following conditions exists:

- (1) Dwelling units with communicating attached garages, unless otherwise exempted by 24.3.4.2.3
- (2) Dwelling units containing fuel-burning appliances or fuel-burning fireplaces

**24.3.4.2.2\*** Where required by 24.3.4.2.1, carbon monoxide alarms or carbon monoxide detectors shall be installed in the following locations:

- (1) Outside of each separate dwelling unit sleeping area in the immediate vicinity of the sleeping rooms
- (2) On every occupiable level of a dwelling unit, including basements, and excluding attics and crawl spaces

**A.24.3.4.2.2** The placement requirements of NFPA 720, *Standard for the Installation of Carbon Monoxide (CO) Detection and Warning Equipment*, are modified specifically for one- and two-family dwellings as required by this *Code* and do not affect other regulations within a jurisdiction.

**24.3.4.2.3** Carbon monoxide alarms and carbon monoxide detectors as specified in 24.3.4.2.1(1) shall not be required in the following locations:

- (1) In garages
- (2) Within dwelling units with communicating attached garages that are open parking structures as defined by the building code
- (3) Within dwelling units with communicating attached garages that are mechanically ventilated in accordance with the mechanical code

The provisions of 24.3.4.2 mandate the installation of carbon monoxide (CO) detectors or CO alarms in new dwellings where there is a potential for accidental CO poisoning from a vehicle in an attached, communicating garage or from fuel-burning appliances, such as a gas-fired or an oil-fired furnace or a fuel-burning fireplace. The reference to Section 9.12 in 24.3.4.2.1 requires compliance with NFPA 720, *Standard for the Installation of Carbon Monoxide (CO) Detection and Warning Equipment*.<sup>7</sup> NFPA 720, which is modeled after NFPA 72, *National Fire Alarm and Signaling Code*, contains the detailed installation requirements for CO alarms, including those for power supply. The required locations for CO alarms in dwellings are nearly identical to those for smoke alarms, except CO alarms are not required in sleeping rooms. Also, like smoke alarms, where more than one CO alarm is required in a dwelling, they must be interconnected so that when one activates, all CO alarms in the dwelling sound their alarms.

Although not mandated in existing dwellings, the installation of CO alarms is recommended if there is a potential for CO poisoning. See the commentary following Section 9.12 for additional details. Exhibit 24.10 depicts a typical battery-powered combination CO and smoke alarm on display for sale at a retail store.

It is important to note that the typical service life of a CO alarm varies from about five to ten years. CO alarms must be

**Exhibit 24.10**

Combination CO and smoke alarm.

replaced by the date indicated on the device to ensure proper operation.

### 24.3.5\* Extinguishment Requirements.

**A.24.3.5** Automatic sprinklers are recognized as an excellent addition to homes to enhance life safety and property protection. Automatic sprinklers can be part of a comprehensive package of fire protection and can assist in the overall master planning of a community. Where all of the buildings within an area are sprinklered, including the single-family dwellings, the response times and personnel of local fire departments can be established at different levels than if the buildings were not sprinklered, saving considerable amounts of tax dollars. When whole developments are sprinklered, water mains, hydrant spacing, road widths, and building density can be altered to help alleviate the economic impact of the sprinklers.

**24.3.5.1** All new one- and two-family dwellings shall be protected throughout by an approved automatic sprinkler system in accordance with 24.3.5.2.

In response to the unacceptable number of fire deaths occurring in one- and two-family dwellings on an annual basis (an average of 2570 civilian fire deaths per year in the United States for the period 2007–2011<sup>8</sup>), the *Code*, starting with the 2006 edition, requires all new one- and two-family dwellings to be protected by automatic sprinkler systems. While the requirement for sprinkler systems in one- and two-family dwellings was new to the 2006 edition of the *Code*, the concept of residential sprinkler protection is not. As part of its decision to mandate sprinklers in new one- and two-family dwellings, the NFPA Technical Committee on Residential Occupancies evaluated economic and sprinkler success data from communities such as Scottsdale, Arizona, and Prince Georges County, Maryland, which have required sprinklers in new homes since 1986 and 1992, respectively. Data from the *Scottsdale Report* has been updated to January 1, 2001,

expanding its scope from 10 to 15 years. Some of the highlights of the updated report follow.

1. 41,408 homes (more than 50 percent of the homes in Scottsdale) were protected by automatic sprinklers.
2. Since the sprinkler ordinance was implemented, 598 home fires occurred — 49 of those were in sprinklered homes.
  - a. No fatalities occurred in the sprinklered homes.
  - b. 13 people died in homes with no sprinklers.
3. Water damage was less in homes protected by sprinklers.
  - a. Ninety-two percent of the fires in sprinklered homes were controlled by one or two sprinklers.
  - b. Sprinkler systems discharged an average of 341 gal (1291 L) of water per fire.
  - c. In nonsprinklered homes, fire fighter hose streams discharged an average of 2935 gal (11,110 L) of water per fire.
4. Fire damage was less in sprinklered homes.
  - a. The average loss per fire in sprinklered homes was \$2,166 (1986–2001, 49 fires).
  - b. The average loss per fire in nonsprinklered homes was \$45,019 (1998–2001, 86 fires).
5. Technological advances have made residential sprinklers less costly and easier to install.
  - a. On national average, sprinkler systems add between 1 percent and 1.5 percent to the total cost of the construction of a home.
  - b. In Scottsdale, the average installation cost was \$0.80 per square foot (\$8.61 per square meter) of floor area.

**24.3.5.2** Where an automatic sprinkler system is installed, either for total or partial building coverage, the system shall be in accordance with [Section 9.7](#); in buildings of four or fewer stories in height above grade plane, systems in accordance with NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*, and with NFPA 13D, *Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes*, shall also be permitted.

NFPA 13D, *Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes*, was developed after extensive research that included full-scale fire tests. It introduced the concept of a quick-response residential sprinkler. Unlike its industrial standard spray sprinkler counterpart, which is inherently slow to fuse its relatively massive eutectic solder element, a quick-response residential sprinkler operates very quickly once its rated temperature is reached. Quick-response sprinklers begin to control a fire early in its growth. In addition to being quick to respond, residential sprinklers (as mandated by NFPA 13D) have a specifically designed spray pattern that delivers water to nearly the full height of the walls of small rooms that are typical of residential occupancies. An example of a residential sprinkler is depicted in [Exhibit 24.11](#).

**Exhibit 24.11**

*Viking Model M-1 Horizontal Sidewall Residential Sprinkler. (Photo courtesy of Viking)*

NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*, addresses residential sprinklers that incorporate the quick-response sprinkler technology described in the preceding paragraph. NFPA 13R thus extends the technological and economic benefits of an NFPA 13D-type system to larger residential buildings, while requiring additional provisions that are commensurate with increased building size that will help to ensure improved protection against injury and life loss to building residents — including those occupying the room of fire origin. Note that where one- and two-family dwellings are protected with automatic sprinkler systems, they are permitted to meet the requirements of NFPA 13, NFPA 13D, or NFPA 13R.

---

## 24.4 Reserved

---

## 24.5 Building Services

### 24.5.1 Heating, Ventilating, and Air-Conditioning.

**24.5.1.1** Heating, ventilating, and air-conditioning equipment shall comply with the provisions of [Section 9.2](#).

**24.5.1.2** Unvented fuel-fired heaters shall not be used unless they are listed and approved.

### 24.5.2 Reserved.

# Reserved

Typically, the occupancy chapters are paired so that the even-numbered chapter in the pair addresses new facilities of the occupancy type and the odd-numbered chapter addresses existing facilities of the occupancy type. [Chapter 24](#), which precedes this chapter, addresses both new and existing one- and two-family dwellings in a single chapter. [Chapter 25](#) has been reserved to permit the chapter on lodging or rooming houses to be assigned an even number (i.e., [Chapter 26](#)). The reserved chapter number might be used at a future date if the requirements for one- and two-family dwellings are split into a pair of chapters — one for new construction and one for existing buildings.

# Lodging or Rooming Houses

Chapter 26 addresses the requirements for both new and existing lodging or rooming houses. These facilities provide sleeping accommodations for 16 or fewer occupants on a transient basis. While some users of the Code might confuse lodging or rooming facilities with a hotel occupancy — or a board and care facility — the primary differences among the occupancies center on the total number of occupants served and the nature of any personal care that is provided. While some of these facilities might provide what appear to be longer-term, daily living accommodations, other facilities, such as a bed-and-breakfast facility, might provide accommodations on a short-term basis. If a bed-and-breakfast facility serves more than 16 occupants, it would be appropriate to use Chapters 28 and 29 for hotels and dormitories to evaluate the requisite life safety features.

Commentary Table 26.1 is a guide to the appropriate occupancy chapter for multitenant residential occupancies.

If sleeping accommodations for more than 16 people are provided, the occupancy is classified as a hotel or dormitory. The reference to Chapter 24 in 26.1.1.1 concerns the provision that permits rooms to be occupied by a maximum of three outsiders in addition to family members in one- and two-family dwellings without changing the occupancy classification. Many of the facilities that house more than three outsiders but fewer than 16 people — for example, a fire station that has a bunk room — ordinarily would not be considered lodging or rooming houses but, nevertheless, do meet the definition. A fire station with bunking facilities would normally be considered a multiple occupancy. For example, the fire station in Exhibit 26.1 would be classified as a multiple occupancy with mixed uses, because it contains assembly, business, lodging or rooming, industrial, and storage occupancies. By applying the most restrictive requirements, this building would require automatic sprinklers via the provisions of 26.3.6.1. If additional exits are added to provide separate means of egress for the bunk room, equipment shop, assembly hall, and apparatus bay and the various uses are separated in accordance with 6.1.14.4, as shown in Exhibit 26.2, the building is considered a multiple occupancy with separated uses, and the provisions for the occupancy within each space would be applied separately. In this arrangement, the kitchen can be considered incidental to the assembly occupancy, and the restrooms, alarm room, and office can be considered incidental to the storage occupancy. See the commentary that follows A.6.1.14.1.3(2) for additional information on incidental uses.

**26.1.1.2 Administration.** The provisions of Chapter 1, Administration, shall apply.

## 26.1 General Requirements

### 26.1.1 Application.

**26.1.1.1\*** The requirements of this chapter shall apply to buildings that provide sleeping accommodations for 16 or fewer persons on either a transient or permanent basis, with or without meals, but without separate cooking facilities for individual occupants, except as provided in Chapter 24.

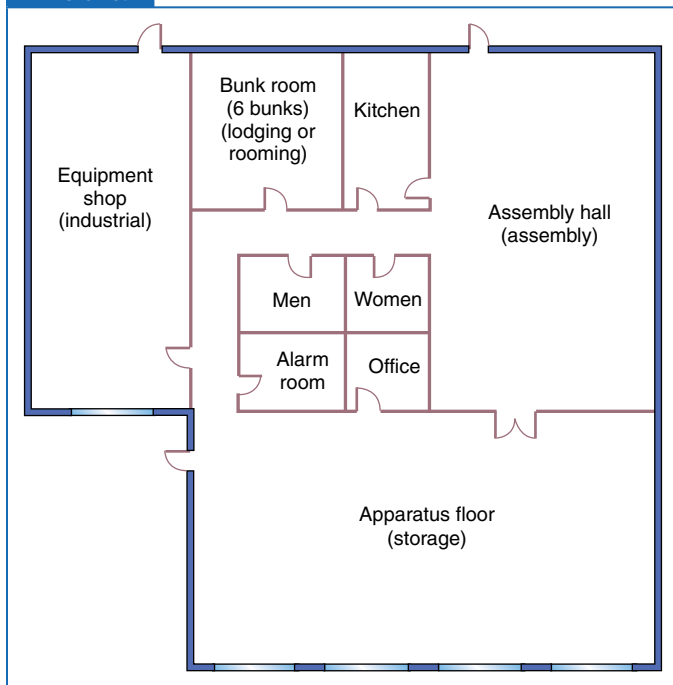

**A.26.1.1.1** Bed and breakfast occupancies with more than 3, but fewer than 17, occupants are considered lodging and rooming houses.

Commentary Table 26.1 Comparative Factors for Classification of Residential Occupancies

Factor	Chapter 26 Lodging or Rooming Houses	Chapters 28 and 29 Hotels and Dormitories	Chapters 30 and 31 Apartment Buildings	Chapters 32 and 33 Residential Board and Care
Occupants of a transient nature?	Yes	Yes	No	No
Number of occupants in facility?	≤16	>16	As few as 3; application based on presence of 3 or more independent dwelling units	≥4
Personal care services provided?	No	No	No	Yes

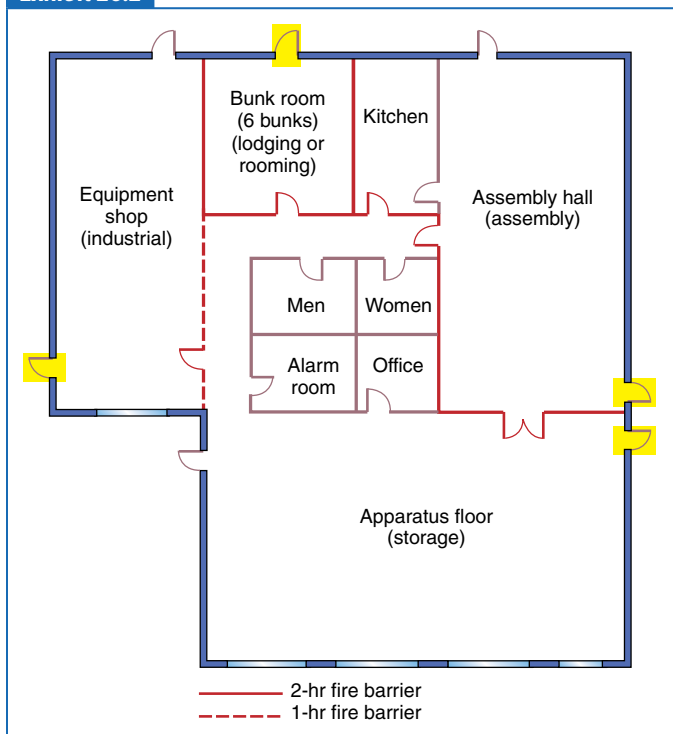

Exhibit 26.1

Fire station that is a multiple occupancy with mixed uses.

Exhibit 26.2

Fire station that is a multiple occupancy with separated uses.

**26.1.1.3 General.** The provisions of Chapter 4, General, shall apply.

**26.1.1.4** The requirements of this chapter shall apply to new buildings and to existing or modified buildings according to the provisions of 1.3.1 of this Code.

**26.1.2 Classification of Occupancy.** See 6.1.8 and 26.1.1.1.

**26.1.3 Multiple Occupancies.**

**26.1.3.1** Multiple occupancies shall be in accordance with 6.1.14.

**26.1.3.2** No lodging or rooming house shall have its sole means of egress pass through any nonresidential occupancy in the same building, unless otherwise permitted by 26.1.3.2.1 or 26.1.3.2.2.

**26.1.3.2.1** In buildings that are protected by an automatic sprinkler system in accordance with Section 9.7, lodging or rooming houses shall be permitted to have their sole means of egress pass through a nonresidential occupancy in the same building, provided that both of the following criteria are met:

- (1) The lodging or rooming house shall comply with Chapter 26.
- (2) The sole means of egress from the lodging or rooming house shall not pass through a high hazard contents area, as defined in 6.2.2.4.

