The location of audible alarm devices in hotels and dormitories affects their audibility. In most new construction, corridor walls are of such soundproof character that a sounding device would be needed in each guest room or guest suite to meet the performance criterion for audibility throughout the building. The use of sounding devices only in the corridor might necessitate their operation at dangerous sound levels to awaken guests in their rooms. The permitted use of positive alarm sequence by 28/29.3.4.3.2 recognizes a technology similar to a presignal system but with additional fail-safe features. See the commentary on 9.6.3.4 for a discussion on positive alarm sequence.

Presignal systems have repeatedly been involved in delaying alarms in multiple-death fires and are not permitted in new hotels and dormitories. However, the occurrence of nuisance alarms in hotels and dormitories is real, and presignal systems continue to be permitted in existing buildings. Therefore, if the presignal is to be transmitted to a building staff location (e.g., the front desk), 9.6.3.3 specifies that it must be received by trained staff. As a result, hotel and dormitory staff assigned to signal-receiving locations must be well trained with respect to fire alarm signals and proper staff response to an alarm.

Automatic emergency forces notification by one of the methods recognized by 9.6.4 is required in new hotels and

**28.3.4.4 Detection.** A corridor smoke detection system in accordance with Section 9.6 shall be provided in buildings other than those protected throughout by an approved, supervised automatic sprinkler system in accordance with 28.3.5.3.

**28.3.4.5\* Smoke Alarms.** Smoke alarms shall be installed in accordance with 9.6.2.10 in every guest room and every living area and sleeping room within a guest suite.

**A.28.3.4.5** Caution needs to be exercised in locating smoke alarms with regard to their proximity to bathrooms, cooking facilities, and HVAC outlets in order to prevent nuisance alarms.

## CHAPTER 29 • Existing

dormitories, as specified by 28.3.4.3.6. In existing hotels and dormitories, provisions must be made to notify the fire department by telephone or other approved means. This requirement can usually be met by providing a telephone at the hotel's front desk or other normally staffed location. The telephone addressed in A.29.3.4.3.6 needs to be equipped for direct outside dial without going through a switchboard and should not be a pay phone. Automatic emergency forces notification must be provided in existing hotels and dormitories when a new fire alarm system is installed or an existing fire alarm system is replaced in accordance with 29.3.4.3.7.

Single-station smoke alarms powered by the building's electrical system are required in each sleeping room and living area located in a guest room or guest suite. The intent is to alert the occupant of the room to the presence of a fire originating in that room or suite. Normally, the alarms are not tied into the building fire alarm [see 28/29.3.4.2(4)]. The expected course of action is as follows:

1. The smoke alarm alerts the occupant of the room; the occupant leaves the room.
2. The self-closing device on the corridor door returns the door to its closed and latched position.
3. The occupant pulls a manual fire alarm box, thereby initiating the building alarm system; the occupant proceeds to an exit and leaves the building.
4. If the occupant fails to sound the alarm manually, compensation is provided in new construction by automatic sprinklers.

In addition to requiring a smoke alarm in each sleeping room, a smoke alarm is required in each living area within the guest room or guest suite. These alarms are required for the following two reasons:

1. The living area is often used for sleeping, even if such use was not the original intent.
2. Most sleeping rooms are arranged so that a fire in the living area will rapidly block escape from the sleeping area.

**29.3.4.4 Detection. (Reserved)**

**29.3.4.5\* Smoke Alarms.** An approved single-station smoke alarm shall be installed in accordance with 9.6.2.10 in every guest room and every living area and sleeping room within a guest suite.

**A.29.3.4.5** Caution needs to be exercised in locating smoke alarms with regard to their proximity to bathrooms, cooking facilities, and HVAC outlets in order to prevent nuisance alarms.

## CHAPTER 28 • New

**28.3.4.6 Carbon Monoxide Alarms and Carbon Monoxide Detection Systems.**

**28.3.4.6.1** Carbon monoxide alarms or carbon monoxide detectors in accordance with [Section 9.8](#) and [28.3.4.6](#) shall be provided in new hotels and dormitories where either of the following conditions exists:

- (1) Guest rooms or guest suites with communicating attached garages, unless otherwise exempted by [28.3.4.6.3](#)
- (2) Guest rooms or guest suites containing a permanently installed fuel-burning appliance or fuel-burning fireplace

**28.3.4.6.2** Where required by [28.3.4.6.1](#), carbon monoxide alarms or carbon monoxide detectors shall be installed in the following locations:

- (1) Outside of each separate guest room or guest suite sleeping area in the immediate vicinity of the sleeping rooms
- (2) On every occupiable level of a guest room and guest suite

**28.3.4.6.3** Carbon monoxide alarms and carbon monoxide detectors as specified in [28.3.4.6.1](#)(1) shall not be required in the following locations:

- (1) In garages
- (2) Within guest rooms or guest suites with communicating attached garages that are open parking structures as defined by the building code
- (3) Within guest rooms or guest suites with communicating attached garages that are mechanically ventilated in accordance with the mechanical code

**28.3.4.6.4** Where fuel-burning appliances or fuel-burning fireplaces are installed outside guest rooms or guest suites, carbon monoxide alarms or carbon monoxide detectors shall be installed in accordance with the manufacturer's published instructions in the locations specified as follows:

- (1) On the ceilings of rooms containing permanently installed fuel-burning appliances or fuel-burning fireplaces
- (2) Centrally located within occupiable spaces served by the first supply air register from a permanently installed, fuel-burning HVAC system
- (3) Centrally located within occupiable spaces adjacent to a communicating attached garage

The provisions of [28.3.4.6](#) mandate the installation of carbon monoxide (CO) detectors or CO alarms in new hotels and dormitories where there is a potential for accidental CO poisoning

## CHAPTER 29 • Existing

**29.3.4.5.1** The smoke alarms shall not be required to be interconnected.

**29.3.4.5.2** Single-station smoke alarms without a secondary (standby) power source shall be permitted.

from a vehicle in an attached, communicating garage or from fuel-burning appliances, such as a gas-fired or an oil-fired furnace or a fuel-burning fireplace. The reference to [Section 9.12](#) in

## CHAPTER 28 • New

**28.3.4.6.1** requires compliance with NFPA 720, *Standard for the Installation of Carbon Monoxide (CO) Detection and Warning Equipment*.<sup>2</sup> NFPA 720, which is modeled after NFPA 72®, *National Fire Alarm and Signaling Code*,<sup>3</sup> contains the detailed installation requirements for CO alarms, including those for power supply. Like smoke alarms, where more than one CO alarm is required in a hotel or dormitory, they must be interconnected so that when one activates, all CO alarms in the hotel or dormitory sound their alarms.

### 28.3.5 Extinguishment Requirements.

**28.3.5.1** All buildings shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with **28.3.5.3**.

#### 28.3.5.2 Reserved.

**28.3.5.3** Where an automatic sprinkler system is installed, either for total or partial building coverage, the system shall be in accordance with **Section 9.7**, as modified by **28.3.5.4**. In buildings four or fewer stories above grade plane, systems in accordance with NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*, shall be permitted.

**28.3.5.4** The provisions for draft stops and closely spaced sprinklers in NFPA 13, *Standard for the Installation of Sprinkler Systems*, shall not be required for openings complying with **8.6.9.1** where the opening is within the guest room or guest suite.

#### 28.3.5.5 Reserved.

**28.3.5.6** Listed quick-response or listed residential sprinklers shall be used throughout guest rooms and guest room suites.

**28.3.5.7** Open parking structures that comply with NFPA 88A, *Standard for Parking Structures*, and are contiguous with hotels or dormitories shall be exempt from the sprinkler requirements of **28.3.5.1**.

**28.3.5.8** In buildings other than those protected throughout with an approved, supervised automatic sprinkler system in accordance with **28.3.5.3**, portable fire extinguishers shall be provided as specified in **Section 9.9** in hazardous areas addressed by **28.3.2.2**.

## CHAPTER 29 • Existing

Although not mandated in existing hotels and dormitories, the installation of CO alarms is recommended if there is a potential for CO poisoning. It is important to note the typical service life of a CO alarm varies from about five to ten years. CO alarms must be replaced by the date indicated on the device to ensure proper operation. See the commentary following **Section 9.12** for additional details.

### 29.3.5 Extinguishment Requirements.

**29.3.5.1** All high-rise buildings, other than those where each guest room or guest suite has exterior exit access in accordance with **7.5.3**, shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with **29.3.5.3**.

#### 29.3.5.2 Reserved.

**29.3.5.3\*** Where an automatic sprinkler system is installed, either for total or partial building coverage, the system shall be in accordance with **Section 9.7**, as modified by **29.3.5.4** and **29.3.5.5**. In buildings four or fewer stories above grade plane, systems in accordance with NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*, shall be permitted.

**A.29.3.5.3** Although not required by the *Code*, the use of residential sprinklers or quick-response sprinklers is encouraged for new installations of sprinkler systems within dwelling units, apartments, and guest rooms. Caution should be exercised, as the system needs to be designed for the sprinkler being used.

**29.3.5.4** The provisions for draft stops and closely spaced sprinklers in NFPA 13, *Standard for the Installation of Sprinkler Systems*, shall not be required for openings complying with **8.6.9.1** where the opening is within the guest room or guest suite.

**29.3.5.5** In guest rooms and in guest room suites, sprinkler installations shall not be required in closets not exceeding 24 ft<sup>2</sup> (2.2 m<sup>2</sup>) and in bathrooms not exceeding 55 ft<sup>2</sup> (5.1 m<sup>2</sup>).

#### 29.3.5.6 Reserved.

#### 29.3.5.7 Reserved.

**29.3.5.8** In buildings other than those protected throughout with an approved, supervised automatic sprinkler system in accordance with **29.3.5.3**, portable fire extinguishers shall be provided as specified in **Section 9.9** in hazardous areas addressed by **29.3.2.2**.

## CHAPTER 28 • New

New hotels and dormitories must be protected throughout by an approved, supervised automatic sprinkler system. The disproportionate percentage of deaths associated with residential occupancies and the conditions precipitating these fatalities in hotel and dormitory settings (the need to wake sleeping occupants and escape in unfamiliar surroundings) prompted the *Code* to require new hotels and dormitories to be provided with automatic sprinkler systems. Previous editions of the *Code* permitted sprinklers to be exempted from new hotels and dormitories where every guest room was provided with exterior exit access; that exemption was deleted for the 2015 edition.

One objective of the *Code* is to protect occupants who are not intimate with the initial fire development from loss of life and improve the survivability of those who are intimate with the fire development, as stated in 4.1.1. Based on this objective, new hotels and dormitories are required to use quick-response or residential sprinklers throughout guest rooms and guest suites per 28.3.5.6. The technology associated with quick-response and

### 28.3.6 Corridors.

#### 28.3.6.1 Walls.

**28.3.6.1.1** Exit access corridor walls shall comply with 28.3.6.1.2 or 28.3.6.1.3.

**28.3.6.1.2** In buildings not complying with 28.3.6.1.3, exit access corridor walls shall consist of fire barriers in accordance with Section 8.3 that have not less than a 1-hour fire resistance rating.

**28.3.6.1.3** In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 28.3.5, corridor walls shall have a minimum ½-hour fire resistance rating.

#### 28.3.6.2 Doors.

**28.3.6.2.1** Doors that open onto exit access corridors shall have not less than a 20-minute fire protection rating in accordance with Section 8.3.

#### 28.3.6.2.2 Reserved.

**28.3.6.2.3** Doors that open onto exit access corridors shall be self-closing and self-latching.

#### 28.3.6.3 Unprotected Openings.

**28.3.6.3.1** Unprotected openings, other than those from spaces complying with 28.3.6.3.2, shall be prohibited in exit access corridor walls and doors.

## CHAPTER 29 • Existing

residential sprinklers helps to maintain tenability within the room of fire origin.

Automatic sprinklers are not required in all existing hotels and dormitories. Requirements for such systems, if they are installed, are specified by 29.3.5.3. Other portions of Chapter 29 offer significant incentives for installing sprinklers. Examples include a reduction in the fire resistance rating of exit enclosures (29.2.2.1.2) and an increase in common path of travel (29.2.5.4) and travel distance (29.2.6.2 and 29.2.6.3.3.1). In addition, the presence of sprinklers influences requirements addressing exit discharge (29.2.7), vertical openings (29.3.1), hazardous areas (29.3.2), interior finish (29.3.3), corridors (29.3.6), and smoke partitions (29.3.7).

Per 29.3.5.1, an automatic sprinkler system is required in existing high-rise hotels and dormitories, unless every guest room or guest suite has exterior exit access. The presence of exterior exit access eliminates the need to traverse a corridor where conditions might not remain tenable.

### 29.3.6 Corridors.

#### 29.3.6.1 Walls.

**29.3.6.1.1** Exit access corridor walls shall comply with either 29.3.6.1.2 or 29.3.6.1.3.

**29.3.6.1.2** In buildings not complying with 29.3.6.1.3, exit access corridor walls shall consist of fire barriers in accordance with 8.2.3 having a minimum ½-hour fire resistance rating.

**29.3.6.1.3** In buildings protected throughout by an approved automatic sprinkler system in accordance with 29.3.5, no fire resistance rating shall be required, but the walls and all openings therein shall resist the passage of smoke.

#### 29.3.6.2 Doors.

**29.3.6.2.1** Doors that open onto exit access corridors, other than those complying with 8.3.4 or in buildings meeting the requirements of 29.3.6.2.2, shall have a minimum 20-minute fire protection rating in accordance with Section 8.3.

**29.3.6.2.2** Where automatic sprinkler protection is provided in the corridor in accordance with 31.3.5.8 through 31.3.5.9, doors shall not be required to have a fire protection rating but shall resist the passage of smoke and be equipped with latches to keep doors tightly closed.

**29.3.6.2.3** Doors that open onto exit access corridors shall be self-closing and self-latching.

#### 29.3.6.3 Unprotected Openings.

**29.3.6.3.1** Unprotected openings, other than those from spaces complying with 29.3.6.3.2, shall be prohibited in exit access corridor walls and doors.

## CHAPTER 28 • New

**28.3.6.3.2** Spaces shall be permitted to be unlimited in area and open to the corridor, provided that all of the following criteria are met:

- (1) The space is not used for guest rooms or guest suites or hazardous areas.
- (2) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with [28.3.5](#).
- (3) The space does not obstruct access to required exits.

**28.3.6.4 Transoms, Louvers, or Transfer Grilles.** Transoms, louvers, or transfer grilles shall be prohibited in walls or doors of exit access corridors.

The provisions of [28/29.3.6](#) reflect concern for providing safety to persons occupying guest rooms during a fire. The minimum fire resistance rating required for corridor wall construction is intended to prevent fire from moving from the corridor to a room or spreading from a room to the corridor.

Although the reduction to a ½-hour fire resistance rating — as permitted by [28.3.6.1.3](#) — would result in little savings in new construction, it could be useful in the rehabilitation of existing structures that are required to meet the provisions for new hotels and dormitories (see [4.6.7](#) and [Chapter 43](#)). Most existing lath and plaster walls provide 20-minute to 30-minute fire resistance ratings. If automatic sprinkler protection is provided throughout the building, the existing walls should not have to be replaced.

In existing buildings with automatic sprinklers, corridor walls are required only to resist the passage of smoke (see [29.3.6.1.3](#)).

## CHAPTER 29 • Existing

**29.3.6.3.2** Spaces shall be permitted to be unlimited in area and open to the corridor, provided that all of the following criteria are met:

- (1) The space is not used for guest rooms or guest suites or hazardous areas.
- (2) The space is protected throughout by an approved automatic sprinkler system in accordance with [29.3.5](#).
- (3) The space does not obstruct access to required exits.

**29.3.6.4 Transoms, Louvers, or Transfer Grilles.**

**29.3.6.4.1** Transoms, louvers, or transfer grilles shall be prohibited in walls or doors of exit access corridors, unless meeting the requirements of [29.3.6.4.2](#), [29.3.6.4.3](#), or [29.3.6.4.4](#).

**29.3.6.4.2** Existing transoms shall be permitted but shall be fixed in the closed position and shall be covered or otherwise protected to provide a fire resistance rating not less than that of the wall in which they are installed.

**29.3.6.4.3** The requirement of [29.3.6.4.1](#) shall not apply where a corridor smoke detection system is provided that, when sensing smoke, sounds the building alarm and shuts down return or exhaust fans that draw air into the corridor from the guest rooms. The transfer grille or louver shall be located in the lower one-third of the wall or door height.

**29.3.6.4.4** The requirement of [29.3.6.4.1](#) shall not apply to buildings protected throughout by an approved automatic sprinkler system complying with [29.3.5](#) or buildings with corridor sprinkler protection in accordance with [31.3.5.8](#) through [31.3.5.9](#). The transfer grille or louver shall be located in the lower one-third of the wall or door height.

The fire protection-rated corridor door required by [28/29.3.6.2](#) provides a level of protection commensurate with the expected fuel load in the room and the fire resistance of the corridor wall construction. The purpose is to prevent a fire in the corridor from entering a room or to contain it within the room of origin by means of corridor wall and door construction. Fuel load studies conducted by the former National Bureau of Standards (now the National Institute of Standards and Technology) demonstrated that residential occupancies typically have fuel loads capable of sustaining a fire for approximately 20 minutes to 30 minutes.

**Paragraph 29.3.6.2.2** permits a nonrated door that resists the passage of smoke in buildings that have corridor sprinkler protection installed in accordance with Option 3 for apartment buildings. See [31.3.5.9](#) and the commentary following [30/31.3.5.13](#) for information on apartment building Option 3 corridor sprinkler requirements. In [Exhibit 28/29.9](#) and

## CHAPTER 28 • New

Exhibit 28/29.9

Protection of guest room corridors and openings in new hotels and dormitories.

Exhibit 28/29.10, the self-closing door is needed to complete the separation established by the fire resistance-rated corridor wall. No provisions permit omission of the self-closing device on the door. Although an existing wall is not required to be fire rated if sprinkler protection is provided, the wall needs to be solid and to resist the passage of smoke.

A 20-minute fire protection rating is required for guest room corridor doors in new hotels and dormitories and those that are existing and nonsprinklered. NFPA 80, *Standard for Fire Doors and Other Opening Protectives*,<sup>4</sup> requires a fire-rated door to be self-closing; however, the requirement for self-closing doors is important enough to be repeated in 28/29.3.6.2.3, rather than relying only on the referenced standard.

Self-closers on corridor doors should be properly maintained to ensure that the doors fully close and positively latch

**28.3.7 Subdivision of Building Spaces.** Buildings shall be subdivided in accordance with 28.3.7.1 or 28.3.7.2.

**28.3.7.1** In buildings not protected throughout by an approved, supervised automatic sprinkler system, each hotel guest room, including guest suites, and dormitory room shall be separated from other guest rooms or dormitory rooms by walls and floors constructed as fire barriers having a minimum 1-hour fire resistance rating.

## CHAPTER 29 • Existing

Exhibit 28/29.10

Protection of guest room corridors and openings in existing hotels and dormitories.

on their own. Carpeting and pressure differences created by air-handling systems can interfere with the operation of door closers. If a room door does not completely close under fire conditions, smoke, heat, and other toxic products of combustion can quickly render the corridor untenable.

NFPA 90A, *Standard for the Installation of Air-Conditioning and Ventilating Systems*,<sup>5</sup> prohibits corridors in hotels from being used as a portion of the system for supply, return, or exhaust air.

Operable transoms are prohibited in hotels based on multiple-death fires in which transoms allowed fire and smoke to move through corridors and into occupied rooms. However, existing hotels built prior to 1950 often use corridors for supply or return air. The Code continues to recognize this practice for existing hotels if the specific conditions of 29.3.6.4 are met.

**29.3.7 Subdivision of Building Spaces.** In buildings other than those meeting the requirements of 29.3.7.1, 29.3.7.2, or 29.3.7.3, every guest room floor shall be divided into not less than two smoke compartments of approximately the same size by smoke partitions in accordance with Section 8.4.

**29.3.7.1** Smoke partitions shall not be required in buildings protected throughout by an approved automatic sprinkler system in accordance with 29.3.5 or a corridor sprinkler system conforming to 31.3.5.8 through 31.3.5.9.

## CHAPTER 28 • New

**28.3.7.2** In buildings protected throughout by an approved, supervised automatic sprinkler system, each hotel guest room, including guest suites, and dormitory room shall be separated from other guest rooms or dormitory rooms by walls and floors constructed as fire barriers having a minimum ½-hour fire resistance rating.

**28.3.7.3** Doors in the barriers required by **28.3.7.1** and **28.3.7.2** shall have a fire protection rating of not less than 20 minutes and shall not be required to be self-closing.

In new hotels and dormitories, a ½-hour fire resistance-rated separation between guest rooms, guest suites, and dormitory rooms is necessary to confine a fire to the room of fire origin. Hotel guest rooms are frequently provided with connecting doors to allow multiple rooms to be used by a single family or group and to allow for access between the rooms. The requirement for a fire barrier separation between the rooms, therefore, necessitates the use of a fire protection-rated door assembly for at least one of the doors in any guest room-to-guest room opening. The required fire protection rating for such a door is ½ hour in both sprinklered and nonsprinklered buildings, and no self-closer is required in accordance with **28.3.7.3**.

### 28.3.8 Special Protection Features. (Reserved)

## 28.4 Special Provisions

### 28.4.1 High-Rise Buildings.

**28.4.1.1** High-rise buildings shall comply with **Section 11.8**.

**28.4.1.2\*** Emergency action plans in accordance with **Section 4.8** shall be provided and shall include all of the following:

- (1) Egress procedures
- (2) Methods
- (3) Preferred evacuation routes for each event, including appropriate use of elevators

**A.28.4.1.2** See **4.8.2.1(4)**.

In response to recommendations from the NFPA High-Rise Building Safety Advisory Committee following the September 11, 2001, terrorist attacks on the World Trade Center in New York City and the Pentagon in Arlington, Virginia, the provisions of **28/29.4.1.2** require both new and existing high-rise hotels and

## CHAPTER 29 • Existing

**29.3.7.2** Smoke partitions shall not be required where each guest room is provided with exterior ways of exit access arranged in accordance with **7.5.3**.

**29.3.7.3** Smoke partitions shall not be required where the aggregate corridor length on each floor is not more than 150 ft (46 m).

**29.3.7.4** Additional smoke partitions shall be provided so that the travel distance from a guest room corridor door to a smoke partition shall not exceed 150 ft (46 m).

All but relatively small floors of nonsprinklered existing buildings must be subdivided into at least two smoke compartments per **29.3.7**. This requirement provides for horizontal movement of occupants, limits the number of rooms, and, therefore, limits the number of occupants exposed to a single fire that might render a corridor untenable. Because no fire resistance rating is required for the smoke partition and smoke dampers are not required, the requirement is not overly burdensome in typical hotel or dormitory buildings. The exemption for automatic sprinklers reflects the excellent safety record of buildings equipped with sprinkler protection.

### 29.3.8 Special Protection Features. (Reserved)

## 29.4 Special Provisions

### 29.4.1 High-Rise Buildings.

**29.4.1.1** High-rise buildings shall comply with **29.3.5.1**.

**29.4.1.2\*** Emergency action plans in accordance with **Section 4.8** shall be provided and shall include all of the following:

- (1) Egress procedures
- (2) Methods
- (3) Preferred evacuation routes for each event, including appropriate use of elevators

**A.29.4.1.2** See **4.8.2.1(4)**.

dormitories to be provided with emergency action plans. See the extensive provisions of **A.4.8.2.1** and **A.4.8.2.1(3)** and their associated commentary for details on the items that should be included in the emergency action plan and a primer on the development of evacuation strategies for specific buildings.

## CHAPTER 28 • New

**28.4.2 Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers in accordance with 8.7.3.3 shall be permitted.

The provision of 28/29.4.2 is new to the 2015 edition of the Code. It recognizes the use of alcohol-based hand-rub (ABHR) dis-

---

## 28.5 Building Services

**28.5.1 Utilities.** Utilities shall comply with the provisions of Section 9.1.

### 28.5.2 Heating, Ventilating, and Air-Conditioning.

**28.5.2.1** Heating, ventilating, and air-conditioning equipment shall comply with the provisions of Section 9.2, except as otherwise required in this chapter.

**28.5.2.2** Unvented fuel-fired heaters, other than gas space heaters in compliance with NFPA 54, *National Fuel Gas Code*, shall not be used.

### 28.5.3 Elevators, Escalators, and Conveyors.

**28.5.3.1** Elevators, escalators, and conveyors shall comply with the provisions of Section 9.4.

**28.5.3.2\*** In high-rise buildings, one elevator shall be provided with a protected power supply and shall be available for use by the fire department in case of emergency.

**A.28.5.3.2** “Protected power supply” means a source of electrical energy of sufficient capacity to allow proper operation of the elevator and its associated control and communications systems. The power supply’s point of origin, system of distribution, type and size of overcurrent protection, degree of isolation from other portions of the building electrical system, and degree of mechanical protection should be such that it is unlikely that the supply would be disrupted at any but the advanced stages of building fire involvement or by structural collapse.

A protected power supply might consist of, and should provide, not less than the level of reliability associated with an electrical distribution system with service equipment located and installed in accordance with 230.72(B) and 230.82(5) of *NFPA 70, National Electrical Code*. The distribution system is not to have any other connection to the building electrical distribution system. A protected power supply is not required to incorporate two sources of energy or automatic transfer capability from a normal to an emergency source; for example, an alternate set of service conductors.

## CHAPTER 29 • Existing

**29.4.2 Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers in accordance with 8.7.3.3 shall be permitted.

pensers in hotels and dormitories, provided that the detailed criteria of 8.7.3.3 are met.

---

## 29.5 Building Services

**29.5.1 Utilities.** Utilities shall comply with the provisions of Section 9.1.

### 29.5.2 Heating, Ventilating, and Air-Conditioning.

**29.5.2.1** Heating, ventilating, and air-conditioning equipment shall comply with the provisions of Section 9.2, except as otherwise required in this chapter.

**29.5.2.2** Unvented fuel-fired heaters, other than gas space heaters in compliance with NFPA 54, *National Fuel Gas Code*, shall not be used.

**29.5.3 Elevators, Escalators, and Conveyors.** Elevators, escalators, and conveyors shall comply with the provisions of Section 9.4.

## CHAPTER 28 • New

The number and type of elevators to be connected to a protected power supply should be limited, or the characteristics of the protected power supply should be selected to ensure conformance to 230.95 of *NFPA 70*, without the provision of ground fault protection for the supply.

An elevator installation supplied by a protected power supply should comply with Article 620 of *NFPA 70* and ASME A17.1/CSA B44, *Safety Code for Elevators and Escalators*. The energy absorption means should always be connected on the load side of the disconnecting means. The energy absorption means should not consist of loads likely to become inoperative or disconnected under the conditions assumed to exist when the elevator is under the control of fire department personnel. Examples of such loads include light and power loads external to the elevator equipment room.

**28.5.4 Waste Chutes, Incinerators, and Laundry Chutes.** Waste chutes, incinerators, and laundry chutes shall comply with the provisions of [Section 9.5](#).

---

## 28.6 Reserved

---

## 28.7 Operating Features

### 28.7.1 Hotel Emergency Organization.

**28.7.1.1\*** Employees of hotels shall be instructed and drilled in the duties they are to perform in the event of fire, panic, or other emergency.

**A.28.7.1.1** Employers are obligated to determine the degree to which employees are to participate in emergency activities. Regulations of the U.S. Department of Labor (OSHA) govern these activities and provide options for employers, from total evacuation to aggressive structural fire fighting by employee brigades. *(For additional information, see 29 CFR 1910, Subparts E and L, “OSHA Regulations for Emergency Procedures and Fire Brigades.”)*

**28.7.1.2\*** Drills of the emergency organization shall be held at quarterly intervals and shall cover such points as the operation and maintenance of the available first aid fire appliances, the testing of devices to alert guests, and a study of instructions for emergency duties.

**A.28.7.1.2** Emergencies should be assumed to have arisen at various locations in the occupancy in order to train employees in logical procedures.

## CHAPTER 29 • Existing

**29.5.4 Waste Chutes, Incinerators, and Laundry Chutes.** Waste chutes, incinerators, and laundry chutes shall comply with the provisions of [Section 9.5](#).

---

## 29.6 Reserved

---

## 29.7 Operating Features

### 29.7.1 Hotel Emergency Organization.

**29.7.1.1\*** Employees of hotels shall be instructed and drilled in the duties they are to perform in the event of fire, panic, or other emergency.

**A.29.7.1.1** Employers are obligated to determine the degree to which employees are to participate in emergency activities. Regulations of the U.S. Department of Labor (OSHA) govern these activities and provide options for employers, from total evacuation to aggressive structural fire fighting by employee brigades. *(For additional information, see 29 CFR 1910, Subparts E and L, “OSHA Regulations for Emergency Procedures and Fire Brigades.”)*

**29.7.1.2\*** Drills of the emergency organization shall be held at quarterly intervals and shall cover such points as the operation and maintenance of the available first aid fire appliances, the testing of devices to alert guests, and a study of instructions for emergency duties.

**A.29.7.1.2** Emergencies should be assumed to have arisen at various locations in the occupancy in order to train employees in logical procedures.

## CHAPTER 28 • New

**28.7.2 Emergency Duties.** Upon discovery of a fire, employees shall carry out all of the following duties:

- (1) Activation of the facility fire protection signaling system, if provided
- (2) Notification of the public fire department
- (3) Other action as previously instructed

**28.7.3 Drills in Dormitories.** Emergency egress and relocation drills in accordance with [Section 4.7](#) shall be held with sufficient frequency to familiarize occupants with all types of hazards and to establish conduct of the drill as a matter of routine. Drills shall be conducted during peak occupancy periods and shall include suitable procedures to ensure that all persons subject to the drill participate.

The requirements for fire drills in hotels and dormitories differ. In hotels, employees must be trained in and practice the duties they are expected to perform in the event of a fire. The *Code* specifically does not require hotel guests to take part in fire drills to avoid contributing to guest complacency with regard to fire alarms. In dormitories, the provisions of [28/29.7.3](#) require all occupants to participate in drills, because occupants of

### 28.7.4 Emergency Instructions for Residents or Guests.

**28.7.4.1\*** A floor diagram reflecting the actual floor arrangement, exit locations, and room identification shall be posted in a location and manner acceptable to the authority having jurisdiction on, or immediately adjacent to, every guest room door in hotels and in every resident room in dormitories.

**A.28.7.4.1** Floor diagrams should reflect the actual floor arrangement and should be oriented with the actual direction to the exits.

The manner in which the information specified in [28/29.7.4.1](#) is to be posted, and the nature of its contents, is at the discretion of

**28.7.4.2\*** Fire safety information shall be provided to allow guests to make the decision to evacuate to the outside, to evacuate to an area of refuge, to remain in place, or to employ any combination of the three options.

**A.28.7.4.2** Factors for developing the fire safety information include such items as construction type, suppression systems, alarm and detection systems, building layout, and building HVAC systems.

**28.7.5 Emergency Action Plans.** Emergency action plans in accordance with [Section 4.8](#) shall be provided.

## CHAPTER 29 • Existing

**29.7.2 Emergency Duties.** Upon discovery of a fire, employees shall carry out all of the following duties:

- (1) Activation of the facility fire protection signaling system, if provided
- (2) Notification of the public fire department
- (3) Other action as previously instructed

**29.7.3 Drills in Dormitories.** Emergency egress and relocation drills in accordance with [Section 4.7](#) shall be held with sufficient frequency to familiarize occupants with all types of hazards and to establish conduct of the drill as a matter of routine. Drills shall be conducted during peak occupancy periods and shall include suitable procedures to ensure that all persons subject to the drill participate.

dormitories tend to be less transient than those of hotels. Dormitory occupants typically live in the building for several weeks or months at a time (or longer), making them “semipermanent” residents. As such, they require a high degree of familiarization with the actions they should take in the event of a fire or similar emergency.

### 29.7.4 Emergency Instructions for Residents or Guests.

**29.7.4.1\*** A floor diagram reflecting the actual floor arrangement, exit locations, and room identification shall be posted in a location and manner acceptable to the authority having jurisdiction on, or immediately adjacent to, every guest room door in hotels and in every resident room in dormitories.

**A.29.7.4.1** Floor diagrams should reflect the actual floor arrangement and should be oriented with the actual direction to the exits.

the authority having jurisdiction and depends on the building, the layout of the building, and the protection provided.

**29.7.4.2\*** Fire safety information shall be provided to allow guests to make the decision to evacuate to the outside, to evacuate to an area of refuge, to remain in place, or to employ any combination of the three options.

**A.29.7.4.2** Factors for developing the fire safety information include such items as construction type, suppression systems, alarm and detection systems, building layout, and building HVAC systems.

**29.7.5 Emergency Action Plans.** Emergency action plans in accordance with [Section 4.8](#) shall be provided.

## CHAPTER 28 • New

**28.7.6 Contents and Furnishings.**

**28.7.6.1** New draperies, curtains, and other similar loosely hanging furnishings and decorations shall meet the flame propagation performance criteria contained in Test Method 1 or Test Method 2, as appropriate, of NFPA 701, *Standard Methods of Fire Tests for Flame Propagation of Textiles and Films*.

**28.7.6.2 Upholstered Furniture and Mattresses.**

**28.7.6.2.1** Newly introduced upholstered furniture shall meet the criteria specified in 10.3.2.1 and 10.3.3.

**28.7.6.2.2** Newly introduced mattresses shall meet the criteria specified in 10.3.2.2 and 10.3.4.

**28.7.6.3** Furnishings or decorations of an explosive or highly flammable character shall not be used.

**28.7.6.4** Fire-retardant coatings shall be maintained to retain the effectiveness of the treatment under service conditions encountered in actual use.

**28.7.7 Inspection of Door Openings.** Door openings shall be inspected in accordance with 7.2.1.15.

The provision of 28/29.7.7 is new to the 2015 edition of the Code. It requires the annual inspection of certain means of egress door openings in accordance with 7.2.1.15 to ensure they operate correctly in the event of an emergency. Doors subject to the required annual inspection include doors equipped with panic hardware or fire exit hardware, doors serving exit enclosures, electrically controlled egress doors, and door assemblies with special locking arrangements in accordance with 7.2.1.6. The annual inspection must be documented to permit verification of compliance by the authority having jurisdiction.