**26.1.3.2.2** In buildings that are not protected by an automatic sprinkler system in accordance with Section 9.7, lodging or rooming houses shall be permitted to have their sole means of egress pass through a nonresidential occupancy in the same building, provided that all of the following criteria are met:

- (1) The sole means of egress from the lodging or rooming house to the exterior shall be separated from the remainder of the building by fire barriers having a minimum 1-hour fire resistance rating.
- (2) The lodging or rooming house shall comply with Chapter 26.
- (3) The sole means of egress from the lodging or rooming house shall not pass through a high hazard contents area, as defined in 6.2.2.4.

**26.1.3.3** Lodging or rooming houses shall be permitted to be located above a nonresidential occupancy only where one of the following conditions exists:

- (1) Where the lodging or rooming house and exits therefrom are separated from the nonresidential occupancy by construction having a minimum 1-hour fire resistance rating
- (2) Where the nonresidential occupancy is protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7
- (3) Where the lodging or rooming house is located above a nonresidential occupancy, and the nonresidential occupancy is protected by an automatic fire detection system in accordance with Section 9.6

A nonresidential occupancy located below a lodging or rooming house presents a life safety challenge for the occupants of the residential space. The typical configuration of these buildings creates the potential for a significant time lapse before occupants of the residential occupancy become aware of an emergency in another part of the building and take the necessary action. The provisions of 26.1.3.2 and 26.1.3.3 are intended to provide added protection for the residential occupancy during that time lapse. Therefore, these requirements are intended to apply wherever this mixture of occupancies exists, whether in new construction or in existing buildings.

**26.1.3.4** Atrium walls in accordance with 6.1.14.4.6 shall be permitted to serve as part of the separation required by 6.1.14.4.1 for creating separated occupancies on a story-by-story basis.

The provision of 26.1.3.4 permits a lodging or rooming house that is part of a separated, multiple occupancy building to utilize an atrium as a portion of the occupancy separation in accordance with 6.1.14.4.6. These criteria are new to the 2015 edition of the *Code*. See the commentary following 6.1.14.4.6 for additional details on the use of an atrium as an occupancy separation.

#### 26.1.4 Definitions.

**26.1.4.1 General.** For definitions, see Chapter 3, Definitions.

**26.1.4.2 Special Definitions.** Special terms applicable to this chapter are defined in Chapter 3. Where necessary, other terms are defined in the text.

**26.1.5 Classification of Hazard of Contents.** The contents of residential occupancies shall be classified as ordinary hazard in accordance with 6.2.2.

NFPA 13, *Standard for the Installation of Sprinkler Systems*,<sup>1</sup> classifies the contents of a lodging or rooming house as light hazard for the purpose of designing automatic sprinkler systems. The difference in classification in the *Code* is based on the threat to life or life safety (ordinary), as opposed to the challenge to the extinguishing capability of the automatic sprinkler system (light).

**26.1.6 Minimum Construction Requirements.**  
(Reserved)

**26.1.7 Occupant Load.** See 26.1.1.1.

---

## 26.2 Means of Escape Requirements

### 26.2.1 Number and Types of Means of Escape.

#### 26.2.1.1 Primary Means of Escape.

**26.2.1.1.1** Every sleeping room and living area shall have access to a primary means of escape complying with Chapter 24 and located to provide a safe path of travel to the outside.

**26.2.1.1.2** Where the sleeping room is above or below the level of exit discharge, the primary means of escape shall be an interior stair in accordance with 26.2.2, an exterior stair, a horizontal exit in accordance with 7.2.4, or an existing fire escape stair in accordance with 7.2.8.

The concept of means of escape has been fully developed in Chapter 24. Provisions for means of escape — rather than means of egress — are specified in 26.2.1.1.1 and 26.2.1.1.2, because the escape paths required for a lodging or rooming house are more similar to those provided for a residential dwelling than those for publicly occupied or commercial buildings.

The *Code* requires at least one means of escape from levels above or below the level of exit discharge to be an enclosed interior stair, an exterior stair, a horizontal exit, or an existing fire escape. The intent is that at least one means of escape (primary) be of a high degree of quality that is similar to the means of egress components described in Chapter 7. Most lodging or rooming houses are converted homes that rarely have a means of egress arrangement complying with Chapter 7. However, the *Code* recognizes the issue of public liability associated with lodging guests and includes requirements in Chapter 26 that provide a level of escape quality higher than that normally found in a single-family home.

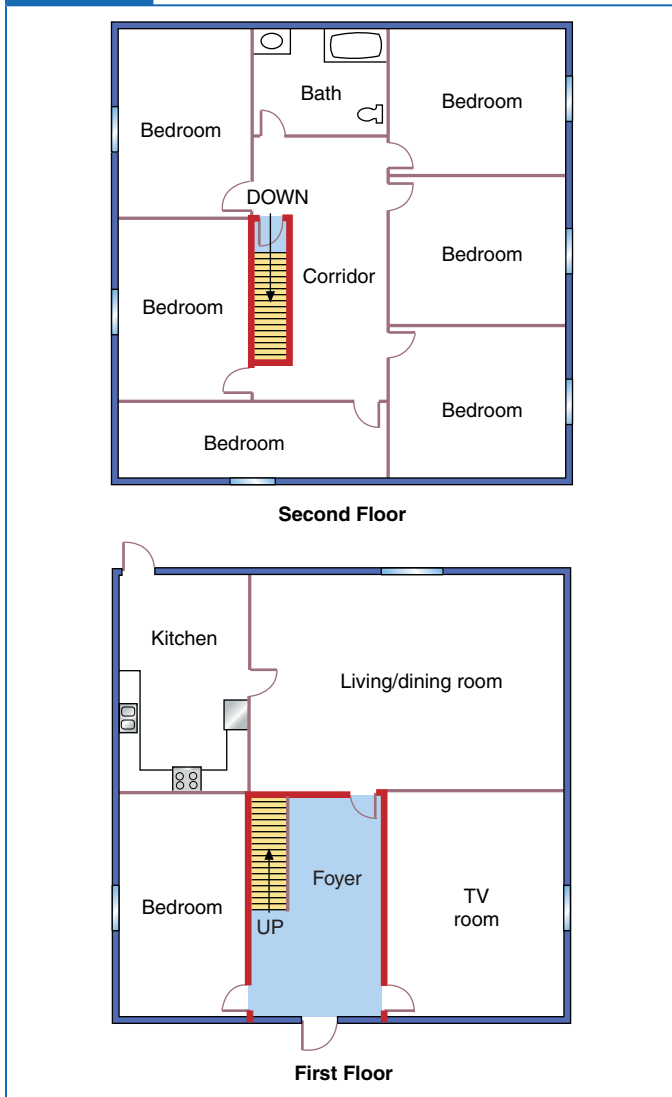

The protection of the primary means of escape as required by 26.2.1.1 — often accomplished by the protection of vertical openings in accordance with 26.2.2 and 26.3.1 — is one of the major distinctions between the requirements applicable to one- and two-family dwellings and those applicable to lodging or rooming houses. By protecting the escape path from exposure to unprotected vertical openings — such as the unenclosed stairs normally found in single-family dwellings — the *Code* helps to ensure that the occupants of a lodging or rooming house can reach a point of safety. This protection is important, because the occupants of a lodging or rooming house characteristically occupy their rooms with the doors closed. Therefore, they lack the awareness of emergency conditions that is experienced by members of a family who live together within a dwelling where doors are usually open.

Exhibit 26.3 through Exhibit 26.7 illustrate possible methods of complying with the means of escape provisions of 26.2.1.1, as affected by the provisions of 26.2.2 and 26.3.1.

**26.2.1.2 Secondary Means of Escape.** In addition to the primary route, each sleeping room and living area shall have a second means of escape in accordance with 24.2.2, unless the sleeping room or living area has a door leading directly outside the building with access to the finished ground level or to a stairway that meets the requirements for exterior stairs in 26.2.1.1.2.

The *Code* specifies that the secondary means of escape must comply with 24.2.2. Secondary means of escape is exempted by 24.2.2.1.2 if the building is sprinklered in accordance with

Exhibit 26.3

Means of escape — existing nonsprinklered lodging or rooming house.

NFPA 13, *Standard for the Installation of Sprinkler Systems*; NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*<sup>2</sup>; or NFPA 13D, *Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes*.<sup>3</sup> Because most new lodging or rooming houses are required to be protected with sprinklers in accordance with 26.3.6.1, secondary means of escape will seldom be required. An exception is that, where a stair is left unenclosed per the sprinkler allowance of 26.3.1.1.3, secondary means of escape must be provided. Where existing nonsprinklered lodging or rooming houses are deficient with respect to secondary means of escape, protection of vertical openings, or required door closers on sleeping room doors, the installation of automatic sprinklers provides a viable alternative to correcting such deficiencies individually.

Exhibit 26.4

Means of escape — two-story stairway.

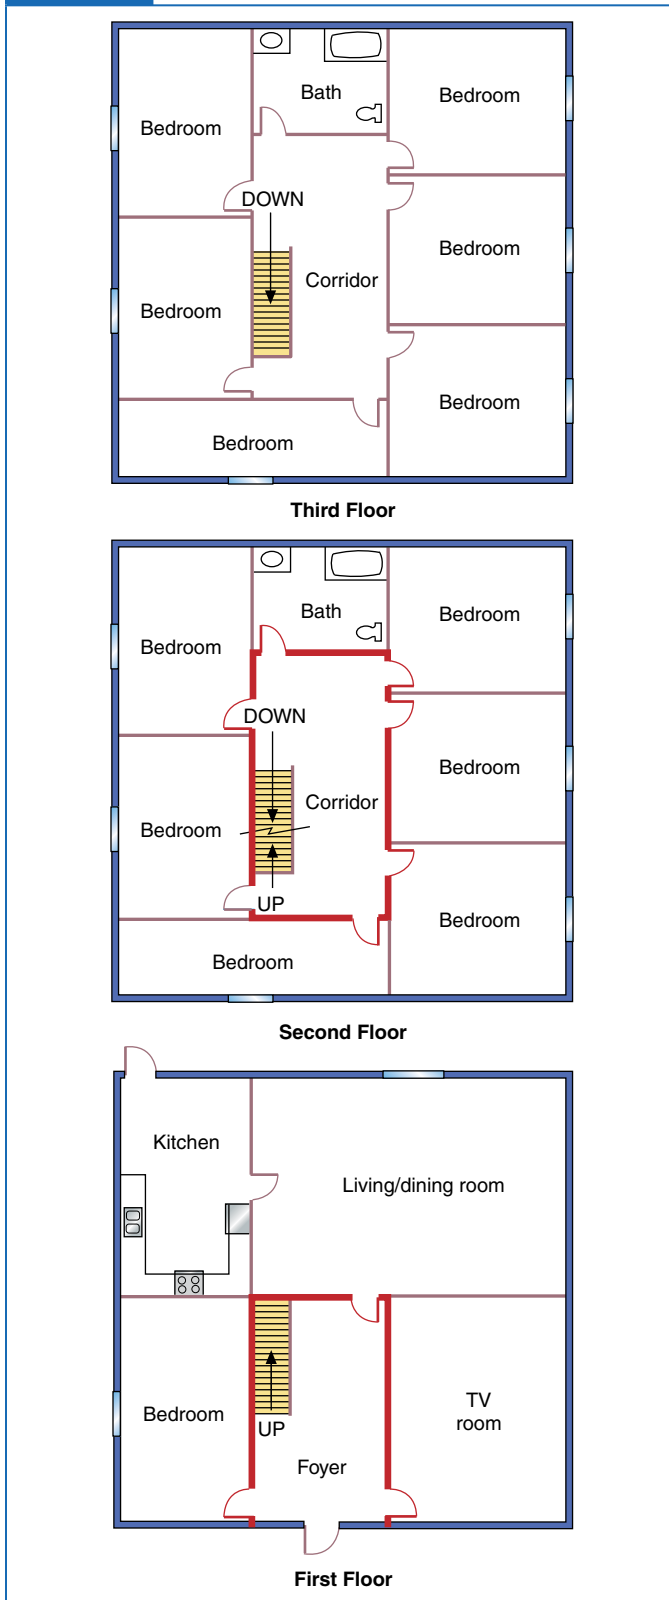

Exhibit 26.5

Means of escape — outside stair use.

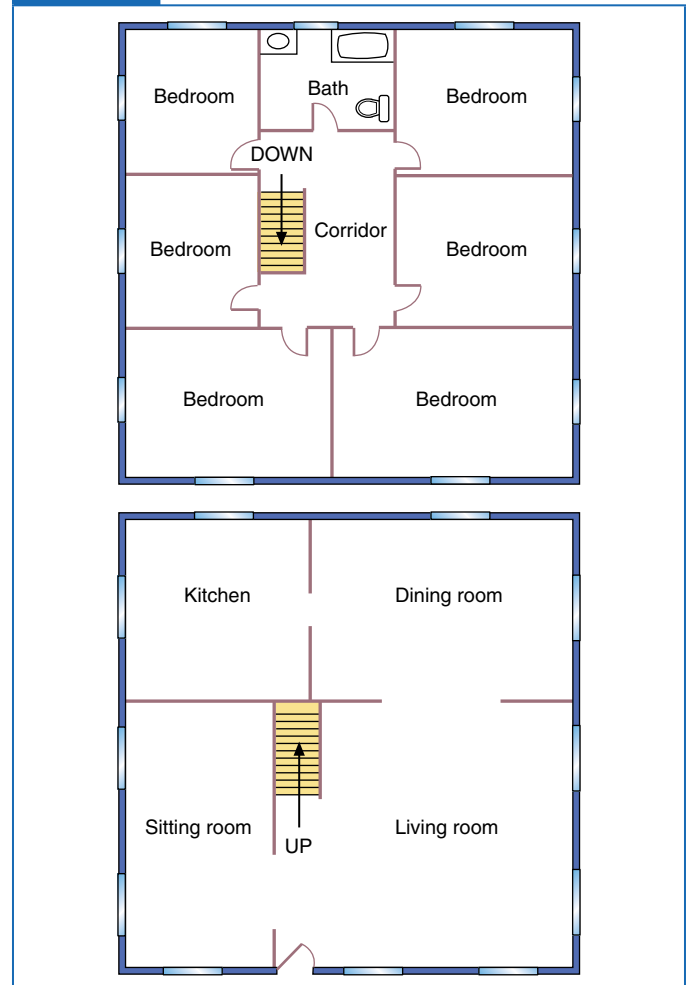

**26.2.1.3 Two Primary Means of Escape.** In other than existing buildings and those protected throughout by an approved, supervised automatic sprinkler system in accordance with 26.3.6, every story more than 2000 ft<sup>2</sup> (185 m<sup>2</sup>) in area, or with travel distance to the primary means of escape more than 75 ft (23 m), shall be provided with two primary means of escape remotely located from each other.

Exhibit 26.6

Means of escape — three-story sprinklered lodging or rooming house.

Exhibit 26.7

Means of escape — two-story sprinklered bed-and-breakfast facility.

## 26.2.2 Stairways.

**26.2.2.1** Interior stairways, other than those in accordance with 26.2.2.2 or 26.2.2.3, shall comply with 7.2.2.5.3 and shall be enclosed by fire barriers having a minimum ½-hour fire resistance rating, with all openings protected with smoke-actuated automatic-closing or self-closing doors having a fire resistance comparable to that required for the enclosure.

**26.2.2.2** Where an interior stair connects the street floor with the story next above or below only, but not with both, the interior stair shall be required to be enclosed only on the street floor.

**26.2.2.3** Stairways shall be permitted to be unenclosed in accordance with 26.3.1.1.2 and 26.3.1.1.3.

In Exhibit 26.3, an enclosed interior stair in accordance with 26.2.2.1 is shown on the first floor. The stair discharges directly to the outside and serves as the primary means of escape for this nonsprinklered rooming house. The entry foyer is separated

from the rest of the first floor by walls with a ½-hour fire resistance rating, and the doors are self-closing with a 20-minute fire protection rating. The entry foyer cannot be used for any other purpose, such as a lounge for the occupants. Walls with a ½-hour fire resistance rating and a self-closing door with a 20-minute fire protection rating also enclose the stairs on the second floor. The walls and door provide the necessary separation between the second-floor corridor and the vertical opening. Compliant windows in all sleeping and living spaces provide the secondary means of escape. Note that if the stair illustrated in [Exhibit 26.3](#) connects only the street floor and the floor above (or floor below), it is permitted to be open to other than the street floor per [26.2.2.2](#).

[Exhibit 26.4](#) illustrates the use of [26.2.2.2](#). To meet the criteria for this provision, stairs A and B connect only two floors and are separated from the rest of the first floor. Stair A cannot extend to the second floor, and stair B cannot extend to the basement. The arrangement of stair A protects the residents on the first and second floors from fire and smoke in the basement. The arrangement of stair B protects the residents on the second floor from fire and smoke on the street-level floor.

**26.2.2.4** Winders in accordance with [7.2.2.2.4](#) shall be permitted.

### 26.2.3 Doors.

**26.2.3.1** Doors in a means of escape, other than bathroom doors in accordance with [26.2.3.2](#), and paths of travel in a means of escape shall be not less than 28 in. (710 mm) wide.

**26.2.3.2** Bathroom doors shall be not less than 24 in. (610 mm) wide.

**26.2.3.3** Every closet door latch shall be such that it can be readily opened from the inside in case of emergency.

**26.2.3.4** Every bathroom door shall be designed to allow opening from the outside during an emergency when locked.

**26.2.3.5** Door-locking arrangements shall comply with either [26.2.3.5.1](#) or [26.2.3.5.2](#).

**26.2.3.5.1\*** No door in any means of escape shall be locked against egress when the building is occupied.

**A.26.2.3.5.1** It is the intent of this requirement that security measures, where installed, do not prevent egress.

**26.2.3.5.2** Delayed-egress locks complying with [7.2.1.6.1](#) shall be permitted, provided that not more than one such device is located in any one escape path.

A lodging or rooming house is prohibited by [26.2.3.5.1](#) from having any door locked against egress (escape) while the building is occupied. This requirement permits a door to have a locking device that allows the door to be opened from within the building for the purpose of escape but does not permit the door to be opened from outside the building. Ordinary double-cylinder locks and chain locks do not meet these provisions.

The language of [7.2.1.5.3](#) is clear: locks, if provided, must not require the use of a key, a tool, or special knowledge or effort for operation from the egress side. This requirement prohibits double-cylinder locks and chain locks that require a key to operate the door from the inside. The use of a simple operation to open a door is required by [7.2.1.5.10](#); locks that require two-handed knobs and similar operations are prohibited.

[Chapter 7](#) recognizes the need for security chains or rods on guest room doors and permits one releasing device in addition to the doorknob or lever. The typical guest room door has three devices: a latch, a lock, and a security chain or rod. However, the *Code* permits only two releasing actions for new installations. This requirement is met by using a latch and lock set equipped with a lock bolt that automatically retracts when the latch handle is turned from the inside; therefore, only one releasing action is needed for the two devices. The second action is the release of the security chain or rod. However, neither device requires the use of a key, a tool, or special knowledge or effort. In existing installations, three releasing devices are permitted: the security device, the lock, and the latch.

The use of the delayed-egress lock detailed in [7.2.1.6.1](#) is recognized by [26.2.3.5.2](#), provided that not more than one such device is encountered in any single escape path. Use of a delayed-egress lock requires that the building be protected throughout by either an automatic sprinkler system or a fire detection system. The 15-second or 30-second delay permitted by [7.2.1.6.1](#) does not affect the immediate release of the lock upon activation of the sprinklers or detectors, or upon loss of power to the lock. This device helps provide the security needed for doors that are used infrequently in lodging or rooming houses. At the same time, doors remain available for emergency use. Chains and padlocks do not provide this protection.

**26.2.3.6** Doors serving a single dwelling unit shall be permitted to be provided with a lock in accordance with [7.2.1.5.7](#).

---

## 26.3 Protection

### 26.3.1 Protection of Vertical Openings.

**26.3.1.1** Vertical openings shall comply with [26.3.1.1.1](#), [26.3.1.1.2](#), or [26.3.1.1.3](#).

**26.3.1.1.1** Vertical openings shall be protected so that no primary escape route is exposed to an unprotected vertical opening.

**26.3.1.1.1.1** The vertical opening shall be considered protected if the opening is cut off and enclosed in a manner that provides a smoke- and fire-resisting capability of not less than ½ hour.

**26.3.1.1.1.2** Any doors or openings shall have a smoke- and fire-resisting capability equivalent to that of the enclosure and shall be automatic-closing on detection of smoke or shall be self-closing.

**26.3.1.1.2** In buildings three or fewer stories in height that are protected throughout by an approved automatic sprinkler system in accordance with 26.3.6, unprotected vertical openings shall be permitted, provided that a primary means of escape from each sleeping area is provided that does not pass through a portion of a lower floor, unless such portion is separated from all spaces on that floor by construction having a minimum ½-hour fire resistance rating.

**26.3.1.1.3** Stair enclosures shall not be required in buildings two or fewer stories in height where both of the following conditions exist:

- (1) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with 26.3.6.1.
- (2) The allowance of 24.2.2.1.2 to omit a secondary means of escape is not used.

In Exhibit 26.5, an outside stair is used as the primary means of escape. Compliant windows in each of the bedrooms provide the secondary means of escape. The interior stair in this arrangement is just a convenience stair, independent of the required means of escape. If no sprinkler system is provided, the stairs must be enclosed in accordance with 26.3.1.1.1, as depicted in Exhibit 26.5. If a sprinkler system is provided, either 26.3.1.1.2 or 26.3.1.1.3 is permitted to be applied.

A vertical opening of up to three stories is permitted by 26.3.1.1.2 to be unprotected in a fully sprinklered, maximum three-story lodging or rooming house, provided that the primary means of escape is separated on the lower floor(s). Exhibit 26.6 illustrates a three-story, sprinklered lodging or rooming house. The stairs are open from the first floor to the third floor. However, ½-hour fire resistance-rated walls separate the living spaces from the stairs on the first and second floors.

In bed-and-breakfast facilities, it is often important to retain the historical integrity or homelike ambience of the building. Separation or enclosure of a decorative main stair would effectively eliminate the characteristics that draw people to these facilities. On the other hand, it is necessary to provide appropriate protection to guests. Exhibit 26.7 illustrates a two-story bed-and-breakfast facility that is protected with automatic sprinklers. Once again, the stair serves as the primary means of escape. In this case, 26.3.1.1.3 is used to permit the stair to remain unenclosed on both levels. It is important to note that the use of this provision has an impact on the secondary means of escape. Even though 24.2.2.1.2 permits the elimination of the secondary means of escape in fully sprinklered buildings, 26.3.1.1.3(2) specifically prohibits the use of 24.2.2.1.2 if the automatic sprinklers are used for the purpose of protecting the vertical opening. The result is that all windows from the sleeping rooms or living areas must comply as a secondary means of escape if this arrangement is to be permitted.

**26.3.1.2\*** Exterior stairs shall be protected against blockage caused by fire within the building.

**A.26.3.1.2** Such protection can be accomplished by separation by physical distance, arrangement of the stairs, protection of the openings exposing the stairs, or a combination thereof.

**26.3.2 Protection from Hazards.** Alcohol-based hand-rub dispensers in accordance with 8.7.3.3 shall be permitted.

The provision of 26.3.2 is new to the 2015 edition of the Code. It recognizes the use of alcohol-based hand-rub (ABHR) dispensers in lodging or rooming houses, provided that the detailed criteria of 8.7.3.3 are met.

### 26.3.3 Interior Finish.

**26.3.3.1 General.** Interior finish shall be in accordance with Section 10.2.

**26.3.3.2 Interior Wall and Ceiling Finish.** Interior wall and ceiling finish materials complying with Section 10.2 shall be Class A, Class B, or Class C.

#### 26.3.3.3 Interior Floor Finish.

**26.3.3.3.1** Newly installed interior floor finish shall comply with Section 10.2.

**26.3.3.3.2** Newly installed interior floor finish shall comply with 10.2.7.1 or 10.2.7.2, as applicable.

### 26.3.4 Detection, Alarm, and Communications Systems.

#### 26.3.4.1 General.

**26.3.4.1.1** Lodging and rooming houses, other than those meeting 26.3.4.1.2, shall be provided with a fire alarm system in accordance with Section 9.6.

**26.3.4.1.2** A fire alarm system in accordance with Section 9.6 shall not be required in existing lodging and rooming houses that have an existing smoke detection system meeting or exceeding the requirements of 26.3.4.5.1 where that detection system includes not less than one manual fire alarm box per floor arranged to initiate the smoke detection alarm.

In existing lodging or rooming houses, 26.3.4.1.2 permits existing multiple-station smoke alarms and a manual fire alarm box arranged as a system to substitute for a standard fire alarm system in accordance with NFPA 72®, *National Fire Alarm and Signaling Code*.<sup>4</sup>

**26.3.4.2 Initiation.** Initiation of the required fire alarm system shall be by manual means in accordance with 9.6.2, or by alarm initiation in accordance with 9.6.2.1(3) in buildings protected throughout by an approved automatic sprinkler system in accordance with 26.3.6.

**26.3.4.3 Notification.** Occupant notification shall be provided automatically in accordance with 9.6.3, as modified by 26.3.4.3.1 and 26.3.4.3.2.

**26.3.4.3.1\*** Visible signals for the hearing impaired shall not be required where the proprietor resides in the building and there are five or fewer rooms for rent.

**A.26.3.4.3.1** The proprietor is the owner or owner's agent with responsible charge.

**26.3.4.3.2** Positive alarm sequence in accordance with 9.6.3.4 shall be permitted.

**26.3.4.4 Detection. (Reserved)**

**26.3.4.5 Smoke Alarms.**

**26.3.4.5.1** Approved smoke alarms, other than existing smoke alarms meeting the requirements of 26.3.4.5.3, shall be installed in accordance with 9.6.2.10 in every sleeping room.

**26.3.4.5.2** In other than existing buildings, the smoke alarms required by 26.3.4.5.1 shall be interconnected in accordance with 9.6.2.10.3.

**26.3.4.5.3** Existing battery-powered smoke alarms, rather than house electric-powered smoke alarms, shall be permitted where the facility has demonstrated to the authority having jurisdiction that the testing, maintenance, and battery replacement programs will ensure reliability of power to the smoke alarms.

Paragraph 26.3.4.5.1 requires the installation of a smoke alarm in each sleeping room. This requirement applies retroactively to existing lodging or rooming houses, as well as to new construction.

While 26.3.4.5.3 permits existing battery-powered smoke alarms to remain in place if approved by the authority having jurisdiction, newly installed smoke alarms must be powered by the building electrical service or in accordance with the other options specified by NFPA 72®, *National Fire Alarm and Signaling Code*. This requirement applies to both new and existing lodging or rooming houses in accordance with 9.6.2.10.7.

**26.3.4.6 Carbon Monoxide Alarms and Carbon Monoxide Detection Systems.**

**26.3.4.6.1** Carbon monoxide alarms or carbon monoxide detectors in accordance with Section 9.12 and 26.3.4.6 shall be provided in new lodging or rooming houses where either of the following conditions exists:

- (1) Lodging or rooming houses with communicating attached garages, unless otherwise exempted by 26.3.4.6.3
- (2) Lodging or rooming houses containing fuel-burning appliances or fuel-burning fireplaces

**26.3.4.6.2\*** Where required by 26.3.4.6.1, carbon monoxide alarms or carbon monoxide detectors shall be installed in the following locations:

- (1) Outside of each separate sleeping area in the immediate vicinity of the sleeping rooms
- (2) On every occupiable level, including basements, and excluding attics and crawl spaces

**A.26.3.4.6.2** The placement requirements of NFPA 720, *Standard for the Installation of Carbon Monoxide (CO) Detection and Warning Equipment*, are modified to accommodate lodging or rooming house occupancies that are part of multiple occupancy buildings (e.g., an on-call physicians' sleeping room in a hospital). The placement requirements of NFPA 720 are modified specifically for lodging or rooming houses as required by this Code and do not affect other regulations within a jurisdiction.

**26.3.4.6.3** Carbon monoxide alarms and carbon monoxide detectors as specified in 26.3.4.6.1(1) shall not be required in the following locations:

- (1) In garages
- (2) Within lodging or rooming houses with communicating attached garages that are open parking structures as defined by the building code
- (3) Within lodging or rooming houses with communicating attached garages that are mechanically ventilated in accordance with the mechanical code

The provisions of 26.3.4.6 mandate the installation of carbon monoxide (CO) detectors or CO alarms in new lodging or rooming houses where there is a potential for accidental CO poisoning from a vehicle in an attached, communicating garage or from fuel-burning appliances, such as a gas-fired or an oil-fired furnace or a fuel-burning fireplace. The reference to Section 9.12 in 26.3.4.6.1 requires compliance with NFPA 720, *Standard for the Installation of Carbon Monoxide (CO) Detection and Warning Equipment*.<sup>5</sup> NFPA 720, which is modeled after NFPA 72, *National Fire Alarm and Signaling Code*, contains the detailed installation requirements for CO alarms, including those for power supply. The required locations for CO alarms in dwellings are nearly identical to those for smoke alarms, except CO alarms are not required in sleeping rooms. Also, like smoke alarms, where more than one CO alarm is required in a lodging or rooming house, they must be interconnected so that when one activates, all CO alarms in the lodging or rooming house sound their alarms.

Although not mandated in existing lodging or rooming houses, the installation of CO alarms is recommended if there is a potential for CO poisoning. It is important to note that the typical service life of a CO alarm varies from about five to ten years. CO alarms must be replaced by the date indicated on the device to ensure proper operation. See the commentary following Section 9.12 for additional details.

**26.3.5 Separation of Sleeping Rooms.**

**26.3.5.1** All sleeping rooms shall be separated from escape route corridors by smoke partitions in accordance with Section 8.4.

**26.3.5.2** There shall be no louvers or operable transoms in corridor walls.

**26.3.5.3** Air passages shall not penetrate corridor walls, unless they are properly installed heating and utility installations other than transfer grilles.

**26.3.5.4** Transfer grilles shall be prohibited in corridor walls.

**26.3.5.5** Doors shall be provided with latches or other mechanisms suitable for keeping the doors closed.

**26.3.5.6** Doors shall not be arranged to prevent the occupant from closing the door.

**26.3.5.7** In buildings other than those protected throughout by an approved automatic sprinkler system in accordance with 26.3.6, doors shall be self-closing or automatic-closing upon detection of smoke.

The requirements of 26.3.5 are similar to those for corridor walls and doors in hotels and apartment buildings; however, no fire resistance rating is required. Unlike hotels and apartment buildings, door closers are exempted in sprinklered lodging or rooming houses. See Exhibit 26.8.