# New and Existing Apartment Buildings

The apartment building classification is one of five residential occupancy types addressed by the *Life Safety Code*. Other residential occupancies include one- and two-family dwellings (Chapter 24), lodging or rooming houses (Chapter 26), hotels and dormitories (Chapters 28 and 29), and residential board and care occupancies (Chapters 32 and 33).

The common principle of life safety that is applied to all residential occupancies addressed by Chapters 24 through 33 is highlighted by 6.1.8.1, which states that residential occupancies are those occupancies in which sleeping accommodations are provided for purposes other than health care or detention and correction. The presence of sleeping occupants is central to the provisions of Chapters 24 through 33, because occupants who are asleep will be unaware of a developing fire and, when awakened to be alerted to the emergency, might be somewhat confused. The definition of the term *residential occupancy* in 6.1.8.1 also differentiates between sleeping occupants in residential occupancies and those in health care or detention and correctional occupancies, which are also characterized by the occupants' incapability of self-preservation. The provisions of Chapters 24 through 33 are also based on the presence of hazards (such as cooking and heating equipment) in residential occupancies and the degree to which occupants are familiar with their living space. Occupants might have little or no familiarity, as in the case of the transient residents of hotels, or they might have the total familiarity that is common to residents of single-family dwellings.

Apartment buildings pose a problem from a life safety perspective, because the typical building configuration often requires an escaping resident to traverse an interior corridor, which subsequently might expose the resident to the heat and smoke of a corridor or dwelling unit fire. In recognition of these potential hazards, the *Code* requires most new apartment

buildings to be protected throughout by an approved, supervised automatic sprinkler system.

From 2008 to 2012, apartment buildings accounted for an average of 93,700 structure fires per year, as reported to U.S. fire departments (down from 112,400 for the previous five year period). This number represents approximately 30 percent of the 370,700 total home fires per year on average for the period (consistent with the period 2003 to 2007). Apartment building fires resulted in an average of 418 civilian deaths per year (16 percent of all home fire deaths), which is consistent with the period 2003 to 2007, and 3950 civilian injuries per year (30 percent of all home fire injuries), which is up from 29 percent for the period 2003 to 2007. The number of apartment building fires decreased approximately 17 percent compared to the period 2003 to 2007.

The causes of apartment building fires differ significantly from one- and two-family dwelling fires in building equipment areas. Data from 2007 through 2011 indicate heating and electrical equipment accounted for 28 percent of the fires in one- and two-family dwellings, while accounting for only 10 percent of the fires in apartment buildings. This difference is most likely due to the centralized arrangement of the heating and electrical systems typical of most apartment buildings. Equipment fires are usually the result of poor maintenance or human error. Heating and electrical systems tend to be more closely regulated, maintained, and supervised in apartment buildings, which results in a reduced chance of equipment malfunction.

The number of fires caused by occupants (e.g., those due to cooking and smoking) is high in both categories of home structures.

These data demonstrate the importance of applying the *Code* to apartment buildings to help ensure fire safety, but they also demonstrate the continuing need for public education regarding the causes and prevention of home fires.

R: Required (see Code for details and exemptions). NR: No requirements.

<sup>†</sup>Number of stories in height.

## CHAPTER 30 • New

**30.1.1 Application.**

**30.1.1.1** The requirements of this chapter shall apply to new buildings or portions thereof used as apartment occupancies. (See 1.3.1.)

Due to the disproportionate percentage of deaths associated with residential occupancies, the *Code* mandates sprinkler protection in new apartment buildings, with no exceptions. For existing apartment buildings, the *Code* provides four alternative protection packages referred to as *options*.

The options specify the varying degrees to which an apartment building is protected by fire detection or fire suppression systems as follows:

1. Option 1 — no suppression or detection systems
2. Option 2 — total automatic fire detection and notification (although 31.3.4.5.1 requires single-station smoke alarms within each apartment unit, such smoke alarms are not part of a system and are not located in all areas of the building; therefore, their presence does not signify an Option 2 apartment building)
3. Option 3 — partial sprinkler protection (mainly corridor sprinklers — see 31.3.5.9)
4. Option 4 — protection throughout by means of an automatic sprinkler system (see 31.3.5.10)

In recognition of the life safety benefits associated with a properly installed and maintained sprinkler system, an Option 4 apartment building is exempted from selected *Code* provisions

**30.1.1.2 Administration.** The provisions of Chapter 1, Administration, shall apply.

**30.1.1.3 General.** The provisions of Chapter 4, General, shall apply.

**30.1.1.4** The term *apartment building*, wherever used in this *Code*, shall include an apartment house, a tenement, a garden apartment, or any other structure meeting the definition of apartment building.

**30.1.2 Classification of Occupancy.** See 6.1.8 and 30.1.4.2.

## CHAPTER 31 • Existing

**31.1.1 Application.**

**31.1.1.1** The requirements of this chapter shall apply to existing buildings or portions thereof currently occupied as apartment occupancies. In addition, the building shall meet the requirements of one of the following options:

- (1) Option 1, buildings without fire suppression or detection systems
- (2) Option 2, buildings provided with a complete approved automatic fire detection and notification system in accordance with 31.3.4.4
- (3) Option 3, buildings provided with approved automatic sprinkler protection in selected areas, as described in 31.3.5.8
- (4) Option 4, buildings protected throughout by an approved automatic sprinkler system

required of Option 1 through Option 3 apartment buildings. The benefits of such exemptions include the following:

1. Increased travel distance allowances
2. Reduction in required corridor fire resistance ratings
3. Decreased interior finish requirements
4. Exemption from smoke compartmentation requirements

The protection requirements for new apartment buildings are equivalent to Option 4.

Table A.31.1 summarizes the different protection packages required, depending on whether an existing apartment building is provided with the protection features required for Option 1, Option 2, Option 3, or Option 4.

This comprehensive approach is an attempt to codify system design. Although a total system would consist of many alternatives, the systems detailed in Options 1 through 4 are more limited, because only four options are available. However, the user can identify the most appropriate option, based on the existing building's size, height, and arrangement. The options provide an opportunity to coordinate the safety approach that best fits a building, rather than adapting a building to a single codified set of criteria.

**31.1.1.2 Administration.** The provisions of Chapter 1, Administration, shall apply.

**31.1.1.3 General.** The provisions of Chapter 4, General, shall apply.

**31.1.1.4** The term *apartment building*, wherever used in this *Code*, shall include an apartment house, a tenement, a garden apartment, or any other structure meeting the definition of apartment building.

**31.1.2 Classification of Occupancy.** See 6.1.8 and 31.1.4.2.

## CHAPTER 30 • New

**30.1.3 Multiple Occupancies.**

**30.1.3.1** Multiple occupancies shall be in accordance with [6.1.14](#).

**30.1.3.2** No dwelling unit of an apartment building shall have its sole means of egress pass through any nonresidential occupancy in the same building, unless otherwise permitted by [30.1.3.2.1](#) or [30.1.3.2.2](#).

**30.1.3.2.1** In buildings that are protected by an automatic sprinkler system in accordance with [Section 9.7](#), dwelling units of an apartment building shall be permitted to have their sole means of egress pass through a nonresidential occupancy in the same building, provided that both of the following criteria are met:

- (1) The dwelling unit of the apartment building shall comply with [Chapter 30](#).
- (2) The sole means of egress from the dwelling unit of the apartment building shall not pass through a high hazard contents area, as defined in [6.2.2.4](#).

**30.1.3.2.2** In buildings that are not protected by an automatic sprinkler system in accordance with [Section 9.7](#), dwelling units of an apartment building shall be permitted to have their sole means of egress pass through a nonresidential occupancy in the same building, provided that all of the following criteria are met:

- (1) The sole means of egress from the dwelling unit of the apartment building to the exterior shall be separated from the remainder of the building by fire barriers having a minimum 1-hour fire resistance rating.
- (2) The dwelling unit of the apartment building shall comply with [Chapter 30](#).
- (3) The sole means of egress from the dwelling unit of the apartment building shall not pass through a high hazard contents area, as defined in [6.2.2.4](#).

**30.1.3.3** Multiple dwelling units shall be permitted to be located above a nonresidential occupancy only where one of the following conditions exists:

- (1) Where the dwelling units of the residential occupancy and exits therefrom are separated from the nonresidential occupancy by construction having a minimum 1-hour fire resistance rating
- (2) Where the nonresidential occupancy is protected throughout by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#)

**30.1.3.4** Atrium walls in accordance with [6.1.14.4.6](#) shall be permitted to serve as part of the separation required by [6.1.14.4.1](#) for creating separated occupancies on a story-by-story basis.

## CHAPTER 31 • Existing

**31.1.3 Multiple Occupancies.**

**31.1.3.1** Multiple occupancies shall be in accordance with [6.1.14](#).

**31.1.3.2** No dwelling unit of an apartment building shall have its sole means of egress pass through any nonresidential occupancy in the same building, unless otherwise permitted by [31.1.3.2.1](#) or [31.1.3.2.2](#).

**31.1.3.2.1** In buildings that are protected by an automatic sprinkler system in accordance with [Section 9.7](#), dwelling units of an apartment building shall be permitted to have their sole means of egress pass through a nonresidential occupancy in the same building, provided that all of the following criteria are met:

- (1) The dwelling unit of the apartment building shall comply with [Chapter 31](#).
- (2) The sole means of egress from the dwelling unit of the apartment building shall not pass through a high hazard contents area, as defined in [6.2.2.4](#).

**31.1.3.2.2** In buildings that are not protected by an automatic sprinkler system in accordance with [Section 9.7](#), dwelling units of an apartment building shall be permitted to have their sole means of egress pass through a nonresidential occupancy in the same building, provided that all of the following criteria are met:

- (1) The sole means of egress from the dwelling unit of the apartment building to the exterior shall be separated from the remainder of the building by fire barriers having a minimum 1-hour fire resistance rating.
- (2) The dwelling unit of the apartment building shall comply with [Chapter 31](#).
- (3) The sole means of egress from the dwelling unit of the apartment building shall not pass through a high hazard contents area, as defined in [6.2.2.4](#).

**31.1.3.3** Multiple dwelling units shall be permitted to be located above a nonresidential occupancy only where one of the following conditions exists:

- (1) Where the dwelling units of the residential occupancy and exits therefrom are separated from the nonresidential occupancy by construction having a minimum 1-hour fire resistance rating
- (2) Where the nonresidential occupancy is protected throughout by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#)
- (3) Where not more than two dwelling units are located above a nonresidential occupancy that is protected by an automatic fire detection system in accordance with [Section 9.6](#)

**31.1.3.4** Atrium walls in accordance with [6.1.14.4.6](#) shall be permitted to serve as part of the separation required by [6.1.14.4.1](#) for creating separated occupancies on a story-by-story basis.

## CHAPTER 30 • New

Residential occupancies often exist in buildings that also house assembly, mercantile, or business occupancies. These nonresidential occupancies might pose an additional threat, because they are not typically occupied after regular business hours. An undetected fire in an unoccupied area has the potential to affect the tenability of the residential portion of the building before occupants can be awakened and take the appropriate actions for safe egress. Therefore, the requirements of 30/31.1.3 help to ensure that it is safe to have apartments within these multiple

**30.1.4 Definitions.**

**30.1.4.1 General.** For definitions, see [Chapter 3](#), Definitions.

**30.1.4.2 Special Definitions.**

**30.1.4.2.1 General.** Special terms applicable to this chapter are defined in [Chapter 3](#). Where necessary, other terms are defined in the text.

**30.1.4.2.2 Apartment Building.** See [3.3.36.3](#).

The text of [A.3.3.36.3](#), which is associated with the definition of the term *apartment building*, clarifies how townhouse-type apartments — particularly those under condominium

**30.1.5 Classification of Hazard of Contents.** The contents of residential occupancies shall be classified as ordinary hazard in accordance with [6.2.2](#).

NFPA 13, *Standard for the Installation of Sprinkler Systems*,<sup>1</sup> classifies the contents of an apartment building as light hazard for the purpose of designing automatic sprinkler systems. The *Code* classifies the contents of an apartment building as ordinary hazard (see

**30.1.6 Minimum Construction Requirements. (Reserved)**

**30.1.7 Occupant Load.** The occupant load, in number of persons for whom means of egress and other provisions are required, shall be determined on the basis of the occupant load factors of [Table 7.3.1.2](#) that are characteristic of the use of the space or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

The occupant load calculations for areas of apartment buildings used for nonresidential purposes is based on the occupant load factors applicable to the use of the area. For example, the occupant load of an area consisting of apartment dwelling units is

## CHAPTER 31 • Existing

occupancy buildings by providing the necessary protection and separation.

The provision of [30/31.1.3.4](#) permits an apartment building that is part of a separated, multiple occupancy building to utilize an atrium as a portion of the occupancy separation in accordance with [6.1.14.4.6](#). These criteria are new to the 2015 edition of the *Code*. See the commentary following [6.1.14.4.6](#) for additional details on the use of an atrium as an occupancy separation.

**31.1.4 Definitions.**

**31.1.4.1 General.** For definitions, see [Chapter 3](#), Definitions.

**31.1.4.2 Special Definitions.**

**31.1.4.2.1 General.** Special terms applicable to this chapter are defined in [Chapter 3](#). Where necessary, other terms are defined in the text.

**31.1.4.2.2 Apartment Building.** See [3.3.36.3](#).

ownership — should be classified for application of the *Code*. It is sometimes mistakenly believed that condominiums are a form of occupancy rather than a form of ownership.

**31.1.5 Classification of Hazard of Contents.** The contents of residential occupancies shall be classified as ordinary hazard in accordance with [6.2.2](#).

[30/31.1.5](#)) on the basis of the threat to life or life safety, rather than the challenge to the extinguishing capability of the automatic sprinkler system (light hazard). The hazard classification definitions in NFPA 13 and NFPA 101 are not directly comparable.

**31.1.6 Minimum Construction Requirements. (Reserved)**

**31.1.7 Occupant Load.** The occupant load, in number of persons for whom means of egress and other provisions are required, shall be determined on the basis of the occupant load factors of [Table 7.3.1.2](#) that are characteristic of the use of the space or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

calculated using 200 ft<sup>2</sup> (18.6 m<sup>2</sup>) per person; an area used for a building management office is calculated using 100 ft<sup>2</sup> (9.3 m<sup>2</sup>) per person, the appropriate factor for business use (see [Table 7.3.1.2](#)).

## CHAPTER 30 • New

## 30.2 Means of Egress Requirements

### 30.2.1 General.

**30.2.1.1** Means of egress from dwelling units to the outside of the building shall be in accordance with **Chapter 7** and this chapter.

**30.2.1.2** Means of escape within the dwelling unit shall comply with the provisions of **Section 24.2** for one- and two-family dwellings.

Every dwelling unit is required to comply with **Section 24.2**, which addresses means of escape in one- and two-family dwellings, as specified by **30/31.2.1.2**. This mandatory reference to **Section 24.2** is important for several reasons. First, it establishes a requirement for two means of escape (primary and secondary) from every sleeping room and living area of a dwelling unit consisting of two or more rooms. Several acceptable types of secondary means of escape are established in **24.2.2.3**, the most common of which is an operable window with specified minimum opening dimensions. No secondary means of escape is required for dwelling units protected by an automatic sprinkler system. Note that **24.2.2.1.2** does not require the entire building to be sprinklered to be exempt from the requirement for secondary means of escape; only the dwelling unit that is deficient with respect to secondary means of escape must be sprinklered. However, a mandate for complete building sprinkler protection, such as that in **30.3.5.1** for new apartment buildings, might be specified elsewhere.

A second important provision of **Section 24.2** is that the means of egress provisions of **Chapter 7** do not apply within the dwelling units unless they are specifically referenced. For example, the minimum width of means of escape doors within a dwelling unit is 28 in. (710 mm), rather than the 32 in. (810 mm) minimum clear width specified by **Chapter 7** for means of egress.

### 30.2.2 Means of Egress Components.

#### 30.2.2.1 General.

**30.2.2.1.1** Components of means of egress shall be limited to the types described in **30.2.2.2** through **30.2.2.12**.

**30.2.2.1.2** In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with **30.3.5**, exit enclosures shall have a minimum 1-hour fire resistance rating, and doors shall have a minimum 1-hour fire protection rating.

## CHAPTER 31 • Existing

## 31.2 Means of Egress Requirements

### 31.2.1 General.

**31.2.1.1** Means of egress from dwelling units to the outside of the building shall be in accordance with **Chapter 7** and this chapter.

**31.2.1.2** Means of escape within the dwelling unit shall comply with the provisions of **Section 24.2** for one- and two-family dwellings.

The requirements of **Chapter 7** apply to the door from the dwelling unit to the common corridor, because this door is the transition point at which means of escape ends and means of egress begins. **Chapter 24** also permits the use of winders and spiral stairs within a dwelling unit, and the provisions of **Chapter 24** for headroom apply within the dwelling unit, in lieu of those of **Chapter 7**. See the commentary on **Chapter 24** for additional information on means of escape from dwelling units.

The means of egress provisions of **Chapter 7** are applied from the dwelling unit to the outside of the building. Many of the items contained in **Section 30/31.2** are provisions that **Chapter 7** provides as options that might be specifically recognized by an occupancy chapter; for example, **30/31.2.2.2.2.2** permits the use of delayed-egress locks in accordance with **7.2.1.6.1**. In other cases, a feature addressed by **Chapter 7** is not permitted to be used in the means of egress of apartment buildings, because it is not specifically permitted by **Section 30/31.2**. The absence of slide escapes in the list of acceptable means of egress components in **30/31.2.2** is an example of a component that is not permitted. Also, **Section 30/31.2** limits the degree to which **Chapter 7** features can be used, such as the provision of maximum lengths of dead-end corridors and common paths of travel addressed in **30/31.2.5**.

### 31.2.2 Means of Egress Components.

#### 31.2.2.1 General.

**31.2.2.1.1** Components of means of egress shall be limited to the types described in **31.2.2.2** through **31.2.2.12**.

**31.2.2.1.2** In buildings using Option 4, exit enclosures shall have a minimum 1-hour fire resistance rating, and doors shall have a minimum 1-hour fire protection rating.

**31.2.2.1.3** In non-high-rise buildings using Option 2, Option 3, or Option 4, exit stair doors shall be permitted to be  $1\frac{3}{4}$  in. (44 mm) thick, solid-bonded wood-core doors that are self-closing and self-latching and in wood frames not less than  $\frac{3}{4}$  in. (19 mm) thick.

## CHAPTER 30 • New

The general provisions for the means of egress components in apartment buildings modify the provisions of **Chapter 7** in the following two areas:

1. Limits on the components of the means of egress
2. Protection of the means of egress

First, a general reference to the components of the means of egress in **Chapter 7** is made in **30/31.2.2.1.1** in place of repeating its myriad provisions. Most of these components are permitted in both new and existing apartment buildings. Some of the components are permitted to be used in accordance with the provisions of **Chapter 7** and the additional provisions of **Chapters 30** and **31**. For example, delayed-egress locks are permitted by **30/31.2.2.2.2**, which permits their use in accordance with **7.2.1.6.1**. In addition, **30/31.2.2.2.4** permits the use of elevator lobby exit access door locking in accordance with **7.2.1.6.3**.

Where a particular egress component is not permitted, no reference to it is made in the applicable occupancy chapter. For example, escalators and fire escape stairs are only permitted to serve as required means of egress in existing apartment buildings. Therefore, **31.2.2.8** and **31.2.2.9** contain specific references to such components, while **30.2.2.8** and **30.2.2.9** are reserved and contain no such reference. Neither chapter permits the use of slide escapes; consequently, no reference to slide escapes is made within the means of egress sections of either chapter.

Second, **Chapter 30** recognizes the effectiveness of automatic sprinklers and permits a fire resistance rating of 1 hour for exit enclosures and other vertical openings (see **30.2.2.1.2** and **30.3.1.1.4**) in new apartment buildings protected throughout by an approved, supervised automatic sprinkler system, regardless of the number of stories connected by the exit stair or other

### 30.2.2.2 Doors.

**30.2.2.2.1** Doors complying with **7.2.1** shall be permitted.

**30.2.2.2.2** Door-locking arrangements shall comply with **30.2.2.2.2.1**, **30.2.2.2.2.2**, **30.2.2.2.2.3**, or **30.2.2.2.2.4**.

**30.2.2.2.2.1\*** No door in any means of egress shall be locked against egress when the building is occupied.

**A.30.2.2.2.2.1** It is the intent of this requirement that security measures, where installed, should not prevent egress.

**30.2.2.2.2.2** Delayed-egress locks complying with **7.2.1.6.1** shall be permitted.

**30.2.2.2.2.3** Access-controlled egress doors complying with **7.2.1.6.2** shall be permitted.

**30.2.2.2.2.4** Elevator lobby exit access door locking in accordance with **7.2.1.6.3** shall be permitted.

**30.2.2.2.3** Revolving doors complying with **7.2.1.10** shall be permitted.

## CHAPTER 31 • Existing

vertical opening. See **31.3.1.1** for exemptions from the requirements for vertical opening protection in existing apartment buildings.

The reduction to a 1-hour fire resistance-rated enclosure for exits is not permitted for assembly, mercantile, or business occupancies and, therefore, is not permitted to be used where the exit serves mixed apartment/assembly, apartment/mercantile, or apartment/business occupancies. In buildings of four or more stories, where apartment occupancies and other occupancies are separated in accordance with **6.1.14.4** and treated independently, 1-hour exit enclosures in the apartment portion and 2-hour enclosures elsewhere might be permitted.

**Exhibit 30/31.1** illustrates the modification to the requirements for protection of exit enclosures and other vertical openings in a fully sprinklered apartment building.

*Exit enclosure separation — sprinklered apartment building.*

### 31.2.2.2 Doors.

**31.2.2.2.1** Doors complying with **7.2.1** shall be permitted.

**31.2.2.2.2** Door-locking arrangements shall comply with **30.2.2.2.2.1**, **30.2.2.2.2.2**, **30.2.2.2.2.3**, or **31.2.2.2.2.4**.

**31.2.2.2.2.1** No door in any means of egress shall be locked against egress when the building is occupied.

**31.2.2.2.2.2** Delayed-egress locks complying with **7.2.1.6.1** shall be permitted.

**31.2.2.2.2.3** Access-controlled egress doors complying with **7.2.1.6.2** shall be permitted.

**31.2.2.2.2.4** Elevator lobby exit access door locking in accordance with **7.2.1.6.3** shall be permitted.

**31.2.2.2.3** Revolving doors complying with **7.2.1.10** shall be permitted.

## CHAPTER 30 • New

**30.2.2.2.4** Apartment occupancies shall be exempt from the re-entry provisions of 7.2.1.5.8 where the exit enclosure serves directly only one dwelling unit per floor, and such exit is a smokeproof enclosure in accordance with 7.2.3.

Apartment buildings are prohibited from having any door locked against egress while the building is occupied. This requirement permits a door to be equipped with a locking device that allows the door to be opened from within the building for the purpose of egress but does not allow the door to be opened from outside the building.

The language of 7.2.1.5.3 is clear: Locks, if provided, must not require the use of a key, a tool, or special knowledge or effort for operation from the egress side of the building. This requirement prohibits double-cylinder locks and chain locks that require a key to operate the door from the inside. The use of a simple operation to open a door is required by 7.2.1.5.10; locks that require two-handed knobs and similar operations are prohibited.

Apartment doors provide security for the occupants in the dwelling unit. Chapter 7 recognizes this necessary function by permitting the use of security chains or rods, as well as locks, on apartment doors and also permits releasing devices in addition to the doorknob or lever. The permitted number of additional releasing actions differs for new and existing buildings. One additional releasing action is permitted for new apartment buildings, and two additional actions are permitted in existing apartment buildings (see 7.2.1.5.10.3 and 7.2.1.5.10.4).

The typical apartment door has three devices: a latch, a lock, and a security chain or rod. This arrangement is permitted for existing installations, provided that only two additional releasing operations (for a total of three) are needed to unlock and unlatch the door. This arrangement is also permitted in new apartment buildings, provided that the latch and lock set are interconnected so that the lock bolt and the latch retract simultaneously when the latch-releasing handle is operated from inside the apartment; thus, only one releasing action is needed for the two devices. The second action is the release of the security chain or rod. The overriding requirement for any of these devices is that they must not require the use of a key, a tool, or special knowledge or effort to operate.

The use of the delayed-egress lock detailed in 7.2.1.6.1 is recognized in 30/31.2.2.2.2. The use of delayed-egress locking systems requires that the building be protected throughout by either an automatic sprinkler system or an automatic fire detection system. The 15-second or 30-second delay permitted by 7.2.1.6.1 does not affect the immediate release of the lock upon

**30.2.2.3 Stairs.**

**30.2.2.3.1** Stairs complying with 7.2.2 shall be permitted.

## CHAPTER 31 • Existing

**31.2.2.2.4** Apartment occupancies protected throughout by an approved, supervised automatic sprinkler system shall be exempt from the re-entry provisions of 7.2.1.5.8 where the exit enclosure serves directly only one dwelling unit per floor, and such exit is a smokeproof enclosure in accordance with 7.2.3.

activation of sprinklers or detectors or upon loss of power to the lock. The delay device provides the security needed for doors that are used infrequently. At the same time, the door remains available for emergency use. Chains and padlocks do not provide these safety features.

The use of elevator lobby exit access door locking detailed in 7.2.1.6.3 is recognized by 30/31.2.2.2.4. This provision allows an elevator to open to an elevator lobby from which access to an exit stair is required to pass through normally locked doors. Although the floors of most apartment buildings are arranged so that elevators open to lobbies that are directly connected to corridors serving the apartments, and, in turn, provide direct access to exit stairs, there may be arrangements where it is desirable to have a “secure” floor in which occupants step off the elevator into a reception area. The provisions of 7.2.1.6.3 permit access to the required exits to be through normally locked doors subject to the additional protection criteria specified therein. See the commentary following 7.2.1.6.3 for additional details on elevator lobby exit access door locking.

Selected exit stair enclosure doors are permitted to be locked against re-entry from the stair side by 7.2.1.5.8, while other stair enclosure doors must remain unlocked. If the selected re-entry provisions are not used, one of the other two options specified by 7.2.1.5.8 must be used for stair enclosures serving five or more stories. Doors are permitted to be locked to prevent re-entry if initiation of the building fire alarm system automatically unlocks the door; otherwise, all stair enclosure doors must remain unlocked at all times.

A provision that first appeared in the 2003 edition of the Code permits the locking of stairway doors against re-entry in sprinklered apartment buildings if the stair serves only one dwelling unit per floor and the stair enclosure is constructed as a smokeproof enclosure in accordance with 7.2.3 (see 30/31.2.2.2.4). This provision is intended to accommodate stairs that open directly to the dwelling units on all floors where re-entry would be impractical from a security standpoint; the only means to provide re-entry would be through another resident’s apartment or condominium. The presence of automatic sprinklers, the construction of the stair as a smokeproof enclosure, and the limitation of permitting the stair to serve only one dwelling unit per floor combine to minimize the probability that conditions in the stair will become untenable.

**31.2.2.3 Stairs.**

**31.2.2.3.1** Stairs complying with 7.2.2 shall be permitted.

## CHAPTER 30 • New

**30.2.2.3.2 Reserved.**

**30.2.2.3.3** Spiral stairs complying with 7.2.2.2.3 shall be permitted within each dwelling unit.

**30.2.2.3.4** Winders complying with 7.2.2.2.4 shall be permitted within each dwelling unit.

No level of an apartment unit in a nonsprinklered existing building is permitted to be located more than one story away from a dwelling unit entrance per 31.2.2.3.2. This requirement would usually prohibit an apartment unit from encompassing more than three stories: main, upper, and lower. However, if an apartment has entrances at more than one level, or if the building is

**30.2.2.4 Smokeproof Enclosures.** Smokeproof enclosures complying with 7.2.3 shall be permitted.

**30.2.2.5 Horizontal Exits.** Horizontal exits complying with 7.2.4 shall be permitted.

**30.2.2.6 Ramps.** Ramps complying with 7.2.5 shall be permitted.

**30.2.2.7 Exit Passageways.** Exit passageways complying with 7.2.6 shall be permitted.

**30.2.2.8 Reserved.****30.2.2.9 Reserved.**

**30.2.2.10 Fire Escape Ladders.** Fire escape ladders complying with 7.2.9 shall be permitted.

**30.2.2.11 Alternating Tread Devices.** Alternating tread devices complying with 7.2.11 shall be permitted.

**30.2.2.12 Areas of Refuge.**

**30.2.2.12.1** Areas of refuge complying with 7.2.12 shall be permitted, as modified by 30.2.2.12.2.

## CHAPTER 31 • Existing

**31.2.2.3.2** Within any individual dwelling unit, unless protected by an approved automatic sprinkler system in accordance with 31.3.5, stairs more than one story above or below the entrance floor level of the dwelling unit shall not be permitted.

**31.2.2.3.3** Spiral stairs complying with 7.2.2.2.3 shall be permitted within a single dwelling unit.

**31.2.2.3.4** Winders complying with 7.2.2.2.4 shall be permitted.

sprinklered, more than three stories are permitted. A similar provision appears in 30.3.1.3, which applies to all vertical openings in new apartment buildings. Because 30/31.3.1.1.3 permits only two levels within an apartment unit to be open to each other in accordance with 8.6.9.1, the third level must be separated in accordance with Section 8.6.

**31.2.2.4 Smokeproof Enclosures.** Smokeproof enclosures complying with 7.2.3 shall be permitted. (See also 31.2.11.1.)

**31.2.2.5 Horizontal Exits.** Horizontal exits complying with 7.2.4 shall be permitted.

**31.2.2.6 Ramps.** Ramps complying with 7.2.5 shall be permitted.

**31.2.2.7 Exit Passageways.** Exit passageways complying with 7.2.6 shall be permitted.

**31.2.2.8\* Escalators.** Escalators previously approved as a component in the means of egress shall be permitted to continue to be considered as in compliance.

**A.31.2.2.8** Due to the nature of escalators, they are no longer acceptable as a component in a means of egress. However, because many escalators have been used for exit access and exit discharge in the past, they are permitted to continue to be considered in compliance. Very few escalators have ever been installed in a manner to qualify as an exit. For information on escalator protection and requirements, see previous editions of the Code.

**31.2.2.9 Fire Escape Stairs.** Fire escape stairs complying with 7.2.8 shall be permitted.

**31.2.2.10 Fire Escape Ladders.** Fire escape ladders complying with 7.2.9 shall be permitted.

**31.2.2.11 Alternating Tread Devices.** Alternating tread devices complying with 7.2.11 shall be permitted.

**31.2.2.12 Areas of Refuge.**

**31.2.2.12.1** Areas of refuge complying with 7.2.12 shall be permitted, as modified by 31.2.2.12.2.

## CHAPTER 30 • New

**30.2.2.12.2\*** In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with [30.3.5](#), the two accessible rooms or spaces separated from each other by smoke-resistive partitions in accordance with the definition of area of refuge in [3.3.22](#) shall not be required.

**A.30.2.2.12.2** The provision of [30.2.2.12.2](#) permits the entire floor to serve as an area of refuge where it is protected in accordance with [31.3.5](#). The provision is acceptable because supervised automatic sprinkler systems have built-in signals for monitoring features of the system, such as the opening and closing of water control valves. Such systems also monitor pump power supplies, water tank levels, and conditions that will impair the satisfactory operation of the sprinkler system. Because of these monitoring features, supervised automatic sprinkler systems have a high level of satisfactory performance and response to fire conditions.

Areas within new apartment buildings that are accessible to persons with severe mobility impairment must be provided with accessible means of egress per [7.5.4.1](#). Existing apartment buildings are exempt from the provisions of [7.5.4.1](#). Therefore, areas of refuge are not required in existing apartment buildings but are permitted to serve as means of egress components.

For stories above the level of exit discharge, where providing ramps is usually not practical, areas of refuge (see [7.2.12](#)) are typically used to meet the requirements for accessible means of egress in new apartment buildings. A story of a fully sprinklered

### 30.2.3 Capacity of Means of Egress.

**30.2.3.1** The capacity of means of egress shall be in accordance with [Section 7.3](#).

**30.2.3.2** Street floor exits shall be sufficient for the occupant load of the street floor plus the required capacity of stairs and ramps discharging onto the street floor.

**30.2.3.3** Corridors with a required capacity of more than 50 persons, as defined in [Section 7.3](#), shall be of sufficient width to accommodate the required occupant load but have a width of not less than 44 in. (1120 mm).

**30.2.3.4** Corridors with a required capacity of not more than 50 persons, as defined in [Section 7.3](#), shall be not less than 36 in. (915 mm) in width.

Where exits from upper floors discharge through interior building areas in accordance with [7.7.2](#), the result is an increased demand on street-floor egress components, such as exit doors. Therefore, street-floor exits must be sized to handle the combined required capacity in accordance with [30/31.2.3.2](#).

## CHAPTER 31 • Existing

**31.2.2.12.2\*** In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with [31.3.5](#), the two accessible rooms or spaces separated from each other by smoke-resistive partitions in accordance with the definition of area of refuge in [3.3.22](#) shall not be required.

**A.31.2.2.12.2** The provision of [31.2.2.12.2](#) permits the entire floor to serve as an area of refuge where it is protected in accordance with [31.3.5](#). The provision is acceptable because supervised automatic sprinkler systems have built-in signals for monitoring features of the system, such as the opening and closing of water control valves. Such systems also monitor pump power supplies, water tank levels, and conditions that will impair the satisfactory operation of the sprinkler system. Because of these monitoring features, supervised automatic sprinkler systems have a high level of satisfactory performance and response to fire conditions.

apartment building is permitted by [30/31.2.2.12.2](#) to be considered an area of refuge, even if an occupant does not have access to any of the apartment units and is confined to the exit access corridor (see the definition of *area of refuge* in [3.3.22](#)). Due to the anticipated effectiveness of the automatic sprinkler system, an occupant with mobility impairment should be able to remain on the floor without experiencing untenable conditions. However, because locked apartment unit doors render spaces other than the corridor inaccessible, the corridor effectively serves as the area of refuge.