*Sleeping room/escape route separation.*

### 26.3.6 Extinguishment Requirements.

**26.3.6.1** All new lodging or rooming houses shall be protected throughout by an approved automatic sprinkler system in accordance with 26.3.6.3.

If a new lodging or rooming house is part of a multiple occupancy and the occupancies are mixed, the entire mixed occupancy is required to be sprinklered. To waive this requirement, the occupancies would have to be arranged so that the lodging or rooming house is treated as a separate occupancy in accordance with 6.1.14.4. This arrangement would require the exit access for each occupancy to be separate. Doors that open directly to the outside from each of the occupancies usually achieve such independent exit access.

**26.3.6.2** Where an automatic sprinkler system is required or is used as an alternative method of protection, either for total or partial building coverage, the system shall be in accordance with Section 9.7 and 26.3.6.2.1 through 26.3.6.2.6.

**26.3.6.2.1** Activation of the automatic sprinkler system shall actuate the fire alarm system in accordance with Section 9.6.

**26.3.6.2.2** In buildings four or fewer stories above grade plane, systems in accordance with NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*, shall be permitted.

**26.3.6.2.3\*** Systems in accordance with NFPA 13D, *Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes*, shall be permitted where all of the following requirements are met:

- (1) The lodging or rooming house shall not be part of a mixed occupancy.
- (2) Entrance foyers shall be sprinklered.
- (3) Lodging or rooming houses with sleeping accommodations for more than eight occupants shall be treated as two-family dwellings with regard to the water supply.

**A.26.3.6.2.3** The decision to permit the use of the criteria from NFPA 13D, *Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes*, in these occupancies is based on the following:

- (1) The desire to obtain a level of fire suppression and control that is approximately equivalent to that delivered by residential facilities protected by such systems (*see A.1.1 in NFPA 13D*)
- (2) The fact that potential fire exposure and challenge to the suppression system in a small lodging and rooming occupancy is of the same nature and no more severe than that found in residences

Because of the wide variety of buildings that might fall into the classification of lodging or rooming houses, it is necessary to provide references to all three of the standards for the installation of automatic sprinkler systems.

The use of NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*, is appropriate for many lodging or rooming houses.

In certain lodging or rooming house occupancies, the use of NFPA 13D, *Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes*, is also appropriate. Some lodging or rooming houses might be similar in physical configuration to a one- or two-family dwelling, whereas others are not. For example, an NFPA 13D system would be appropriate for a single-family dwelling that is used as a bed-and-breakfast (lodging or rooming house classification for purposes of applying this Code) but not for a fire station with a bunk room. The provision of 26.3.6.2.3(3) refers to 6.5.2 of NFPA 13D, which specifies in multipurpose piping systems, where common

water supply connections serve more than one dwelling unit, 5 gpm (19 L/min) must be added to the sprinkler system demand to determine the size of common piping and the size of the total water supply requirements where no provision is made to prevent flow into the domestic water system upon operation of a sprinkler.

**26.3.6.2.4** In buildings sprinklered in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*, closets less than 12 ft<sup>2</sup> (1.1 m<sup>2</sup>) in area in individual dwelling units shall not be required to be sprinklered.

**26.3.6.2.5** In buildings sprinklered in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*, closets that contain equipment such as washers, dryers, furnaces, or water heaters shall be sprinklered, regardless of size.

**26.3.6.2.6** In existing lodging or rooming houses, sprinkler installations shall not be required in closets not exceeding 24 ft<sup>2</sup> (2.2 m<sup>2</sup>) and in bathrooms not exceeding 55 ft<sup>2</sup> (5.1 m<sup>2</sup>).

---

## 26.4 Reserved

---

## 26.5 Building Services

**26.5.1 Utilities.** Utilities shall comply with the provisions of [Section 9.1](#).

### 26.5.2 Heating, Ventilating, and Air-Conditioning.

**26.5.2.1** Heating, ventilating, and air-conditioning equipment shall comply with the provisions of [Section 9.2](#).

**26.5.2.2** Unvented fuel-fired heaters, other than gas space heaters in compliance with NFPA 54, *National Fuel Gas Code*, shall not be used.

**26.5.3 Elevators, Escalators, and Conveyors.** Elevators, escalators, and conveyors shall comply with the provisions of [Section 9.4](#).

---

## 26.6 Reserved

---

## 26.7 Operating Features

### 26.7.1 Contents and Furnishings.

**26.7.1.1** Contents and furnishings shall not be required to comply with [Section 10.3](#).

**26.7.1.2** Furnishings or decorations of an explosive or highly flammable character shall not be used.

**26.7.1.3** Fire-retardant coatings shall be maintained to retain the effectiveness of the treatment under service conditions encountered in actual use.

# Reserved

Typically, the occupancy chapters are paired so that the even-numbered chapter in the pair addresses new facilities of the occupancy type and the odd-numbered chapter addresses existing facilities of the occupancy type. [Chapter 26](#), which precedes this chapter, addresses both new and existing lodging or rooming houses in a single chapter. [Chapter 27](#) has been reserved to permit the chapter on new hotels and dormitories to be assigned an even number (i.e., [Chapter 28](#)). The reserved chapter number might be used at a future date if the requirements for lodging or rooming houses are split into a pair of chapters — one for new construction and one for existing buildings.

# New and Existing Hotels and Dormitories

Chapters 28 and 29 address residential occupancies that are primarily transient in nature. Hotel and motel accommodations that are mainly used for stays of relatively short duration fit into this category. Dormitory occupancies, although typically used for up to nine months of near-continuous occupancy in the case of a college or university dormitory, are also regulated by these chapters.

The hotel and dormitory classification is one of five residential occupancy types addressed by the *Life Safety Code*. Other residential occupancies include one- and two-family dwellings (Chapter 24), lodging or rooming houses (Chapter 26), apartment buildings (Chapters 30 and 31), and residential board and care occupancies (Chapters 32 and 33).

The common principle of life safety that is applied to all residential occupancies addressed by Chapters 24 through 33 is highlighted by 6.1.8.1, which states that residential occupancies are those occupancies in which sleeping accommodations are provided for purposes other than health care or detention and correction. The presence of sleeping occupants is central to the provisions of Chapters 24 through 33, because occupants who are asleep will be unaware of a developing fire and, when awakened to be alerted to the emergency, might be somewhat confused. The definition of the term *residential occupancy* in 6.1.8.1 also differentiates between sleeping occupants in residential occupancies and those in health care or detention and correctional occupancies, which are also characterized by the occupants' incapability of self-preservation. The provisions of Chapters 24 through 33 are also based on the presence of hazards (such as cooking and heating equipment) in residential occupancies and the degree to which occupants are familiar with their living space. Occupants might have little or no familiarity with the building, as in the case of the transient residents of hotels, or they might have the total familiarity that is common to residents of single-family dwellings.

Unfamiliar surroundings and the possibility of being asleep when a fire occurs are factors that jeopardize the safety of hotel guests in particular. Hotels pose an additional problem, because typical hotel building configurations often require escaping guests to traverse an interior corridor, which subsequently might

expose them to the heat and smoke of corridor and room fires. In recognition of these potential hazards, the *Code* requires most new hotels and dormitories to be protected throughout by approved, supervised automatic sprinkler systems.

In recent years, hotels and motels have experienced a steady reduction in the number of fires, civilian casualties, and civilian injuries. Part of the explanation for these reductions is the increasing percentage of hotels that are provided with smoke detection and automatic sprinkler systems. From 2007 to 2011, hotels and motels averaged 3600 structure fires per year, as reported to fire departments across the United States. These fires resulted in a yearly average of 11 civilian deaths and 139 civilian injuries. These numbers are approximately equivalent to, or slightly down from, the previous 4-year averages for which statistics were available (2003 to 2007) of 3970 structure fires, 11 civilian deaths, and 151 civilian injuries per year.

Exhibit 28/29.1 depicts Bally's Resort and Casino, formerly the MGM Grand Hotel and Casino in Las Vegas, Nevada, as it appears today. On the morning of November 21, 1980, a fire at the MGM Grand resulted in the deaths of 85 occupants. Because of this fire, and several others in the 1980s, nearly all new hotels, and many existing hotels, are protected with automatic sprinkler systems.

Exhibit 28/29.1

Bally's Resort and Casino, site of the November 1980 MGM Grand Hotel and Casino fire in which 85 occupants perished.

## 28.1 General Requirements

### 28.1.1 Application.

28.1.1.1 The requirements of this chapter shall apply to new buildings or portions thereof used as hotel or dormitory occupancies. (See 1.3.1.)

## 29.1 General Requirements

### 29.1.1 Application.

29.1.1.1 The requirements of this chapter shall apply to existing buildings or portions thereof currently occupied as hotel or dormitory occupancies, unless meeting the requirement of 29.1.1.4.

## CHAPTER 28 • New

**28.1.1.2 Administration.** The provisions of [Chapter 1](#), Administration, shall apply.

**28.1.1.3 General.** The provisions of [Chapter 4](#), General, shall apply.

**28.1.1.4** Any dormitory divided into suites of rooms, with one or more bedrooms opening into a living room or study that has a door opening into a common corridor serving a number of suites, shall be classified as an apartment building.

**28.1.1.5** The term *hotel*, wherever used in this *Code*, shall include a hotel, an inn, a club, a motel, a bed and breakfast, or any other structure meeting the definition of hotel.

[Chapters 28 and 29](#) apply to various operations that do not specifically use the term *hotel* but are considered such by definition. The terms *dormitory* and *hotel* are defined in [3.3.65](#) and [3.3.145](#), respectively. In some cases, [Chapters 28 and 29](#) apply even if the identification of the occupancy suggests the application of a different chapter. For example, a “rooming house” that accommodates more than 16 people is classified as a hotel.

Conversely, some operations that one might expect to be covered by [Chapters 28 and 29](#) are not. For example, [28/29.1.1.4](#) recognizes that the common dormitory design in which a group of bedrooms opens into a study or living room duplicates a typical apartment design in which several bedrooms open into a living room or kitchen. Because the design and the risk of fire are similar, the *Code* treats this arrangement as an apartment building, despite the lack of individual kitchens. [Exhibit 28/29.2](#) illustrates the arrangement of a dormitory suite that would be treated as an apartment.

**28.1.2 Classification of Occupancy.** See [6.1.8](#) and [28.1.4.2](#).

### 28.1.3 Multiple Occupancies.

**28.1.3.1** Multiple occupancies shall be in accordance with [6.1.14](#).

**28.1.3.2** No guest room or guest suite of a hotel or dormitory shall have its sole means of egress pass through any nonresidential occupancy in the same building, unless otherwise permitted by [28.1.3.2.1](#) or [28.1.3.2.2](#).

**28.1.3.2.1** In buildings that are protected by an automatic sprinkler system in accordance with [Section 9.7](#), guest rooms and guest suites of hotels and dormitories shall be permitted to have their sole means of egress pass through a nonresidential occupancy in the same building, provided that both of the following criteria are met:

- (1) The hotel or dormitory shall comply with [Chapter 28](#).
- (2) The sole means of egress from the guest room or guest suite of the hotel or dormitory shall not pass through a high-hazard contents area, as defined in [6.2.2.4](#).

## CHAPTER 29 • Existing

**29.1.1.2 Administration.** The provisions of [Chapter 1](#), Administration, shall apply.

**29.1.1.3 General.** The provisions of [Chapter 4](#), General, shall apply.

**29.1.1.4** Any dormitory divided into suites of rooms, with one or more bedrooms opening into a living room or study that has a door opening into a common corridor serving a number of suites, shall be classified as an apartment building.

**29.1.1.5** The term *hotel*, wherever used in this *Code*, shall include a hotel, an inn, a club, a motel, a bed and breakfast, or any other structure meeting the definition of hotel.

**Exhibit 28/29.2**

*Dormitory suite apartment.*

**29.1.2 Classification of Occupancy.** See [6.1.8](#) and [29.1.4.2](#).

### 29.1.3 Multiple Occupancies.

**29.1.3.1** Multiple occupancies shall be in accordance with [6.1.14](#).

**29.1.3.2** No guest room or guest suite of a hotel or dormitory shall have its sole means of egress pass through any nonresidential occupancy in the same building, unless otherwise permitted by [29.1.3.2.1](#) or [29.1.3.2.2](#).

**29.1.3.2.1** In buildings that are protected by an automatic sprinkler system in accordance with [Section 9.7](#), guest rooms and guest suites of hotels and dormitories shall be permitted to have their sole means of egress pass through a nonresidential occupancy in the same building, provided that both of the following criteria are met:

- (1) The hotel or dormitory shall comply with [Chapter 29](#).
- (2) The sole means of egress from a guest room or guest suite of the hotel or dormitory shall not pass through a high-hazard contents area, as defined in [6.2.2.4](#).

## CHAPTER 28 • New

**28.1.3.2.2** In buildings that are not protected by an automatic sprinkler system in accordance with [Section 9.7](#), guest rooms and guest suites of hotels and dormitories shall be permitted to have their sole means of egress pass through a nonresidential occupancy in the same building, provided that all of the following criteria are met:

- (1) The sole means of egress from the guest room or guest suite of the hotel or dormitory to the exterior shall be separated from the remainder of the building by fire barriers having a minimum 1-hour fire resistance rating.
- (2) The hotel or dormitory shall comply with [Chapter 28](#).
- (3) The sole means of egress from the guest room or guest suite of the hotel or dormitory shall not pass through a high-hazard contents area, as defined in [6.2.2.4](#).

Residential occupancies often exist in buildings that also house assembly, mercantile, or business occupancies. These nonresidential occupancies might pose an additional threat, because they are not typically occupied after regular business hours. An undetected fire in an unoccupied area has the potential to affect the tenability of the residential portion of the building before

**28.1.3.3** Atrium walls in accordance with [6.1.14.4.6](#) shall be permitted to serve as part of the separation required by [6.1.14.4.1](#) for creating separated occupancies on a story-by-story basis.

### 28.1.4 Definitions.

**28.1.4.1 General.** For definitions, see [Chapter 3](#), Definitions.

**28.1.4.2 Special Definitions.** A list of special terms used in this chapter follows:

- (1) **Dormitory.** See [3.3.64](#).
- (2) **Guest Room.** See [3.3.132](#).
- (3) **Guest Suite.** See [3.3.273.1](#).
- (4) **Hotel.** See [3.3.145](#).

In the definition of *dormitory* in [3.3.65](#), the wording “without individual cooking facilities” refers to the absence of cooking equipment, excluding small appliances, such as coffee makers and microwave ovens, in any room or unit of a dormitory. If such equipment is present throughout a facility, the occupancy should be classified as an apartment building. The wording “with or without meals” recognizes the presence of a central cafeteria used to serve meals for the occupants of a dormitory.

The requirements of [Chapters 28](#) and [29](#) often are worded to apply specifically within a guest room or guest suite. The first sentence of [A.3.3.65](#) clarifies that, where the chapters use the terms *guest room* and *guest suite*, the intent is that the

## CHAPTER 29 • Existing

**29.1.3.2.2** In buildings that are not protected by an automatic sprinkler system in accordance with [Section 9.7](#), guest rooms and guest suites of hotels and dormitories shall be permitted to have their sole means of egress pass through a nonresidential occupancy in the same building, provided that all of the following criteria are met:

- (1) The sole means of egress from the guest room or guest suite of the hotel or dormitory to the exterior shall be separated from the remainder of the building by fire barriers having a minimum 1-hour fire resistance rating.
- (2) The hotel or dormitory shall comply with [Chapter 29](#).
- (3) The sole means of egress from the guest room or guest suite of the hotel or dormitory shall not pass through a high-hazard contents area, as defined in [6.2.2.4](#).

occupants can be awakened and take the appropriate actions for safe egress. Therefore, the requirements of [28/29.1.3](#) help to ensure that it is safe to have hotels or dormitories within such multiple occupancy buildings by providing the necessary protection where treated as mixed occupancies and separation where treated as separated occupancies.

**29.1.3.3** Atrium walls in accordance with [6.1.14.4.6](#) shall be permitted to serve as part of the separation required by [6.1.14.4.1](#) for creating separated occupancies on a story-by-story basis.

### 29.1.4 Definitions.

**29.1.4.1 General.** For definitions, see [Chapter 3](#), Definitions.

**29.1.4.2 Special Definitions.** A list of special terms used in this chapter follows:

- (1) **Dormitory.** See [3.3.64](#).
- (2) **Guest Room.** See [3.3.132](#).
- (3) **Guest Suite.** See [3.3.273.1](#).
- (4) **Hotel.** See [3.3.145](#).

requirement also be applied to dormitory rooms used for sleeping and living purposes.

A residential occupancy with sleeping accommodations for more than 16 persons, even if referred to as a lodging or rooming house by its operators, is classified as a hotel and is regulated under the provisions of [Chapter 28](#) or [Chapter 29](#). In [A.3.3.145](#), which addresses the definition of the term *hotel*, the reference to a 30-day time period helps to define the term *transient*. Where guest rooms or guest suites have individual cooking facilities, the appropriate occupancy classification is as an apartment building. However, certain facilities (e.g., extended-stay hotels) might contain the potential for hazards associated with both a

## CHAPTER 28 • New

hotel (unfamiliarity with surroundings) and an apartment building (higher fuel load, greater number of ignition sources, and travel through multiple rooms). In such cases, the authority

### 28.1.5 Classification of Hazard of Contents.

**28.1.5.1** The contents of residential occupancies shall be classified as ordinary hazard in accordance with 6.2.2.

**28.1.5.2** For the design of automatic sprinkler systems, the classification of contents in NFPA 13, *Standard for the Installation of Sprinkler Systems*, shall apply.

NFPA 13, *Standard for the Installation of Sprinkler Systems*,<sup>1</sup> classifies the contents of a hotel or dormitory occupancy building as light hazard for the purpose of designing automatic sprinkler systems. Classification in the *Code*, noted in 28/29.1.5.1, is based

### 28.1.6 Minimum Construction Requirements. (Reserved)

Although Chapters 28 and 29 do not establish minimum construction requirements, if the hotel contains an assembly occupancy, which is fairly common, Chapters 12 and 13 do establish

**28.1.7 Occupant Load.** The occupant load, in number of persons for whom means of egress and other provisions are required, shall be determined on the basis of the occupant load factors of Table 7.3.1.2 that are characteristic of the use of the space or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

Subsection 28/29.1.7 requires the occupant load to be determined in accordance with the occupant load factors in Table 7.3.1.2. Note that the occupant load factors for residential use do not preclude the need for providing egress capacity from concentrated sleeping areas (e.g., bunk rooms) based on the maximum probable population, rather than on the calculated occupant load using the floor area. If the actual population of a bunk room exceeds one person per 200 ft<sup>2</sup> (18.6 m<sup>2</sup>), the egress

## 28.2 Means of Egress Requirements

### 28.2.1 General.

**28.2.1.1** Means of egress from guest rooms or guest suites to the outside of the building shall be in accordance with Chapter 7 and this chapter.

## CHAPTER 29 • Existing

having jurisdiction (AHJ) might classify the building as a mixed occupancy (hotel and apartment building) and apply the more restrictive requirements.

### 29.1.5 Classification of Hazard of Contents.

**29.1.5.1** The contents of residential occupancies shall be classified as ordinary hazard in accordance with 6.2.2.

**29.1.5.2** For the design of automatic sprinkler systems, the classification of contents in NFPA 13, *Standard for the Installation of Sprinkler Systems*, shall apply.

on the threat to life or life safety (ordinary) rather than the challenge to the extinguishing capability of the automatic sprinkler system (light).

### 29.1.6 Minimum Construction Requirements. (Reserved)

minimum construction requirements, based on the location of the assembly occupancy within the building. See 12/13.1.6 for construction requirements for assembly occupancies.

**29.1.7 Occupant Load.** The occupant load, in number of persons for whom means of egress and other provisions are required, shall be determined on the basis of the occupant load factors of Table 7.3.1.2 that are characteristic of the use of the space or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

capacity features (e.g., door widths) must be designed based on the actual number of occupants. See Section 7.3 for further details on the use of occupant load for determining the capacity of the means of egress.

The occupant load calculations for areas of hotels used for nonresidential purposes are based on the occupant load factors applicable to the use of the area.

## 29.2 Means of Egress Requirements

### 29.2.1 General.

**29.2.1.1** Means of egress from guest rooms or guest suites to the outside of the building shall be in accordance with Chapter 7 and this chapter.

## CHAPTER 28 • New

**28.2.1.2** Means of escape within the guest room or guest suite shall comply with the provisions of [Section 24.2](#) for one- and two-family dwellings.

**28.2.1.3** For the purpose of application of the requirements of [Chapter 24](#), the terms *guest room* and *guest suite* shall be synonymous with the terms *dwelling unit* or *living unit*.

Means of escape from guest rooms and guest suites must comply with [Section 24.2](#), which addresses means of escape in one- and two-family dwellings, in accordance with [28/29.2.1](#). This mandatory reference to [Section 24.2](#) is important for several reasons. First, it establishes a requirement for two means of escape (primary and secondary) from every sleeping room and living area of a guest suite having two rooms or more. Several acceptable types of secondary means of escape are established in [24.2.2.3](#), the most common of which is an operable window with specified minimum opening dimensions. No secondary means of escape is required if a guest suite is protected by an automatic sprinkler system. Note that [24.2.2.1.2](#) does not require that the entire building be sprinklered, only that the guest suite deficient with respect to the secondary means of escape be sprinklered. However, a mandate for complete building sprinkler protection might be specified elsewhere, as in [28/29.3.5.1](#).

## 28.2.2 Means of Egress Components.

### 28.2.2.1 General.

**28.2.2.1.1** Components of means of egress shall be limited to the types described in [28.2.2.2](#) through [28.2.2.12](#).

**28.2.2.1.2** In buildings, other than high-rise buildings, that are protected throughout by an approved, supervised automatic sprinkler system in accordance with [28.3.5](#), exit enclosures shall have a minimum 1-hour fire resistance rating, and doors shall have a minimum 1-hour fire protection rating.

The general provisions of [28/29.2.2](#) for the means of egress components in hotels and dormitories modify the provisions of [Chapter 7](#) in the following two areas:

1. Limits on the permitted components of the means of egress
2. Protection of certain components of the means of egress

First, a general reference to the components of the means of egress in [Chapter 7](#) is made in [28/29.2.1.1](#) in place of repeating its myriad provisions. Most of these components are permitted in both new and existing hotels and dormitories. Some of the components are permitted to be used in accordance with the provisions of [Chapter 7](#) and the additional provisions of [Chapters 28](#) and [29](#). For example, [28/29.2.2.2.2](#) permits the use of delayed-egress locks in accordance with [7.2.1.6.1](#). While

## CHAPTER 29 • Existing

**29.2.1.2** Means of escape within the guest room or guest suite shall comply with the provisions of [Section 24.2](#) for one- and two-family dwellings.

**29.2.1.3** For the purpose of application of the requirements of [Chapter 24](#), the terms *guest room* and *guest suite* shall be synonymous with the terms *dwelling unit* or *living unit*.

A second important provision of [Section 24.2](#) is that the means of egress provisions of [Chapter 7](#) do not apply within the guest room or guest suite unless they are specifically referenced. For example, the minimum width of means of escape doors within a guest room or guest suite is 28 in. (710 mm), rather than the 32 in. (810 mm) minimum clear width specified for means of egress by [Chapter 7](#). The requirements of [Chapter 7](#) apply to the door from the room or suite to the common corridor, because this door is the transition point at which means of escape ends and the standard means of egress begins. [Chapter 24](#) also permits the use of winders and spiral stairs within a guest room or guest suite, and the provisions of [Chapter 24](#) for headroom apply within the guest room or guest suite, superseding those of [Chapter 7](#). See the commentary on [Chapter 24](#) for additional information on means of escape from dwelling units.

## 29.2.2 Means of Egress Components.

### 29.2.2.1 General.

**29.2.2.1.1** Components of means of egress shall be limited to the types described in [29.2.2.2](#) through [29.2.2.12](#).

**29.2.2.1.2** In buildings, other than high-rise buildings, that are protected throughout by an approved automatic sprinkler system in accordance with [29.3.5](#), exit enclosures shall have a minimum 1-hour fire resistance rating, and doors shall have a minimum 1-hour fire protection rating.

previous editions of the *Code* restricted the use of delayed egress devices to not more than one in any egress path, that limitation was removed for the 2015 edition. In addition, [28/29.2.2.2.4](#) permits the use of elevator lobby exit access door locking in accordance with [7.2.1.6.3](#).

Where a particular egress component is not permitted, no reference to it is made in the applicable occupancy chapter. For example, escalators and fire escape stairs are only permitted to serve as required means of egress in existing hotels. Therefore, [29.2.2.8](#) and [29.2.2.9](#) contain specific references to such components, while [28.2.2.8](#) and [28.2.2.9](#) are reserved and contain no such reference. Neither chapter permits the use of slide escapes; consequently, no reference to slide escapes is made within the means of egress sections of either chapter.

## CHAPTER 28 • New

Second, Chapter 28 recognizes the relatively low fuel loads of hotels and modifies the exit enclosure requirements of Chapter 7. In other than high-rise buildings, 28.2.2.1.2 permits a fire resistance rating of 1 hour for exit enclosures and other vertical openings (see 28.3.1.1.3), regardless of the number of stories connected, provided that the building is protected throughout by an approved, supervised automatic sprinkler system. See 29.3.1 for the unique vertical opening protection criteria for existing hotels and dormitories.

Because the Code requires all new hotels and dormitories to be protected throughout by an approved automatic sprinkler system, a 1-hour fire resistance-rated exit enclosure is permitted in other than high-rise buildings. The sprinkler exemption for hotels with exterior exit access from every guest room, which was provided in previous editions of the Code, was removed for the 2015 edition.

The reduction to a 1-hour fire resistance-rated enclosure for exits is not permitted for assembly, mercantile, or business occupancies and, therefore, is not permitted to be used where mixed hotel/assembly, hotel/mercantile, or hotel/business occupancies are involved. In buildings of four or more stories in height, where hotel occupancies and other occupancies are separated in accordance with 6.1.14.4 and treated independently, 1-hour

### 28.2.2.2 Doors.

28.2.2.2.1 Doors complying with 7.2.1 shall be permitted.

28.2.2.2.2 Door-locking arrangements shall comply with 28.2.2.2.2.1, 28.2.2.2.2.2, 28.2.2.2.2.3, or 28.2.2.2.2.4.

28.2.2.2.2.1 No door in any means of egress shall be locked against egress when the building is occupied.

28.2.2.2.2.2 Delayed-egress locks complying with 7.2.1.6.1 shall be permitted.

28.2.2.2.2.3 Access-controlled egress doors complying with 7.2.1.6.2 shall be permitted.

28.2.2.2.2.4 Elevator lobby exit access door locking in accordance with 7.2.1.6.3 shall be permitted.

Hotels and dormitories are prohibited from having any door locked against egress while the building is occupied. This requirement permits a door to be equipped with a locking device that allows the door to be opened from within the building for the purpose of egress but does not allow the door to be opened from outside the building.

The language of 7.2.1.5.3 is clear: Locks, if provided, must not require the use of a key, a tool, or special knowledge or effort for operation from the egress side of the building. This requirement prohibits double-cylinder locks and chain locks that

## CHAPTER 29 • Existing

exit enclosures in the hotel portion and 2-hour enclosures elsewhere might be permitted.

Exhibit 28/29.3 illustrates the modification to the requirements for protection of exit enclosures and other vertical openings in a fully sprinklered, non-high-rise building.

Exit enclosure separation — sprinklered non-high-rise building.

### 29.2.2.2 Doors.

29.2.2.2.1 Doors complying with 7.2.1 shall be permitted.

29.2.2.2.2 Door-locking arrangements shall comply with 29.2.2.2.2.1, 29.2.2.2.2.2, 29.2.2.2.2.3, or 29.2.2.2.2.4.

29.2.2.2.2.1 No door in any means of egress shall be locked against egress when the building is occupied.

29.2.2.2.2.2 Delayed-egress locks complying with 7.2.1.6.1 shall be permitted.

29.2.2.2.2.3 Access-controlled egress doors complying with 7.2.1.6.2 shall be permitted.

29.2.2.2.2.4 Elevator lobby exit access door locking in accordance with 7.2.1.6.3 shall be permitted.

require a key to operate the door from the inside. The use of a simple operation to open a door is required by 7.2.1.5.10; locks that require two-handed knobs and similar operations are prohibited.

Hotel room doors provide security for the occupants in the room. Chapter 7 recognizes this necessary function by permitting the use of security chains or rods, as well as locks, on hotel room doors and also permits releasing devices in addition to the doorknob or lever. The permitted number of additional releasing actions differs for new and existing buildings. One additional

## CHAPTER 28 • New

releasing action is permitted for new occupancies, and two additional actions are permitted in existing occupancies (see 7.2.1.5.10.3 and 7.2.1.5.10.4).

The typical hotel room door has three devices: a latch, a lock, and a security chain or rod. This arrangement is permitted in existing hotels and dormitories, provided that only two additional releasing operations (for a total of three) are needed to unlock and unlatch the door. This arrangement is also permitted in new hotels and dormitories, provided that the latch and lock set are interconnected so that the lock bolt and the latch retract simultaneously when the latch-releasing handle is operated from inside the room; thus, only one releasing action is needed for the two devices. The second action is the release of the security chain or rod. The overriding requirement for any of these devices is that they must not require the use of a key, a tool, or special knowledge or effort to operate.

The use of the delayed-egress lock detailed in 7.2.1.6.1 is recognized in 28/29.2.2.2.2. The use of delayed-egress locking systems requires that an automatic sprinkler system or automatic fire detection system protects the entire building. The 15-second or 30-second delay permitted by 7.2.1.6.1 does not affect the immediate release of the lock upon activation of sprinklers or detectors or upon loss of power to the lock. The delay device provides the security needed for doors that are used infrequently. At the same time, the door remains available for

**28.2.2.2.3** Revolving doors complying with 7.2.1.10 shall be permitted.

**28.2.2.3 Stairs.** Stairs complying with 7.2.2 shall be permitted.

**28.2.2.4 Smokeproof Enclosures.** Smokeproof enclosures complying with 7.2.3 shall be permitted.

**28.2.2.5 Horizontal Exits.** Horizontal exits complying with 7.2.4 shall be permitted.

**28.2.2.6 Ramps.** Ramps complying with 7.2.5 shall be permitted.

**28.2.2.7 Exit Passageways.** Exit passageways complying with 7.2.6 shall be permitted.

**28.2.2.8 Reserved.**

## CHAPTER 29 • Existing

emergency use. Chains and padlocks do not provide these safety features.