### 31.2.3 Capacity of Means of Egress.

**31.2.3.1** The capacity of means of egress shall be in accordance with [Section 7.3](#).

**31.2.3.2** Street floor exits shall be sufficient for the occupant load of the street floor plus the required capacity of stairs and ramps discharging onto the street floor.

[Exhibit 30/31.2](#) illustrates a lobby design that might be found in apartment buildings in which multiple exit stairs and street-floor exits converge at one or two exterior door locations. The required aggregate capacity of doors A and B is based on the number of people expected to use them. Assuming that the

## CHAPTER 30 • New

street floor has an occupant load of 400 persons and each of the two enclosed exit stairs (i.e., stair 1 and stair 2) discharging into the street floor has a required capacity of 200 persons (i.e., a maximum of 50 percent of the 400-person occupant load of the second or third floor via stair 1 and a maximum of 50 percent of the 400-person occupant load of the basement via stair 2), the required egress capacity for the street floor would be 800 persons. The unobstructed door or level egress width required to accommodate 800 persons is 13 ft 4 in. (4065 mm). The opening provided by each pair of doors, A and B, needs to be 6 ft 8 in. (2030 mm) in clear width.

## CHAPTER 31 • Existing

Exhibit 30/31.2

Egress capacity for street level.

### 30.2.4 Number of Means of Egress.

**30.2.4.1** The number of means of egress shall comply with [Section 7.4](#).

**30.2.4.2** The minimum number of exits shall comply with [30.2.4.3](#), [30.2.4.4](#), or [30.2.4.6](#).

**30.2.4.3** Every dwelling unit shall have access to at least two separate exits remotely located from each other as required by [7.5.1](#).

**30.2.4.4** Dwelling units shall be permitted to have access to a single exit, provided that one of the following conditions is met:

- (1) The dwelling unit has an exit door opening directly to the street or yard at the finished ground level.
- (2) The dwelling unit has direct access to an outside stair that complies with [7.2.2](#) and serves a maximum of two units, both of which are located on the same story.
- (3) The dwelling unit has direct access to an interior stair that serves only that unit and is separated from all other portions of the building by fire barriers having a minimum 1-hour fire resistance rating, with no opening therein.

### 31.2.4 Number of Means of Egress.

**31.2.4.1** The number of means of egress shall comply with [7.4.1.1](#) and [7.4.1.3](#) through [7.4.1.6](#).

**31.2.4.2** The minimum number of exits shall comply with [31.2.4.3](#), [31.2.4.4](#), [31.2.4.5](#), [31.2.4.6](#), or [31.2.4.7](#).

**31.2.4.3** Every dwelling unit shall have access to not less than two separate exits remotely located from each other as required by [7.5.1](#).

**31.2.4.4** Dwelling units shall be permitted to have access to a single exit, provided that one of the following conditions is met:

- (1) The dwelling unit has an exit door opening directly to the street or yard at the finished ground level.
- (2) The dwelling unit has direct access to an outside stair that complies with [7.2.2](#) and serves not more than two units, both located on the same story.
- (3) The dwelling unit has direct access to an interior stair that serves only that unit and is separated from all other portions of the building by fire barriers having a minimum 1-hour fire resistance rating, with no opening therein.

## CHAPTER 30 • New

**30.2.4.5 Reserved.**

**30.2.4.6** A single exit shall be permitted in buildings where the total number of stories does not exceed four, provided that all of the following conditions are met:

- (1) There are four or fewer dwelling units per story.
- (2) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with **30.3.5**.
- (3) The exit stairway does not serve more than one-half story below the level of exit discharge.
- (4) The travel distance from the entrance door of any dwelling unit to an exit does not exceed 35 ft (10.7 m).
- (5) The exit stairway is completely enclosed or separated from the rest of the building by barriers having a minimum 1-hour fire resistance rating.
- (6) All openings between the exit stairway enclosure and the building are protected with self-closing door assemblies having a minimum 1-hour fire protection rating.
- (7) All corridors serving as access to exits have a minimum 1-hour fire resistance rating.
- (8) Horizontal and vertical separation having a minimum ½-hour fire resistance rating is provided between dwelling units.

## CHAPTER 31 • Existing

**31.2.4.5** A single exit shall be permitted in buildings where the total number of stories does not exceed four, provided that all of the following conditions are met:

- (1) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with **31.3.5**.
- (2) The exit stairway does not serve more than one-half of a story below the level of exit discharge.
- (3) The travel distance from the entrance door of any dwelling unit to an exit does not exceed 35 ft (10.7 m).
- (4) The exit stairway is completely enclosed or separated from the rest of the building by barriers having a minimum 1-hour fire resistance rating.
- (5) All openings between the exit stairway enclosure and the building are protected with self-closing doors having a minimum 1-hour fire protection rating.
- (6) All corridors serving as access to exits have a minimum ½-hour fire resistance rating.
- (7) Horizontal and vertical separation having a minimum ½-hour fire resistance rating is provided between dwelling units.

**31.2.4.6\*** A single exit shall be permitted in buildings not exceeding three stories in height, provided that all of the following conditions are met:

- (1) The exit stairway does not serve more than one-half of a story below the level of exit discharge.
- (2) The travel distance from the entrance door of any dwelling unit to an exit does not exceed 35 ft (10.7 m).
- (3) The exit stairway is completely enclosed or separated from the rest of the building by barriers having a minimum 1-hour fire resistance rating.
- (4) All openings between the exit stairway enclosure and the building are protected with self-closing doors having a minimum 1-hour fire protection rating.
- (5) All corridors serving as access to exits have a minimum ½-hour fire resistance rating.
- (6) Horizontal and vertical separation having a minimum ½-hour fire resistance rating is provided between dwelling units.

**A.31.2.4.6** This single-exit exemption could be applied to an apartment building three stories in height with a basement.

**31.2.4.7** A building of any height with not more than four dwelling units per floor, with a smokeproof enclosure in accordance with the requirements of **7.2.3** or outside stair as the exit, where such exit is immediately accessible to all dwelling units served thereby, shall be permitted to have a single exit. The term *immediately accessible* means that the travel distance from the entrance door of any dwelling unit to an exit shall not exceed 20 ft (6100 mm).

## CHAPTER 30 • New

A single means of egress is permitted by 30/31.2.4.4 under the conditions of paragraphs 1 through 3, which follow.

1. The living unit has an exit leading directly to the street or yard at ground level. This arrangement is common in the case of townhouses or row houses. Under this arrangement, the front door is the only required exit, so no provisions for a rear door are required. If a rear door is provided, it does not have to meet the locking or other requirements of the Code.

2. The apartment has direct access to an outside stair serving a maximum of two apartments, both of which are on the same floor. The outside stair must be separated from the interior of the building, as detailed in 7.2.2.6.3. This arrangement is detailed in Exhibit 30/31.3.

3. The single exit is a private stairway serving one apartment only and is separated from all abutting apartment units, including those on lower floors, by 1-hour-rated construction. Note that this stairway is required to be separated only from other spaces by the required 1-hour construction; it is not required to be separated from the apartment unit that it serves. This arrangement is depicted in Exhibit 30/31.4.

Garden-type apartment buildings, where the apartment unit entrance doors open either directly into a single exit stair enclosure or into a vestibule or short corridor leading to a single, enclosed exit stair, are addressed by 30.2.4.6. In other situations, the stair is open to the exterior or is enclosed by glass at the front of the building. A single exit under this arrangement is permitted if additional conditions can be met.

Exhibit 30/31.5 illustrates the provisions of 30.2.4.6 where the following requirements are met:

1. The building must be sprinklered in accordance with 30.3.5.
2. The building must be not more than four stories in height.
3. The building must have not more than four apartment units per floor.
4. The single exit stair must be separated from the building by fire barriers having a minimum 1-hour fire resistance rating.
5. The exit enclosure doors (E) must be 1-hour fire protection-rated and self-closing, as must the apartment unit doors (A), if they open directly into the exit enclosure.
6. If the apartment unit doors (A) open into a corridor, they must be 20-minute fire protection rated.

A frequent violation of the provision for a single exit is the use of nonrated doors and the lack of door closers. The travel distance from the apartment unit door to the exit enclosure door (A to E) is not permitted to exceed 35 ft (10.7 m). Both horizontal and vertical 30-minute fire resistance-rated separations are required between apartment units.

## CHAPTER 31 • Existing

Exhibit 30/31.3

Outside stair serving two apartment units.

Exhibit 30/31.4

Stair serving one apartment unit.

Exhibit 30/31.5

New apartment building — single-exit arrangement with corridors.

Exhibit 30/31.6 depicts the application of 30.2.4.6 to a new apartment building with no corridors. Rather, each apartment opens directly to the exit enclosure. The walls separating the apartments from the exit must be 1-hour fire barriers, and the doors between the apartments and the exit (E) must have a 1-hour fire protection rating to satisfy the exit enclosure requirements of 7.1.3.2.

## CHAPTER 30 • New

For existing apartment buildings, similar criteria are provided in 31.2.4.5; however, 31.2.4.5 differs by not limiting the number of apartment units per floor, as depicted in Exhibit 30/31.7, and by requiring the corridor fire resistance rating to be ½ hour instead of 1 hour.

The provision of 31.2.4.6 is similar to that of 31.2.4.5 in that it permits a single exit from a typical garden-type apartment building. However, the apartment building is not required to be sprinklered and is limited to not more than three stories in height.

The provision of 31.2.4.7 for existing apartment buildings describes an uncommon arrangement. Note that there are no

Exhibit 30/31.6

New apartment building — single-exit arrangement without corridors.

### 30.2.5 Arrangement of Means of Egress.

**30.2.5.1** Access to all required exits shall be in accordance with Section 7.5, as modified by 30.2.5.2.

**30.2.5.2** The distance between exits addressed by 7.5.1.3 shall not apply to nonlooped exit access corridors in buildings that have corridor doors from the dwelling units that are arranged such that the exits are located in opposite directions from such doors.

**30.2.5.3** Common path of travel shall comply with 30.2.5.3.1 or 30.2.5.3.2.

**30.2.5.3.1** No common path of travel shall exceed 35 ft (10.7 m) in buildings not protected throughout by an approved, supervised automatic sprinkler system installed in accordance with 30.3.5. Travel within a dwelling unit shall not be included when calculating common path of travel.

## CHAPTER 31 • Existing

height limitations, but only four apartment units per floor are permitted. Furthermore, apartments must have immediate access to a smokeproof enclosure or to an outside stair that meets the requirements of a smokeproof enclosure. The exemptions to the requirements for outside stairs in Chapter 7 for unprotected openings that expose a stair would not apply in this case, because 31.2.4.7 specifically references the smokeproof enclosure requirements of 7.2.3. Unprotected openings that expose the stair are prohibited by 7.2.3.

Exhibit 30/31.7

Existing apartment building — single-exit arrangement.

### 31.2.5 Arrangement of Means of Egress.

**31.2.5.1** Access to all required exits shall be in accordance with Section 7.5.

**31.2.5.2** Reserved.

**31.2.5.3** Common path of travel shall comply with 31.2.5.3.1 or 31.2.5.3.2.

**31.2.5.3.1** No common path of travel shall exceed 35 ft (10.7 m) in buildings not protected throughout by an approved, supervised automatic sprinkler system installed in accordance with 31.3.5. Travel within a dwelling unit shall not be included when calculating common path of travel.

## CHAPTER 30 • New

**30.2.5.3.2** No common path of travel shall exceed 50 ft (15 m) in buildings protected throughout by an approved, supervised automatic sprinkler system installed in accordance with 30.3.5. Travel within a dwelling unit shall not be included when determining common path of travel.

**30.2.5.4** Dead-end corridors shall be limited in accordance with either 30.2.5.4.1 or 30.2.5.4.2.

**30.2.5.4.1** Dead-end corridors shall not exceed 35 ft (10.7 m) in buildings not protected throughout by an approved automatic sprinkler system in accordance with 30.3.5.

**30.2.5.4.2** Dead-end corridors shall not exceed 50 ft (15 m) in buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 30.3.5.

The provisions for the arrangement of the means of egress in apartment buildings differ somewhat from the provisions in Chapter 7. The first difference appears in 30.2.5.2, which addresses the remoteness of exits. Applying the exit remoteness provisions of 7.5.1.3 could result in a corridor that is longer than is necessary for the efficient use of the space. Some relief is offered by 30.2.5.2. Exhibit 30/31.8 helps to clarify the intent of 30.2.5.2. In Part (a) of Exhibit 30/31.8, all four dwelling units have access to two exits immediately upon leaving the dwelling unit and entering the exit access corridor — that is, there is no common path of travel within the corridor from any of the apartments. This arrangement meets the provisions of 30.2.5.2. Contrast this arrangement with that depicted in Part (b) of Exhibit 30/31.8, where only dwelling units A and B have access to two exits immediately upon leaving the dwelling unit and entering the exit access corridor. This arrangement does not meet the provisions of 30.2.5.2.

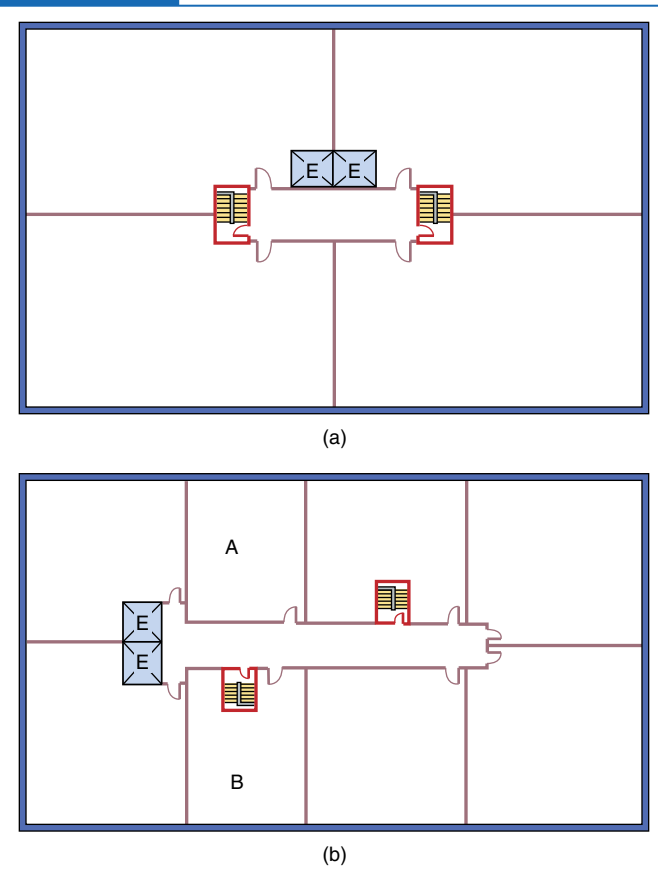

The concepts underlying the limitations imposed on common paths of travel and dead-end corridors are similar but not identical to those explained in the commentary on 7.5.1.5. Because of modifications made by Chapters 30 and 31 in defining where common path of travel begins, the difference between common paths of travel and dead-end corridors is less pronounced for apartment buildings. For most other occupancies, common path of travel is measured from the most remote point subject to occupancy to the point where occupants have a choice of traveling in independent directions (see 7.5.1.1.4 and the definition of the term *common path of travel* in 3.3.47). For apartment buildings, the travel distance within the dwelling unit, though regulated by 30/31.2.6, is not included as part of the common path of travel. Therefore, common path of travel, as illustrated by the solid arrows in Exhibit 30/31.9, is measured

## CHAPTER 31 • Existing

**31.2.5.3.2** No common path of travel shall exceed 50 ft (15 m) in buildings protected throughout by an approved, supervised automatic sprinkler system installed in accordance with 31.3.5. Travel within a dwelling unit shall not be included when calculating common path of travel.

**31.2.5.4** Dead-end corridors shall not exceed 50 ft (15 m).

Exhibit 30/31.8

*New apartment buildings — exit remoteness.*

## CHAPTER 30 • New

from the room door to the point where occupants have a choice of traveling in independent directions. This depiction can be thought of as a modified common path of travel, because measurement does not extend into the dwelling unit.

The distances permitted for common path of travel in new and existing apartment buildings also differ. Because new apartment buildings are required to be sprinklered without exception (see 30.3.5.1), the 35 ft (10.7 m) modified common path of travel and dead-end corridor limitations permitted by 30.2.5.3.1 and 30.2.5.4.1 will usually be supplanted by the 50 ft (15 m) limitation permitted by 30.2.5.3.2 and 30.2.5.4.2. The 35 ft (10.7 m) criterion for nonsprinklered buildings is maintained for the purpose of applying Chapter 30 to the rehabilitation of existing, nonsprinklered apartment buildings as specified by Chapter 43.

In most existing apartment buildings, automatic sprinklers are not required. However, if the building is protected throughout by an approved, supervised automatic sprinkler system, the common path of travel is permitted to be 50 ft (15 m), which is the same distance permitted for the length of existing dead-end corridors, regardless of the presence of automatic sprinklers.

**30.2.6 Travel Distance to Exits.** Travel distance shall be measured in accordance with Section 7.6.

**30.2.6.1** Travel distance within a dwelling unit (apartment) to a corridor door shall not exceed 75 ft (23 m) in buildings not protected throughout by an approved, supervised automatic sprinkler system installed in accordance with 30.3.5.

**30.2.6.2** Travel distance within a dwelling unit (apartment) to a corridor door shall not exceed 125 ft (38 m) in buildings protected throughout by an approved, supervised automatic sprinkler system installed in accordance with 30.3.5.

**30.2.6.3** The travel distance from a dwelling unit (apartment) entrance door to the nearest exit shall be limited in accordance with 30.2.6.3.1, 30.2.6.3.2, or 30.2.6.3.3.

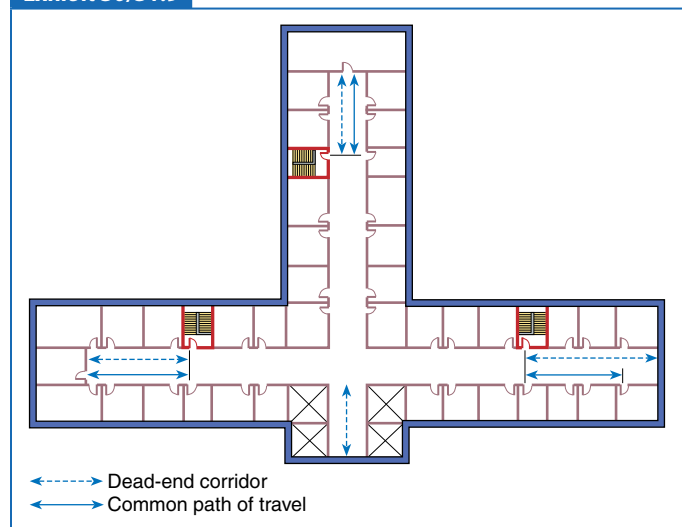

**30.2.6.3.1** The travel distance from a dwelling unit (apartment) entrance door to the nearest exit shall not exceed 100 ft (30 m).

**30.2.6.3.2** In buildings protected throughout by an approved, supervised automatic sprinkler system installed in accordance with 30.3.5, the travel distance from a dwelling unit (apartment) entrance door to the nearest exit shall not exceed 200 ft (61 m).

**30.2.6.3.3** The travel distance from a dwelling unit (apartment) entrance door to the nearest exit shall not exceed 200 ft (61 m) for exterior ways of exit access arranged in accordance with 7.5.3.

## CHAPTER 31 • Existing

Exhibit 30/31.9

Modified common path of travel and dead-end corridors in an apartment building.

**31.2.6 Travel Distance to Exits.** Travel distance shall be measured in accordance with Section 7.6.

**31.2.6.1** Travel distance within a dwelling unit (apartment) to a corridor door shall not exceed the following limits:

- (1) For buildings using Option 1 or Option 3, 75 ft (23 m)
- (2) For buildings using Option 2 or Option 4, 125 ft (38 m)

**31.2.6.2** The travel distance from a dwelling unit (apartment) entrance door to the nearest exit shall not exceed the following limits, as modified by 31.2.6.3:

- (1) For buildings using Option 1, 100 ft (30 m)
- (2) For buildings using Option 2 or Option 3, 150 ft (46 m)
- (3) For buildings using Option 4, 200 ft (61 m)

**31.2.6.3** Travel distance to exits shall not exceed 200 ft (61 m) for exterior ways of exit access arranged in accordance with 7.5.3.

## CHAPTER 30 • New

**30.2.6.4** The travel distance, from areas other than those within living units, to an exit, shall not exceed 200 ft (61 m), or 250 ft (76 m) in buildings protected throughout by an approved, supervised automatic sprinkler system installed in accordance with [30.3.5.5](#).

The travel distance limitations specified in [30/31.2.6](#) divide the measurement into the following two portions of the overall travel distance:

1. Travel within an apartment unit to the door to the common space of the building
2. Travel from the corridor door to the nearest exit

If the travel distance within an apartment unit is excessive, an additional remote door to the corridor can usually be added to correct the deficiency. The presence of automatic sprinklers or the use of exterior ways of exit access modifies travel distance requirements. In existing buildings, the presence of a fire detection and notification system or a partial sprinkler system (Option 2 or Option 3) also modifies travel distance require-

**30.2.7 Discharge from Exits.** Exit discharge shall comply with [Section 7.7](#).

**30.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with [Section 7.8](#).

**30.2.9 Emergency Lighting.** Emergency lighting in accordance with [Section 7.9](#) shall be provided in all buildings four or more stories in height, or with more than 12 dwelling units, unless every dwelling unit has a direct exit to the outside of the building at the finished ground level.

**30.2.10 Marking of Means of Egress.** Means of egress shall have signs in accordance with [Section 7.10](#) in all buildings requiring more than one exit.

**30.2.11 Special Means of Egress Features.**

**30.2.11.1 Reserved.**

**30.2.11.2 Lockups.** Lockups in apartment buildings shall comply with the requirements of [22.4.5](#).

**30.2.11.3 Normally Unoccupied Building Service Equipment Support Areas.** The use of [Section 7.13](#) shall be prohibited.

## CHAPTER 31 • Existing

**31.2.6.4** The travel distance, from areas other than those within living units, to an exit shall not exceed 200 ft (61 m), or 250 ft (76 m) in buildings protected throughout by an approved, supervised automatic sprinkler system installed in accordance with [31.3.5](#).

ments, though not to the extent of a complete automatic sprinkler system (Option 4).

Many apartment buildings have common activity rooms, lounges, lobbies, and similar spaces that are neither dwelling units, as addressed by [30.2.6.1](#) and [30.2.6.2](#), nor exit access corridor-like spaces, as addressed by [30.2.6.3](#). Travel distance limitations from areas other than those within dwelling units of new apartment buildings are established by [30.2.6.4](#). The maximum 200 ft (61 m) travel distance allowance, which can be increased to 250 ft (76 m) in sprinklered buildings, treats the travel distance in one continuous measurement. For example, the travel distance limitation would apply to the full distance of travel through an activity room and the associated exit access corridors to the exit.

**31.2.7 Discharge from Exits.** Exit discharge shall comply with [Section 7.7](#).

**31.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with [Section 7.8](#).

**31.2.9 Emergency Lighting.** Emergency lighting in accordance with [Section 7.9](#) shall be provided in all buildings four or more stories in height or with more than 12 dwelling units, unless every dwelling unit has a direct exit to the outside of the building at grade level.

**31.2.10 Marking of Means of Egress.** Means of egress shall have signs in accordance with [Section 7.10](#) in all buildings requiring more than one exit.

**31.2.11 Special Means of Egress Features.**

**31.2.11.1\* High-Rise Buildings.** In high-rise buildings using Option 1, Option 2, or Option 3, smokeproof enclosures shall be provided in accordance with [7.2.3](#).

**A.31.2.11.1** The provision of [31.2.11](#) recognizes the need to provide smoke control in existing buildings. Smokeproof enclosures can be accomplished without the use of a vestibule in accordance with [7.2.3](#).

**31.2.11.2 Lockups.** Lockups in apartment buildings, other than approved existing lockups, shall comply with the requirements of [23.4.5](#).

**31.2.11.3 Normally Unoccupied Building Service Equipment Support Areas.** The use of [Section 7.13](#) shall be prohibited.

## CHAPTER 30 • New

Emergency lighting is required in both new and existing apartment buildings if the building either has more than 12 dwelling units or is more than three stories in height. The provision of 30/31.2.9 exempting emergency lighting does not apply to all apartment buildings with exterior exit access but only to those where each apartment unit has direct exit at grade (no vertical travel). In accordance with Section 7.9, where it is required, emergency lighting must be provided in designated portions of the means of egress, but not within individual dwelling units (apartments). Designated components include corridors, exit stairs, and the exit discharge. Omission of emergency lighting in the exit discharge outside the building is a frequent Code violation.

Existing, nonsprinklered, high-rise apartment buildings are affected by 31.2.11.1. If smokeproof enclosures meeting

### 30.3 Protection

#### 30.3.1 Protection of Vertical Openings.

**30.3.1.1** Vertical openings shall comply with 30.3.1.1.1 through 30.3.1.3.

**30.3.1.1.1** Vertical openings shall be enclosed or protected in accordance with Section 8.6.

**30.3.1.1.2** Where the provisions of 8.6.6 are used, the requirements of 30.3.5.8 shall be met.

**30.3.1.1.3** Vertical openings in accordance with 8.6.9.1 shall be permitted.

**30.3.1.1.4** In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 30.3.5, walls enclosing vertical openings shall have a minimum 1-hour fire resistance rating, and the doors shall have a minimum 1-hour fire protection rating.

**30.3.1.2** No floor below the level of exit discharge used only for storage, heating equipment, or purposes other than residential occupancy and open to the public shall have unprotected openings to floors used for residential purposes.

**30.3.1.3** Within any individual dwelling unit, unless protected by an approved automatic sprinkler system in accordance with 30.3.5, vertical openings more than one story above or below the entrance floor level of the dwelling unit shall not be permitted.

The protection of vertical openings is provided by a reference to Section 8.6 for both new and existing apartment buildings (see 30/31.3.1.1.1). However, automatic sprinkler protection is required throughout new apartment buildings where the building has a communicating space in accordance with 8.6.6.

## CHAPTER 31 • Existing

7.2.3 are not already provided, it might be more practical to add sprinkler protection to the entire building, so as to meet Option 4, than to modify stairs to meet the requirements for smokeproof enclosures.

The provisions of Section 7.13 modify the requirements for means of egress in normally unoccupied building service equipment support areas, unless the application of Section 7.13 is prohibited by the applicable occupancy chapter (see 7.13.1.1). The provision of 30/31.2.11.3 prohibits the use of Section 7.13 in both new and existing apartment buildings. As a result, such areas must comply with the usual means of egress requirements of Chapter 7 if they are occupiable (e.g., to access equipment for maintenance purposes), even if not normally occupied.

### 31.3 Protection

#### 31.3.1 Protection of Vertical Openings.

**31.3.1.1** Vertical openings shall comply with 31.3.1.1.1 through 31.3.1.2.

**31.3.1.1.1** Vertical openings shall be enclosed or protected in accordance with Section 8.6.

**31.3.1.1.2** Reserved.

**31.3.1.1.3** Vertical openings in accordance with 8.6.9.1 shall be permitted.

**31.3.1.1.4** In buildings protected throughout by an approved automatic sprinkler system in accordance with 31.3.5, and in which exits and required ways of travel thereto are adequately safeguarded against fire and smoke within the building, or where every individual room has direct access to an exterior exit without passing through any public corridor, the protection of vertical openings that are not part of required exits shall not be required.

**31.3.1.2** No floor below the level of exit discharge used only for storage, heating equipment, or purposes other than residential occupancy and open to the public shall have unprotected openings to floors used for residential purposes.

The provision of 30/31.3.1.1.3 has traditionally permitted an unenclosed stair to be located within an apartment unit (living unit) for the purpose of connecting two adjacent stories. The open stair typically serves as means of escape for occupants of a living unit. The provisions of 8.6.9.1 do not permit the opening to

## CHAPTER 30 • New

serve as required means of egress. It is not the *Code's* intent to prohibit an open stair from serving as means of escape for occupants of a dwelling unit.

In the case of a three-story apartment unit, only two of the three stories can be connected by an open stair. The stair connecting the third level must be enclosed in accordance with [Section 8.6](#).

Atria are permitted in both new and existing apartment buildings (see [8.6.7](#)). However, [8.6.7](#) requires total automatic sprinkler protection in buildings with atria. Therefore, an existing apartment building would be permitted to have an atrium only where Option 4 (complete sprinkler protection) is used.

### 30.3.2 Protection from Hazards.

**30.3.2.1 Hazardous Areas.** Any hazardous area shall be protected in accordance with [Section 8.7](#).

**30.3.2.1.1** The areas described in [Table 30.3.2.1.1](#) shall be protected as indicated.

**30.3.2.1.2** Where sprinkler protection without fire-rated separation is used, areas shall be separated from other spaces by smoke partitions complying with [Section 8.4](#).

**Table 30.3.2.1.1 Hazardous Area Protection**

Hazardous Area Description	Separation/Protection <sup>†</sup>
Boiler and fuel-fired heater rooms serving more than a single dwelling unit	1 hour and sprinklers
Employee locker rooms	1 hour or sprinklers
Gift or retail shops	1 hour or sprinklers
Bulk laundries	1 hour and sprinklers
Laundries ≤100 ft <sup>2</sup> (≤9.3 m <sup>2</sup> ) outside of dwelling units	1 hour or sprinklers <sup>‡</sup>
Laundries >100 ft <sup>2</sup> (>9.3 m <sup>2</sup> ) outside of dwelling units	1 hour and sprinklers
Maintenance shops	1 hour and sprinklers
Storage rooms outside of dwelling units	1 hour or sprinklers
Trash collection rooms	1 hour and sprinklers

<sup>†</sup>Minimum fire resistance rating.

<sup>‡</sup>Where sprinklers are provided, the separation specified in [8.7.1.2](#) and [30.3.2.1.2](#) is not required.

## CHAPTER 31 • Existing

All new apartment buildings must be protected throughout by an approved, supervised automatic sprinkler system. Prior to the 2009 edition of the *Code*, some apartment buildings with means of egress directly to the outside from every apartment, much like a detached single-family home, were exempt from the requirement for automatic sprinklers. However, since the 2006 edition of the *Code*, new one- and two-family dwellings are required to be sprinklered (see [24.3.5.1](#)). As such, there is no justification to permit the omission of sprinklers from new apartment buildings with egress arrangements that resemble those of one- and two-family dwellings.

### 31.3.2 Protection from Hazards.

**31.3.2.1 Hazardous Areas.** Any hazardous area shall be protected in accordance with [Section 8.7](#).

**31.3.2.1.1** The areas described in [Table 31.3.2.1.1](#) shall be protected as indicated.

**31.3.2.1.2** Where sprinkler protection without fire-rated separation is used, areas shall be separated from other spaces by smoke partitions complying with [Section 8.4](#).

**Table 31.3.2.1.1 Hazardous Area Protection**

Hazardous Area Description	Separation/Protection <sup>†</sup>
Boiler and fuel-fired heater rooms serving more than a single dwelling unit	1 hour or sprinklers
Employee locker rooms	1 hour or sprinklers
Gift or retail shops >100 ft <sup>2</sup> (>9.3 m <sup>2</sup> )	1 hour or sprinklers <sup>‡</sup>
Bulk laundries	1 hour or sprinklers
Laundries >100 ft <sup>2</sup> (>9.3 m <sup>2</sup> ) outside of dwelling units	1 hour or sprinklers <sup>‡</sup>
Maintenance shops	1 hour or sprinklers
Rooms or spaces used for storage of combustible supplies and equipment in quantities deemed hazardous by the authority having jurisdiction	1 hour or sprinklers
Trash collection rooms	1 hour or sprinklers

<sup>†</sup>Minimum fire resistance rating.

<sup>‡</sup>Where sprinklers are provided, the separation specified in [8.7.1.2](#) and [31.3.2.1.2](#) is not required.

## CHAPTER 30 • New

Note the differences in the hazardous area protection requirements for new and existing apartment buildings as specified in [Table 30.3.2.1.1](#) and [Table 31.3.2.1.1](#). In new apartment buildings, many of the areas are required to be separated by 1-hour fire barrier walls and protected by automatic sprinklers. In existing apartment buildings, automatic sprinklers are sometimes used as an alternative to the separation requirement.

### 30.3.3 Interior Finish.

**30.3.3.1 General.** Interior finish shall be in accordance with [Section 10.2](#).

**30.3.3.2 Interior Wall and Ceiling Finish.** Interior wall and ceiling finish materials complying with [Section 10.2](#) shall be permitted as follows:

- (1) Exit enclosures — Class A
- (2) Lobbies and corridors — Class A or Class B
- (3) Other spaces — Class A, Class B, or Class C

#### 30.3.3.3 Interior Floor Finish.

**30.3.3.3.1** Interior floor finish shall comply with [Section 10.2](#).

**30.3.3.3.2** Interior floor finish in exit enclosures and exit access corridors and spaces not separated from them by walls complying with [30.3.6](#) shall be not less than Class II.

**30.3.3.3.3** Interior floor finish shall comply with [10.2.7.1](#) or [10.2.7.2](#), as applicable.

### 30.3.4 Detection, Alarm, and Communications Systems.

#### 30.3.4.1 General.

**30.3.4.1.1** Apartment buildings four or more stories in height or with more than 11 dwelling units, other than those meeting the requirements of [30.3.4.1.2](#), shall be provided with a fire alarm system in accordance with [Section 9.6](#), except as modified by [30.3.4.2](#) through [30.3.4.5](#).

**30.3.4.1.2** A fire alarm system shall not be required in buildings where each dwelling unit is separated from other contiguous dwelling units by fire barriers (*see Section 8.3*) having a minimum 1-hour fire resistance rating, and where each dwelling unit has either its own independent exit or its own independent stairway or ramp discharging at the finished ground level.