The use of elevator lobby exit access door locking detailed in 7.2.1.6.3 is recognized by 28/29.2.2.2.4. This provision allows an elevator to open to an elevator lobby from which access to an exit stair is required to pass through normally locked doors. Although the floors of most hotels are arranged so that elevators open to lobbies that are directly connected to corridors serving the guest rooms, and in turn provide direct access to exit stairs, there may be arrangements where it is desirable to have a "secure" floor in which occupants step off the elevator into a reception area. The provisions of 7.2.1.6.3 permit access to the required exits to be through normally locked doors subject to the additional protection criteria specified therein. See the commentary following 7.2.1.6.3 for additional details on elevator lobby exit access door locking.

Selected exit stair enclosure doors are permitted to be locked to prevent re-entry from the stair side by 7.2.1.5.8, while other stair enclosure doors must remain unlocked. If the selected re-entry provisions are not used, one of the other two options specified by 7.2.1.5.8 must be used for stair enclosures serving five or more stories. Doors are permitted to be locked to prevent re-entry from the stairwell if initiation of the building fire alarm system automatically unlocks the door; otherwise, all stair enclosure doors must remain unlocked at all times.

**29.2.2.2.3** Revolving doors complying with 7.2.1.10 shall be permitted.

**29.2.2.3 Stairs.** Stairs complying with 7.2.2 shall be permitted.

**29.2.2.4 Smokeproof Enclosures.** Smokeproof enclosures complying with 7.2.3 shall be permitted.

**29.2.2.5 Horizontal Exits.** Horizontal exits complying with 7.2.4 shall be permitted.

**29.2.2.6 Ramps.** Ramps complying with 7.2.5 shall be permitted.

**29.2.2.7 Exit Passageways.** Exit passageways complying with 7.2.6 shall be permitted.

**29.2.2.8\* Escalators.** Escalators previously approved as a component in a means of egress shall be permitted to continue to be considered in compliance.

**A.29.2.2.8** Due to the nature of escalators, they are no longer acceptable as a component in a means of egress. However, because many escalators have been used for exit access and exit discharge in the past, they are permitted to continue to be considered in compliance. Very few escalators have ever been installed in a manner to qualify as an exit. For information on

## CHAPTER 28 • New

**28.2.2.9 Reserved.**

**28.2.2.10 Fire Escape Ladders.** Fire escape ladders complying with 7.2.9 shall be permitted.

**28.2.2.11 Alternating Tread Devices.** Alternating tread devices complying with 7.2.11 shall be permitted.

**28.2.2.12 Areas of Refuge.**

**28.2.2.12.1** Areas of refuge complying with 7.2.12 shall be permitted, as modified by 28.2.2.12.2.

**28.2.2.12.2\*** In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 28.3.5, the two accessible rooms or spaces separated from each other by smoke-resistive partitions in accordance with the definition of area of refuge in 3.3.22 shall not be required.

**A.28.2.2.12.2** The provision of 28.2.2.12.2 permits the entire floor to serve as an area of refuge where it is protected in accordance with 28.3.5. The provision is acceptable because supervised automatic sprinkler systems have built-in signals for monitoring features of the system, such as the opening and closing of water control valves. Such systems also monitor pump power supplies, water tank levels, and conditions that will impair the satisfactory operation of the sprinkler system. Because of these monitoring features, supervised automatic sprinkler systems have a high level of satisfactory performance and response to fire conditions.

In new hotels and dormitories, areas accessible to persons with severe mobility impairment must be provided with accessible means of egress per 7.5.4.1. For stories above the level of exit discharge, where providing ramps is usually not practical, areas of refuge (see 7.2.12) are typically used to meet the requirements for accessible means of egress. A story of a fully sprinklered hotel or dormitory is permitted to be considered an area of refuge by 28.2.2.12.2, even if an occupant does not have access to any of the guest rooms and is confined to the exit access corridor (see the definition of *area of refuge* in 3.3.22). Due to the anticipated effectiveness of the automatic sprinkler system, an occupant with severe mobility impairment should be able to remain on

**28.2.3 Capacity of Means of Egress.**

**28.2.3.1** The capacity of means of egress shall be in accordance with Section 7.3.

**28.2.3.2** Street floor exits shall be sufficient for the occupant load of the street floor plus the required capacity of stairs and ramps discharging onto the street floor.

**28.2.3.3\*** Corridors, other than those within individual guest rooms or individual guest suites, shall be of sufficient width to

## CHAPTER 29 • Existing

escalator protection and requirements, see previous editions of the *Code*.

**29.2.2.9 Fire Escape Stairs.** Fire escape stairs complying with 7.2.8 shall be permitted.

**29.2.2.10 Fire Escape Ladders.** Fire escape ladders complying with 7.2.9 shall be permitted.

**29.2.2.11 Alternating Tread Devices.** Alternating tread devices complying with 7.2.11 shall be permitted.

**29.2.2.12 Areas of Refuge.**

**29.2.2.12.1** Areas of refuge complying with 7.2.12 shall be permitted, as modified by 28.2.2.12.2.

**29.2.2.12.2\*** In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 29.3.5, the two accessible rooms or spaces separated from each other by smoke-resistive partitions in accordance with the definition of area of refuge in 3.3.22 shall not be required.

**A.29.2.2.12.2** The provision of 29.2.2.12.2 permits the entire floor to serve as an area of refuge where it is protected in accordance with 29.3.5. The provision is acceptable because supervised automatic sprinkler systems have built-in signals for monitoring features of the system, such as the opening and closing of water control valves. Such systems also monitor pump power supplies, water tank levels, and conditions that will impair the satisfactory operation of the sprinkler system. Because of these monitoring features, supervised automatic sprinkler systems have a high level of satisfactory performance and response to fire conditions.

the floor without experiencing untenable conditions. However, because locked guest room doors render spaces other than the corridor inaccessible, the corridor effectively serves as the area of refuge.

Existing hotels and dormitories are exempt from the provisions of 7.5.4.1; therefore, areas of refuge are not required but are permitted to serve as means of egress components. If an area of refuge is used within an existing hotel, 29.2.2.12.2 permits a story of a fully sprinklered hotel or dormitory to be considered an area of refuge, even if an occupant does not have access to any of the guest rooms and is confined to the exit access corridor.

**29.2.3 Capacity of Means of Egress.**

**29.2.3.1** The capacity of means of egress shall be in accordance with Section 7.3.

**29.2.3.2** Street floor exits shall be sufficient for the occupant load of the street floor plus the required capacity of stairs and ramps discharging onto the street floor.

## CHAPTER 28 • New

accommodate the required occupant load and shall be not less than 44 in. (1120 mm).

**A.28.2.3.3** The exemption contained in 28.2.3.3 applies to corridors within an individual room or suite and does not apply where a suite can be subdivided and rented separately.

Where exits from upper floors discharge through the level of exit discharge in accordance with 7.7.2, the result is an increased demand on street-floor egress components, such as exit doors. Street-floor exits must be sized to handle the combined required capacity in accordance with 28/29.2.3.2.

Exhibit 28/29.4 illustrates the traditional grand lobby design found in many hotels in which multiple exit stairs and street-floor exits converge at one or two exterior door locations. The required aggregate capacity of doors A and B is based on the number of people expected to use them. Assuming that the street floor has an occupant load of 400 persons and each of the two enclosed exit stairs (i.e., stair 1 and stair 2) discharging into the street floor has a required capacity of 200 persons (i.e., a maximum of 50 percent of the 400-person occupant load of the second or third floor via stair 1 and a maximum of 50 percent of the 400-person occupant load of the basement via stair 2), the required egress capacity for the street floor would be 800 persons. The unobstructed door or level egress width required to accommodate 800 persons is 13 ft 4 in. (4065 mm). The opening provided by each pair of doors, A and B, needs to be 6 ft 8 in. (2030 mm) in clear width.

## 28.2.4 Number of Means of Egress.

**28.2.4.1** Means of egress shall comply with all of the following, except as otherwise permitted by 28.2.4.2 and 28.2.4.3:

- (1) The number of means of egress shall be in accordance with Section 7.4.
- (2) Not less than two separate exits shall be provided on every story.
- (3) Not less than two separate exits shall be accessible from every part of every story.

**28.2.4.2** Exit access, as required by 28.2.4.1(3), shall be permitted to include a single exit access path for the distances permitted as common paths of travel by 28.2.5.

**28.2.4.3** A single exit shall be permitted in buildings where the total number of stories does not exceed four, provided that all of the following conditions are met:

- (1) There are four or fewer guest rooms or guest suites per story.
- (2) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with 28.3.5.

## CHAPTER 29 • Existing

Exhibit 28/29.4

Egress capacity for street floor.

## 29.2.4 Number of Means of Egress.

**29.2.4.1** Means of egress shall comply with all of the following, except as otherwise permitted by 29.2.4.2 and 29.2.4.3:

- (1) The number of means of egress shall be in accordance with 7.4.1.1 and 7.4.1.3 through 7.4.1.6.
- (2) Not less than two separate exits shall be accessible from every part of every story, including stories below the level of exit discharge and stories occupied for public purposes.

**29.2.4.2** Exit access, as required by 29.2.4.1(2), shall be permitted to include a single exit access path for the distances permitted as common paths of travel by 29.2.5.

**29.2.4.3** A single exit shall be permitted in buildings where the total number of stories does not exceed four, provided that all of the following conditions are met:

- (1) There are four or fewer guest rooms or guest suites per story.
- (2) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with 29.3.5.

## CHAPTER 28 • New

- (3) The exit stairway does not serve more than one-half of a story below the level of exit discharge.
- (4) The travel distance from the entrance door of any guest room or guest suite to an exit does not exceed 35 ft (10.7 m).
- (5) The exit stairway is completely enclosed or separated from the rest of the building by barriers having a minimum 1-hour fire resistance rating.
- (6) All openings between the exit stairway enclosure and the building are protected with self-closing door assemblies having a minimum 1-hour fire protection rating.
- (7) All corridors serving as access to exits have a minimum 1-hour fire resistance rating.
- (8) Horizontal and vertical separation having a minimum ½-hour fire resistance rating is provided between guest rooms or guest suites.

Although 28.2.4.1(2) requires a minimum of two exits on every story in new hotels and dormitories, 7.4.1.2 requires a third exit when the occupant load of a floor exceeds 500 and a fourth exit when it exceeds 1000. The requirement of 7.4.1.2 will probably have little effect on modern hotel design practices, because

### 28.2.5 Arrangement of Means of Egress.

**28.2.5.1** Access to all required exits shall be in accordance with Section 7.5, as modified by 28.2.5.2.

**28.2.5.2** The distance between exits addressed by 7.5.1.3 shall not apply to common nonlooped exit access corridors in buildings that have corridor doors from the guest room or guest suite that are arranged such that the exits are located in opposite directions from such doors.

**28.2.5.3** In buildings not protected throughout by an approved, supervised automatic sprinkler system in accordance with 28.3.5, common paths of travel shall not exceed 35 ft (10.7 m); travel within a guest room or guest suite shall not be included when calculating common path of travel.

**28.2.5.4** In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 28.3.5, common path of travel shall not exceed 50 ft (15 m); travel within a guest room or guest suite shall not be included when determining common path of travel.

**28.2.5.5** In buildings not protected throughout by an approved, automatic sprinkler system in accordance with 28.3.5, dead-end corridors shall not exceed 35 ft (10.7 m).

**28.2.5.6** In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 28.3.5, dead-end corridors shall not exceed 50 ft (15 m).

**28.2.5.7** Any guest room or any guest suite of rooms in excess of 2000 ft<sup>2</sup> (185 m<sup>2</sup>) shall be provided with not less than two exit access doors remotely located from each other.

## CHAPTER 29 • Existing

- (3) The exit stairway does not serve more than one-half of a story below the level of exit discharge.
- (4) The travel distance from the entrance door of any guest room or guest suite to an exit does not exceed 35 ft (10.7 m).
- (5) The exit stairway is completely enclosed or separated from the rest of the building by barriers having a minimum 1-hour fire resistance rating.
- (6) All openings between the exit stairway enclosure and the building are protected with self-closing door assemblies having a minimum 1-hour fire protection rating.
- (7) All corridors serving as access to exits have a minimum 1-hour fire resistance rating.
- (8) Horizontal and vertical separation having a minimum ½-hour fire resistance rating is provided between guest rooms or guest suites.

floors large enough to accommodate more than 500 persons would probably be provided with more than two exits, based on travel distance limit considerations (see 28/29.2.6). Note that 7.4.1.2 does not apply to existing hotels and dormitories [see 29.2.4.1(1)].

### 29.2.5 Arrangement of Means of Egress.

**29.2.5.1** Access to all required exits shall be in accordance with Section 7.5.

**29.2.5.2** Reserved.

**29.2.5.3** In buildings not protected throughout by an approved, supervised automatic sprinkler system in accordance with 29.3.5, common paths of travel shall not exceed 35 ft (10.7 m); travel within a guest room or guest suite shall not be included when calculating common path of travel.

**29.2.5.4** In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 29.3.5, common path of travel shall not exceed 50 ft (15 m); travel within a guest room or guest suite shall not be included when determining common path of travel.

**29.2.5.5** Dead-end corridors shall not exceed 50 ft (15 m).

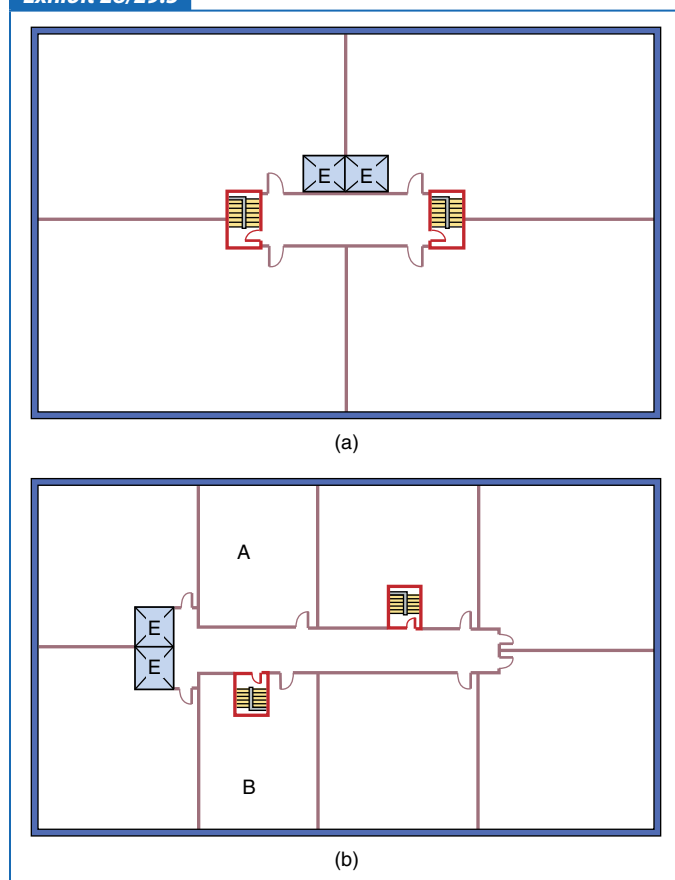

## CHAPTER 28 • New

The provisions for the arrangement of the means of egress for hotels and dormitories differ somewhat from the general provisions in Chapter 7. The first difference appears in 28.2.5.2, which addresses the remoteness of exits. Applying the remoteness of exits provisions of 7.5.1.3 could result in a corridor that is longer than is necessary for the efficient use of the space. Some relief is offered by 28.2.5.2. Exhibit 28/29.5 helps to clarify the intent of 28.2.5.2. In Part (a) of Exhibit 28/29.5, all four guest rooms/guest suites have access to two exits immediately upon leaving the guest room/guest suite and entering the exit access corridor — that is, there is no common path of travel within the corridor from any of the guest rooms/guest suites. This arrangement meets the provisions of 28.2.5.2. Contrast this arrangement with that depicted in Part (b) of Exhibit 28/29.5, where only guest rooms/guest suites A and B have access to two exits immediately upon leaving the guest room/guest suite and entering the exit access corridor. The other guest rooms/guest suites do not have immediate access to two exits. This arrangement does not meet the provisions of 28.2.5.2.