The intent of [30/31.3.4.1.2](#) is to exempt townhouse-type apartment buildings from the requirement for a fire alarm system, because, during a fire, each apartment unit retains safe egress routes for longer than is typical of apartment buildings with

## CHAPTER 31 • Existing

Although the lists that appear in [Table 30.3.2.1.1](#) and [Table 31.3.2.1.1](#) provide specific direction for certain hazardous contents areas, they are not all-inclusive. Other areas that are deemed hazardous need to be provided with the appropriate level of protection in accordance with [Section 8.7](#).

### 31.3.3 Interior Finish.

**31.3.3.1 General.** Interior finish shall be in accordance with [Section 10.2](#).

**31.3.3.2 Interior Wall and Ceiling Finish.** Interior wall and ceiling finish materials complying with [Section 10.2](#) shall be permitted as follows:

- (1) Exit enclosures — Class A or Class B
- (2) Lobbies and corridors — Class A or Class B
- (3) Other spaces — Class A, Class B, or Class C

**31.3.3.3 Interior Floor Finish.** In buildings utilizing Option 1 or Option 2, newly installed interior floor finish in exits and exit access corridors shall be not less than Class II in accordance with [10.2.7](#).

### 31.3.4 Detection, Alarm, and Communications Systems.

#### 31.3.4.1 General.

**31.3.4.1.1** Apartment buildings four or more stories in height or with more than 11 dwelling units, other than those meeting the requirements of [31.3.4.1.2](#), shall be provided with a fire alarm system in accordance with [Section 9.6](#), except as modified by [31.3.4.2](#) through [31.3.4.5](#).

**31.3.4.1.2** A fire alarm system shall not be required where each dwelling unit is separated from other contiguous dwelling units by fire barriers (*see Section 8.3*) having a minimum ½-hour fire resistance rating, and where each dwelling unit has either its own independent exit or its own independent stairway or ramp discharging at the finished ground level.

interior exit access corridors. The safe egress route helps to ensure that any delay in occupant notification resulting from the absence of an alarm system can be tolerated without undue risk.

## CHAPTER 30 • New

**30.3.4.2 Initiation.**

**30.3.4.2.1** Initiation of the required fire alarm system shall be by manual means in accordance with 9.6.2, unless the building complies with 30.3.4.2.2.

**30.3.4.2.2** Initiation of the required fire alarm system by manual means shall not be required in buildings four or fewer stories in height, containing not more than 16 dwelling units, and protected throughout by an approved, supervised automatic sprinkler system installed in accordance with 30.3.5.1.

**30.3.4.2.3** In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 30.3.5, required fire alarm systems shall be initiated upon operation of the automatic sprinkler system.

**30.3.4.3 Notification.**

**30.3.4.3.1** Occupant notification shall be provided automatically in accordance with Section 9.6, and both of the following shall also apply:

- (1) Visible signals shall be installed in units designed for the hearing impaired.
- (2) Positive alarm sequence in accordance with 9.6.3.4 shall be permitted.

**30.3.4.3.2** Annunciation, and annunciation zoning, in accordance with 9.6.7 shall be provided, unless the building complies with either 30.3.4.3.3 or 30.3.4.3.4. Annunciation shall be provided at a location readily accessible from the primary point of entry for emergency response personnel.

**30.3.4.3.3** Annunciation, and annunciation zoning, shall not be required in buildings two or fewer stories in height and having not more than 50 dwelling units.

**30.3.4.3.4** Annunciation, and annunciation zoning, shall not be required in buildings four or fewer stories in height containing not more than 16 dwelling units and protected throughout by an approved, supervised automatic sprinkler system installed in accordance with 30.3.5.1.

**30.3.4.3.5** Emergency forces notification shall be accomplished in accordance with 9.6.4.

## CHAPTER 31 • Existing

**31.3.4.2 Initiation.**

**31.3.4.2.1** Initiation of the required fire alarm system shall be by manual means in accordance with 9.6.2, unless the building complies with 31.3.4.2.2.

**31.3.4.2.2** Initiation of the required fire alarm system by manual means shall not be required in buildings four or fewer stories in height, containing not more than 16 dwelling units, and protected throughout by an approved, supervised automatic sprinkler system installed in accordance with 31.3.5.2.

**31.3.4.2.3** In buildings using Option 2, the required fire alarm system shall be initiated by the automatic fire detection system in addition to the manual initiation means of 31.3.4.2.1.

**31.3.4.2.4** In buildings using Option 3, the required fire alarm system shall be initiated upon operation of the automatic sprinkler system in addition to the manual initiation means of 31.3.4.2.1.

**31.3.4.2.5** In buildings using Option 4, the required fire alarm system shall be initiated upon operation of the automatic sprinkler system in addition to the manual initiation means of 31.3.4.2.1.

**31.3.4.3 Notification.**

**31.3.4.3.1** Occupant notification shall be provided automatically in accordance with Section 9.6, and all of the following shall also apply:

- (1) Visible signals shall be installed in units designed for the hearing impaired.
- (2) Positive alarm sequence in accordance with 9.6.3.4 shall be permitted.
- (3) Existing approved presignal systems shall be permitted in accordance with 9.6.3.3.

**31.3.4.3.2** An annunciator panel, whose location shall be approved by the authority having jurisdiction, connected with the required fire alarm system shall be provided, unless the building meets the requirements of 31.3.4.3.3 or 31.3.4.3.4.

**31.3.4.3.3** Annunciation shall not be required in buildings two or fewer stories in height and having not more than 50 rooms.

**31.3.4.3.4** Annunciation shall not be required in buildings four or fewer stories in height containing not more than 16 dwelling units and protected throughout by an approved, supervised automatic sprinkler system installed in accordance with 31.3.5.2.

**31.3.4.3.5** Emergency forces notification shall be accomplished in accordance with 9.6.4.

## CHAPTER 30 • New

If a fire alarm system is required in an apartment building, then it must provide notification to the fire department using one of the four methods described in 9.6.4.2 (i.e., auxiliary fire alarm system, central station fire alarm system, proprietary supervising station fire alarm system, or remote supervising station fire alarm system). This requirement, which first appeared in the 2003 edition of the *Code*, applies to both new and existing apartment buildings.

Note that 9.6.4.3 recognizes that some existing fire alarm systems are not readily adaptable to provide automatic fire department notification. In such cases, the authority having

**30.3.4.4 Detection. (Reserved)**

**30.3.4.5\* Smoke Alarms.** Smoke alarms shall be installed in accordance with 9.6.2.10 in every sleeping area, outside every sleeping area in the immediate vicinity of the bedrooms, and on all levels of the dwelling unit, including basements.

**A.30.3.4.5** Previous editions of the *Code* permitted the single-station smoke alarm required by 30.3.4.5 to be omitted from each apartment where a complete automatic smoke detection system

## CHAPTER 31 • Existing

jurisdiction (AHJ) can approve an alternative plan to ensure a prompt fire department response. With the proliferation of personal cellular phones in recent years, the AHJ might consider approving the installation of signs located at the manual fire alarm boxes that read “Local Alarm Only — In Case of Fire, Call 911,” or similar verbiage, in lieu of requiring automatic notification. In all cases, where a supervised automatic sprinkler system is required by the *Code*, a sprinkler waterflow condition must automatically provide alarm notification to the fire department (see 9.7.2.2).

**31.3.4.4 Detection.**

**31.3.4.4.1\*** In buildings using Option 2, a complete automatic fire detection system in accordance with 9.6.1.3 and 31.3.4.4.2 shall be required.

**A.31.3.4.4.1** It is intended that a building compliant with Option 2 function as described in the paragraph that follows.

Occupants within a living unit become aware of a fire emergency, either through personal awareness or through being alerted by the smoke alarm(s) installed within the living unit. Other building occupants are alerted to the fire emergency by the building fire alarm system that is initiated by manual fire alarm boxes adjacent to the exits, heat detection within the living unit where the fire emergency exists, smoke detection in the common areas outside the living unit, or a combination thereof. The installation of system heat detectors versus smoke detectors within the living unit is intended to eliminate nuisance-type alarms and reduce occupant complacency from frequent false alarms. The installation of smoke detection within the living unit should only be contemplated after a careful analysis of the goals and with the approval of the authority having jurisdiction.

**31.3.4.4.2** Automatic fire detection devices shall be installed as follows:

- (1) Smoke detectors shall be installed in all common areas and work spaces outside the living unit, such as exit stairs, egress corridors, lobbies, storage rooms, equipment rooms, and other tenantless spaces in environments that are suitable for proper smoke detector operation.
- (2) Heat detectors shall be located within each room of the living unit.

**31.3.4.5 Smoke Alarms.**

## CHAPTER 30 • New

was installed throughout the building. With such a system, when one detector is activated, an alarm is sounded throughout the building. Experience with complete smoke detection systems in apartment buildings has shown that numerous nuisance alarms are likely to occur. Where there is a problem with frequent nuisance alarms, occupants ignore the alarm, or the system is either disconnected or otherwise rendered inoperative.

Existing apartment buildings using Option 2 are protected throughout by a fire detection system (see 31.3.4.4). The increased travel distance permitted in an Option 2 apartment building (see 31.2.6.1 and 31.2.6.2) is based on early occupant notification of fire. Therefore, the detectors must initiate the alarm system in addition to the initiation provided by manual fire alarm boxes.

Sprinkler systems protect the corridors of existing apartment buildings using Option 3 (see 31.3.5.9). The activation of the sprinkler system must initiate the alarm system in addition to the initiation provided by manual fire alarm boxes.

Existing apartment buildings using Option 4 are protected throughout by automatic sprinkler systems (see 31.3.5.10). The activation of the sprinkler system must initiate the alarm system in addition to the initiation provided by manual fire alarm boxes.

Fire alarm system annunciation is exempted by 30/31.3.4.3.3 and 30/31.3.4.3.4, based on the presence of automatic sprinklers and small building size. Given the additional limitation on building height and number of units, it is believed that fire in a fully

## CHAPTER 31 • Existing

**31.3.4.5.1\*** In buildings other than those equipped throughout with an existing, complete automatic smoke detection system, smoke alarms shall be installed in accordance with 9.6.2.10, as modified by 31.3.4.5.2, outside every sleeping area in the immediate vicinity of the bedrooms and on all levels of the dwelling unit, including basements.

**A.31.3.4.5.1** NFPA 101 provides adequate, balanced fire protection and takes into consideration the passive and active systems required in a given occupancy. The level of protection prescribed by NFPA 72, *National Fire Alarm and Signaling Code*, which includes smoke alarms in all sleeping rooms, without exception, does not necessarily take into consideration the complete protection package mandated by NFPA 101.

**31.3.4.5.2** Smoke alarms required by 31.3.4.5.1 shall not be required to be provided with a secondary (standby) power source.

**31.3.4.5.3** In buildings other than those equipped throughout with an existing, complete automatic smoke detection system or a complete, supervised automatic sprinkler system in accordance with 31.3.5, smoke alarms shall be installed in every sleeping area in accordance with 9.6.2.10, as modified by 31.3.4.5.4.

**31.3.4.5.4** Smoke alarms required by 31.3.4.5.3 shall be permitted to be battery powered.

sprinklered building can be controlled to a level that allows a delay by responding emergency forces in locating a fire.

In existing apartment buildings using Option 2, a total automatic fire detection system is required and must be interconnected with the building fire alarm system in accordance with 31.3.4.2.3. This system is required in addition to the smoke alarms required by 31.3.4.5. Note that 31.3.4.4 does not require the fire detection system to be comprised solely of smoke detectors but, instead, permits the use of either heat or smoke detectors, or combinations of the two. Heat detectors are permitted by 31.3.4.4 within apartments, because they are used as part of a system that is separate from the smoke alarms addressed in 31.3.4.5. The smoke alarms will alert occupants within an apartment of a fire originating within that unit. When an occupant leaves the apartment, the door closes and latches behind the occupant (see 31.3.6.2.3), and the occupant pulls a manual fire alarm box. If the occupant fails to sound the alarm manually and the fire continues to develop in the apartment, the heat detectors will initiate the building fire alarm system prior to the fire

## CHAPTER 30 • New

becoming a threat to other apartment units. Fire detection systems have proved very effective where used. In addition, because the system is required to be tied into the building fire alarm system, the use of heat detectors instead of system smoke detectors eliminates nuisance alarms that might be caused by cooking or smoking.

The smoke alarm(s) required by 30.3.4.5 and 31.3.4.5.1 should be located in the hall area(s) that provides access to rooms used for sleeping. In multilevel apartment units, the smoke alarm covering the upper level should normally be located at the top of the stairs. The smoke alarm(s) should be mounted on the ceiling or on the wall; *NFPA 72*<sup>®</sup>, *National Fire Alarm and Signaling Code*,<sup>2</sup> provides detailed smoke alarm placement requirements. Smoke alarms should be remotely located from cooking areas. Where unusual factors such as room configuration, air movement, or stagnant air pockets must be considered, the authority having jurisdiction and the designer should determine the placement of the smoke alarms.

In addition to requiring smoke alarms outside of sleeping rooms, the *Code* requires all new apartment buildings to be provided with smoke alarms within sleeping rooms as well, regardless of sprinkler protection. In existing apartment buildings,

### 30.3.4.6 Carbon Monoxide Alarms and Carbon Monoxide Detection Systems.

**30.3.4.6.1** Carbon monoxide alarms or carbon monoxide detectors in accordance with Section 9.12 and 30.3.4.6 shall be provided in new apartment buildings where either of the following conditions exists:

- (1) Dwelling units with communicating attached garages, unless otherwise exempted by 30.3.4.6.3
- (2) Dwelling units containing a permanently installed fuel-burning appliance or fuel-burning fireplace

**30.3.4.6.2** Where required by 30.3.4.6.1, carbon monoxide alarms or carbon monoxide detectors shall be installed in the following locations:

- (1) Outside of each separate dwelling unit sleeping area in the immediate vicinity of the sleeping rooms
- (2) On every occupiable level of a dwelling unit

**30.3.4.6.3** Carbon monoxide alarms and carbon monoxide detectors as specified in 30.3.4.6.1(1) shall not be required in the following locations:

- (1) In garages
- (2) Within dwelling units with communicating attached garages that are open parking structures as defined by the building code
- (3) Within dwelling units with communicating attached garages that are mechanically ventilated in accordance with the mechanical code

## CHAPTER 31 • Existing

sleeping room smoke alarms are required where the building is not protected by a complete smoke detection or automatic sprinkler system. Because this retroactive requirement for smoke alarms in existing apartment building sleeping rooms would likely cause a hardship if they were required to be powered by the building electrical system, 31.3.4.5.4 permits the sleeping room smoke alarms to be powered only by replaceable batteries. The smoke alarms outside of the sleeping rooms must be powered as required by *NFPA 72*.

Note that 9.6.2.10.7 requires smoke alarms to be powered as required by *NFPA 72*; *NFPA 72* requires smoke alarms to be powered by the building's electrical system, which is achieved by using directly wired or plug-in-type smoke alarms. Alternatively, smoke alarms are permitted to be powered by a nonrechargeable, nonreplaceable battery capable of operating the device for 10 years under normal conditions, followed by 4 minutes of alarm, followed by 7 days of trouble condition.

It is not the *Code's* intent to prohibit the interconnection of smoke alarms within individual apartments. Where an apartment unit requires more than one smoke alarm, interconnection will probably be required to meet the performance criterion for audibility detailed in 9.6.2.10.8.

## CHAPTER 30 • New

**30.3.4.6.4** Where fuel-burning appliances or fuel-burning fireplaces are installed outside dwelling units, carbon monoxide alarms or carbon monoxide detectors shall be installed in accordance with the manufacturer's published instructions in the locations specified as follows:

- (1) On the ceilings of rooms containing permanently installed fuel-burning appliances or fuel-burning fireplaces
- (2) Centrally located within occupiable spaces served by the first supply air register from a permanently installed, fuel-burning HVAC system
- (3) Centrally located within occupiable spaces adjacent to a communicating attached garage

The provisions of **30.3.4.6** mandate the installation of carbon monoxide (CO) detectors or CO alarms in new apartment buildings where there is a potential for accidental CO poisoning from a vehicle in an attached, communicating garage or from fuel-burning appliances, such as a gas-fired or an oil-fired furnace or a fuel-burning fireplace. The reference to **Section 9.12** in **30.3.4.6.1** requires compliance with NFPA 720, *Standard for the Installation of Carbon Monoxide (CO) Detection and Warning Equipment*.<sup>3</sup> NFPA 720, which is modeled after NFPA 72, *National Fire Alarm and Signaling Code*, contains the detailed installation requirements for CO alarms, including those for power supply.

### 30.3.5 Extinguishment Requirements.

**30.3.5.1** All buildings shall be protected throughout by an approved, supervised automatic sprinkler system installed in accordance with **30.3.5.2**.

**30.3.5.2** Where an automatic sprinkler system is installed, either for total or partial building coverage, the system shall be installed in accordance with **Section 9.7**, as modified by **30.3.5.3** and **30.3.5.4**. In buildings four or fewer stories above grade plane, systems in accordance with NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*, shall be permitted.

**30.3.5.3\*** In buildings sprinklered in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*, closets less than 12 ft<sup>2</sup> (1.1 m<sup>2</sup>) in area in individual dwelling units shall not be required to be sprinklered. Closets that contain equipment such as washers, dryers, furnaces, or water heaters shall be sprinklered, regardless of size.

## CHAPTER 31 • Existing

Like smoke alarms, where more than one CO alarm is required in an apartment, they must be interconnected so that when one activates, all CO alarms in the apartment sound their alarms.

Although not mandated in existing apartment buildings, the installation of CO alarms is recommended if there is a potential for CO poisoning. It is important to note that the typical service life of a CO alarm varies from about five to ten years. CO alarms must be replaced by the date indicated on the device to ensure proper operation. See the commentary following **Section 9.12** for additional details.

### 31.3.5 Extinguishment Requirements.

**31.3.5.1 Reserved.**

**31.3.5.2\*** Where an automatic sprinkler system is installed, either for total or partial building coverage, the system shall be installed in accordance with **Section 9.7**, as modified by **31.3.5.3** and **31.3.5.4**. In buildings four or fewer stories above grade plane, systems in accordance with NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*, shall be permitted.

**A.31.3.5.2** Although not required by the *Code*, the use of residential sprinklers or quick-response sprinklers is encouraged for new installations of sprinkler systems within dwelling units, apartments, and guest rooms. Caution should be exercised, because the system needs to be designed for the sprinkler being used.

**31.3.5.3** In individual dwelling units, sprinkler installation shall not be required in closets not exceeding 24 ft<sup>2</sup> (2.2 m<sup>2</sup>) and in bathrooms not exceeding 55 ft<sup>2</sup> (5.1 m<sup>2</sup>). Closets that contain equipment such as washers, dryers, furnaces, or water heaters shall be sprinklered, regardless of size.

## CHAPTER 30 • New

**A.30.3.5.3** The 12 ft<sup>2</sup> (1.1 m<sup>2</sup>) closet sprinkler exemption differs from requirements in NFPA 13, *Standard for the Installation of Sprinkler Systems*, because fire loss data supports the long-standing position of the *Code*, since the 1976 edition, to omit sprinklers from such closets. The provision is further supported by the lack of losses in buildings protected in accordance with NFPA 13D, *Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes*, and NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*, which permit the omission of sprinklers from closets not exceeding 24 ft<sup>2</sup> (2.2 m<sup>2</sup>).

**Paragraph 30.3.5.3** exempts small closets from being sprinklered because of the limited fuel load characteristic of apartment unit closets. The closets exempted are limited to those within a living unit; closets in common building areas are not exempted. Also,

**30.3.5.4\*** In buildings sprinklered in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*, bathrooms not greater than 55 ft<sup>2</sup> (5.1 m<sup>2</sup>) in individual dwelling units shall not be required to be sprinklered.

**A.30.3.5.4** The provision of **30.3.5.4** differs from NFPA 13, *Standard for the Installation of Sprinkler Systems*, because fire data shows that in apartment fires where sprinklers were present, bathrooms were the area of origin in 1 percent of the total fires, and resulted in no civilian deaths, civilian injuries, or property loss.

The provision allowing the omission of sprinklers from small bathrooms in **30/31.3.5.4** was previously contained in NFPA 13; however, it was deleted for the 2013 edition of NFPA 13. The addition of **30/31.3.5.4** to the 2015 edition of the *Life Safety Code*

**30.3.5.5** The draft stop and closely spaced sprinkler requirements of NFPA 13, *Standard for the Installation of Sprinkler Systems*, shall not be required for convenience openings complying with **8.6.9.1** where the convenience opening is within the dwelling unit.

**30.3.5.6** Listed quick-response or listed residential sprinklers shall be used throughout all dwelling units.

The *Code* permits NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*,<sup>4</sup> to be used, within its scope, in place of NFPA 13, *Standard for the Installation of Sprinkler Systems*. However, the provision of **30.3.5.6**, which

## CHAPTER 31 • Existing

any closet that contains HVAC equipment or washers and dryers is not permitted to take advantage of the sprinkler exemption due to the inherent ignition sources and combustible fuel load.

**31.3.5.4\*** In buildings sprinklered in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*, bathrooms not greater than 55 ft<sup>2</sup> (5.1 m<sup>2</sup>) in individual dwelling units shall not be required to be sprinklered.

**A.31.3.5.4** The provision of **31.3.5.4** differs from NFPA 13, *Standard for the Installation of Sprinkler Systems*, because fire data shows that in apartment fires where sprinklers were present, bathrooms were the area of origin in 1 percent of the total fires, and resulted in no civilian deaths, civilian injuries, or property loss.

maintains what has been permitted since the 1976 edition. As indicated in **A.30/A.31.3.5.4**, fire data suggest that the omission of sprinklers from small bathrooms in dwelling units creates no appreciable risk to occupant life safety.

**31.3.5.5** The draft stop and closely spaced sprinkler requirements of NFPA 13, *Standard for the Installation of Sprinkler Systems*, shall not be required for convenience openings complying with **8.6.9.1** where the convenience opening is within the dwelling unit.

**31.3.5.6 Reserved.**

requires the use of listed quick-response sprinklers or listed residential sprinklers within dwelling units of new apartment buildings, supersedes any sprinkler options permitted by NFPA 13R or NFPA 13.

## CHAPTER 30 • New

**30.3.5.7** Open parking structures complying with NFPA 88A, *Standard for Parking Structures*, that are contiguous with apartment buildings shall be exempt from the sprinkler requirements of **30.3.5.1**.

**30.3.5.8** Buildings with unprotected openings in accordance with **8.6.6** shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with **30.3.5**.

**30.3.5.9 Reserved.**

**30.3.5.10 Reserved.**

**30.3.5.11 Reserved.**

**30.3.5.12 Reserved.**

## CHAPTER 31 • Existing

**31.3.5.7 Reserved.**

**31.3.5.8 Reserved.**

**31.3.5.9** Buildings using Option 3 shall be provided with automatic sprinkler protection installed in accordance with **31.3.5.9.1** through **31.3.5.9.4**.

**31.3.5.9.1** Automatic sprinklers shall be installed in the corridor, along the corridor ceiling, utilizing the maximum spacing requirements of the standards referenced by **Section 9.7**.

**31.3.5.9.2** An automatic sprinkler shall be installed within every dwelling unit that has a door opening to the corridor, with such sprinkler positioned over the center of the door, unless the door to the dwelling unit has not less than a 20-minute fire protection rating and is self-closing.

**31.3.5.9.3** The workmanship and materials of the sprinkler installation specified in **31.3.5.8** shall meet the requirements of **Section 9.7**.

**31.3.5.9.4** Where Option 3 is being used to permit the use of 1¾ in. (44 mm) thick, solid-bonded wood-core doors in accordance with **31.2.2.1.3**, sprinklers shall be provided within the exit enclosures in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*.

**31.3.5.10** Buildings using Option 4 shall be protected throughout by an approved automatic sprinkler system in accordance with **31.3.5.2** and meeting the requirements of **Section 9.7** for supervision for buildings seven or more stories in height.

**31.3.5.11\*** Where sprinklers are being used as an option to any requirement in this *Code*, the sprinklers shall be installed throughout the space in accordance with the requirements of that option.

**A.31.3.5.11** For example, if an Option 3 sprinkler system were being used to justify use of Class C wall finish in an exit enclosure, the sprinkler system would need to be extended into the exit enclosure, even if the rest of the requirements for Option 3 did not require the sprinklers in the exit enclosure.

**31.3.5.12 High-Rise Building Sprinklers.**

**31.3.5.12.1** All high-rise buildings, other than those meeting **31.3.5.12.2** or **31.3.5.12.3**, shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with **31.3.5.2**.

## CHAPTER 30 • New

**30.3.5.13** Portable fire extinguishers in accordance with **Section 9.9** shall be provided in hazardous areas addressed by **30.3.2.1**, unless the building is protected throughout with an approved, supervised automatic sprinkler system in accordance with **30.3.5.2**.

For existing apartment buildings, Option 3 and Option 4 require the installation of automatic sprinklers. **Exhibit 30/31.10** illustrates the sprinkler location requirements for an Option 3 existing apartment building. A 20-minute fire protection-rated,

*Option 3 sprinkler protection for existing apartment buildings.*

## CHAPTER 31 • Existing

**31.3.5.12.2** An automatic sprinkler system shall not be required where every dwelling unit has exterior exit access in accordance with **7.5.3**.

**31.3.5.12.3\*** An automatic sprinkler system shall not be required in buildings having an approved, engineered life safety system in accordance with **31.3.5.12.4**.

**A.31.3.5.12.3** This system might consist of a combination of any or all of the following systems:

- (1) Partial automatic sprinkler protection
- (2) Smoke detection alarms
- (3) Smoke control
- (4) Compartmentation or other approved systems, or both

**31.3.5.12.4** Where required by **31.3.5.12.3**, an engineered life safety system shall be developed by a registered professional engineer experienced in fire and life safety system design, shall be approved by the authority having jurisdiction, and shall include any or all of the following:

- (1) Partial automatic sprinkler protection
- (2) Smoke detection systems
- (3) Smoke control systems
- (4) Compartmentation
- (5) Other approved systems

**31.3.5.13** Portable fire extinguishers in accordance with **Section 9.9** shall be provided in hazardous areas addressed by **31.3.2.1**, unless the building is protected throughout with an approved, supervised automatic sprinkler system in accordance with **31.3.5.2**.

self-closing corridor door is permitted by **31.3.5.9.2** to serve in lieu of the sprinklers positioned inside each apartment unit in the vicinity of the corridor door; however, the corridor sprinklers must still be provided.

The *Code* provides numerous incentives for existing apartment buildings to use Option 4 (complete sprinkler protection), as detailed in **31.3.5.10**. Some of the more significant incentives that apply to existing apartment buildings are provided in **31.2.4** (single exit), **31.2.6** (increased permitted travel distances), **31.2.11.1** (elimination of smokeproof enclosure requirement for high-rise buildings), **31.3.6.2.2** (elimination of corridor door fire protection rating requirement), and **31.3.7.1** (elimination of smoke compartmentation).

One of the objectives of the *Code* is to provide a structure that will protect occupants who are not intimate with the initial fire development for the time needed to evacuate (see **4.1.1**). Given that objective, new apartment buildings are required to use quick-response or residential sprinklers throughout apartment dwelling units. The use of approved residential or quick-response sprinklers within dwelling units of existing apartment

## CHAPTER 30 • New

buildings is encouraged by A.31.3.5.2. The Code's intent is to achieve the quick response provided by these sprinklers, as well as the high-spray pattern provided by residential sprinklers. The technology associated with quick-response and residential sprinklers helps to maintain tenability within the room of fire origin.

Designers of sprinkler systems must use caution, as residential and quick-response sprinklers cannot always be installed in a system that was originally designed for standard sprinklers. Situations also exist where residential or quick-response sprinklers might not be listed for use, such as an area with vaulted ceilings. In such cases, the designer could provide the best alternative sprinkler.

Approved supervised sprinkler systems are required throughout existing high-rise apartment buildings per 31.3.5.12.

### 30.3.6 Corridors.

**30.3.6.1 Walls.** Exit access corridor walls shall comply with 30.3.6.1.1 or 30.3.6.1.2.

**30.3.6.1.1** In buildings not complying with 30.3.6.1.2, exit access corridor walls shall consist of fire barriers in accordance with Section 8.3 that have not less than a 1-hour fire resistance rating.

**30.3.6.1.2** In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 30.3.5.2, corridor walls shall have a minimum ½-hour fire resistance rating.

#### 30.3.6.2 Doors.

**30.3.6.2.1** Doors that open onto exit access corridors shall have not less than a 20-minute fire protection rating in accordance with Section 8.3.

#### 30.3.6.2.2 Reserved.

**30.3.6.2.3** Doors that open onto exit access corridors shall be self-closing and self-latching.

#### 30.3.6.3 Unprotected Openings.

**30.3.6.3.1** Unprotected openings, other than those from spaces complying with 30.3.6.3.2, shall be prohibited in exit access corridor walls and doors.

**30.3.6.3.2** Spaces shall be permitted to be unlimited in area and open to the corridor, provided that the following criteria are met:

- (1) The space is not used for guest rooms or guest suites or hazardous areas.

## CHAPTER 31 • Existing

See the definition of the term *high-rise building* in 3.3.36.7. However, the Code does provide two alternatives. The first exempts sprinklers throughout if each living unit has direct exterior exit access. The Code also permits the application of an approved engineered life safety system in lieu of installing sprinklers throughout. Although not required, A.31.3.5.12.3 recommends that this engineered life safety system include some combination of automatic sprinkler protection, detection, smoke control, and compartmentation. The Code further requires that the authority having jurisdiction approve an alternative approach. During the planning phase, the designer should meet with the AHJ to determine whether a system is acceptable in lieu of automatic sprinklers.

### 31.3.6 Corridors.

**31.3.6.1\* Walls.** Exit access corridor walls shall consist of fire barriers in accordance with Section 8.3 having a minimum ½-hour fire resistance rating.

**A.31.3.6.1** The intent is to recognize that existing partitions of sound wood lath and plaster, wire lath and plaster, or gypsum lath and plaster construction have demonstrated the ability to contain most room fires. Recent data on archaic construction methods have established the fire resistance rating of such construction at about 20 minutes. Such construction meets the intent of 31.3.6.1.

#### 31.3.6.2 Doors.

**31.3.6.2.1** Doors that open onto exit access corridors, other than those complying with 8.3.4 or in buildings meeting the requirement of 31.3.6.2.2, shall have not less than a 20-minute fire protection rating in accordance with Section 8.3.

**31.3.6.2.2** In buildings using Option 3 or Option 4, doors shall be constructed to resist the passage of smoke.

**31.3.6.2.3** Doors that open onto exit access corridors shall be self-closing and self-latching.

#### 31.3.6.3 Unprotected Openings.

**31.3.6.3.1** Unprotected openings, other than those from spaces complying with 31.3.6.3.2, shall be prohibited in exit access corridor walls and doors.

**31.3.6.3.2** Spaces shall be permitted to be unlimited in area and open to the corridor, provided that all of the following criteria are met:

- (1) The space is not used for guest rooms or guest suites or hazardous areas.

## CHAPTER 30 • New

- (2) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with 30.3.5.
- (3) The space does not obstruct access to required exits.

**30.3.6.4 Transoms, Louvers, or Transfer Grilles.** Transoms, louvers, or transfer grilles shall be prohibited in walls or doors of exit access corridors.

The provisions of 30/31.3.6 reflect concern for providing safety for occupants in their apartments during a fire. The minimum 1-hour fire resistance rating required for corridor wall construction in new nonsprinklered apartment buildings is intended to prevent fire from moving from the corridor to an apartment or from an apartment to the corridor. (It is noted that all new apartment buildings must be protected by automatic sprinklers — this provision is maintained in Chapter 30 to accommodate rehabilitation work in existing nonsprinklered buildings in accordance with Chapter 43.)

The minimum ½-hour fire resistance rating required for corridor wall construction in existing apartment buildings recognizes that most existing lath and plaster walls provide a 30-minute fire resistance rating.

The provision of 30.3.6.1.2 also permits a reduction to a ½-hour fire resistance rating in new sprinklered apartment buildings. Although this reduction would result in little savings in new construction, it could be useful in the rehabilitation of existing structures that are required to meet the provisions for new construction (see 4.6.7 and Chapter 43). If automatic sprinkler protection is provided throughout the building, the existing corridor walls should not have to be replaced.

The installation and proper maintenance of the required self-closing device on the door between an apartment and the common corridor could lead to a significant reduction in fatalities caused by fire in apartment buildings. Studies of typical apartment fires indicate that fire spreads beyond the apartment of origin because doors are left open as occupants escape.

In other cases, fatalities occur when occupants who suspect a fire open the door to a room fully involved with fire or cause full fire involvement of the room by introducing oxygen through the open door. Spring-loaded hinges or closers will cause these doors to close and latch, preventing smoke or fire from spreading into the corridor and exposing other occupants.

The doors required by 30/31.3.6.2 provide a level of protection commensurate with the expected fuel load in the apartment unit and the fire resistance of the corridor wall construction. The purpose is to prevent a fire in the corridor from entering an apartment or to contain it within the apartment unit of origin by means of corridor wall and door construction. Fuel load studies conducted by the former National Bureau of Standards (now the National Institute of Standards and Technology) demonstrated that residential occupancies typically have fuel loads capable of sustaining a fire for approximately 20 minutes to 30 minutes.

## CHAPTER 31 • Existing

- (2) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with 31.3.5.2.
- (3) The space does not obstruct access to required exits.

**31.3.6.4 Transoms, Louvers, or Transfer Grilles.** Transoms, louvers, or transfer grilles shall be prohibited in walls or doors of exit access corridors.

Exhibit 30/31.11 and Exhibit 30/31.12 detail the corridor wall construction and opening protection requirements of 30.3.6 and 31.3.6, respectively.

Exhibit 30/31.11

Corridor wall construction in new apartment building.

Exhibit 30/31.12

Corridor wall construction in existing apartment building.

## CHAPTER 30 • New

**30.3.7 Subdivisions of Building Spaces.** Buildings shall be subdivided in accordance with 30.3.7.1 or 30.3.7.2.

**30.3.7.1** In buildings not meeting the requirement of 30.3.7.2, dwelling units shall be separated from each other by walls and floors constructed as fire barriers having a minimum 1-hour fire resistance rating.

**30.3.7.2** In buildings protected throughout by an approved, supervised automatic sprinkler system, dwelling units shall be separated from each other by walls and floors constructed as fire barriers having a minimum ½-hour fire resistance rating.

The smoke partitions required by 31.3.7 for existing apartment buildings are relatively easy to provide, because no fire resistance rating is required, and smoke dampers are not required at duct penetrations. In most cases, installing a set of cross-corridor doors with smoke-actuated automatic closers will meet the requirement. Exemptions to the smoke partition requirement

### 30.3.8 Special Protection Features. (Reserved)

## 30.4 Special Provisions

### 30.4.1 High-Rise Buildings.

**30.4.1.1** High-rise buildings shall comply with Section 11.8. The provisions of 30.3.5.3 and 30.3.4.5 shall be permitted.

**30.4.1.2\*** Emergency action plans in accordance with Section 4.8 shall be provided and shall include all of the following:

- (1) Egress procedures
- (2) Methods

## CHAPTER 31 • Existing

**31.3.7 Subdivision of Building Spaces — Smoke Partitions.** In buildings other than those meeting the requirements of 31.3.7.1, 31.3.7.2, 31.3.7.3, 31.3.7.4, or 31.3.7.5, both of the following criteria shall be met:

- (1) Smoke partitions in accordance with Section 8.4 shall be provided in exit access corridors to establish not less than two compartments of approximately equal size.
- (2) The length of each smoke compartment, measured along the corridor, shall not exceed 200 ft (61 m).

**31.3.7.1** Smoke partitions shall not be required in buildings using Option 4.

**31.3.7.2** Smoke partitions shall not be required in buildings having exterior exit access in accordance with 7.5.3 that provides access to two exits.

**31.3.7.3** Smoke partitions shall not be required in buildings complying with 31.2.4.4, 31.2.4.5, 31.2.4.6, or 31.2.4.7.

**31.3.7.4** Smoke partitions shall not be required in buildings with exits not more than 50 ft (15 m) apart.

**31.3.7.5** Smoke partitions shall not be required where each dwelling unit has direct access to the exterior at the finished ground level.

are provided for sprinklered buildings (31.3.7.1), buildings with a single exit (31.3.7.3), and buildings that do not use corridors as required exit access (31.3.7.2 and 31.3.7.5).

The provision of 31.3.7.4 exempts smoke partitions from being located on a floor where the exit stairs are spaced not farther than 50 ft (15 m) apart, measured along the corridor.

### 31.3.8 Special Protection Features. (Reserved)

## 31.4 Special Provisions

### 31.4.1 High-Rise Buildings.

**31.4.1.1** High-rise buildings shall comply with 31.2.11.1 and 31.3.5.11.

**31.4.1.2\*** Emergency action plans in accordance with Section 4.8 shall be provided and shall include all of the following:

- (1) Egress procedures
- (2) Methods

## CHAPTER 30 • New

(3) Preferred evacuation routes for each event, including appropriate use of elevators

**A.30.4.1.2** See 4.8.2.1(4).

In response to recommendations from the NFPA High-Rise Building Safety Advisory Committee following the September 11, 2001, terrorist attacks on the World Trade Center in New York City and the Pentagon in Arlington, Virginia, the provisions of 30/31.4.1.2 require both new and existing high-rise apartment

**30.4.2 Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers in accordance with 8.7.3.3 shall be permitted.

The provision of 30/31.4.2 is new to the 2015 edition of the Code. It recognizes the use of alcohol-based hand-rub (ABHR) dis-

## 30.7 Operating Features

**30.7.1 Emergency Instructions for Residents of Apartment Buildings.** Emergency instructions shall be provided annually to each dwelling unit to indicate the location of alarms, egress paths, and actions to be taken, both in response to a fire in the dwelling unit and in response to the sounding of the alarm system.

The manner in which the information required by Section 30/31.7.1 is provided to the residents, and the nature of its contents, is at the discretion of the authority having jurisdiction and depends on the building, the layout of the building, and the protection provided. For example, the instructions could be provided to residents when they sign their lease and move into their

### 30.7.2 Contents and Furnishings.

**30.7.2.1** Contents and furnishings shall not be required to comply with Section 10.3.

**30.7.2.2** Furnishings or decorations of an explosive or highly flammable character shall not be used outside of dwelling units.

**30.7.2.3** Fire-retardant coatings shall be maintained to retain the effectiveness of the treatment under service conditions encountered in actual use.

**30.7.3 Inspection of Door Openings.** Door openings shall be inspected in accordance with 7.2.1.15.

The provision of 30/31.7.3 is new to the 2015 edition of the Code. It requires the annual inspection of certain means of egress door openings in accordance with 7.2.1.15 to ensure they operate correctly in the event of an emergency. Doors subject to the required annual inspection include doors equipped with panic hardware or fire exit hardware, doors serving exit enclosures, electrically controlled egress doors, and door assemblies with special locking arrangements in accordance with 7.2.1.6. The annual inspection must be documented to permit verification of compliance by the authority having jurisdiction.

# New and Existing Residential Board and Care Occupancies

CHAPTER

32/33

The primary characteristics that differentiate residential board and care occupancies from other residential occupancies is the assumed ability (or lack thereof) of occupants to evacuate the building in the event of a fire or similar emergency and the availability or level of personal care services. The term *personal care*, as defined in 3.3.208, includes assistance with many of the activities of daily living. Personal care services might include assisting residents with bathing and dressing and helping residents with bill payment and similar household maintenance–related tasks. Personal care does not include nursing home–type care; nor does it include medical care.

Prior to the 2003 edition of the *Code*, application of the requirements for both new and existing residential board and care facilities required the determination of the occupants' evacuation capability — that is, the occupants' ability to move, as a group, to a point of safety in the event of a fire. Evacuation capability was broken down into three subclasses — prompt, slow, and impractical. Ongoing evaluation by the authority having jurisdiction (AHJ) was required to ensure the facility was not being used outside the limitations of its design (e.g., a facility designed and constructed using the provisions for slow evacuation capability actually having an impractical evacuation capability). When tasked with the development of provisions for residential board and care facilities to be included in *NFPA 5000*<sup>®</sup>, *Building Construction and Safety Code*<sup>®</sup>,<sup>1</sup> the NFPA Technical Committee on Board and Care Facilities recognized that, because a facility's population is expected to change over time, a facility's evacuation capability will likely change over time as well. It was not, then, practical to simply insert the requirements from this *Code* into *NFPA 5000*. As such, the committee modified the requirements for new board and care facilities so as not to depend on the evacuation capability of the occupants of the facility.

For consistency with *NFPA 5000*, the committee also revised the provisions of Chapter 32 of this *Code*, which address new facilities, so they no longer depend on the determination of evacuation capability. Chapter 33, which addresses existing facilities, retains the evacuation capability provisions so as to avoid unnecessarily placing existing facilities out of compliance. Since occupants of new board and care facilities might not have the ability to evacuate without assistance, such occupancies must be designed and constructed to facilitate the “defend-in-place” occupant protection strategy, much like health care

occupancies. To utilize the defend-in-place strategy, the building must be able to withstand the effects of fire for the time necessary to either evacuate the occupants or relocate them to a safe location within the building.

Chapters 32 and 33 classify residential board and care occupancies based on the number of residents. For this purpose, the chapters are subdivided to address requirements for small (16 or fewer residents) and large (more than 16 residents) facilities. As the number of residents put at risk by fire increases, the requirements naturally become more strict.

Of the determinations that must be made to classify a residential board and care occupancy (i.e., availability of personal care, number of residents, and, in the case of existing facilities, evacuation capability), the most difficult is evacuation capability. Evacuation capability is established on the basis of the occupants' (i.e., residents and staff working together) ability to move to a safe location, such as an enclosed exit stair or a point outside of the structure. The term *evacuation capability* is defined in 3.3.78; A.3.3.78 provides guidance on classifying evacuation capability.

Where an existing facility does not comply with the requirements for new facilities in Chapter 32, Chapter 33 requires facility management to furnish the AHJ with an evacuation capability determination conducted using a procedure acceptable to the AHJ. If documentation of such determination is not furnished, the evacuation capability is considered, by default, as impractical.

Protection features for residential board and care occupancies range from regulating the allowable types of construction, to mandating alarm and detection systems, to mandating automatic sprinkler protection for all new facilities.

Another difference between residential board and care occupancies and other residential occupancies is highlighted in Section 32/33.4, which addresses the location of a residential board and care occupancy within an apartment building. The apartment building itself is evaluated on its suitability to house the residential board and care occupancy. The apartment units used as a residential board and care occupancy are judged individually, based on the requirements of Section 32/33.2, which applies to small residential board and care occupancies.

As in the case of other occupancy chapters that address occupants with limited self-preservation capability, Chapters 32 and 33 rely on staff intervention and staff support to assist the

## CHAPTER 32 • New

residents during fire and similar emergencies. It is the responsibility of the staff to understand and implement the emergency plan for the facility. The plan must include a method for familiarizing residents with the procedures to be followed during a fire.

**Exhibit 32/33.1** depicts a typical residential board and care occupancy.

## CHAPTER 33 • Existing

**Exhibit 32/33.1**

*Typical residential board and care occupancy.*

## 32.1 General Requirements

### 32.1.1 Application.

**32.1.1.1 General.** The requirements of this chapter shall apply to new buildings or portions thereof used as residential board and care occupancies. (See 1.3.1.)

**32.1.1.2 Administration.** The provisions of Chapter 1, Administration, shall apply.

**32.1.1.3 General.** The provisions of Chapter 4, General, shall apply.

**32.1.1.4 Reserved.**

## 33.1 General Requirements

### 33.1.1\* Application.

**A.33.1.1** The requirements of Chapter 33 are designed to accommodate typical changes in the capabilities of the resident, such as those due to accidents, temporary illness, cyclical variations in capabilities, and gradual aging. This approach is based on the assumption that the capabilities of the resident will be evaluated not less than annually, and for residents with geriatric problems or degenerative diseases, not less than every 6 months. Also, residents should be re-evaluated after each accident or illness that requires hospitalization.

The requirements of Chapter 33 were developed on the assumption that the occupants will normally evacuate the building in fire emergencies. During fire exit drills, all occupants should evacuate the building with staff assistance, as needed. Exceptions can be made in facilities with an evacuation capability rating of impractical. Managers of board and care homes with nursing home backgrounds sometimes are not aware of the differences between the requirements of 19.7.1 and 33.7.3.

**33.1.1.1 General.** The requirements of this chapter shall apply to existing buildings or portions thereof currently occupied as residential board and care occupancies.

**33.1.1.2 Administration.** The provisions of Chapter 1, Administration, shall apply.

**33.1.1.3 General.** The provisions of Chapter 4, General, shall apply.

**33.1.1.4\* Chapter 32 Compliance.** Any facility meeting the requirements of Chapter 32 shall not be required to meet those of Chapter 33.

## CHAPTER 32 • New

**32.1.1.5 Chapter Sections.** This chapter is divided into five sections as follows:

- (1) **Section 32.1** — General Requirements
- (2) **Section 32.2** — Small Facilities (that is, sleeping accommodations for not more than 16 residents)
- (3) **Section 32.3** — Large Facilities (that is, sleeping accommodations for more than 16 residents)
- (4) **Section 32.4** — Suitability of an Apartment Building to House a Board and Care Occupancy (*Sections 32.5 and 32.6 are reserved.*)
- (5) **Section 32.7** — Operating Features

**32.1.1.6 Conversion.** For the purposes of this chapter, exceptions for conversions shall apply only for a change of occupancy from an existing residential or health care occupancy to a residential board and care occupancy.

Residential board and care occupancies take many forms: assisted living facilities, halfway houses, retirement homes, rooming houses, and community living centers, among others. Regardless of the label, the level of care that is provided is the key to identifying a residential board and care facility.

In recent years, the number of retirement community facilities has grown. These facilities might provide different living arrangements for the elderly within the same building or a group of buildings. They also might offer any combination of independent living facilities (apartments), board and care facilities, and full nursing facilities. It is important that the occupancy classification for each building or area is properly identified and that proper separation between the occupancies is provided as necessary. See 32/33.1.3 for details on multiple occupancies involving board and care facilities.

From 1990 to 2013, NFPA documented multiple-death (defined as three or more fatalities) fires in 29 board and care occupancies resulting in 154 deaths. **Commentary Table 32/33.1** provides a list of those fires, including those for which NFPA prepared fire investigation reports.

The following were major contributing factors to the loss of life in those fires investigated by NFPA:

1. Lack of automatic sprinklers
2. Doors open to the room of fire origin
3. Doors open to stairs or unprotected vertical openings
4. Ineffective staff or resident training or response

**Chapters 32 and 33** address basic fire protection features for a board and care facility while maintaining the ability to operate

## CHAPTER 33 • Existing

**A.33.1.1.4** The provision of 33.1.1.4 was added after **Chapter 32** was revised in its entirety to avoid potential conflicts between the two chapters. Occupancies meeting **Chapter 32** requirements are deemed to comply with **Chapter 33**.

**33.1.1.5 Chapter Sections.** This chapter is divided into five sections as follows:

- (1) **Section 33.1** — General Requirements
- (2) **Section 33.2** — Small Facilities (that is, sleeping accommodations for not more than 16 residents)
- (3) **Section 33.3** — Large Facilities (that is, sleeping accommodations for more than 16 residents)
- (4) **Section 33.4** — Suitability of an Apartment Building to House a Board and Care Occupancy (*Sections 33.5 and 33.6 are reserved.*)
- (5) **Section 33.7** — Operating Features

**33.1.1.6 Conversion.** For the purposes of this chapter, exceptions for conversions shall apply only for a change of occupancy from an existing residential or health care occupancy to a residential board and care occupancy.

such a facility in a noninstitutional environment. The requirements for small board and care facilities are similar to the provisions for one- and two-family dwellings and lodging or rooming houses. The requirements for existing large facilities, other than those in which residents are classified as impractical to evacuate, are similar to the requirements for new hotels; the requirements for new large facilities are similar to those for health care facilities because of the potential for occupants who are unable to evacuate themselves in the event of a fire. Existing large facilities in which residents are classified as impractical to evacuate must comply with the requirements of **Chapter 19**, **Chapter 32**, or **Chapter 33**, as applicable (see 33.1.1.4 and 33.3.1.2.2). Although the provisions of **Chapters 32 and 33** might be similar to those of other residential occupancies, certain requirements differ due to the unique characteristics of board and care facilities — such as the varying degrees to which occupants are able to respond to a fire emergency.

The requirements of **Chapters 32 and 33** are based on two main concepts, as follows:

1. Larger buildings are more difficult to evacuate than smaller buildings and require more built-in fire protection.
2. Occupants who are more difficult to evacuate require more built-in fire protection than occupants who are easier to evacuate.

**Chapter 32** essentially assumes impractical evacuation capability, while **Chapter 33** requires ongoing evaluation to determine evacuation capability.

It is anticipated that a small facility typically will be located in a structure that has the appearance of, and that operates in a

## CHAPTER 32 • New

manner similar to, a dwelling. The operation and size of a small facility demand unique consideration with respect to the fire protection features provided. Certain fire protection features that are appropriate for large facilities, such as smoke barriers, might not be appropriate and might not provide adequate protection in small facilities. For this reason, 33.2.1.2.1.2, which permits small facilities to comply with the requirements for large facilities, applies only to those facilities that have previously met the criteria for the exemption. The 1985 edition of the *Code* permitted small facilities to comply with the requirements for large facilities in lieu of the provisions for small facilities. As stated in 33.2.1.2.1.2, a small facility that has previously been approved, based on the requirements for a large facility, is permitted to continue to be evaluated as a large facility. However, any other small facility must meet the provisions for a small facility and is not permitted to meet the provisions for a large facility as an alternative.

Several requirements in Chapter 32 are exempted for conversions. Where a building previously occupied as another type of residential occupancy or a health care occupancy is converted to a board and care facility, such change of occupancy must comply with Chapter 43. This requirement would apply where a hotel, an apartment building, a lodging or rooming house, a dwelling, a hospital, a nursing home, or a limited care facility is converted to a residential board and care facility. However, certain provisions of Chapter 32 are intended to eliminate undue hardship while maintaining a reasonable degree of life safety. In such cases, the specific wording of Chapter 32 exempts the existing building from meeting a requirement that would otherwise apply to a new board and care facility. For example, 32.2.2.5.1.2 permits existing 28 in. (710 mm) wide doors in converted facilities to remain in use rather than being replaced with the 32 in. (810 mm) wide doors normally required in new board and care facilities.

**32.1.2 Classification of Occupancy.** See 6.1.9 and 32.1.3.

### 32.1.3 Multiple Occupancies.

**32.1.3.1** Multiple occupancies shall comply with 6.1.14 and 32.1.3 in buildings other than those meeting the requirement of 32.1.3.2.

**32.1.3.2** The requirement of 32.1.3.1 shall not apply to apartment buildings housing residential board and care occupancies in conformance with Section 32.4. In such facilities, any safeguards required by Section 32.4 that are more restrictive than those for other housed occupancies shall apply only to the extent prescribed by Section 32.4.

**32.1.3.3** No board and care occupancy shall have its sole means of egress or means of escape pass through any nonresidential or non-health care occupancy in the same building.

**33.1.2 Classification of Occupancy.** See 6.1.9 and 33.1.3.

### 33.1.3 Multiple Occupancies.

**33.1.3.1** Multiple occupancies shall comply with 6.1.14 in buildings other than those meeting the requirement of 33.1.3.2.

**33.1.3.2** The requirement of 33.1.3.1 shall not apply to apartment buildings housing residential board and care occupancies in conformance with Section 33.4. In such facilities, any safeguards required by Section 33.4 that are more restrictive than those for other housed occupancies shall apply only to the extent prescribed by Section 33.4.

**33.1.3.3** No board and care occupancy shall have its sole means of egress or means of escape pass through any nonresidential or non-health care occupancy in the same building.

## CHAPTER 32 • New

**32.1.3.4** No board and care occupancy shall be located above a nonresidential or non-health care occupancy, unless the board and care occupancy and exits therefrom are separated from the nonresidential or non-health care occupancy by construction having a minimum 2-hour fire resistance rating.

The location of a residential board and care occupancy in a multiple occupancy building presents a life safety challenge for the occupants of the board and care occupancy. The typical configuration of such buildings creates the potential for significant time to elapse before occupants of the board and care occupancy become aware of an emergency in another part of the building and take the necessary action. The requirements of [32/33.1.3](#) help to ensure that it is safe to locate board and care occupancies within these multiple occupancy buildings by providing the necessary protection and separation. (See [6.1.14](#) for details on multiple occupancies.)

The requirements of [32/33.1.3.4](#) mandate that, where a residential board and care facility is located above another type of occupancy, the board and care facility and its exits must be separated from the other occupancy. Therefore, if a new residential board and care occupancy is located on the second floor, the exit stair must have a 2-hour fire-rated enclosure, even though [7.1.3.2](#) permits a 1-hour fire-rated enclosure. Where the separation requirements in [Chapters 32](#) and [33](#) differ from those in [Table 6.1.14.4.1\(a\)](#) and [Table 6.1.14.4.1\(b\)](#), the more restrictive requirements apply — that is, those provisions that require the

### 32.1.4 Definitions.

**32.1.4.1 General.** For definitions, see [Chapter 3](#), Definitions.

**32.1.4.2 Special Definitions.** A list of special terms used in this chapter follows:

- (1) **Personal Care.** See [3.3.208](#).
- (2) **Point of Safety.** See [3.3.213](#).
- (3) **Residential Board and Care Occupancy.** See [3.3.190.12](#).
- (4) **Residential Board and Care Resident.** See [3.3.233](#).
- (5) **Staff (Residential Board and Care).** See [3.3.263](#).
- (6) **Thermal Barrier.** See [3.3.31.3](#).

## CHAPTER 33 • Existing

**33.1.3.4** No board and care occupancy shall be located above a nonresidential or non-health care occupancy, unless one of the following conditions is met:

- (1) The board and care occupancy and exits therefrom are separated from the nonresidential or non-health care occupancy by construction having a minimum 2-hour fire resistance rating.
- (2) The nonresidential or non-health care occupancy is protected throughout by an approved, supervised automatic sprinkler system in accordance with [Section 9.7](#) and is separated therefrom by construction having a minimum 1-hour fire resistance rating.

higher fire resistance rating. Note that the requirements of [32/33.1.3.4](#) requiring rated separations supersede the option provided by [Chapter 6](#) for mixed occupancies.

The provision of [33.1.3.2](#) clarifies that existing board and care facilities located within an apartment building need not comply with the requirements for a mixed apartment/board and care occupancy. The provisions of [Section 33.4](#) apply to the entire building and supplement the provisions of [Chapter 31](#) for apartment buildings. In addition, the apartment unit housing a board and care facility must comply with the provisions of [Section 33.2](#) (see [33.4.1.2](#)). Where a new board and care facility is constructed as part of a new apartment building or opens in an existing apartment building, it must comply with the requirements of [Chapter 6](#) for multiple occupancies, as well as those of [Section 32.4](#).

The provisions of [32/33.1.3.3](#) and [32/33.1.3.4](#) are intended to provide added protection for the board and care occupancy during evacuation. They apply wherever a mixture of board and care and nonresidential or non-health care occupancies exists, whether in a new or existing building.

### 33.1.4 Definitions.

**33.1.4.1 General.** For definitions, see [Chapter 3](#), Definitions.

**33.1.4.2 Special Definitions.** A list of special terms used in this chapter follows:

- (1) **Evacuation Capability.** See [3.3.78](#).
- (2) **Impractical Evacuation Capability.** See [3.3.78.1](#).
- (3) **Personal Care.** See [3.3.208](#).
- (4) **Point of Safety.** See [3.3.213](#).
- (5) **Prompt Evacuation Capability.** See [3.3.78.2](#).
- (6) **Residential Board and Care Occupancy.** See [3.3.190.12](#).
- (7) **Residential Board and Care Resident.** See [3.3.233](#).
- (8) **Slow Evacuation Capability.** See [3.3.78.3](#).

## CHAPTER 32 • New

A number of key terms, such as *evacuation capability*, *personal care*, and *point of safety*, are referenced in 32/33.1.4.2. An understanding of these terms is necessary to make effective use of the requirements for board and care facilities.

Evacuation capability (see definition in 3.3.78) is an underlying factor for the Chapter 33 provisions for existing facilities. However, in most occupancy chapters, the Code assumes that the building occupants have an evacuation capability similar to that of others within that occupancy, and the requirements are based on the ability of occupants to reach safety by exiting the building. In Chapter 32, along with the health care and detention and correctional occupancy chapters, the Code assumes that many of the building occupants will be incapable of evacuating the building, and protection of life from fire is achieved by the defend-in-place method. In large residential buildings (such as hotels and apartment buildings), where evacuation capability might be affected due to the large size of the building, substantial, built-in fire protection is required.

In Chapter 33, evacuation capability must be determined before the applicable requirements can be identified. The numerous and diverse types of facilities that are included in residential board and care occupancies preclude all occupants from having the same evacuation capability. For example, the occupants in an orphanage, a shelter for battered spouses, a group home for highly functioning mentally handicapped persons, or a halfway house for recovering substance abusers might have normal, that is, prompt evacuation capability. In facilities housing elderly persons with physical or mental impairments, the occupants might be slow moving or might need assistance in recognizing the need for evacuation. In some facilities, evacuation of the building might not be practical at all.

Evacuation capability for an entire facility is not determined based on the resident who is least capable. A facility that houses one impaired resident might have excellent evacuation capability if the staff or an assigned resident “buddy” is able to provide the assistance needed to effect a prompt evacuation of the entire group. Evacuation capability is based on the ability of the occupants to relocate, as a group, to a point of safety that is not necessarily a public way (see definition of the term *point of safety*

**32.1.5 Acceptability of Means of Egress or Escape.** No means of escape or means of egress shall be considered as complying with the minimum criteria for acceptance, unless emergency evacuation drills are regularly conducted using that route in accordance with the requirements of 32.7.3.

## CHAPTER 33 • Existing

- (9) **Staff (Residential Board and Care).** See 3.3.263.
- (10) **Thermal Barrier.** See 3.3.31.3.

in 3.3.213). The protection features required by Chapter 33 are intended to coordinate with the evacuation capability of the occupants. As such, the fire endurance of the structure, the interior finish materials, and the types and arrangement of means of escape and exits, as well as the corridor separation provisions, vary, depending on whether a facility houses occupants who are prompt, slow, or impractical to evacuate. Facilities that are impractical to evacuate use the defend-in-place concept. In small facilities, this concept is achieved by improving the protection of vertical openings. In large facilities, the concept is achieved by mandating the use of the health care provisions of Chapters 18 and 19. In all cases, an existing facility is permitted to meet the requirements for new facilities in Chapter 32 in lieu of those of Chapter 33 (see 33.1.1.4).

Personal care (see definition in 3.3.208) is significant, because the occupants of a board and care facility require care. Personal care is not medical care, as might be provided in a hospital or nursing home, but, rather, a form of assistance in meeting the demands of daily living. The term *transient medical care*, as used in A.3.3.208, refers to the kind of medical care that is normally provided in the home by family members. Transient medical care does not refer to skilled nursing or acute medical care.

The term *point of safety* (see definition in 3.3.213) is another term that is specifically used in Chapters 32 and 33. It is well recognized that there are many buildings from which evacuation of all occupants to the outside cannot be achieved within a reasonable amount of time. A point of safety is an area in which occupants can safely remain until the fire is extinguished or until assistance can arrive to complete evacuation to the building exterior.

Several sections of the Code published in the 1980s referred to a finish rating of 15 minutes or 20 minutes. The term *finish rating* is similar to, but not as widely used as, the term *thermal barrier* (see definition in 3.3.31.3). For this reason, Chapters 32 and 33 use the term *thermal barrier* in lieu of the term *finish rating* in specifying the protection of structural elements and the separation of areas where automatic sprinkler protection is omitted. As noted in A.3.3.31.3, finish ratings might be used to determine a material's acceptability as a thermal barrier.

**33.1.5 Acceptability of Means of Egress or Escape.** No means of escape or means of egress shall be considered as complying with the minimum criteria for acceptance, unless emergency evacuation drills are regularly conducted using that route in accordance with the requirements of 33.7.3.

## CHAPTER 32 • New

**32.1.6\* Fire Resistance–Rated Assemblies.** Fire resistance–rated assemblies shall comply with [Section 8.3](#).

**A.32.1.6** The provisions of [8.3.1\(4\)](#) address a ½-hour fire resistance rating. The information in [A.8.3.1.1\(4\)](#) addresses common materials used in barriers having a minimum ½-hour fire resistance rating.

**32.1.7 Reserved.**

**32.1.8 Reserved.**

The acceptability of the means of egress or escape is addressed by [32/33.1.5](#). Exits and means of escape are of little value unless residents are familiar with them and are comfortable using them. An exit or means of escape that is never used in drills will most likely not be used during an emergency evacuation. This does not mean that, if windows serve as secondary means of escape, a resident must practice escaping out the window during a drill. However, during drills, it is important to identify the appropriate windows and ensure that residents are familiar with their operation and proper use during escape.

**Subsections 33.1.7 and 33.1.8** address changes that might occur over the life of an existing residential board and care occupancy. Physical/structural growth will be easily identified, since permits would normally be required for such changes. Changes

## CHAPTER 33 • Existing

**33.1.6\* Fire Resistance–Rated Assemblies.** Fire resistance–rated assemblies shall comply with [Section 8.3](#).

**A.33.1.6** The provisions of [8.3.1\(4\)](#) address a ½-hour fire resistance rating. The information in [A.8.3.1.1\(4\)\(4\)](#) addresses common materials used in barriers having a minimum ½-hour fire resistance rating.

**33.1.7 Changes in Facility Size.** A change in facility size from small to large shall be considered a change in occupancy subclassification and shall require compliance with the provisions applicable to new construction.

**33.1.8\* Changes in Group Evacuation Capability.** A change in evacuation capability to a slower level shall be permitted where the facility conforms to one of the following requirements:

- (1) The requirements of [Chapter 32](#) applicable to new board and care facilities.
- (2) The requirements of [Chapter 33](#) applicable to existing board and care facilities for the new evacuation capability, provided that the building is protected throughout by an approved, supervised automatic sprinkler system complying with [32.3.3.5](#).

**A.33.1.8** When the group evacuation capability changes to a level of greater risk, the owner/operator of the facility needs to take such action as is necessary, within a reasonable time frame, to restore the evacuation capability of the facility to that for which it was approved. If subsequent evaluations indicate that the original evacuation capability of the facility cannot or is not being maintained at the original level of risk, the facility would be considered as having changed the occupancy subclassification to one of greater risk, and the safeguards required for the level of greater risk would apply. If a facility improves its original evacuation capability to one of less risk, a re-evaluation and upgrading to the requirements for new construction are not needed.

in evacuation capability might be subtler and will require a careful review of the facility's fire drill records.

Prior to the 2012 edition of the *Code*, where the evacuation capability of a board and care facility changed to a slower classification, it was required to comply with the requirements of [Chapter 32](#) for new board and care facilities. Due to the proliferation of board and care residents aging in place, the 2012 edition was revised to permit facilities with such changes in evacuation capability to continue to comply with [Chapter 33](#), provided that they are protected by an automatic sprinkler system in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*<sup>2</sup> [see [33.1.8\(2\)](#)]. Note that the requirements of [33.1.7](#) and [33.1.8](#) supersede those of [Chapter 43](#) for change of use (see [Section 43.7](#)).

## CHAPTER 32 • New

**32.2 Small Facilities****32.2.1 General.****32.2.1.1 Scope.**

**32.2.1.1.1** Section 32.2 shall apply to residential board and care occupancies providing sleeping accommodations for not more than 16 residents.

**32.2.1.1.2** Where sleeping accommodations for more than 16 residents are provided, the occupancy shall be classified as a large facility in accordance with Section 32.3.

**32.2.1.2 Reserved.**

The importance of an accurate evaluation of evacuation capabilities in existing facilities cannot be overstated. Ineffective resident or staff response was a contributing factor in many of the multiple-death fires listed in Commentary Table 32/33.1.

Determining a facility's evacuation capability is not simply a matter of timing a fire drill in the middle of the day. Many variables affect residents' capability to evacuate, and these variables must be carefully considered and factored into the documentation presented to the authority having jurisdiction for approval. Some variables that should be considered follow.

## CHAPTER 33 • Existing

**33.2 Small Facilities****33.2.1 General.****33.2.1.1 Scope.**

**33.2.1.1.1** Section 33.2 shall apply to residential board and care occupancies providing sleeping accommodations for not more than 16 residents.

**33.2.1.1.2** Where there are sleeping accommodations for more than 16 residents, the occupancy shall be classified as a large facility in accordance with Section 33.3.

**33.2.1.2 Requirements Based on Evacuation Capability.**

**33.2.1.2.1** Small facilities, other than those meeting the requirement of 33.2.1.2.1.1 or 33.2.1.2.1.2, shall comply with the requirements of Section 33.2, as indicated for the appropriate evacuation capability; the ability of all occupants, residents, staff, and family members shall be considered in determining evacuation capability.

**33.2.1.2.1.1\*** Facilities where the authority having jurisdiction has determined equivalent safety is provided in accordance with Section 1.4 shall not be required to comply with Section 33.2.

**A.33.2.1.2.1.1** In determining equivalency for existing buildings, conversions, modernizations, renovations, or unusual design concepts, the authority having jurisdiction might permit evaluations based on the residential board and care occupancies fire safety evaluation system (FSES) of NFPA 101A, *Guide on Alternative Approaches to Life Safety*.

**33.2.1.2.1.2** Facilities that were previously approved as complying with the requirements for a large facility having the same evacuation capability shall not be required to comply with Section 33.2.

**33.2.1.2.2** Facility management shall furnish to the authority having jurisdiction, upon request, an evacuation capability determination using a procedure acceptable to the authority having jurisdiction; where such documentation is not furnished, the evacuation capability shall be classified as impractical.

*Time of Day.* An occupant's ability to evacuate might be slowed dramatically when the occupant must be awakened. In such a situation, the occupant must process the information that evacuation is necessary and then proceed to evacuate.

*Medication.* Many individuals in board and care occupancies take various medications for behavior control or as sleeping aids. If an individual is medicated, he or she might need additional response and evacuation assistance.

## CHAPTER 32 • New

*Mobility and Location of Occupants.* Once individuals become aware of an emergency and take action, their ability to move through the building must be considered. Individuals using wheelchairs, walkers, or canes are further slowed when using stairs or ramps or when opening doors.

*Staff Assistance.* Though the Code does not specify minimum staffing levels, they should be considered, especially where the resident-to-staff ratio is high. Staff might be limited in their ability to assist with occupant evacuation where multiple residents need assistance.

The evacuation capability of the population of a residential board and care occupancy might vary over time. The required documentation should be reviewed regularly to ensure that it accurately represents the current evacuation capability of the residents and staff.

When determining equivalency in accordance with 33.2.1.2.1.1, it is important to note that the equivalency measurement systems

**32.2.1.3 Minimum Construction Requirements. (Reserved)**

## CHAPTER 33 • Existing

of the 2013 edition of NFPA 101A, *Guide on Alternative Approaches to Life Safety*,<sup>3</sup> were calibrated against the requirements of the 2012 edition of NFPA 101 and might not accurately evaluate equivalency with the requirements of the 2015 edition of the *Life Safety Code*. At the time this handbook went to press, the 2016 edition of NFPA 101A was being prepared. Once issued, the 2016 edition of NFPA 101A can be used to measure equivalency against the requirements of the 2015 edition of the *Code*.

The provision of 33.2.1.2.1.2 continues to recognize a previously approved existing situation that resulted from compliance with a provision of the 1985 edition of the *Code* that permitted small board and care facilities to comply with the requirements for large facilities — see the definition of the term *previously approved* in 3.3.214. The protection features applicable to large facilities might not necessarily provide adequate protection for small facilities. See the commentary following 32/33.1.1.6.