The concepts underlying the limitations imposed on common paths of travel and dead-end corridors are similar but not

Exhibit 28/29.5

New hotels and dormitories — exit remoteness.

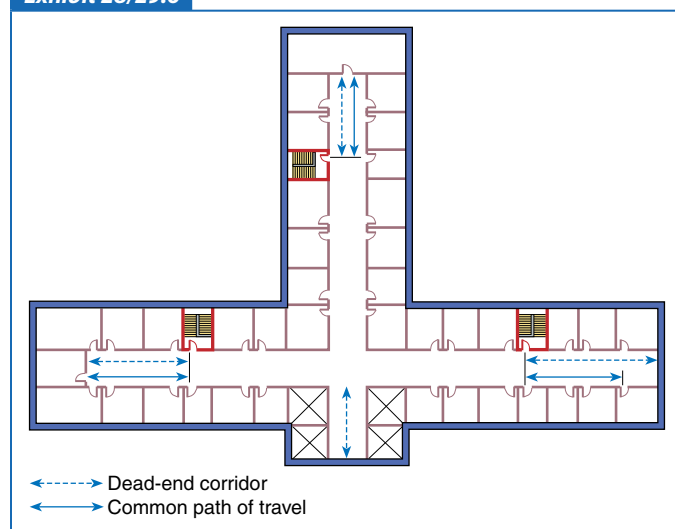

## CHAPTER 29 • Existing

identical to those explained in the commentary on 7.5.1.5. Because of modifications made by Chapters 28 and 29 in defining where common path of travel begins, the difference between common paths of travel and dead-end corridors is less pronounced for hotels and dormitories. For most other occupancies, common path of travel is measured from the most remote point subject to occupancy to the point where occupants have a choice of traveling in independent directions (see 7.5.1.4 and the definition of *common path of travel* in 3.3.47). In hotels, the travel distance within the guest room, though regulated by 28/29.2.6.1 and 28/29.2.6.2, is not included as part of the common path of travel, because the path of travel within the guest room is considered means of escape, rather than means of egress. Therefore, common path of travel, as illustrated by the solid arrows in Exhibit 28/29.6, is measured from the room door to the point where occupants have a choice of traveling in independent directions. This depiction can be thought of as a modified common path of travel, because measurement does not extend into the guest room or guest suite.

The distances permitted for common path of travel in new and existing hotels and dormitories also differ. Because new hotels and dormitories are required to be sprinklered (see 28.3.5.1), the 35 ft (10.7 m) modified common path of travel and dead-end corridor limitations permitted by 28.2.5.3 and 28.2.5.5 will be supplanted by the 50 ft (15 m) limitation permitted by 28.2.5.4 and 28.2.5.6. The provisions of 28.2.5.3 and 28.2.5.5 might apply to the rehabilitation of an existing, non-sprinklered building. See Chapter 43 for details on existing building rehabilitation.

In existing hotels, automatic sprinklers are not generally required. However, if the building is protected throughout by an

Exhibit 28/29.6

Modified common path of travel and dead-end corridors in hotels and dormitories.

## CHAPTER 28 • New

approved, supervised automatic sprinkler system, the common path of travel is permitted to be 50 ft (15 m), which is the same distance permitted for the length of existing dead-end corridors, regardless of the presence of automatic sprinklers.

Although not considered part of the common path of travel, travel within a guest room or a guest suite in a new hotel is

### 28.2.6 Travel Distance to Exits.

**28.2.6.1** Travel distance within a guest room or guest suite to a corridor door shall not exceed 75 ft (23 m) in buildings not protected by an approved, supervised automatic sprinkler system in accordance with 28.3.5.

**28.2.6.2** Travel distance within a guest room or guest suite to a corridor door shall not exceed 125 ft (38 m) in buildings protected by an approved, supervised automatic sprinkler system in accordance with 28.3.5.

**28.2.6.3** Travel distance from the corridor door of any guest room or guest suite to the nearest exit shall comply with 28.2.6.3.1, 28.2.6.3.2, or 28.2.6.3.3.

**28.2.6.3.1** Travel distance from the corridor door of any guest room or guest suite to the nearest exit, measured in accordance with Section 7.6, shall not exceed 100 ft (30 m).

**28.2.6.3.2** Travel distance from the corridor door of any guest room or guest suite to the nearest exit, measured in accordance with Section 7.6, shall not exceed 200 ft (61 m) for exterior ways of exit access arranged in accordance with 7.5.3.

**28.2.6.3.3** Travel distance from the corridor door of any guest room or guest suite to the nearest exit shall comply with 28.2.6.3.3.1 and 28.2.6.3.3.2.

**28.2.6.3.3.1** Travel distance from the corridor door of any guest room or guest suite to the nearest exit shall be measured in accordance with Section 7.6 and shall not exceed 200 ft (61 m) where the exit access and any portion of the building that is tributary to the exit access are protected throughout by an approved, supervised automatic sprinkler system in accordance with 28.3.5.

**28.2.6.3.3.2** Where the building is not protected throughout by an approved, supervised automatic sprinkler system, the 200 ft (61 m) travel distance shall be permitted within any portion of the building that is protected by an approved, supervised automatic sprinkler system, provided that the sprinklered portion of the building is separated from any nonsprinklered portion by fire barriers having a fire resistance rating as follows:

- (1) Minimum 1-hour fire resistance rating for buildings three or fewer stories in height
- (2) Minimum 2-hour fire resistance rating for buildings four or more stories in height

## CHAPTER 29 • Existing

regulated indirectly by 28.2.5.7, which limits the area of rooms or suites with a single exit access to not larger than 2000 ft<sup>2</sup> (185 m<sup>2</sup>). See also 28/29.2.6.1 and 28/29.2.6.2 for travel distance limitations within guest rooms and guest suites.

### 29.2.6 Travel Distance to Exits.

**29.2.6.1** Travel distance within a guest room or guest suite to a corridor door shall not exceed 75 ft (23 m) in buildings not protected by an approved, supervised automatic sprinkler system in accordance with 29.3.5.

**29.2.6.2** Travel distance within a guest room or guest suite to a corridor door shall not exceed 125 ft (38 m) in buildings protected by an approved, supervised automatic sprinkler system in accordance with 29.3.5.

**29.2.6.3** Travel distance from the corridor door of any guest room or guest suite to the nearest exit shall comply with 29.2.6.3.1, 29.2.6.3.2, or 29.2.6.3.3.

**29.2.6.3.1** Travel distance from the corridor door of any guest room or guest suite to the nearest exit, measured in accordance with Section 7.6, shall not exceed 100 ft (30 m).

**29.2.6.3.2** Travel distance from the corridor door of any guest room or guest suite to the nearest exit, measured in accordance with Section 7.6, shall not exceed 200 ft (61 m) for exterior ways of exit access arranged in accordance with 7.5.3.

**29.2.6.3.3** Travel distance from the corridor door of any guest room or guest suite to the nearest exit shall comply with 29.2.6.3.3.1 and 29.2.6.3.3.2.

**29.2.6.3.3.1** Travel distance from the corridor door of any guest room or guest suite to the nearest exit shall be measured in accordance with Section 7.6 and shall not exceed 200 ft (61 m) where the exit access and any portion of the building that is tributary to the exit access are protected throughout by an approved, supervised automatic sprinkler system in accordance with 29.3.5.

**29.2.6.3.3.2** Where the building is not protected throughout by an approved, supervised automatic sprinkler system, the 200 ft (61 m) travel distance shall be permitted within any portion of the building that is protected by an approved, supervised automatic sprinkler system, provided that the sprinklered portion of the building is separated from any nonsprinklered portion by fire barriers having a fire resistance rating as follows:

- (1) Minimum 1-hour fire resistance rating for buildings three or fewer stories in height
- (2) Minimum 2-hour fire resistance rating for buildings four or more stories in height

## CHAPTER 28 • New

The travel distance limitations specified in 28/29.2.6 are divided into the following two portions of the overall travel distance:

1. Travel within a room or suite of rooms to the room door
2. Travel from the corridor door to the nearest exit

This concept and the distance limitations specified in 28/29.2.6 are illustrated in Exhibit 28/29.7. If the travel distance within a room or suite of rooms is excessive, an additional remote door to the corridor can usually be added to correct the deficiency. Excessive travel distance within the corridor can usually be corrected by adding another exit.

### 28.2.7 Discharge from Exits.

28.2.7.1 Exit discharge shall comply with Section 7.7.

28.2.7.2\* Any required exit stair that is located so that it is necessary to pass through the lobby or other open space to reach the outside of the building shall be continuously enclosed down to a level of exit discharge or to a mezzanine within a lobby at a level of exit discharge.

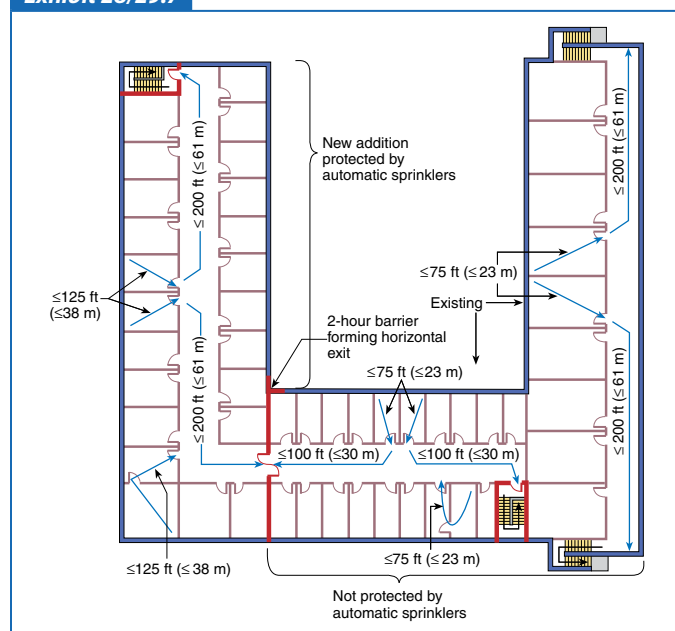

A.28.2.7.2 Where open stairways are permitted, they are considered as exit access to exits rather than as exits, and the requirements for travel distance to exits include the travel on such stairs. (See 7.6.3.)

28.2.7.3 The distance of travel from the termination of the exit enclosure to an exterior door leading to a public way shall not exceed 100 ft (30 m).

Section 7.7 permits a maximum of 50 percent of the number and capacity of exits to discharge through interior building areas under limited conditions (see 7.7.2). Paragraph 28/29.2.7.2 modifies the restrictions of Section 7.7 by treating an exit that discharges onto a mezzanine within the lobby of a hotel (with subsequent open stair travel to the lobby floor on the level of exit discharge) as equivalent to an exit that discharges directly into the lobby at the level of exit discharge. Therefore, 50 percent of the exits can discharge onto a mezzanine; the other 50 percent must discharge directly outside. However, the distance

## CHAPTER 29 • Existing

Exhibit 28/29.7

Travel distance measurement and limitations in hotels and dormitories.

### 29.2.7 Discharge from Exits.

29.2.7.1 Exit discharge shall comply with Section 7.7.

29.2.7.2\* Any required exit stair that is located so that it is necessary to pass through the lobby or other open space to reach the outside of the building shall be continuously enclosed down to a level of exit discharge or to a mezzanine within a lobby at a level of exit discharge.

A.29.2.7.2 Where open stairways or escalators are permitted, they are considered as exit access to exits rather than as exits, and the requirements for travel distance to exits include the travel on such stairs and escalators. (See 7.6.3.)

29.2.7.3 The distance of travel from the termination of the exit enclosure to an exterior door leading to a public way shall not exceed 150 ft (46 m) in buildings protected throughout by an approved automatic sprinkler system in accordance with 29.3.5 and shall not exceed 100 ft (30 m) in all other buildings.

from the termination of the exit enclosure to the exterior door is limited to a maximum of 100 ft (30 m) in new buildings (see 28.2.7.3). In existing buildings, the same 100 ft (30 m) limitation applies, unless the building is protected with automatic sprinklers, in which case the distance can be extended to 150 ft (46 m) (see 29.2.7.3). The part of the exit discharge that occurs within the building is depicted in Exhibit 28/29.8 by the arrow that connects the door at stair 1 with the lobby door to the outside. See also the commentary following 7.7.2.

## CHAPTER 28 • New

## CHAPTER 29 • Existing

Exhibit 28/29.8

*Exit discharge through interior building areas.*

**28.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with [Section 7.8](#).

### 28.2.9 Emergency Lighting.

**28.2.9.1** Emergency lighting in accordance with [Section 7.9](#) shall be provided.

**28.2.9.2** The requirement of [28.2.9.1](#) shall not apply where each guest room or guest suite has an exit direct to the outside of the building at street or the finished ground level.

**28.2.10 Marking of Means of Egress.** Means of egress shall have signs in accordance with [Section 7.10](#).

### 28.2.11 Special Means of Egress Features.

**28.2.11.1 Reserved.**

**28.2.11.2 Lockups.** Lockups in hotel and dormitory occupancies shall comply with the requirements of [22.4.5](#).

**28.2.11.3 Normally Unoccupied Building Service Equipment Support Areas.** The use of [Section 7.13](#) shall be prohibited.

The provisions of [Section 7.13](#) modify the requirements for means of egress in normally unoccupied building service equipment support areas, unless the application of [Section 7.13](#) is prohibited by the applicable occupancy chapter (see [7.13.1.1](#)). The provision of [28/29.2.11.3](#) prohibits the use of [Section 7.13](#) in

## 28.3 Protection

### 28.3.1 Protection of Vertical Openings.

**28.3.1.1** Vertical openings shall comply with [28.3.1.1.1](#) through [28.3.1.2](#).

**28.3.1.1.1** Vertical openings shall be enclosed or protected in accordance with [Section 8.6](#).

**29.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with [Section 7.8](#).

### 29.2.9 Emergency Lighting.

**29.2.9.1** Emergency lighting in accordance with [Section 7.9](#) shall be provided in all buildings with more than 25 rooms.

**29.2.9.2** The requirement of [29.2.9.1](#) shall not apply where each guest room or guest suite has an exit direct to the outside of the building at street or the finished ground level.

**29.2.10 Marking of Means of Egress.** Means of egress shall have signs in accordance with [Section 7.10](#).

### 29.2.11 Special Means of Egress Features.

**29.2.11.1 Reserved.**

**29.2.11.2 Lockups.** Lockups in hotel and dormitory occupancies, other than approved existing lockups, shall comply with the requirements of [23.4.5](#).