**33.2.1.3 Minimum Construction Requirements.**

**33.2.1.3.1 Prompt Evacuation Capability.** (No special requirements.)

**33.2.1.3.2 Slow Evacuation Capability.**

**33.2.1.3.2.1** The facility shall be housed in a building where the interior is fully sheathed with lath and plaster or other material providing a minimum 15-minute thermal barrier, as modified by 33.2.1.3.2.3 through 33.2.1.3.2.7, including all portions of bearing walls, bearing partitions, floor construction, and roofs.

**33.2.1.3.2.2** All columns, beams, girders, and trusses shall be encased or otherwise protected with construction having a minimum ½-hour fire resistance rating.

**33.2.1.3.2.3** Exposed steel or wood columns, girders, and beams (but not joists) located in the basement shall be permitted.

**33.2.1.3.2.4** Buildings of Type I, Type II(222), Type II(111), Type III(211), Type IV, or Type V(111) construction shall not be required to meet the requirements of 33.2.1.3.2. (See 8.2.1.)

**33.2.1.3.2.5** Areas protected by approved automatic sprinkler systems in accordance with 33.2.3.5 shall not be required to meet the requirements of 33.2.1.3.2.

**33.2.1.3.2.6** Unfinished, unused, and essentially inaccessible loft, attic, or crawl spaces shall not be required to meet the requirements of 33.2.1.3.2.

**33.2.1.3.2.7** Where the facility has demonstrated to the authority having jurisdiction that the group is capable of evacuating the building in 8 minutes or less, or where the group achieves an E-score of 3 or less using the board and care occupancies

Because 32.2.3.5.1 requires new small board and care facilities to be sprinklered, no additional requirements with respect to minimum building construction types apply to new construction. However, no sprinkler mandate is specified for existing small board and care facilities. Therefore, 33.2.1.3.2 and 33.2.1.3.3 establish minimum construction requirements to provide an adequate level of safety for existing small facilities with slow or impractical evacuation capability.

Exhibit 32/33.2 illustrates the concept of sheathing the interior of a small board and care facility building with slow evacuation capability to achieve the 15-minute thermal barrier required by 33.2.1.3.2. The nonsprinklered areas (A, C, and D) are required to have sheathing to protect the bearing walls, floor construction, and roof. The heavy timber columns and beams in area A do not require sheathing but must provide a minimum fire resistance rating of 30 minutes. As permitted by 33.2.1.3.2.5, the sprinklered areas of the building are exempt from the sheathing requirement.

The provision of 33.2.1.3.2.7 is intended to permit unsheathed, unsprinklered wood frame construction in facilities that house groups capable of evacuation to a point of safety within 8 minutes. For such groups, the additional evacuation time provided by fire-resistant sheathing is not necessary.

All existing small facilities with impractical evacuation capability must be protected with a supervised automatic sprinkler

**32.2.1.4 Multiple-Level Buildings.** For purposes of applying requirements of this chapter that utilize the term *level of exit discharge*, including determination of stories in height as addressed in 4.6.3, the level of exit discharge shall be permitted to be the combination of floor levels as addressed in 32.2.1.4.1, 32.2.1.4.2, or 32.2.1.4.3.

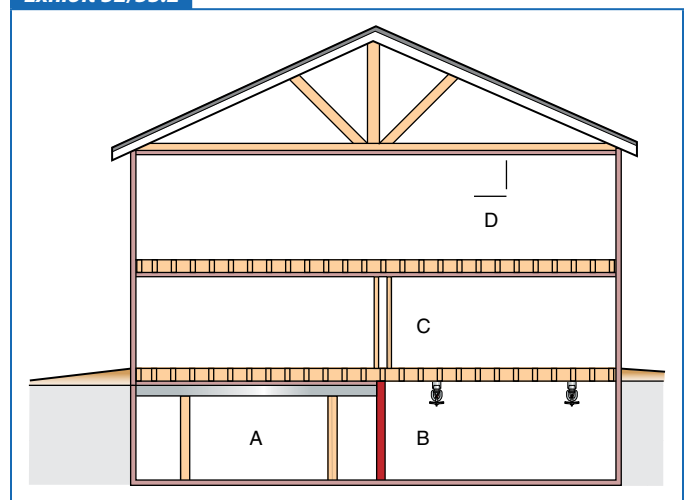

**32.2.1.4.1** One floor level located not more than three stair risers above the level of exit discharge shall be permitted to be considered part of the level of exit discharge.

**32.2.1.4.2** One floor level located not more than three stair risers below the level of exit discharge shall be permitted to be considered part of the level of exit discharge.

evacuation capability determination methodology of NFPA 101A, *Guide on Alternative Approaches to Life Safety*, the requirements of 33.2.1.3.2 shall not apply.

**33.2.1.3.3 Impractical Evacuation Capability.** Nonsprinklered buildings shall be of any construction type in accordance with 8.2.1, other than Type II(000), Type III(200), or Type V(000) construction. Buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 33.2.3.5 shall be permitted to be of any type of construction.

Exhibit 32/33.2

Sheathing requirements in a small facility with slow evacuation capability.

system per 33.2.3.5.3.7. The provision of 33.2.1.3.3 permitting any construction type is applicable if the entire building, not only the residential board and care facility, is protected with a supervised automatic sprinkler system.

**33.2.1.4 Multiple-Level Buildings.** For purposes of applying requirements of this chapter that utilize the term *level of exit discharge*, including determination of stories in height as addressed in 4.6.3, the level of exit discharge shall be permitted to be the combination of floor levels as addressed in 33.2.1.4.1, 33.2.1.4.2, or 33.2.1.4.3.

**33.2.1.4.1** One floor level located not more than three stair risers above the level of exit discharge shall be permitted to be considered part of the level of exit discharge.

**33.2.1.4.2** One floor level located not more than three stair risers below the level of exit discharge shall be permitted to be considered part of the level of exit discharge.

## CHAPTER 32 • New

**32.2.1.4.3** Where one floor level is located above the level of exit discharge, another floor level is located below the level of exit discharge, and not more than a total of three stair risers separate the upper level from the lower level, the two floor levels shall be permitted to be considered part of the level of exit discharge.

**32.2.1.4.4** The provisions of 32.2.1.4.1, 32.2.1.4.2, and 32.2.1.4.3 shall not be used in combination with each other.

The provisions of 32/33.2.1.4 through 32/33.2.1.4.4 are new to the 2015 edition of the Code. They specify that a floor level above or below the level of exit discharge (LED) is permitted to be considered part of the LED, provided that is connected to the LED by a stair having a maximum of three risers, as specified in 32/33.2.1.4.1 and 32/33.2.1.4.2. A floor level above the LED and a floor level below the LED are both permitted to be considered

## CHAPTER 33 • Existing

**33.2.1.4.3** Where one floor level is located above the level of exit discharge, another floor level is located below the level of exit discharge, and not more than a total of three stair risers separate the upper level from the lower level, the two floor levels shall be permitted to be considered part of the level of exit discharge.

**33.2.1.4.4** The provisions of 33.2.1.4.1, 33.2.1.4.2, and 33.2.1.4.3 shall not be used in combination with each other.

part of the LED, provided that the upper and lower levels are separated by not more than three stair risers, as specified in 32/33.2.1.4.3. These provisions exempt such levels from being considered as additional stories for the purpose of determining the number of stories in height in accordance with 4.6.3. An example of the application of 32/33.2.14 is depicted in Exhibit 32/33.3.

Exhibit 32/33.3

Multiple levels meeting level of exit discharge criteria.

**32.2.2 Means of Escape.** Designated means of escape shall be continuously maintained free of all obstructions or impediments to full instant use in the case of fire or emergency.

**32.2.2.1 Reserved.**

**33.2.2 Means of Escape.** Designated means of escape shall be continuously maintained free of all obstructions or impediments to full instant use in the case of fire or emergency.

**33.2.2.1 Number of Means of Escape.**

**33.2.2.1.1** Each normally occupied story of the facility shall have not less than two remotely located means of escape that do not involve using windows, unless the facility meets the requirement of 33.2.2.1.4 or 33.2.2.1.5.

**33.2.2.1.2** Not less than one of the means of escape required by 33.2.2.1.1 shall be in accordance with 33.2.2.2.

## CHAPTER 32 • New

**32.2.2.2 Primary Means of Escape.**

**32.2.2.2.1** Every sleeping room and living area shall have access to a primary means of escape located to provide a safe path of travel to the outside at street level or the finished ground level.

**32.2.2.2.2** Where sleeping rooms or living areas are above or below the level of exit discharge, the primary means of escape shall be an interior stair in accordance with 32.2.2.4, an exterior stair, a horizontal exit, or a fire escape stair.

**32.2.2.3 Secondary Means of Escape.**

**32.2.2.3.1** Sleeping rooms, other than those complying with 32.2.2.3.2 or 32.2.2.3.3, and living areas in facilities without a sprinkler system installed in accordance with 32.2.3.5 shall have a second means of escape consisting of one of the following:

- (1) Door, stairway, passage, or hall providing a way of unobstructed travel to the outside of the dwelling at street or the finished ground level that is independent of, and remotely located from, the primary means of escape
- (2) Passage through an adjacent nonlockable space independent of, and remotely located from, the primary means of escape to any approved means of escape
- (3)\* Outside window or door operable from the inside, without the use of tools, keys, or special effort, that provides a clear opening of not less than 5.7 ft<sup>2</sup> (0.53 m<sup>2</sup>), with the width not less than 20 in. (510 mm), the height not less than 24 in. (610 mm), and the bottom of the opening not more than 44 in. (1120 mm) above the floor, with such means of escape acceptable, provided that one of the following criteria is met:

## CHAPTER 33 • Existing

**33.2.2.1.3** The provisions of Chapter 7 shall not apply to means of escape, unless specifically referenced in this chapter.

**33.2.2.1.4** In prompt evacuation capability facilities, one means of escape shall be permitted to involve windows complying with 33.2.2.3.1(3).

**33.2.2.1.5** A second means of escape from each story shall not be required where the entire building is protected throughout by an approved automatic sprinkler system complying with 33.2.3.5 and the facility has two means of escape; this provision shall not be permitted to be used in conjunction with 33.2.2.3.3.

**33.2.2.2 Primary Means of Escape.**

**33.2.2.2.1** Every sleeping room and living area shall have access to a primary means of escape located to provide a safe path of travel to the outside at street level or the finished ground level.

**33.2.2.2.2** Where sleeping rooms or living areas are above or below the level of exit discharge, the primary means of escape shall be an interior stair in accordance with 33.2.2.4, an exterior stair, a horizontal exit, or a fire escape stair.

**33.2.2.2.3** In slow and impractical evacuation capability facilities, the primary means of escape for each sleeping room shall not be exposed to living areas and kitchens, unless the building is protected by an approved automatic sprinkler system in accordance with 33.2.3.5 utilizing quick-response or residential sprinklers throughout.

**33.2.2.2.4** Standard-response sprinklers shall be permitted for use in hazardous areas in accordance with 33.2.3.2.

**33.2.2.3 Secondary Means of Escape.**

**33.2.2.3.1** In addition to the primary route, each sleeping room shall have a second means of escape consisting of one of the following, unless the provisions of 33.2.2.3.2, 33.2.2.3.3, or 33.2.2.3.4 are met:

- (1) Door, stairway, passage, or hall providing a way of unobstructed travel to the outside of the dwelling at street or the finished ground level that is independent of, and remotely located from, the primary means of escape
- (2) Passage through an adjacent nonlockable space independent of, and remotely located from, the primary means of escape to any approved means of escape
- (3)\* Outside window or door operable from the inside, without the use of tools, keys, or special effort, that provides a clear opening of not less than 5.7 ft<sup>2</sup> (0.53 m<sup>2</sup>), with the width not less than 20 in. (510 mm), the height not less than 24 in. (610 mm), and the bottom of the opening not more than 44 in. (1120 mm) above the floor, with such means of escape acceptable, provided that one of the following criteria is met:

## CHAPTER 32 • New

- (a) The window is within 20 ft (6100 mm) of the finished ground level.
- (b) The window is directly accessible to fire department rescue apparatus, as approved by the AHJ.
- (c) The window or door opens onto an exterior balcony.
- (4) Windows having a sill height below the adjacent finished ground level that are provided with a window well meeting the following criteria:
  - (a) The window well has horizontal dimensions that allow the window to be fully opened.
  - (b) The window well has an accessible net clear opening of not less than 9 ft<sup>2</sup> (0.84 m<sup>2</sup>), with a length and width of not less than 36 in. (915 mm).
  - (c) A window well with a vertical depth of more than 44 in. (1120 mm) is equipped with an approved permanently affixed ladder or with steps meeting the following criteria:
    - i. The ladder or steps do not encroach more than 6 in. (150 mm) into the required dimensions of the window well.
    - ii. The ladder or steps are not obstructed by the window.

**A.32.2.2.3.1(3)** A window with dimensions of 20 in. × 24 in. (510 mm × 610 mm) has an opening of 3.3 ft<sup>2</sup> (0.31 m<sup>2</sup>), which is less than the required 5.7 ft<sup>2</sup> (0.53 m<sup>2</sup>). Therefore, either the height or width needs to exceed the minimum requirement to provide the required clear area.

**32.2.2.3.2** Sleeping rooms that have a door leading directly to the outside of the building with access to the finished ground level or to an exterior stairway meeting the requirements of **32.2.2.6.3** shall be considered as meeting all the requirements for a second means of escape.

**32.2.2.3.3** Sleeping rooms shall not be required to have a secondary means of escape where the clinical needs of the residents require special security measures, provided all of the following are met:

- (1) The building is protected throughout by an approved automatic sprinkler system in accordance with **32.3.3.5**.
- (2) A fire alarm system is provided in accordance with **32.3.3.4.1** through **32.3.3.4.3** and **32.3.3.4.6**.
- (3) Smoke detectors are provided in accordance with **32.3.3.4.8**.

The provisions of **33.2.2.1**, **32/33.2.2.2**, and **32/33.2.2.3** establish the criteria for acceptable means of escape in small board and care facilities. In new facilities, every sleeping room and living area must be provided with access to a primary and secondary means of escape per **32.2.2.2** and **32.2.2.3**, much like the other

## CHAPTER 33 • Existing

- (a) The window is within 20 ft (6100 mm) of the finished ground level.
- (b) The window is directly accessible to fire department rescue apparatus, as approved by the authority having jurisdiction.
- (c) The window or door opens onto an exterior balcony.
- (4) Windows having a sill height below the adjacent finished ground level that are provided with a window well meeting the following criteria:
  - (a) The window well has horizontal dimensions that allow the window to be fully opened.
  - (b) The window well has an accessible net clear opening of not less than 9 ft<sup>2</sup> (0.84 m<sup>2</sup>), with a length and width of not less than 36 in. (915 mm).
  - (c) A window well with a vertical depth of more than 44 in. (1120 mm) is equipped with an approved permanently affixed ladder or with steps meeting the following criteria:
    - i. The ladder or steps do not encroach more than 6 in. (150 mm) into the required dimensions of the window well.
    - ii. The ladder or steps are not obstructed by the window.

**A.33.2.2.3.1(3)** A window with dimensions of 20 in. × 24 in. (510 mm × 610 mm) has an opening of 3.3 ft<sup>2</sup> (0.31 m<sup>2</sup>), which is less than the required 5.7 ft<sup>2</sup> (0.53 m<sup>2</sup>). Therefore, either the height or width needs to exceed the minimum requirement to provide the required clear area.

**33.2.2.3.2** Sleeping rooms that have a door leading directly to the outside of the building with access to the finished ground level or to a stairway that meets the requirements of exterior stairs in **33.2.2.2.2** shall be considered as meeting all the requirements for a second means of escape.

**33.2.2.3.3** A second means of escape from each sleeping room shall not be required where the facility is protected throughout by an approved automatic sprinkler system in accordance with **33.2.3.5**.

**33.2.2.3.4** Existing approved means of escape shall be permitted to continue to be used.

residential occupancies. Note, however, that the requirement for a secondary means of escape is exempted when the building is sprinklered per **32.2.2.3.1**. In existing facilities, **33.2.2.1** requires each story of the facility to be provided with at least two means of escape. Only one of the means of escape must meet the

## CHAPTER 32 • New

provisions for a primary means of escape. The second means of escape is permitted to be a window, provided that the window complies with 33.2.2.3.1(3) and the facility evacuation capability is prompt (see 33.2.2.1.4).

In existing facilities, the second means of escape from each floor is not required if the entire building housing the residential board and care facility is protected throughout by an automatic sprinkler system in accordance with 33.2.3.5. In this instance, the single means of escape must meet the criteria for a primary means of escape specified in 33.2.2.2. However, the facility itself must have at least two means of escape.

Where a window is considered as a secondary means of escape within a sleeping room, the window must meet the criteria detailed in 33.2.2.3.1(3), but use of the window is not limited to any specific evacuation capability. Windows are not permitted to serve as a primary means of escape.

The provisions of 32/33.2.2.2 specify a primary means of escape that is arranged so that an occupant can travel safely to the outside at grade level. The intent of the requirement is to ensure that use of the primary means of escape will not be lost due to fire on another floor. Exhibit 32/33.4 depicts an exterior stair (A) that serves as the primary means of escape for the second floor. Occupants of the second floor can travel safely to the outside at grade, because the interior stair (B) is separated from the second floor by enclosing construction on the second floor.

Exterior stair used as primary means of escape.

## CHAPTER 33 • Existing

The primary means of escape from rooms above or below grade level will involve vertical travel, such as stairs. For this reason, the Code establishes a higher level of reliability by requiring the primary means of escape to be an enclosed interior stair, an exterior stair, a horizontal exit, or an existing fire escape stair. In Exhibit 32/33.4, this requirement is met by using the exterior stair as the primary means of escape from the second floor, even if the partially enclosed interior stair (second floor only) is used for day-to-day travel between floors.

In existing residential board and care occupancies with slow and impractical evacuation capability, and without quick-response or residential sprinklers throughout, 33.2.2.2.3 prohibits the primary means of escape from being exposed to common living spaces and kitchens. Therefore, the primary means of escape from a sleeping room is not permitted to include travel through a day room, a common use space, or a space that is open to a common living space. Exhibit 32/33.5 depicts an example meeting this requirement. By using the outside balconies and exterior stairs as the primary means of escape, the means of escape can be used by occupants of the second floor without exposing them to a fire involving the contents of a common living area.

The objective of 33.2.2.2.3 is to reduce the probability that smoke and heat from a fire involving the contents of a common living area will adversely affect the use of the primary means of escape. The requirement is based, in part, on historical fire experience, which indicates that fires in residential board and care facilities frequently originate in the furniture and contents of common living spaces.

In recognition of the fact that an automatic sprinkler system using quick-response or residential sprinklers provides a high

Alternate arrangement for exterior stairs used as primary means of escape in existing facilities.

## CHAPTER 32 • New

level of protection, 32.2.2.3 permits the primary means of escape to be exposed to common living areas where such sprinkler protection is provided. Furthermore, 32.2.2.4 permits standard-response sprinklers to be used, in lieu of quick-response or residential sprinklers, in hazardous areas that are required to be separated from other parts of the building per 32.2.3.2. The provision for standard-response sprinklers is permitted because sleeping residents do not occupy hazardous areas.

A secondary means of escape from each sleeping and living area is required for existing, nonsprinklered small board and care facilities and new, nonsprinklered small board and care facilities (as permitted for conversions by 32.2.3.5.2). The main purpose for the secondary means of escape is to provide the occupants with a reasonable escape alternative when fire or smoke blocks the primary means of escape. Four acceptable methods for providing a secondary means of escape are outlined by 32/33.2.2.3.1(1) through (4). Exhibit 32/33.6 illustrates several methods for providing secondary means of escape.

## CHAPTER 33 • Existing

The doors marked A in Exhibit 32/33.6 meet the intent of 32/33.2.2.3.1(1), because they are independent of, and remotely located from, the primary means of escape required by 32/33.2.2.2. If the sleeping room has a second door that leads to the same hallway as the door serving as a primary means of escape, little additional protection is provided, because fire or smoke could affect use of both doors at approximately the same time. If the corridor within the facility into which a sleeping room door opens is separated from all common living spaces, it might be determined that the arrangement is acceptable, provided that the corridor leads to two separate independent and remote means of escape.

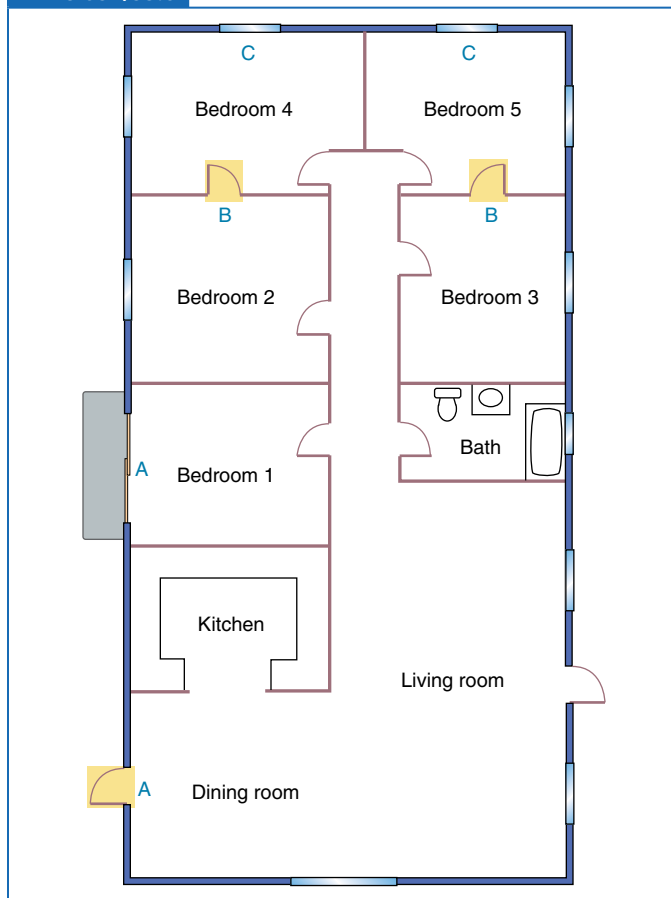

The doors marked B in Exhibit 32/33.6 provide a secondary means of escape that passes through an adjacent space, such as another sleeping room. The unlocked doors that lead from bedroom 2 into bedroom 4, and from bedroom 3 into bedroom 5, provide free and unobstructed access in accordance with 32/33.2.2.3.1(2). Once a resident reaches bedroom 4 or bedroom 5, the secondary means of escape is window C, in accordance with 32/33.2.2.3.1(3) or 32/33.2.2.3.1(4). It should be noted that, if locks are installed on the doors marked B for security purposes (to prevent unauthorized entry to bedroom 4 or bedroom 5), the secondary means of escape serving bedrooms 2 and 3 is compromised and renders the facility's means of escape noncompliant.

The windows that are marked C in Exhibit 32/33.6 comply with the minimum dimensions specified in 32/33.2.2.3.1(3) and are permitted as a second means of escape from a story of an existing small facility only if the evacuation capability is prompt (see 33.2.2.1.4). However, the use of an operable window of the minimum dimensions specified in 32/33.2.2.3.1(3) is permitted as a secondary means of escape from sleeping rooms and living areas, regardless of the residents' evacuation capability.

The arrangement for providing secondary means of escape described in 32/33.2.2.3.1(4) recognizes the increasing trend of developing or converting basements into living space or sleeping areas. Fire in these areas or the areas located above them could easily block the primary means of escape, which is usually a single stair to the upper level. This option provides requirements for the size of the window well, in addition to the window size, to provide sufficient space to operate the window and move up to grade level. For additional guidance, see Figure A.24.2.2.3.3, which applies to window wells in one- and two-family dwellings, the requirements for which are identical to those for small board and care facilities.

Exhibit 32/33.7 illustrates the minimum dimensions required for secondary means of escape windows. Note that the minimum width dimension cannot be simultaneously used with the minimum height dimension, because the minimum area requirement will not be satisfied. If either the minimum height or minimum width dimension is used, the other dimension must be increased to yield the required opening area.

Exhibit 32/33.6

Secondary means of escape options.

CHAPTER 32 • New

In addition to the minimum size of the window, the utility of the window must be ensured by one of the following three alternatives:

1. The window must be within 20 ft (6100 mm) of grade to minimize the risk of injury from dropping from the open window.
2. The fire department must be capable of rescuing the occupant from the window. (The authority having jurisdiction must determine acceptable means of fire department rescue, such as by means of aerial ladder apparatus or ground ladders, and additional criteria necessary for approval, such as fire department vehicle accessibility.)
3. The occupant must be capable of reaching an exterior balcony to breathe fresh air while awaiting either rescue or fire extinguishment.

A facility is exempted from providing a secondary means of escape from sleeping rooms if it meets one of three conditions that follow. First, 32/33.2.2.3.2 permits such an exemption if the sleeping room has a door leading directly to the outside of the building, with access to grade. In this case, the door to the outside serves as the equivalent of both the primary and secondary means of escape. Exhibit 32/33.5 illustrates such an arrangement.

Second, the secondary means of escape is exempted where a residential board and care facility is protected throughout with an automatic sprinkler system in accordance with 32/33.2.3.5. However, 33.2.2.3.3 is not permitted to be used in conjunction with 33.2.2.1.5, because the result would be a single means of escape from each room and each floor. Therefore, in existing facilities, the secondary means of escape from a sleeping room is exempted only if a second means of escape is provided from each floor and the facility is protected by an automatic sprinkler system.

Third, the secondary means of escape is exempted where an existing board and care facility is provided with a means of escape arrangement that has been approved by the AHJ per 33.2.2.3.4.

CHAPTER 33 • Existing

Exhibit 32/33.7

Minimum dimensions for escape windows.

## CHAPTER 32 • New

**32.2.2.4 Interior Stairs Used for Primary Means of Escape.** Interior stairs shall be protected in accordance with 32.2.2.4.1 through 32.2.2.4.4, unless they meet the requirement of 32.2.2.4.5, 32.2.2.4.6, or 32.2.2.4.7.

**32.2.2.4.1** Interior stairs shall be enclosed with fire barriers in accordance with Section 8.3 having a minimum ½-hour resistance rating.

**32.2.2.4.2** Stairs shall comply with 7.2.2.5.3.

**32.2.2.4.3** The entire primary means of escape shall be arranged so that occupants are not required to pass through a portion of a story above or a story below, unless that route is separated from all spaces on that story by construction having a minimum ½-hour fire resistance rating.

**32.2.2.4.4** In buildings of construction other than Type II(000), Type III(200), or Type V(000), the supporting construction shall be protected to afford the required fire resistance rating of the supported wall.

**32.2.2.4.5** Stairs that connect a story at street level to only one other story shall be permitted to be open to the story that is not at street level.

**32.2.2.4.6** In buildings three or fewer stories in height and protected by an approved automatic sprinkler system in accordance with 32.2.3.5, stair enclosures shall not be required, provided that there still remains a primary means of escape from each sleeping area that does not require occupants to pass through a portion of a lower floor, unless that route is separated from all spaces on that floor by construction having a minimum ½-hour fire resistance rating.

**32.2.2.4.7** Stairs serving a maximum of two stories in buildings protected with an approved automatic sprinkler system in accordance with 32.2.3.5 shall be permitted to be unenclosed.

## CHAPTER 33 • Existing

**33.2.2.4 Interior Stairs Used for Primary Means of Escape.** Interior stairs used for primary means of escape shall comply with 33.2.2.4.1 through 33.2.2.4.9.

**33.2.2.4.1** Interior stairs shall be enclosed with fire barriers in accordance with Section 8.3 having a minimum ½-hour fire resistance rating and shall comply with 7.2.2.5.3.

**33.2.2.4.2 Reserved.**

**33.2.2.4.3** The entire primary means of escape shall be arranged so that it is not necessary for occupants to pass through a portion of a lower story, unless that route is separated from all spaces on that story by construction having a minimum ½-hour fire resistance rating.

**33.2.2.4.4** In buildings of construction other than Type II(000), Type III(200), or Type V(000), the supporting construction shall be protected to afford the required fire resistance rating of the supported wall.

**33.2.2.4.5** Stairs that connect a story at street level to only one other story shall be permitted to be open to the story that is not at street level.

**33.2.2.4.6** Stair enclosures shall not be required in buildings three or fewer stories in height that house prompt or slow evacuation capability facilities, provided that both of the following criteria are met:

- (1) The building is protected by an approved automatic sprinkler system in accordance with 33.2.3.5 that uses quick-response or residential sprinklers.
- (2) A primary means of escape from each sleeping area exists that does not pass through a portion of a lower floor, unless that route is separated from all spaces on that floor by construction having a minimum ½-hour fire resistance rating.

**33.2.2.4.7** Stair enclosures shall not be required in buildings that are two or fewer stories in height, that house prompt evacuation capability facilities with not more than eight residents, and that are protected by an approved automatic sprinkler system in accordance with 33.2.3.5 that uses quick-response or residential sprinklers.

**33.2.2.4.8** The provisions of 33.2.2.3.3, 33.2.3.4.3.6, or 33.2.3.4.3.7 shall not be used in conjunction with 33.2.2.4.7.

**33.2.2.4.9** Stairs shall be permitted to be open at the topmost story only where all of the following criteria are met:

- (1) The building is three or fewer stories in height.
- (2) The building houses prompt or slow evacuation capability facilities.
- (3) The building is protected by an approved automatic sprinkler system in accordance with 33.2.3.5.
- (4) The entire primary means of escape of which the stairs are a part is separated from all portions of lower stories.

## CHAPTER 32 • New

The intent of 32/33.2.2.4 is to require that an interior stair serving as a primary means of escape be enclosed. It does not mandate that an interior stair used for day-to-day use, but not considered a primary means of escape, be enclosed. However, the stair might require separation from the floor to prevent exposure of occupants to unsafe conditions while they travel through the primary means of escape (see 32/33.2.2.2, 32/33.2.3.1, and Exhibit 32/33.4 and its associated commentary).

If the interior stair serves as primary means of escape, it must be arranged so that occupants are not required to pass through occupied or furnished portions of lower floors. Passage through unfurnished vestibule-like areas on lower floors is permitted if such vestibules are separated from occupied and furnished areas by walls and doors. These vestibules provide safety equivalent to that provided by a stair enclosure.

It is the intent of the Code that interior stairs in accordance with 32/33.2.2.4, and all their associated exemptions (32.2.2.4.5 through 32.2.2.4.7 and 33.2.2.4.5 through 33.2.2.4.9), qualify as enclosed interior stairs permitted by 32/33.2.2.2 to serve as the primary means of escape.

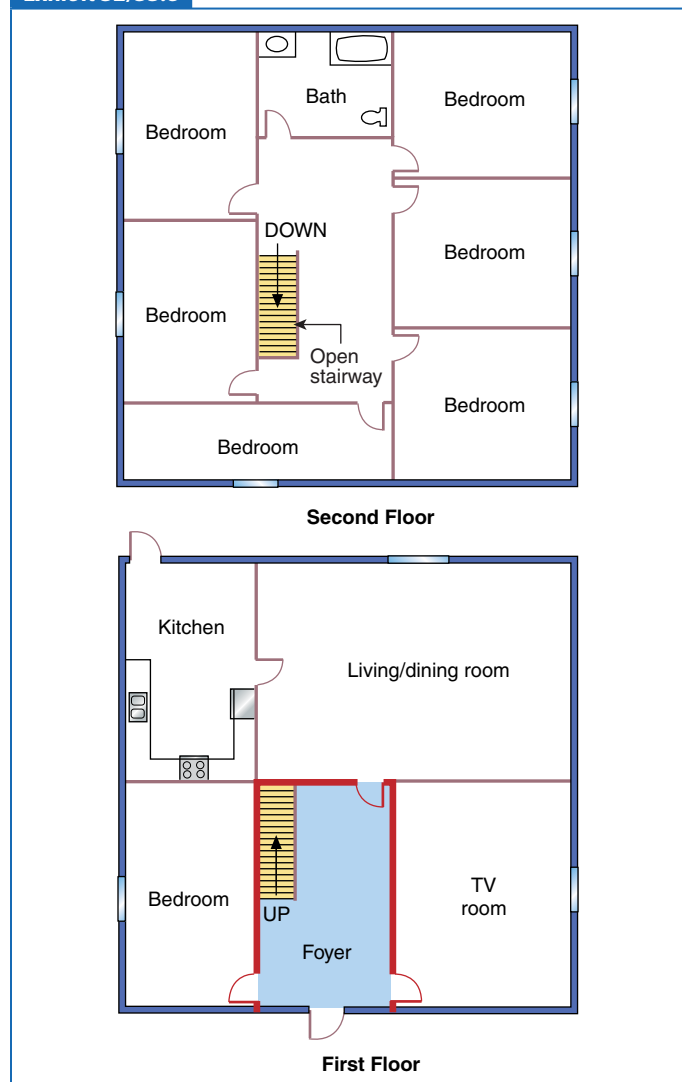

The intent of 32/33.2.2.4.5 is to permit a stair that connects the first floor to the second floor to be open to the second floor but separated from the effects of fire on the first floor. This provision also permits a stair that connects the basement level to the first floor to be open to the basement level but separated from the effects of fire on the first floor. This partially enclosed interior stair can serve as a primary means of escape in accordance with 32/33.2.2.2.

Exhibit 32/33.8 illustrates a partially enclosed interior stair (separated from ground floor) in accordance with 32/33.2.2.4.5 that serves as the primary means of escape for the second floor. This partially enclosed interior stair is considered to be the equivalent of an enclosed interior stair. The separating walls and doors on the first floor serve the dual purposes of enclosing the stair on that floor and providing a route that does not expose occupants to occupied or furnished areas of the first floor. Thus, the first-floor stair “lobby” cannot be used as a lounge and cannot contain furniture or furnishings.

The intent of 32/33.2.2.4.6 is to permit an unenclosed interior stair to serve as the equivalent of an enclosed interior stair in new small facilities and existing small facilities with prompt or slow evacuation capability. However, the buildings must be of three or fewer stories and must be protected throughout with an automatic sprinkler system using quick-response or residential sprinklers. Exhibit 32/33.8 can also be used to illustrate the provisions of 32/33.2.2.4.6. Although the enclosing walls around the foyer on the first floor serve as the stair enclosure on that floor in accordance with 32/33.2.2.4.5, the same enclosing walls serve to protect the escape path from the areas that are occupied or furnished on the first floor in accordance with 32/33.2.2.4.6.

## CHAPTER 33 • Existing

Exhibit 32/33.8

Partially enclosed interior stair.

Additionally, given the presence of sprinklers and other criteria of 32/33.2.2.4.6, the open stair can extend to a third level.

The provisions of 32/33.2.2.4.7 permit a two-story open stair (and its associated exposure to the areas that are occupied or furnished, or both, on the ground floor) to serve as primary means of escape for new small facilities and existing small facilities (not more than eight residents) with prompt evacuation capability, provided that the facility is sprinklered using quick-response or residential sprinklers. This provision, in effect, equates such a board and care facility with a one- or two-family dwelling. An unenclosed interior stair meeting the criteria of this provision is considered the equivalent of an enclosed interior stair.

## CHAPTER 32 • New

For existing facilities, the *Code* prohibits the use of the following provisions in conjunction with 33.2.2.4.7 (see 33.2.2.4.8):

1. Paragraph 33.2.2.3.3, which exempts bedrooms from a required secondary means of escape if the building is sprinklered
2. Paragraphs 33.2.3.4.3.6 and 33.2.3.4.3.7, which exempt common space smoke detectors where the building is sprinklered and the bedrooms are provided with smoke alarms

Multiple use of the provisions specified in items 1 and 2, which are intended for application to sprinklered buildings, could result in a level of life safety less than that required by Chapters 32 and 33.

**32.2.2.5 Doors.**

**32.2.2.5.1** Doors, other than those meeting the requirements of 32.2.2.5.1.1 and 32.2.2.5.1.2, and paths of travel to a means of escape shall be not less than 32 in. (810 mm) wide.

**32.2.2.5.1.1** Bathroom doors shall be not less than 24 in. (610 mm) wide.

**32.2.2.5.1.2** In conversions (see 32.1.1.6), 28 in. (710 mm) doors shall be permitted.

**32.2.2.5.2** Doors shall be swinging or sliding.

**32.2.2.5.3** Every closet door latch shall be readily opened from the inside.

**32.2.2.5.4** Every bathroom door shall be designed to allow opening from the outside during an emergency when locked.

**32.2.2.5.5** No door in any means of escape, other than those meeting the requirement of 32.2.2.5.5.1, 32.2.2.5.5.2, or 32.2.2.5.5.3, shall be locked against egress when the building is occupied.

**32.2.2.5.5.1** Delayed-egress locks complying with 7.2.1.6.1 shall be permitted on exterior doors only.

**32.2.2.5.5.2** Access-controlled egress door assemblies complying with 7.2.1.6.2 shall be permitted.

**32.2.2.5.5.3** Door-locking arrangements shall be permitted where the clinical needs of residents require specialized security measures or where residents pose a security threat, provided all of the following conditions are met:

- (1) Staff can readily unlock doors at all times in accordance with 32.2.2.5.5.4.
- (2) The building is protected by an approved automatic sprinkler system in accordance with 32.2.3.5.
- (3) The provision of 32.2.3.5.2 for conversions is not be permitted to be used.

## CHAPTER 33 • Existing

In existing small board and care facilities, 33.2.2.4.9 permits stairs to be open at the topmost story only where the entire primary means of escape associated with the stairs is separated from all portions of lower stories. In addition, this provision requires the following:

1. Buildings are to be of three or fewer stories.
2. Buildings are to house occupants with prompt or slow evacuation capability.
3. Buildings are to be protected by an approved automatic sprinkler system in accordance with 33.2.3.5.

**33.2.2.5 Doors.**

**33.2.2.5.1** Doors, other than bathroom doors addressed in 33.2.2.5.1.1, and paths of travel to a means of escape shall be not less than 28 in. (710 mm) wide.

**33.2.2.5.1.1** Bathroom doors shall be not less than 24 in. (610 mm) wide.

**33.2.2.5.1.2 Reserved.**

**33.2.2.5.2** Doors shall be swinging or sliding.

**33.2.2.5.3** Every closet door latch shall be readily opened from the inside.

**33.2.2.5.4** Every bathroom door shall be designed to allow opening from the outside during an emergency when locked.

**33.2.2.5.5** No door in any means of escape, other than those meeting the requirement of 33.2.2.5.5.1, 33.2.2.5.5.2, or 33.2.2.5.5.3, shall be locked against egress when the building is occupied.

**33.2.2.5.5.1** Delayed-egress locks complying with 7.2.1.6.1 shall be permitted on exterior doors only.

**33.2.2.5.5.2** Access-controlled egress door assemblies complying with 7.2.1.6.2 shall be permitted.

**33.2.2.5.5.3** Door-locking arrangements shall be permitted where the clinical needs of residents require specialized security measures or where residents pose a security threat, provided all of the following conditions are met:

- (1) Staff can readily unlock doors at all times in accordance with 33.2.2.5.5.4.
- (2) The building is protected by an approved automatic sprinkler system in accordance with 33.2.3.5.

## CHAPTER 32 • New

**32.2.2.5.5.4** Doors located in the means of egress and permitted to be locked in accordance with **32.2.2.5.5.3** shall comply with all of the following:

- (1) Provisions shall be made for the rapid removal of occupants by means of one of the following:
  - (a) Remote control of locks from within the locked building
  - (b) Keying of all locks to keys carried by staff at all times
  - (c) Other such reliable means available to staff at all times
- (2) Only one locking device shall be permitted on each door.

**32.2.2.5.6** Forces to open doors shall comply with **7.2.1.4.5**.

**32.2.2.5.7** Door-latching devices shall comply with **7.2.1.5.10**.

**32.2.2.5.8** Floor levels at doors shall comply with **7.2.1.3**.

If an existing dwelling is converted to a small board and care facility, the provisions of **4.6.11** require that such a change of occupancy is to meet the requirements of **4.6.7**, which, in turn, references **Chapter 43** for building rehabilitation. **Chapter 43** requires such a change of occupancy to a higher hazard category to meet the requirements for new board and care facilities (see **43.7.2.3**). The provision of **32.2.2.5.1.2** recognizes the hardship and minor improvement that would be realized if existing 28 in. (710 mm) wide doors were required to be replaced by 32 in. (810 mm) wide doors.

Residential board and care facilities are prohibited from having any door in the means of escape locked against egress while the building is occupied in accordance with **32/33.2.2.5.5**, except as permitted by **32/33.2.2.5.5.3**, which is new to the 2015 edition of the *Code*. This prohibition is consistent with a fundamental means of egress provision of **Chapter 7**. **Chapter 7** permits a door to have a locking device that allows the door to be easily opened from within the facility for the purpose of egress

### 32.2.2.6 Stairs.

**32.2.2.6.1** Stairs shall comply with **7.2.2**, unless otherwise specified in this chapter.

**32.2.2.6.2** Existing winders complying with **7.2.2.2.4** shall be permitted to remain only in conversions.

**32.2.2.6.3\*** Exterior stairs shall be protected against blockage caused by fire within the building.

**A.32.2.2.6.3** Exterior stair protection can be accomplished through separation by physical distance, arrangement of the stairs, protection of the openings exposing the stairs, or other means acceptable to the authority having jurisdiction.

### 32.2.3 Protection.

#### 32.2.3.1 Protection of Vertical Openings.

## CHAPTER 33 • Existing

**33.2.2.5.5.4** Doors that are located in the means of egress and are permitted to be locked in accordance with **33.2.2.5.5.3** shall comply with all of the following:

- (1) Provisions shall be made for the rapid removal of occupants by means of one of the following:
  - (a) Remote control of locks from within the locked building
  - (b) Keying of all locks to keys carried by staff at all times
  - (c) Other such reliable means available to staff at all times
- (2) Only one locking device shall be permitted on each door.

**33.2.2.5.6** Forces to open doors shall comply with **7.2.1.4.5**.

**33.2.2.5.7** Door-latching devices shall comply with **7.2.1.5.10**.

but does not allow the door to be opened from outside the facility. Ordinary double-cylinder locks and chain locks do not meet these provisions.

The provisions of **32/33.2.2.5.5.3** permit doors to be locked in the direction of egress where necessary for the residents' safety, based on their clinical needs. Such locking arrangements are permitted only in buildings that are protected by automatic sprinkler systems and where means are provided to facilitate rapid unlocking of doors by staff as specified by **32/33.2.2.5.5.4**. Facilities for which door locking might be appropriate include those for housing residents with dementia, who require the personal care services associated with a board and care facility and are at risk of wandering from the facility.

Although resident sleeping room doors are located in the means of escape, it is the intent of **32/33.2.2.5.7** to permit the multiple latching/locking devices addressed by **7.2.1.5.10.3** and **7.2.1.5.10.4**.

### 33.2.2.6 Stairs.

**33.2.2.6.1** Stairs shall comply with **7.2.2**, unless otherwise specified in this chapter.

**33.2.2.6.2** Winders complying with **7.2.2.2.4** shall be permitted.

**33.2.2.6.3\*** Exterior stairs shall be protected against blockage caused by fire within the building.

**A.33.2.2.6.3** Exterior stair protection can be accomplished through separation by physical distance, arrangement of the stairs, protection of the openings exposing the stairs, or other means acceptable to the authority having jurisdiction.

### 33.2.3 Protection.

#### 33.2.3.1 Protection of Vertical Openings.

## CHAPTER 32 • New

**32.2.3.1.1 Reserved.**

**32.2.3.1.2** Vertical openings, other than those meeting the requirement of **32.2.3.1.4**, shall be separated by smoke partitions in accordance with **Section 8.4** having a minimum ½-hour fire resistance rating.

**32.2.3.1.3 Reserved.**

**32.2.3.1.4** Stairs shall be permitted to be open where complying with **32.2.2.4.6** or **32.2.2.4.7**.

Exterior stairs do not have to meet the **Chapter 7** requirements for outside stairs per **32/33.2.2.6.3**. However, if the exterior stair is to be used as a primary means of escape, protection must be provided to reduce the likelihood that a fire within the facility will render the stair unusable. Although this provision applies to small board and care facilities, note that **7.2.2.6.3.1(2)** exempts outside stairs that serve a two-story building from the protection requirements of **7.2.2.6.3** if a remotely located second exit is provided. In such a case, the presence of an additional remote means of escape might be judged as adequate to eliminate the need to protect the exterior stair from a fire within the building. The text of **A.32/A.33.2.2.6.3** provides additional guidance on protecting exterior stairs in small board and care facilities.

For new small board and care facilities, **32.2.3.1** mandates the enclosure of vertical openings with smoke partitions having a minimum ½-hour fire resistance rating in accordance with **Section 8.4**. See the definition of the term *smoke partition* in **3.3.256**.

A smoke partition that limits the transfer of smoke is different from a smoke barrier that restricts smoke movement from one side of a barrier to the other. A smoke partition should be thought of as a barrier that reasonably limits, but doesn't necessarily prevent, smoke transfer. As such, suspended ceiling systems and monolithic surfaced ceilings can provide resistance to smoke transfer that is approximately equal to the traditional nonrated corridor wall or partition. See **Section 8.4** and its commentary for details on smoke partitions.

Per **32.2.3.1.4**, stairs are permitted to be open if they meet one of the options provided by **32.2.2.4.6** or **32.2.2.4.7**. The two open-stair options for new small facilities are summarized as follows:

- Paragraph 32.2.2.4.6** permits open stairs in sprinklered buildings not exceeding three stories in height, as long as each story is provided with a primary means of escape that is arranged so that occupants are not required to pass through a lower floor, unless that path is separated from all spaces on the lower floors by ½-hour-rated fire barriers.

## CHAPTER 33 • Existing

**33.2.3.1.1** Vertical openings, other than stairs complying with **33.2.2.4.5**, **33.2.2.4.6**, or **33.2.2.4.7**, shall be protected so as not to expose a primary means of escape.

**33.2.3.1.2** Vertical openings required to be protected by **33.2.3.1.1** shall be considered protected where separated by smoke partitions in accordance with **Section 8.4** that resist the passage of smoke from one story to any primary means of escape on another story.

**33.2.3.1.3** Smoke partitions used to protect vertical openings shall have a minimum ½-hour fire resistance rating.

**33.2.3.1.4** Any doors or openings to the protected vertical opening shall be capable of resisting fire for a minimum of 20 minutes.

- Paragraph 32.2.2.4.7** permits completely open stairs in sprinklered buildings, provided that the stair serves (connects) not more than two stories.

In existing small board and care facilities, vertical openings are permitted to be unenclosed, except in cases where, by leaving the vertical opening unenclosed, the primary means of escape route is exposed to the unprotected vertical opening. **Exhibit 32/33.9** illustrates an interior stair that, if it were not enclosed, would create an unprotected vertical opening. The

**Exhibit 32/33.9**

Vertical opening protected so as not to expose the primary means of escape.

## CHAPTER 32 • New

interior stair is not part of the primary means of escape, but the vertical opening it creates must be enclosed so that the route to the exterior stair (which serves as the primary means of escape for the second floor) is not exposed to an unprotected vertical opening. The enclosure around the vertical opening must be, at a minimum, a smoke partition.

In Exhibit 32/33.10, the vertical opening created by the interior stair does not expose the primary means of escape, which are the direct routes from each bedroom to the exterior balconies and stairs.

### 32.2.3.2 Hazardous Areas.

**32.2.3.2.1\*** Any space where there is storage or activity having fuel conditions exceeding those of a one- or two-family dwelling and that possesses the potential for a fully involved fire shall be protected in accordance with 32.2.3.2.4 and 32.2.3.2.5.

**A.32.2.3.2.1** Spaces containing approved, properly installed and maintained furnaces and heating equipment, furnace rooms, and cooking and laundry facilities should not be classified as hazardous areas solely on the basis of such equipment.

**32.2.3.2.2** Spaces requiring protection in accordance with 32.2.3.2.1 shall include, but shall not be limited to, areas for cartoned storage, food or household maintenance items in wholesale or institutional-type quantities and concentrations, or mass storage of residents' belongings.

#### 32.2.3.2.3 Reserved.

**32.2.3.2.4** Any hazardous area that is on the same floor as, and is in or abuts, a primary means of escape or a sleeping room shall be protected by one of the following means:

- (1) Protection shall be an enclosure having a minimum 1-hour fire resistance rating, in accordance with 8.2.3, and an automatic fire detection system connected to the fire alarm system provided in 32.2.3.4.1.
- (2) Protection shall be automatic sprinkler protection, in accordance with 32.2.3.5, and a smoke partition, in accordance with Section 8.4, located between the hazardous area and

## CHAPTER 33 • Existing

Exhibit 32/33.10

*Vertical opening not exposing the primary means of escape.*

### 33.2.3.2 Hazardous Areas.

**33.2.3.2.1** Any space where there is storage or activity having fuel conditions exceeding those of a one- or two-family dwelling and that possesses the potential for a fully involved fire shall be protected in accordance with 33.2.3.2.4 and 33.2.3.2.5.

**33.2.3.2.2** Spaces requiring protection in accordance with 33.2.3.2.1 shall include, but shall not be limited to, areas for cartoned storage, food or household maintenance items in wholesale or institutional-type quantities and concentrations, or mass storage of residents' belongings.

**33.2.3.2.3** Areas containing approved, properly installed and maintained furnaces and heating equipment; furnace rooms; and cooking and laundry facilities shall not be classified as hazardous areas solely on the basis of such equipment.

**33.2.3.2.4** Any hazardous area that is on the same floor as, and is in or abuts, a primary means of escape or a sleeping room shall be protected by one of the following means:

- (1) Protection shall be an enclosure having a minimum 1-hour fire resistance rating, with self-closing or automatic-closing fire doors in accordance with 7.2.1.8 having a minimum ¾-hour fire protection rating.
- (2) Protection shall be automatic sprinkler protection, in accordance with 33.2.3.5, and a smoke partition, in accordance with Section 8.4, located between the hazardous area and

## CHAPTER 32 • New

the sleeping area or primary escape route, with any doors in such separation self-closing or automatic-closing in accordance with 7.2.1.8.

**32.2.3.2.5** Other hazardous areas shall be protected by one of the following:

- (1) Enclosure having a minimum ½-hour fire resistance rating, with a self-closing or automatic-closing door in accordance with 7.2.1.8 that is equivalent to minimum 1¾ in. (44 mm) thick, solid-bonded wood-core construction, and protected by an automatic fire detection system connected to the fire alarm system provided in 32.2.3.4.1
- (2) Automatic sprinkler protection in accordance with 32.2.3.5, regardless of enclosure

It is recognized that small board and care facilities closely resemble one- and two-family dwellings. However, one of the most notable differences between the two is the type of hazards that might be present. In a small board and care facility, greater quantities of household maintenance and cleaning products, food in cartons, and mass storage of residents' belongings result in areas where a fire could quickly grow to full room involvement. These are the areas that 32/33.2.3.2.1 and 32/33.2.3.2.2 intend to be separated in accordance with 32/33.2.3.2.4 and 32/33.2.3.2.5.

The protection of hazardous areas is based on the potential impact that a fire in the hazardous area would have on a primary means of escape or on sleeping rooms. If the hazardous area is located on the same floor as sleeping rooms or a primary means of escape, and if a sleeping room or means of escape is exposed to the hazardous area, one of the following two protection options is permitted:

1. The hazardous area must be separated from the remainder of the floor by construction with at least a 1-hour fire resistance rating, and automatic fire detection connected to the alarm system must be provided.
2. Automatic sprinkler protection must be provided within the hazardous area, and the separating construction must meet the requirements for smoke partitions in Section 8.4 but is not required to be fire rated.

### 32.2.3.3 Interior Finish.

**32.2.3.3.1 General.** Interior finish shall be in accordance with Section 10.2.

**32.2.3.3.2 Interior Wall and Ceiling Finish.** Interior wall and ceiling finish materials complying with Section 10.2 shall be Class A, Class B, or Class C.

## CHAPTER 33 • Existing

the sleeping area or primary escape route, with any doors in such separation self-closing or automatic-closing in accordance with 7.2.1.8.

**33.2.3.2.5** Other hazardous areas shall be protected by one of the following:

- (1) Enclosure having a minimum ½-hour fire resistance rating, with self-closing or automatic-closing doors in accordance with 7.2.1.8 equivalent to minimum 1¾ in. (44 mm) thick, solid-bonded wood-core construction
- (2) Automatic sprinkler protection in accordance with 33.2.3.5, regardless of enclosure

If the hazardous area is located on a different floor or does not abut a primary means of escape or sleeping rooms, the hazard is considered less severe and can be protected using one of the following two methods:

1. The hazardous area must be separated from the remainder of the floor by construction with at least a ½-hour fire rating, and automatic fire detection connected to the alarm system must be provided.
2. Automatic sprinkler protection must be provided within the hazardous area; however, no smoke-resisting separation is required.

For example, consider a basement in a wood-frame building housing a small board and care facility. The basement, which is used only for the storage of combustible materials, is not a required means of escape. If the basement storage area does not abut a sleeping area on the same floor and is sprinklered, sheathing the ceiling to provide fire resistance separation is not required. In applying the provisions of 32.2.3.2, note that the sprinkler protection required in nearly all new small board and care facilities by 32.2.3.5.1 should make the protection of hazardous contents areas relatively straightforward.

### 33.2.3.3 Interior Finish.

**33.2.3.3.1 General.** Interior finish shall be in accordance with Section 10.2.

**33.2.3.3.2 Interior Wall and Ceiling Finish.** Interior wall and ceiling finish materials complying with Section 10.2 shall be as follows:

- (1) Class A or Class B in facilities other than those having prompt evacuation capability
- (2) Class A, Class B, or Class C in facilities having prompt evacuation capability

## CHAPTER 32 • New

**32.2.3.3.3 Interior Floor Finish.**

**32.2.3.3.3.1** Interior floor finish shall comply with [Section 10.2](#).

**32.2.3.3.3.2** Interior floor finish shall comply with [10.2.7.1](#) or [10.2.7.2](#), as applicable.

**32.2.3.4 Detection, Alarm, and Communications Systems.**

**32.2.3.4.1 General.** A manual fire alarm system shall be provided in accordance with [Section 9.6](#).

**32.2.3.4.2 Occupant Notification.** Occupant notification shall be provided automatically, without delay, in accordance with [9.6.3](#).

**32.2.3.4.3 Smoke Alarms.**

**32.2.3.4.3.1** Approved smoke alarms shall be provided in accordance with [9.6.2.10](#).

**32.2.3.4.3.2** Smoke alarms shall be installed on all levels, including basements but excluding crawl spaces and unfinished attics.

**32.2.3.4.3.3** Additional smoke alarms shall be installed in all living areas, as defined in [3.3.21.5](#).

**32.2.3.4.3.4** Each sleeping room shall be provided with an approved smoke alarm in accordance with [9.6.2.10](#).

## CHAPTER 33 • Existing

**33.2.3.3.3 Interior Floor Finish.** (No requirements.)**33.2.3.4 Detection, Alarm, and Communications Systems.**

**33.2.3.4.1 Fire Alarm Systems.** A manual fire alarm system shall be provided in accordance with [Section 9.6](#), unless the provisions of [33.2.3.4.1.1](#) or [33.2.3.4.1.2](#) are met.

**33.2.3.4.1.1** A fire alarm system shall not be required where interconnected smoke alarms complying with [33.2.3.4.3](#) and not less than one manual fire alarm box per floor arranged to continuously sound the smoke detector alarms are provided.

**33.2.3.4.1.2** Other manually activated continuously sounding alarms acceptable to the authority having jurisdiction shall be permitted in lieu of a fire alarm system.

**33.2.3.4.2 Occupant Notification.** Occupant notification shall be in accordance with [9.6.3](#).

**33.2.3.4.3\* Smoke Alarms.**

**A.33.2.3.4.3** Most often, smoke alarms sounding an alarm at 85 dBA or greater, installed outside the bedroom area, will meet the intent of this requirement. Smoke alarms remotely located from the bedroom might not be loud enough to awaken the average person. In such cases, it is recommended that smoke alarms be interconnected so that the activation of any smoke alarm will cause all smoke alarms to activate.

NFPA 101 provides adequate, balanced fire protection and takes into consideration the passive and active systems required in a given occupancy. The level of protection prescribed by NFPA 72, *National Fire Alarm and Signaling Code*, which includes smoke alarms in all sleeping rooms, without exception, does not necessarily take into consideration the complete protection package prescribed by NFPA 101.

**33.2.3.4.3.1** Approved smoke alarms shall be provided in accordance with [9.6.2.10](#), unless otherwise indicated in [33.2.3.4.3.6](#) and [33.2.3.4.3.7](#).

**33.2.3.4.3.2** Smoke alarms shall be installed on all levels, including basements but excluding crawl spaces and unfinished attics.

**33.2.3.4.3.3** Additional smoke alarms shall be installed for living rooms, dens, day rooms, and similar spaces.

**33.2.3.4.3.4 Reserved.**

**33.2.3.4.3.5** Smoke alarms shall be powered from the building electrical system and, when activated, shall initiate an alarm that is audible in all sleeping areas.

## CHAPTER 32 • New

In both new and existing board and care facilities, a means of manually initiating the fire alarm system is required. However, 33.2.3.4.1 contains two options for existing facilities. The use of a “system” of interconnected multiple-station smoke alarms is permitted by 33.2.3.4.1.1 to meet the fire alarm requirement by providing one manual fire alarm box that is integrated with the smoke alarms on each floor. In addition, 33.2.3.4.1.2 recognizes that, in a small existing building, a sophisticated fire alarm system that employs components listed for use in fire alarm systems might not be necessary. The requirements can be satisfied by the installation of alternative means of notifying the occupants, such as electric bells activated by a clearly identified switch on each floor where approved by the authority having jurisdiction.

The requirement of 32.2.3.4.3.1 does not mandate a system of smoke detectors in a small facility. If the building is small enough, single-station smoke alarms might meet the criterion of audibility in all sleeping areas. However, if the building is of significant size or consists of multiple levels, interconnected

### 32.2.3.5\* Extinguishment Requirements.

**A.32.2.3.5** All sprinkler systems installed in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*, and NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*, are required to be inspected, tested, and maintained in accordance with NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*. However, systems installed in accordance with NFPA 13D, *Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes*, are historically exempt from applying NFPA 25. While there is a great deal of information in NFPA 25 that is not appropriate for NFPA 13D sprinkler systems, there are some basic

## CHAPTER 33 • Existing

**33.2.3.4.3.6** Smoke alarms in accordance with 33.2.3.4.3.1 shall not be required where buildings are protected throughout by an approved automatic sprinkler system, in accordance with 33.2.3.5, that uses quick-response or residential sprinklers, and are protected with approved smoke alarms installed in each sleeping room, in accordance with 9.6.2.10, that are powered by the building electrical system.

**33.2.3.4.3.7** Smoke alarms in accordance with 33.2.3.4.3.1 shall not be required where buildings are protected throughout by an approved automatic sprinkler system, in accordance with 33.2.3.5, that uses quick-response or residential sprinklers, with existing battery-powered smoke alarms in each sleeping room, and where, in the opinion of the authority having jurisdiction, the facility has demonstrated that testing, maintenance, and a battery replacement program ensure the reliability of power to the smoke alarms.

multiple-station smoke alarms will probably be needed. Additional smoke alarms are required in living rooms and day rooms.

Prior to the 2003 edition of the *Code*, several provisions permitted the omission of smoke alarms from small board and care facilities. However, given the wider acceptance of unprotected vertical openings permitted by 32.2.3.1, the smoke alarm exemptions are no longer permitted for new facilities. Several conditions for exempting smoke alarms from existing small board and care facilities, however, are provided. To exempt the requirement for common space smoke alarms, as permitted by 33.2.3.4.3.6 and 33.2.3.4.3.7, the entire building must be protected with an automatic sprinkler system using quick-response or residential sprinklers in accordance with 33.2.3.5, and the bedrooms must be provided with smoke alarms. If the existing smoke alarms in the bedrooms are powered solely by batteries, they do not need to be replaced with electrically powered smoke alarms if the AHJ judges that the facility has an adequate testing, maintenance, and battery replacement program.

### 33.2.3.5\* Extinguishment Requirements.

**A.33.2.3.5** All sprinkler systems installed in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*, and NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*, are required to be inspected, tested, and maintained in accordance with NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*. However, systems installed in accordance with NFPA 13D, *Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes*, are historically exempt from applying NFPA 25. While there is a great deal of information in NFPA 25 that is not appropriate for NFPA 13D sprinkler systems, there are some basic

## CHAPTER 32 • New

concepts of inspection, testing, and maintenance that are critical to system performance and must be performed when an NFPA 13D sprinkler system is installed in a board and care occupancy. The frequencies mandated by this *Code* are slightly different from those required by NFPA 25. It is the intent of this *Code* to utilize the frequencies stated in **Chapter 32**, but to reference the purpose and the procedures for the inspections, tests, and maintenance from NFPA 25.

**32.2.3.5.1\*** All facilities, other than those meeting the requirement of **32.2.3.5.2**, shall be protected throughout by an approved automatic sprinkler system, installed in accordance with **32.2.3.5.3**, using quick-response or residential sprinklers.

**A.32.2.3.5.1** Where any provision requires the use of an automatic sprinkler system in accordance with **32.2.3.5**, the provision of **32.2.3.5.2** is not permitted to be used.

**32.2.3.5.2\*** In conversions, sprinklers shall not be required in small board and care homes serving eight or fewer residents when all occupants have the ability as a group to move reliably to a point of safety within 3 minutes.

**A.32.2.3.5.2** Where a facility utilizing the provision of **32.2.3.5.2** is occupied by residents who can no longer comply with the 3-minute evacuation response, **33.1.8** requires the facility to comply with the requirements for new construction, including automatic sprinkler protection. (See also **A.33.1.8**.)

**32.2.3.5.3** Where an automatic sprinkler system is installed, for either total or partial building coverage, all of the following requirements shall be met:

- (1) The system shall be in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*, and shall initiate the fire alarm system in accordance with **32.2.3.4.1**.
- (2) The adequacy of the water supply shall be documented to the authority having jurisdiction.

**32.2.3.5.3.1** In buildings four or fewer stories above grade plane, systems in accordance with NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*, shall be permitted. All habitable areas, closets, roofed porches, roofed decks, and roofed balconies shall be sprinklered.

## CHAPTER 33 • Existing

concepts of inspection, testing, and maintenance that are critical to system performance and must be performed when an NFPA 13D sprinkler system is installed in a board and care occupancy. The frequencies mandated by this *Code* are slightly different from those required by NFPA 25. It is the intent of this *Code* to utilize the frequencies stated in **Chapter 32**, but to reference the purpose and the procedures for the inspections, tests, and maintenance from NFPA 25.

**33.2.3.5.1 Reserved.**

**33.2.3.5.2 Reserved.**

**33.2.3.5.3** Where an automatic sprinkler system is installed, for either total or partial building coverage, all of the following requirements shall be met:

- (1) The system shall be in accordance with **Section 9.7** and shall initiate the fire alarm system in accordance with **33.2.3.4.1**, as modified by **33.2.3.5.3.1** through **33.2.3.5.3.6**.
- (2) The adequacy of the water supply shall be documented to the authority having jurisdiction.

**33.2.3.5.3.1\*** In prompt evacuation capability facilities, all of the following shall apply:

- (1) An automatic sprinkler system in accordance with NFPA 13D, *Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes*, shall be permitted.
- (2) Automatic sprinklers shall not be required in closets not exceeding 24 ft<sup>2</sup> (2.2 m<sup>2</sup>) and in bathrooms not exceeding 55 ft<sup>2</sup> (5.1 m<sup>2</sup>), provided that such spaces are finished with lath and plaster or materials providing a 15-minute thermal barrier.

**A.33.2.3.5.3.1** The decision to permit the use of the criteria from NFPA 13D, *Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes*, in these occupancies is based on the following:

## CHAPTER 32 • New

**32.2.3.5.3.2\*** An automatic sprinkler system with a 30-minute water supply, and complying with all of the following requirements and with NFPA 13D, *Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes*, shall be permitted:

- (1) All habitable areas, closets, roofed porches, roofed decks, and roofed balconies shall be sprinklered.
- (2) Facilities with more than eight residents shall be treated as two-family dwellings with regard to water supply.

**A.32.2.3.5.3.2** The decision to permit the use of the criteria from NFPA 13D, *Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes*, in these occupancies is based on the following:

- (1) The desire to obtain a level of fire suppression and control approximately equivalent to that delivered by residential facilities protected by such systems (*see A.1.1 in NFPA 13D*)
- (2) The fact that potential fire exposure and challenge to the suppression system in a small board and care facility are of the same nature and are no more severe than those found in residences

**Chapter 32** permits the use of NFPA 13D, and NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*, outside of their scopes. This permission is based on a review of the occupancy and a recognition that the fires in board and care facilities are similar to those of other residential occupancies and that the level of protection is appropriate. The requirements of NFPA 13D and NFPA 13R have been supplemented with requirements for additional water supplies to

## CHAPTER 33 • Existing

- (1) The desire to obtain a level of fire suppression and control approximately equivalent to that delivered by residential facilities protected by such systems (*see A.1.1 in NFPA 13D*)
- (2) The fact that potential fire exposure and challenge to the suppression system in a small board and care facility are of the same nature and are no more severe than those found in residences

**Chapter 33** permits the use of NFPA 13D and NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*, outside of their scopes. This permission is based on a review of the occupancy and a recognition that the fires in board and care facilities are similar to those of other residential occupancies and that the level of protection is appropriate. In some circumstances, such as those for impractical evacuation capabilities, the requirements of NFPA 13D and NFPA 13R have been supplemented with requirements for additional water supplies to compensate for the special needs of the board and care occupancy.

**33.2.3.5.3.2** In slow and impractical evacuation capability facilities, all of the following shall apply:

- (1) An automatic sprinkler system in accordance with NFPA 13D, *Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes*, with a 30-minute water supply, shall be permitted.
- (2) All habitable areas and closets shall be sprinklered.
- (3) Automatic sprinklers shall not be required in bathrooms not exceeding 55 ft<sup>2</sup> (5.1 m<sup>2</sup>), provided that such spaces are finished with lath and plaster or materials providing a 15-minute thermal barrier.

## CHAPTER 32 • New

compensate for the special needs of the board and care occupancy.

NFPA 13D contains additional requirements for a piping system serving both sprinkler and domestic needs.

**32.2.3.5.4** Automatic sprinkler systems installed in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*, and NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*, shall be provided with electrical supervision in accordance with **9.7.2**.

**32.2.3.5.5** Automatic sprinkler systems installed in accordance with NFPA 13D, *Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes*, shall be provided with valve supervision by one of the following methods:

- (1) Single listed control valve that shuts off both domestic and sprinkler systems and separate shutoff for the domestic system only
- (2) Electrical supervision in accordance with **9.7.2**
- (3) Valve closure that causes the sounding of an audible signal in the facility

## CHAPTER 33 • Existing

**33.2.3.5.3.3** In prompt and slow evacuation capability facilities, where an automatic sprinkler system is in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*, sprinklers shall not be required in closets not exceeding 24 ft<sup>2</sup> (2.2 m<sup>2</sup>) and in bathrooms not exceeding 55 ft<sup>2</sup> (5.1 m<sup>2</sup>), provided that such spaces are finished with lath and plaster or materials providing a 15-minute thermal barrier.

**33.2.3.5.3.4** In prompt and slow evacuation capability facilities in buildings four or fewer stories above grade plane, systems in accordance with NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*, shall be permitted.

**33.2.3.5.3.5** In impractical evacuation capability facilities in buildings four or fewer stories above grade plane, systems in accordance with NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*, shall be permitted. All habitable areas and closets shall be sprinklered. Automatic sprinklers shall not be required in bathrooms not exceeding 55 ft<sup>2</sup> (5.1 m<sup>2</sup>), provided that such spaces are finished with lath and plaster or materials providing a 15-minute thermal barrier.