**29.2.11.3 Normally Unoccupied Building Service Equipment Support Areas.** The use of [Section 7.13](#) shall be prohibited.

both new and existing hotels and dormitories. As a result, such areas must comply with the usual means of egress requirements of [Chapter 7](#) if they are occupiable (e.g., to access equipment for maintenance purposes), even if they are not normally occupied.

## 29.3 Protection

### 29.3.1 Protection of Vertical Openings.

**29.3.1.1** Vertical openings shall comply with [29.3.1.1.1](#) through [29.3.1.2](#).

**29.3.1.1.1** Vertical openings shall be enclosed or protected in accordance with [Section 8.6](#).

## CHAPTER 28 • New

**28.3.1.1.2** Vertical openings in accordance with 8.6.9.1 shall be permitted.

**28.3.1.1.3** In buildings, other than high-rise buildings, that are protected throughout by an approved, supervised automatic sprinkler system in accordance with 28.3.5, the walls enclosing vertical openings shall have a minimum 1-hour fire resistance rating, and doors shall have a minimum 1-hour fire protection rating.

New hotels and dormitories must be protected throughout by an approved, supervised automatic sprinkler system (see 28.3.5.1). Therefore, all new non-high-rise hotels and dormitories, by virtue of their compliance with the sprinkler requirements of 28.3.5.1, are permitted to use the 1-hour vertical enclosure protection option in accordance with 28.3.1.1.3, regardless of the number of stories the vertical opening connects. See also the commentary following 28/29.2.2.1.2 for discussion on the requirements for exits.

The protection of vertical openings in existing hotels and dormitories is achieved by means of compliance with Section 8.6, or compliance with the performance requirements of 29.3.1.1.3. Note that no such performance approach is provided for new hotels and dormitories.

The provisions of 28/29.3.1.1.2 are the same and permit an open stair connecting a maximum of two levels within a guest suite. This stair is permitted to serve as a means of escape (see 8.6.9.1 for the provisions for convenience openings).

**28.3.1.2** No floor below the level of exit discharge used only for storage, heating equipment, or purposes other than residential occupancy shall have unprotected openings to floors used for residential purposes.

### 28.3.2 Protection from Hazards.

**28.3.2.1 General.** All rooms containing high-pressure boilers, refrigerating machinery, transformers, or other service equipment subject to possible explosion shall not be located directly under or directly adjacent to exits and shall be effectively cut off from other parts of the building as specified in Section 8.7.

## CHAPTER 29 • Existing

**29.3.1.1.2** Vertical openings in accordance with 8.6.9.1 shall be permitted.

**29.3.1.1.3** In buildings, other than high-rise buildings, that are protected throughout by an approved automatic sprinkler system in accordance with 29.3.5, and in which exits and required ways of travel thereto are adequately safeguarded against fire and smoke within the building, or where every individual room has direct access to an exterior exit without passing through any public corridor, the protection of vertical openings that are not part of required exits shall not be required where approved by the authority having jurisdiction and where such openings do not endanger required means of egress.

**29.3.1.1.4** In buildings two or fewer stories in height, unprotected openings shall be permitted by the authority having jurisdiction to continue to be used where the building is protected throughout by an approved automatic sprinkler system in accordance with 29.3.5.

Existing unprotected openings in non-high-rise buildings are permitted by 29.3.1.1.3 under the following conditions:

1. Openings are approved by the authority having jurisdiction.
2. The building is fully sprinklered.
3. Exits and exit accesses are adequately safeguarded against fire and smoke in the remainder of the building.
4. In lieu of the condition in item 3, every room has direct access to an exterior exit that does not require travel through a public corridor.
5. Shafts that enclose required exit stairs are protected.

Existing unprotected vertical openings are permitted by 29.3.1.1.4 under the following conditions:

1. Openings are approved by the AHJ.
2. The building is not more than two stories in height.
3. The building is fully sprinklered.

**29.3.1.2** No floor below the level of exit discharge used only for storage, heating equipment, or purposes other than residential occupancy shall have unprotected openings to floors used for residential purposes.

### 29.3.2 Protection from Hazards.

**29.3.2.1 General.** All rooms containing high-pressure boilers, refrigerating machinery, transformers, or other service equipment subject to possible explosion shall not be located directly under or directly adjacent to exits and shall be effectively cut off from other parts of the building as specified in Section 8.7.

## CHAPTER 28 • New

**28.3.2.2 Hazardous Areas.**

**28.3.2.2.1** Any hazardous area shall be protected in accordance with [Section 8.7](#).

**28.3.2.2.2** The areas described in [Table 28.3.2.2.2](#) shall be protected as indicated.

**28.3.2.2.3** Where sprinkler protection without fire-rated separation is used, areas shall be separated from other spaces by smoke partitions complying with [Section 8.4](#).

**Table 28.3.2.2.2 Hazardous Area Protection**

Hazardous Area Description	Separation/Protection <sup>a</sup>
Boiler and fuel-fired heater rooms serving more than a single guest room or guest suite	1 hour and sprinklers
Employee locker rooms	1 hour or sprinklers
Gift or retail shops	1 hour or sprinklers
Bulk laundries	1 hour and sprinklers
Guest laundries $\leq 100$ ft <sup>2</sup> ( $\leq 9.3$ m <sup>2</sup> ) outside of guest rooms or guest suites	1 hour or sprinklers <sup>b</sup>
Guest laundries $> 100$ ft <sup>2</sup> ( $> 9.3$ m <sup>2</sup> ) outside of guest rooms or guest suites	1 hour and sprinklers
Maintenance shops	1 hour and sprinklers
Storage rooms <sup>c</sup>	1 hour or sprinklers
Trash collection rooms	1 hour and sprinklers

<sup>a</sup>Minimum fire resistance rating.

<sup>b</sup>Where sprinklers are provided, the separation specified in [8.7.1.2](#) and [28.3.2.2.3](#) is not required.

<sup>c</sup>Where storage areas not exceeding 24 ft<sup>2</sup> (2.2 m<sup>2</sup>) are directly accessible from the guest room or guest suite, no separation or protection is required.

Note the differences in the hazardous area protection requirements for new and existing hotels and dormitories. In new occupancies, many areas are required to be separated by 1-hour fire barrier walls and to be protected by automatic sprinklers. In existing buildings, automatic sprinklers are often used as an alternative to rated construction, with the exception of trash collection rooms and maintenance shops, where both protection methods are required.

## CHAPTER 29 • Existing

**29.3.2.2 Hazardous Areas.**

**29.3.2.2.1** Any hazardous area shall be protected in accordance with [Section 8.7](#).

**29.3.2.2.2** The areas described in [Table 29.3.2.2.2](#). [Table 29.3.2.2.2](#) shall be protected as indicated.

**29.3.2.2.3** Where sprinkler protection without fire-rated separation is used, areas shall be separated from other spaces by smoke partitions complying with [Section 8.4](#).

**Table 29.3.2.2.2 Hazardous Area Protection**

Hazardous Area Description	Separation/Protection <sup>a</sup>
Boiler and fuel-fired heater rooms serving more than a single guest room or guest suite	1 hour or sprinklers
Employee locker rooms	1 hour or sprinklers
Gift or retail shops $> 100$ ft <sup>2</sup> ( $> 9.3$ m <sup>2</sup> )	1 hour or sprinklers <sup>b</sup>
Bulk laundries	1 hour or sprinklers
Guest laundries $> 100$ ft <sup>2</sup> ( $> 9.3$ m <sup>2</sup> ) outside of guest rooms or guest suites	1 hour or sprinklers <sup>b</sup>
Maintenance shops	1 hour and sprinklers
Rooms or spaces used for storage of combustible supplies and equipment in quantities deemed hazardous by the authority having jurisdiction <sup>c</sup>	1 hour or sprinklers
Trash collection rooms	1 hour and sprinklers

<sup>a</sup>Minimum fire resistance rating.

<sup>b</sup>Where sprinklers are provided, the separation specified in [8.7.1.2](#) and [29.3.2.2.3](#) is not required.

<sup>c</sup>Where storage areas not exceeding 24 ft<sup>2</sup> (2.2 m<sup>2</sup>) are directly accessible from the guest room or guest suite, no separation or protection is required.

While the lists that appear in [Table 28.3.2.2.2](#) and [Table 29.3.2.2.2](#) provide specific direction for certain hazardous contents areas, they are not all-inclusive. Other areas that are deemed hazardous need to be provided with the appropriate level of protection in accordance with [Section 8.7](#).

## CHAPTER 28 • New

**28.3.3 Interior Finish.**

**28.3.3.1 General.** Interior finish shall be in accordance with [Section 10.2](#).

**28.3.3.2 Interior Wall and Ceiling Finish.** Interior wall and ceiling finish materials complying with [Section 10.2](#) shall be permitted as follows:

- (1) Exit enclosures — Class A
- (2) Lobbies and corridors — Class A or Class B
- (3) Other spaces — Class A, Class B, or Class C

**28.3.3.3 Interior Floor Finish.**

**28.3.3.3.1** Interior floor finish shall comply with [Section 10.2](#).

**28.3.3.3.2** Interior floor finish in exit enclosures and exit access corridors and spaces not separated from them by walls complying with [28.3.6.1](#) shall be not less than Class II.

**28.3.3.3.3** Interior floor finish shall comply with [10.2.7.1](#) or [10.2.7.2](#), as applicable.

**28.3.4 Detection, Alarm, and Communications Systems.**

**28.3.4.1 General.** A fire alarm system in accordance with [Section 9.6](#), except as modified by [28.3.4.2](#) through [28.3.4.6](#), shall be provided.

**28.3.4.2 Initiation.** The required fire alarm system shall be initiated by each of the following:

- (1) Manual means in accordance with [9.6.2](#)
- (2) Manual fire alarm box located at the hotel desk or other convenient central control point under continuous supervision by responsible employees
- (3) Required automatic sprinkler system
- (4) Required automatic detection system other than sleeping room smoke detectors

**28.3.4.3 Notification.**

**28.3.4.3.1\*** Occupant notification shall be provided automatically in accordance with [9.6.3](#).

**A.28.3.4.3.1** Visible signaling appliances might be governed by provisions of federal regulations in 28 CFR 36, Appendix A, “Americans with Disabilities Act Accessibility Guidelines for Buildings and Facilities,” Section 4.28, Alarms.

## CHAPTER 29 • Existing

**29.3.3 Interior Finish.**

**29.3.3.1 General.** Interior finish shall be in accordance with [Section 10.2](#).

**29.3.3.2 Interior Wall and Ceiling Finish.** Interior wall and ceiling finish materials complying with [Section 10.2](#) shall be permitted as follows:

- (1) Exit enclosures — Class A or Class B
- (2) Lobbies and corridors — Class A or Class B
- (3) Other spaces — Class A, Class B, or Class C

**29.3.3.3 Interior Floor Finish.** In nonsprinklered buildings, newly installed interior floor finish in exits and exit access corridors shall be not less than Class II in accordance with [10.2.7](#).

**29.3.4 Detection, Alarm, and Communications Systems.**

**29.3.4.1 General.** A fire alarm system in accordance with [Section 9.6](#), except as modified by [29.3.4.2](#) through [29.3.4.5](#), shall be provided in buildings, other than those where each guest room has exterior exit access in accordance with [7.5.3](#) and the building is three or fewer stories in height.

**29.3.4.2 Initiation.** The required fire alarm system shall be initiated by each of the following:

- (1) Manual means in accordance with [9.6.2](#), unless there are other effective means to activate the fire alarm system, such as complete automatic sprinkler or automatic detection systems, with manual fire alarm box in accordance with [29.3.4.2\(2\)](#) required
- (2) Manual fire alarm box located at the hotel desk or other convenient central control point under continuous supervision by responsible employees
- (3) Required automatic sprinkler system
- (4) Required automatic detection system other than sleeping room smoke detectors

**29.3.4.3 Notification.**

**29.3.4.3.1** Occupant notification shall be provided automatically in accordance with [9.6.3](#).

## CHAPTER 28 • New

**28.3.4.3.2** Positive alarm sequence in accordance with **9.6.3.4** shall be permitted.

**28.3.4.3.3\*** Guest rooms and guest suites specifically required and equipped to accommodate hearing-impaired individuals shall be provided with a visible notification appliance.

**A.28.3.4.3.3** A quantity of such rooms and suites might be required to be equipped to accommodate hearing-impaired individuals based on the total number of rooms in a transient lodging facility. (See 28 CFR 36, Appendix A, “Americans with Disabilities Act Accessibility Guidelines for Buildings and Facilities.”)

**28.3.4.3.4** In occupiable areas, other than guest rooms and guest suites, visible notification appliances shall be provided.

**28.3.4.3.5** Annunciation and annunciation zoning in accordance with **9.6.7** shall be provided in buildings three or more stories in height or having more than 50 guest rooms or guest suites. Annunciation shall be provided at a location readily accessible from the primary point of entry for emergency response personnel.

**28.3.4.3.6** Emergency forces notification shall be provided in accordance with **9.6.4**.

The *Code* requires that, in addition to the normal distribution of manual fire alarm boxes (i.e., pull stations, see **9.6.2**), the front desk, telephone operator’s location, or similar location must also be equipped with a manual fire alarm box. The intent is that a manual fire alarm box is to be available at the location where staff would receive notification of an emergency phoned in by a guest.

## CHAPTER 29 • Existing

**29.3.4.3.2** Positive alarm sequence in accordance with **9.6.3.4**, and a presignal system in accordance with **9.6.3.3**, shall be permitted.

**29.3.4.3.3 Reserved.**

**29.3.4.3.4 Reserved.**

**29.3.4.3.5 Reserved.**

**29.3.4.3.6\*** Where the existing fire alarm system does not provide for automatic emergency forces notification in accordance with **9.6.4**, provisions shall be made for the immediate notification of the public fire department by telephone or other means in case of fire, and, where there is no public fire department, notification shall be made to the private fire brigade.

**A.29.3.4.3.6** The provision for immediate notification of the public fire department is intended to include, but is not limited to, all of the arrangements in **9.6.4.2**. Other arrangements that depend on a clerk or other member of the staff to notify the fire department might also be permitted. In such cases, however, it is essential that a trained staff member and an immediately available means of calling the fire department are continuously available. If a telephone is to be used, it should not be of any type or arrangement that requires a coin or the unlocking of a device to contact the fire department.

**29.3.4.3.7** Where a new fire alarm system is installed or the existing fire alarm system is replaced, emergency forces notification shall be provided in accordance with **9.6.4**.

The smoke alarms installed in sleeping rooms are usually single-station alarms that are provided for the sole purpose of notifying the occupants of the presence of smoke within that room. Thus, the alarms are not a part of a required automatic detection system and are not required to initiate the building fire alarm system. The *Code*, in fact, prohibits guest room smoke

## CHAPTER 28 • New

alarms from activating the system to prevent numerous activations that could pose a nuisance alarm problem in hotels and dormitories (see 9.6.2.10.9). Smoke alarms are available that alert the occupants of the room and annunciate at a central point, notifying management of a problem in that room without sounding an alarm throughout the building.

The provision of 29.3.4.2(1) eliminates the requirement for manual fire alarm boxes to be located so that all portions of a building are within 200 ft (61 m) of a manual fire alarm box (see 9.6.2) in existing hotels and dormitories where an automatic sprinkler system or an automatic fire detection system is provided throughout the building. The alarm system is still required; only the requirement for additional manual fire alarm boxes is eliminated.