**33.2.3.5.3.6** Initiation of the fire alarm system shall not be required for existing installations in accordance with **33.2.3.5.6**.

**33.2.3.5.3.7** All impractical evacuation capability facilities shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with **33.2.3.5.3**.

**33.2.3.5.4 Reserved.**

**33.2.3.5.5 Reserved.**

## CHAPTER 32 • New

**32.2.3.5.6** Sprinkler piping serving not more than six sprinklers for any isolated hazardous area shall be permitted to be installed in accordance with 9.7.1.2 and shall meet all of the following requirements:

- (1) In new installations, where more than two sprinklers are installed in a single area, waterflow detection shall be provided to initiate the fire alarm system required by 32.2.3.4.1.
- (2) The duration of water supplies shall be as required by 32.2.3.5.3.2.

**32.2.3.5.7** Attics shall be protected in accordance with 32.2.3.5.7.1 or 32.2.3.5.7.2.

**32.2.3.5.7.1** Where an automatic sprinkler system is required by 32.2.3.5, attics used for living purposes, storage, or fuel-fired equipment shall be protected with automatic sprinklers that are part of the required, approved automatic sprinkler system in accordance with 9.7.1.1.

**32.2.3.5.7.2** Where an automatic sprinkler system is required by 32.2.3.5, attics not used for living purposes, storage, or fuel-fired equipment shall meet one of the following criteria:

- (1) Attics shall be protected throughout by a heat detection system arranged to activate the building fire alarm system in accordance with Section 9.6.
- (2) Attics shall be protected with automatic sprinklers that are part of the required, approved automatic sprinkler system in accordance with 9.7.1.1.
- (3) Attics shall be of noncombustible or limited-combustible construction.
- (4) Attics shall be constructed of fire-retardant-treated wood in accordance with NFPA 703, *Standard for Fire Retardant-Treated Wood and Fire-Retardant Coatings for Building Materials*.

**32.2.3.5.8** Systems installed in accordance with NFPA 13D, *Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes*, shall be inspected, tested, and maintained in accordance with 32.2.3.5.8.1 through 32.2.3.5.8.15, which reference specific sections of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*. The frequency of the inspection, test, or maintenance shall be in accordance with this Code, whereas the purpose and procedure shall be from NFPA 25.

**32.2.3.5.8.1** Control valves shall be inspected monthly in accordance with 13.3.2 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

## CHAPTER 33 • Existing

**33.2.3.5.6** Sprinkler piping serving not more than six sprinklers for any isolated hazardous area shall be permitted to be installed in accordance with 9.7.1.2 and shall meet all of the following requirements:

- (1) In new installations, where more than two sprinklers are installed in a single area, waterflow detection shall be provided to initiate the fire alarm system required by 33.2.3.4.1.
- (2) The duration of water supplies shall be as required for the sprinkler systems addressed in 33.2.3.5.3.

**33.2.3.5.7** Attics shall be protected in accordance with 33.2.3.5.7.1 or 33.2.3.5.7.2.

**33.2.3.5.7.1** Where an automatic sprinkler system is installed, attics used for living purposes, storage, or fuel-fired equipment shall be protected with automatic sprinklers that are part of the required, approved automatic sprinkler system in accordance with 9.7.1.1.

**33.2.3.5.7.2** Where an automatic sprinkler system is installed, attics not used for living purposes, storage, or fuel-fired equipment shall meet one of the following criteria:

- (1) Attics shall be protected throughout by a heat detection system arranged to activate the building fire alarm system in accordance with Section 9.6.
- (2) Attics shall be protected with automatic sprinklers that are part of the required, approved automatic sprinkler system in accordance with 9.7.1.1.
- (3) Attics shall be of noncombustible or limited-combustible construction.
- (4) Attics shall be constructed of fire-retardant-treated wood in accordance with NFPA 703, *Standard for Fire Retardant-Treated Wood and Fire-Retardant Coatings for Building Materials*.
- (5) Attics shall be protected by heat alarms arranged to provide occupant notification in accordance with 33.2.3.4.2.

**33.2.3.5.8** Systems installed in accordance with NFPA 13D, *Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes*, shall be inspected, tested, and maintained in accordance with 33.2.3.5.8.1 through 33.2.3.5.8.15, which reference specific sections of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*. The frequency of the inspection, test, or maintenance shall be in accordance with this Code, whereas the purpose and procedure shall be from NFPA 25.

**33.2.3.5.8.1** Control valves shall be inspected monthly in accordance with 13.3.2 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

## CHAPTER 32 • New

**32.2.3.5.8.2** Gages shall be inspected monthly in accordance with 13.2.7.1 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

**32.2.3.5.8.3** Alarm devices shall be inspected quarterly in accordance with 5.2.6 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

**32.2.3.5.8.4** Alarm devices shall be tested semiannually in accordance with 5.3.3 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

**32.2.3.5.8.5** Valve supervisory switches shall be tested semiannually in accordance with 13.3.3.5 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

**32.2.3.5.8.6** Visible sprinklers shall be inspected annually in accordance with 5.2.1 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

**32.2.3.5.8.7** Visible pipe shall be inspected annually in accordance with 5.2.2 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

**32.2.3.5.8.8** Visible pipe hangers shall be inspected annually in accordance with 5.2.3 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

**32.2.3.5.8.9** Buildings shall be inspected annually prior to the onset of freezing weather to ensure that there is adequate heat wherever water-filled piping is run in accordance with 5.2.5 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

**32.2.3.5.8.10** A representative sample of fast-response sprinklers shall be tested once the sprinklers in the system are 20 years old in accordance with 5.3.1.1.1.2 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*. If the sample fails the test, all of the sprinklers represented by that sample shall be replaced. If the sprinklers pass the test, the test shall be repeated every 10 years thereafter.

**32.2.3.5.8.11** A representative sample of dry-pendent sprinklers shall be tested once the sprinklers in the system are 10 years old in accordance with 5.3.1.1.1.5 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*. If the sample fails the test, all of the sprinklers represented by that sample shall be replaced. If the sprinklers pass the test, the test shall be repeated every 10 years thereafter.

**32.2.3.5.8.12** Antifreeze solutions shall be tested annually in accordance with 5.3.4 of NFPA 25, *Standard for the Inspection,*

## CHAPTER 33 • Existing

**33.2.3.5.8.2** Gages shall be inspected monthly in accordance with 13.2.7.1 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

**33.2.3.5.8.3** Alarm devices shall be inspected quarterly in accordance with 5.2.6 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

**33.2.3.5.8.4** Alarm devices shall be tested semiannually in accordance with 5.3.3 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

**33.2.3.5.8.5** Valve supervisory switches shall be tested semiannually in accordance with 13.3.3.5 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

**33.2.3.5.8.6** Visible sprinklers shall be inspected annually in accordance with 5.2.1 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

**33.2.3.5.8.7** Visible pipe shall be inspected annually in accordance with 5.2.2 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

**33.2.3.5.8.8** Visible pipe hangers shall be inspected annually in accordance with 5.2.3 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

**33.2.3.5.8.9** Buildings shall be inspected annually prior to the onset of freezing weather to ensure that there is adequate heat wherever water-filled piping is run in accordance with 5.2.5 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

**33.2.3.5.8.10** A representative sample of fast-response sprinklers shall be tested once the sprinklers in the system are 20 years old in accordance with 5.3.1.1.1.2 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*. If the sample fails the test, all of the sprinklers represented by that sample shall be replaced. If the sprinklers pass the test, the test shall be repeated every 10 years thereafter.

**33.2.3.5.8.11** A representative sample of dry-pendent sprinklers shall be tested once the sprinklers in the system are 10 years old in accordance with 5.3.1.1.1.5 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*. If the sample fails the test, all of the sprinklers represented by that sample shall be replaced. If the sprinklers pass the test, the test shall be repeated every 10 years thereafter.

**33.2.3.5.8.12** Antifreeze solutions shall be tested annually in accordance with 5.3.4 of NFPA 25, *Standard for the Inspection,*

## CHAPTER 32 • New

*Testing, and Maintenance of Water-Based Fire Protection Systems.*

**32.2.3.5.8.13** Control valves shall be operated through their full range and returned to normal annually in accordance with 13.3.3.1 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

**32.2.3.5.8.14** Operating stems of OS&Y valves shall be lubricated annually in accordance with 13.3.4 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

**32.2.3.5.8.15** Dry-pipe systems that extend into the unheated portions of the building shall be inspected, tested, and maintained in accordance with 13.4.4 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

New small board and care facilities must be protected by an automatic sprinkler system using quick-response or residential sprinklers in accordance with **32.2.3.5.1**. This requirement recognizes the ability of quick-response and residential sprinklers to maintain tenability in the room of origin during most fire scenarios.

The provision of **32.2.3.5.2** recognizes the difficulties in retrofitting buildings that are converted to small board and care facilities and provides some relief in these situations.

The provision of **33.2.3.5.3** does not require the installation of automatic sprinkler systems in existing small board and care facilities. Rather, it establishes the criteria for installing automatic sprinkler systems that are provided voluntarily for the purpose of applying modifications to other *Code* requirements based on the presence of such systems.

Although a small board and care facility is of a different occupancy classification than a one- and two-family dwelling or manufactured home, **32.2.3.5.3.2** and **33.2.3.5.3** permit the use of residential sprinkler systems installed in accordance with NFPA 13D, *Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes*,<sup>4</sup> for the reasons explained in **A.32.2.3.5.3.2** and **A.33.2.3.5.3.1**. In new facilities and existing facilities with slow or impractical evacuation capability, occupants might not be immediately evacuated; therefore, the normal 10-minute water supply duration specified in NFPA 13D is required to be increased to 30 minutes. Also, in new facilities and existing facilities with slow or impractical evacuation capability, sprinklers are required in closets and all habitable areas.

The exemption for sprinklers in the bathrooms and closets of existing facilities, as permitted by **33.2.3.5.3.3**, supplements the requirements of NFPA 13, *Standard for the Installation of Sprinkler Systems*. In addition to meeting the size limitation requirements, the walls and ceilings of bathroom and closet spaces must have a

## CHAPTER 33 • Existing

*Testing, and Maintenance of Water-Based Fire Protection Systems.*

**33.2.3.5.8.13** Control valves shall be operated through their full range and returned to normal annually in accordance with 13.3.3.1 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

**33.2.3.5.8.14** Operating stems of OS&Y valves shall be lubricated annually in accordance with 13.3.4 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

**33.2.3.5.8.15** Dry-pipe systems that extend into the unheated portions of the building shall be inspected, tested, and maintained in accordance with 13.4.4 of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*.

15-minute thermal barrier rating to qualify for the sprinkler exemption. The 15-minute thermal barrier rating includes walls and ceilings behind fixtures, such as prefabricated tub and shower enclosures.

The use of sprinkler systems installed in accordance with NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*,<sup>5</sup> is recognized by **32.2.3.5.3.1**, **33.2.3.5.3.4**, and **33.2.3.5.3.5**. In all new facilities and existing facilities with impractical evacuation capability, closets and habitable areas (other than existing small bathrooms) must be sprinklered.

Where a new small board and care facility is sprinklered in accordance with NFPA 13D or NFPA 13R, roofed porches, roofed decks, and roofed balconies must also be protected by automatic sprinklers (see **32.2.3.5.3.1** and **32.2.3.5.3.2**). Such areas are not typically required to be sprinklered by NFPA 13D or NFPA 13R. This additional coverage is intended to protect occupants from an undetected fire originating in those areas, developing, and potentially overwhelming the sprinkler system. It is expected that such areas can likely be protected by sidewall sprinklers, and freeze protection should not be necessary (see NFPA 13D and NFPA 13R for sprinkler system installation details). A companion provision addresses attics in **32/33.2.3.5.7**.

In existing facilities with prompt and slow evacuation capability, the sprinkler systems might need to be supervised, depending on the requirements of the installation standard used. For new small board and care facilities, **32.2.3.5.4** requires electrical supervision of automatic sprinkler systems installed in accordance with NFPA 13 and NFPA 13R. **Paragraph 32.2.3.5.5** requires supervision of NFPA 13D systems by one of three methods: a single valve controlling both the domestic and sprinkler water supply, electrical supervision in accordance with **9.7.2**, or an audible alarm device that sounds when the sprinkler water supply valve is closed.

## CHAPTER 32 • New

All existing small facilities with impractical evacuation capability must be sprinklered per [32.2.3.5.3.7](#). In a multiple occupancy building, if sprinkler protection is provided only in the board and care facility, and not throughout the building, any modifications to requirements predicated on complete building sprinkler coverage are not permitted to be used.

Because of the importance of the role of sprinkler systems in protecting occupants who cannot readily evacuate a building (defend-in-place strategy), sprinkler systems in all new facilities and existing facilities with impractical evacuation capability must be supervised in accordance with [9.7.2](#) or as specified in [32.2.3.5.5](#) for new small facilities with NFPA 13D systems. Note that [9.7.2](#) requires electrical supervision of control valves and the transmission of waterflow alarms to the fire department. NFPA 13D and NFPA 13R permit the sprinkler systems to be installed with the domestic water supply valve as the only means to shut off the sprinklers; there are no valves that control only the sprinkler system.

The provisions of [32/33.2.3.5.6](#) (sprinkler protection of hazardous areas) that require water supply duration to be in accordance with [32.2.3.5.3.2](#) and [33.2.3.5.3](#) affect facilities where unlimited public water is not available and captive sources such as tanks are used. Either a 10-minute or 30-minute water supply duration is needed, depending on whether the facility is new or existing; if it is an existing facility, the duration is also dependent on whether the facility has a prompt, slow, or impractical evacuation capability. Because [9.7.1.2](#) requires a capacity of 0.15 gpm/ft<sup>2</sup> (6.1 mm/min) for up to six sprinklers protecting an isolated hazardous area, a significant water reserve might be necessary.

The provisions of [32/33.2.3.5.7](#) mandate attic protection in facilities that are sprinklered in accordance with NFPA 13D or 13R, where those sprinkler installation standards would typically permit the omission of sprinklers. The intent of this requirement is to protect occupants by preventing an undetected fire from developing in an attic space and overwhelming the sprinkler system in the occupied portions of the building. If the attic is used for living purposes, is used for storage, or contains fuel-fired equipment, sprinklers must be provided as required by NFPA 13 (see [32/33.2.3.5.7.1](#)).

If the attic is not used for living purposes, is not used for storage, or does not contain fuel-fired equipment, four attic protection methods are specified by [32/33.2.3.5.7.2](#) as follows:

### 32.2.3.6 Construction of Corridor Walls.

**32.2.3.6.1** Corridor walls, other than those meeting the provisions of [32.2.3.6.2](#), shall meet all of the following requirements:

- (1) Walls separating sleeping rooms shall have a minimum ½-hour fire resistance rating. The minimum ½-hour fire

## CHAPTER 33 • Existing

1. Heat detection installed throughout the attic and arranged to activate the building fire alarm system
2. Automatic sprinklers installed throughout the attic in accordance with NFPA 13
3. Attic construction limited to noncombustible or limited-combustible materials (e.g., steel and gypsum wallboard)
4. Attic construction limited to fire-retardant-treated wood

The attic protection criteria were determined to be necessary following a fire in a board and care facility in New York that resulted in four deaths.<sup>6</sup> The facility was protected by an NFPA 13D sprinkler system with no sprinklers in the attic. The fire originated outside the building in a semi-enclosed porch (which also lacked sprinklers) and spread up the building's siding and into the unprotected attic. The delay in discovering the fire and the lack of attic protection were identified as factors that contributed to the loss of life. The *Code* requires attic protection both in new facilities and, retroactively, in existing sprinklered facilities to ensure the intended level of protection.

Because there are very minimal maintenance requirements for sprinkler systems installed in accordance with NFPA 13D, and because the scope of NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*,<sup>7</sup> excludes NFPA 13D sprinkler systems, [32/33.2.3.5.8](#) specifies a series of testing and maintenance requirements for such systems when installed in small board and care occupancies. Where NFPA 13D is utilized outside its originally intended scope (one- and two-family dwellings and manufactured homes), the *Code* supplements the requirements of NFPA 13D to ensure a high level of reliability, because the system is either a mandatory system or it is being used to modify some other *Code* requirement. The testing and maintenance requirements of [32/33.2.3.5.8](#) are not onerous. Several of the provisions, such as monthly visual inspection of control valves per [32/33.2.3.5.8.1](#), can be accomplished by the facility's owner or operator. Such routine visual inspection will help to ensure a control valve is not inadvertently closed, which could lead to the system's failure in the event of a fire.

### 33.2.3.6 Construction of Corridor Walls.

**33.2.3.6.1** Unless otherwise indicated in [33.2.3.6.1.1](#) through [33.2.3.6.1.4](#), corridor walls shall meet all of the following requirements:

- (1) Walls separating sleeping rooms from corridors and areas open to the corridor shall have a minimum ½-hour fire

## CHAPTER 32 • New

resistance rating shall be considered to be achieved if the partitioning is finished on both sides with lath and plaster or materials providing a 15-minute thermal barrier.

- (2) Sleeping room doors shall be substantial doors, such as those of 1¾ in. (44 mm) thick, solid-bonded wood-core construction or of other construction of equal or greater stability and fire integrity.
- (3) Any vision panels shall be fixed fire window assemblies in accordance with 8.3.4 or shall be wired glass not exceeding 9 ft<sup>2</sup> (0.84 m<sup>2</sup>) each in area and installed in approved frames.

**32.2.3.6.2** The requirements of 32.2.3.6.1 shall not apply to corridor walls that are smoke partitions in accordance with Section 8.4 where the facility is protected in accordance with 32.2.3.5, and all of the following shall also apply:

- (1) In such instances, there shall be no limitation on the type or size of glass panels.
- (2) Door closing shall comply with 32.2.3.6.4.

**32.2.3.6.3** No louvers, operable transoms, or other air passages shall penetrate the wall, except properly installed heating and utility installations other than transfer grilles, which shall be prohibited.

## CHAPTER 33 • Existing

resistance rating. The minimum ½-hour fire resistance rating shall be considered to be achieved if the partitioning is finished on both sides with lath and plaster or materials providing a 15-minute thermal barrier.

- (2) Sleeping room doors shall be substantial doors, such as those of 1¾ in. (44 mm) thick, solid-bonded wood-core construction or of other construction of equal or greater stability and fire integrity.
- (3) Any vision panels shall be fixed fire window assemblies in accordance with 8.3.4 or shall be wired glass not exceeding 9 ft<sup>2</sup> (0.84 m<sup>2</sup>) each in area and installed in approved frames.

**33.2.3.6.1.1** In prompt evacuation capability facilities, all sleeping rooms shall be separated from the escape route by smoke partitions in accordance with Section 8.4, and door closing shall be regulated by 33.2.3.6.4.

**33.2.3.6.1.2** The requirement of 33.2.3.6.1 shall not apply to corridor walls that are smoke partitions in accordance with Section 8.4 and that are protected by automatic sprinklers in accordance with 33.2.3.5 on both sides of the wall and door, and all of the following shall also apply:

- (1) In such instances, there shall be no limitation on the type or size of glass panels.
- (2) Door closing shall comply with 33.2.3.6.4.

**33.2.3.6.1.3** Sleeping arrangements that are not located in sleeping rooms shall be permitted for nonresident staff members, provided that the audibility of the alarm in the sleeping area is sufficient to awaken staff who might be sleeping.

**33.2.3.6.1.4** In previously approved facilities, where the facility has demonstrated to the authority having jurisdiction that the group is capable of evacuating the building in 8 minutes or less, or where the group achieves an E-score of 3 or less using the board and care occupancies evacuation capability determination methodology of NFPA 101A, *Guide on Alternative Approaches to Life Safety*, sleeping rooms shall be separated from escape routes by walls and doors that are smoke resistant.

**33.2.3.6.2 Reserved.**

**33.2.3.6.3** No louvers, operable transoms, or other air passages shall penetrate the wall, except properly installed heating and utility installations other than transfer grilles, which shall be prohibited.

## CHAPTER 32 • New

**32.2.3.6.4** Doors shall meet all of the following requirements:

- (1) Doors shall be provided with latches or other mechanisms suitable for keeping the doors closed.
- (2) No doors shall be arranged to prevent the occupant from closing the door.
- (3) Doors shall be self-closing or automatic-closing in accordance with 7.2.1.8 in buildings other than those protected throughout by an approved automatic sprinkler system in accordance with 32.2.3.5.

The intent of 32/33.2.3.6.1 in requiring corridor walls to have a ½-hour fire resistance rating is to require a nominal resistance to burn-through, particularly where the fire rating of existing partitions cannot be documented. Examples of acceptable partition assemblies include, but are not limited to, ½ in. (13 mm) thick gypsum wallboard, wood lath and plaster, or metal lath and plaster.

Per 32.2.3.6.2 and 33.2.3.6.1.2, fire resistance-rated assemblies are not required where sprinkler protection is provided on both sides of the corridor wall and door. Complete sprinkler protection, as required for new construction by 32.2.3.5.1 and permitted for existing facilities by 33.2.3.5, would clearly meet this criterion. Therefore, this provision represents the most typical case where corridor walls and doors are required only to meet the requirements for smoke partitions (see Section 8.4).

**32.2.4 Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers in accordance with 8.7.3.3 shall be permitted.

The provision of 32/33.2.4 is new to the 2015 edition of the Code. It recognizes the use of alcohol-based hand-rub (ABHR) dis-

**32.2.5 Building Services.**

**32.2.5.1 Utilities.** Utilities shall comply with Section 9.1.

**32.2.5.2 Heating, Ventilating, and Air-Conditioning.**

**32.2.5.2.1** Heating, ventilating, and air-conditioning equipment shall comply with 9.2.1 and 9.2.2, unless otherwise required in this chapter.

**32.2.5.2.2** No stove or combustion heater shall be located to block escape in case of fire caused by the malfunction of the stove or heater.

**32.2.5.2.3** Unvented fuel-fired heaters shall not be used in any residential board and care facility.

**32.2.5.3 Elevators, Escalators, and Conveyors.** Elevators, escalators, and conveyors shall comply with Section 9.4.

## CHAPTER 33 • Existing

**33.2.3.6.4** Doors shall meet all of the following requirements:

- (1) Doors shall be provided with latches or other mechanisms suitable for keeping the doors closed.
- (2) No doors shall be arranged to prevent the occupant from closing the door.
- (3) Doors shall be self-closing or automatic-closing in accordance with 7.2.1.8 in buildings other than those protected throughout by an approved automatic sprinkler system in accordance with 33.2.3.5.3.

Many board and care facilities employ sleep-in staff. Placing a staff cot in a supervisor's office, living room, or other room does not reclassify that room as a sleeping room. The provision in 33.2.3.6.1.3 is intended to permit staff members to sleep in locations that are not separated from the corridors.

Paragraph 33.2.3.6.1.4 permits a previously approved situation to continue to be recognized in existing small facilities with residents who perform in the faster half of the overall slow evacuation capability category. This provision cannot be used for a first-time evaluation of the adequacy of smoke-resisting corridor walls.

Doors in corridor walls are required by 32/33.2.3.6.4(3) to be self-closing or automatic-closing, unless the entire building is protected throughout by an approved automatic sprinkler system.

**33.2.4 Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers in accordance with 8.7.3.3 shall be permitted.

dispensers in small board and care facilities, provided that the detailed criteria of 8.7.3.3 are met.

**33.2.5 Building Services.**

**33.2.5.1 Utilities.** Utilities shall comply with Section 9.1.

**33.2.5.2 Heating, Ventilating, and Air-Conditioning.**

**33.2.5.2.1** Heating, ventilating, and air-conditioning equipment shall comply with the provisions of 9.2.1 and 9.2.2, except as otherwise required in this chapter.

**33.2.5.2.2** No stove or combustion heater shall be located to block escape in case of fire caused by the malfunction of the stove or heater.

**33.2.5.2.3** Unvented fuel-fired heaters shall not be used in any residential board and care facility.

## CHAPTER 32 • New

The provision of 32/33.2.5.2.2 does not require a kitchen containing a stove to be completely separated by smoke partitions, only that the stove be located so that a malfunction does not result in a blockage of the means of escape. If, in the opinion of the authority having jurisdiction, the location of the stove would

## 32.3 Large Facilities

### 32.3.1 General.

#### 32.3.1.1 Scope.

**32.3.1.1.1** Section 32.3 shall apply to residential board and care occupancies providing sleeping accommodations for more than 16 residents.

**32.3.1.1.2** Facilities having sleeping accommodations for not more than 16 residents shall comply with Section 32.2.

#### 32.3.1.2 Reserved.

## CHAPTER 33 • Existing

cause the means of escape to be blocked in the event of a malfunction, the application of 32/33.2.3.2 might be appropriate for mitigating the hazard.

The use of typical kerosene portable heaters, as well as other fuel-fired, unvented heaters, is prohibited by 32/33.2.5.2.3.

## 33.3 Large Facilities

### 33.3.1 General.

#### 33.3.1.1 Scope.

**33.3.1.1.1** Section 33.3 shall apply to residential board and care occupancies providing sleeping accommodations for more than 16 residents.

**33.3.1.1.2** Facilities having sleeping accommodations for not more than 16 residents shall be evaluated in accordance with Section 33.2.

**33.3.1.1.3** Facilities meeting the requirements of Section 33.3 shall be considered to have met the requirements of Section 33.2 for the appropriate evacuation capability classification, except as amended in Section 33.3.

#### 33.3.1.2 Requirements Based on Evacuation Capability.

**33.3.1.2.1 Prompt and Slow.** Large facilities classified as prompt or slow evacuation capability, other than those meeting the requirement of 33.3.1.2.1.1 or 33.3.1.2.1.2, shall comply with the requirements of Section 33.3, as indicated for the appropriate evacuation capability.

**33.3.1.2.1.1\*** Facilities where the authority having jurisdiction has determined equivalent safety is provided in accordance with Section 1.4 shall not be required to comply with the requirements of Section 33.3, as indicated for the appropriate evacuation capability.

**A.33.3.1.2.1.1** In determining equivalency for existing buildings, conversions, modernizations, renovations, or unusual design concepts, the authority having jurisdiction might permit evaluations based on the residential board and care occupancies fire safety evaluation system (FSES) of NFPA 101A, *Guide on Alternative Approaches to Life Safety*.

**33.3.1.2.1.2** Facilities that were previously approved as complying with 33.3.1.2.2 shall not be required to comply with the requirements of Section 33.3, as indicated for the appropriate evacuation capability.

**33.3.1.2.2 Impractical.** Large facilities classified as impractical evacuation capability shall meet the requirements of Section 33.3 for impractical evacuation capability, or the requirements for limited care facilities in Chapter 19, unless the authority having

The importance of an accurate evaluation of evacuation capabilities in existing facilities cannot be overstated. Ineffective resident or staff response was a contributing factor in many of the multiple-death fires listed in [Commentary Table 32/33.1](#).

Determining a facility's evacuation capability is not simply a matter of timing a fire drill in the middle of the day. Many variables affect a resident's capability to evacuate, and these variables must be carefully considered and factored into the documentation presented to the authority having jurisdiction for approval. Some variables that should be considered follow.

*Time of Day.* An occupant's ability to evacuate might be slowed dramatically when the occupant must be awakened. In such a situation, the occupant must process the information that evacuation is necessary and then begin evacuating.

*Medication.* Many individuals in board and care occupancies take various medications for behavior control or as sleeping aids. If an individual is medicated, he or she might need additional assistance in responding and evacuating.

*Mobility and Location of Occupants.* Once individuals become aware of an emergency and take action, their ability to move through the building must be considered. Individuals using wheelchairs, walkers, or canes are further slowed when using stairs or ramps or when opening doors.

*Staff Assistance.* Though the Code does not specify minimum staffing levels, staffing levels should be considered, especially where high resident-to-staff ratios exist. Given the additional needs mentioned in the first three variables, the staff will be limited in their ability to affect evacuation time where multiple residents need assistance.

The evacuation capability of the population of a board and care occupancy might vary over time. The required documentation should be reviewed regularly to ensure that it accurately represents the current evacuation capability of the residents and staff.

When determining equivalency in accordance with [33.3.1.2.1.1](#) or [33.3.1.2.2](#), it is important to note that the equival-

jurisdiction has determined equivalent safety is provided in accordance with [Section 1.4](#).

### 33.3.1.2.3 Evacuation Capability Determination.

**33.3.1.2.3.1** Facility management shall furnish to the authority having jurisdiction, upon request, an evacuation capability determination using a procedure acceptable to the authority having jurisdiction.

**33.3.1.2.3.2** Where the documentation required by [33.3.1.2.3.1](#) is not furnished, the evacuation capability shall be classified as impractical.

ency measurement systems of the 2013 edition of NFPA 101A, *Guide on Alternative Approaches to Life Safety*, were calibrated against the requirements of the 2012 edition of NFPA 101 and might not accurately evaluate equivalency with the requirements of the 2015 edition of the *Life Safety Code*. At the time this handbook went to press, the 2016 edition of NFPA 101A was being prepared. Once issued, the 2016 edition of NFPA 101A can be used to measure equivalency against the requirements of the 2015 edition of the *Code*.

Prior to the 2012 edition of the *Code*, existing large board and care facilities with impractical evacuation capability were required to comply with the requirements of [Chapter 19](#) for limited care facilities, rather than those of [Chapter 33](#). [Chapter 33](#) was revised for the 2012 edition to permit large facilities with impractical evacuation capability to comply with either [Chapter 19](#) or [Chapter 33](#) by adding protection criteria to [Chapter 33](#) to address the risk posed by this evacuation capability level. Requiring facility owners to upgrade facilities to meet all of the stringent health care occupancy requirements of [Chapter 19](#) when the evacuation capability has slowed to impractical due to occupants aging in place was determined to be unreasonable and unrealistic. Compliance with the requirements for impractical evacuation capability in [Section 33.3](#) should be achievable and will allow residents to remain safely in a facility, regardless of the degradation of evacuation capability.

The package of requirements for existing large board and care facilities with impractical evacuation capability includes the following:

1. Minimum corridor width of 44 in. (1120 mm) ([33.3.2.3.3](#))
2. Emergency lighting ([33.3.2.9](#))
3. Hazardous area separation by smoke partitions ([33.3.3.2.3](#))
4. Fire alarm system with corridor and living area smoke detection ([33.3.3.4.8](#))
5. Automatic sprinkler system per NFPA 13, *Standard for the Installation of Sprinkler Systems* ([33.3.3.5.2](#))
6. Smoke barriers ([33.3.3.7](#))

## CHAPTER 32 • New

The requirements in [Section 32.3](#) for new large board and care facilities, which were significantly revised for the 2003 edition of the *Code*, are predicated on the assumption that the facility might be occupied by residents classified as having

**32.3.1.3 Minimum Construction Requirements.** Large board and care facilities shall be limited to the building construction types specified in [Table 32.3.1.3](#) (see [8.2.1](#)), based on the number of stories in height as defined in [4.6.3](#).

Because evacuation strategies might be limited to moving residents to a point of safety, the *Code* regulates construction type to ensure building stability if the residents are to remain inside. The stability of the building is maintained by the use of an

**32.3.1.4 Occupant Load.** The occupant load, in number of persons for whom means of egress and other provisions are required, shall be determined on the basis of the occupant load factors of [Table 7.3.1.2](#) that are characteristic of the use of the space, or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

The determination of actual occupant load is based on the total number of residents, staff, and visitors. If the actual occupant load of the facility exceeds the occupant load calculated on the basis of one person per 200 ft<sup>2</sup> (18.6 m<sup>2</sup>), as stipulated in [Table 7.3.1.2](#), the egress capacity must be designed to meet the

## 32.3.2 Means of Egress.

### 32.3.2.1 General.

**32.3.2.1.1** Means of egress from resident rooms and resident dwelling units to the outside of the building shall be in accordance with [Chapter 7](#) and this chapter.

**32.3.2.1.2** Means of escape within the resident room or resident dwelling unit shall comply with [Section 24.2](#) for one- and two-family dwellings.

### 32.3.2.2 Means of Egress Components.

**32.3.2.2.1 Components Permitted.** Components of means of egress shall be limited to the types described in [32.3.2.2.2](#) through [32.3.2.2.10](#).

**32.3.2.2.2 Doors.** Doors in means of egress shall meet all of the following criteria:

- (1) Doors complying with [7.2.1](#) shall be permitted.
- (2) Doors within individual rooms and suites of rooms shall be permitted to be swinging or sliding.

## CHAPTER 33 • Existing

impractical evacuation capability. Since the requirements are based on an assumed worst-case scenario, no evaluation of evacuation capability is required in facilities meeting the requirements of [Chapter 32](#).

**33.3.1.3 Minimum Construction Requirements.** Large facilities shall be limited to the building construction types specified in [Table 33.3.1.3](#). (See [8.2.1](#).)

automatic sprinkler system (as required for new construction by [32.3.3.5.1](#)), by the use of fire-resistant construction, or by a combination of the two, depending on the location of the board and care facility in the building.

**33.3.1.4 Occupant Load.** The occupant load, in number of persons for whom means of egress and other provisions are required, shall be determined on the basis of the occupant load factors of [Table 7.3.1.2](#) that are characteristic of the use of the space, or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

actual (larger) occupant load. However, if the actual occupant load is smaller than the calculated occupant load, the minimum egress capacity must not be less than that required for the calculated (larger) occupant load.

## 33.3.2 Means of Egress.

### 33.3.2.1 General.

**33.3.2.1.1** Means of egress from resident rooms and resident dwelling units to the outside of the building shall be in accordance with [Chapter 7](#) and this chapter.

**33.3.2.1.2** Means of escape within the resident room or resident dwelling unit shall comply with [Section 24.2](#) for one- and two-family dwellings.

### 33.3.2.2 Means of Egress Components.

**33.3.2.2.1 Components Permitted.** Components of means of egress shall be limited to the types described in [33.3.2.2.2](#) through [33.3.2.2.10](#).

**33.3.2.2.2 Doors.** Doors in means of egress shall be as follows:

- (1) Doors complying with [7.2.1](#) shall be permitted.
- (2) Doors within individual rooms and suites of rooms shall be permitted to be swinging or sliding.

X: Permitted. NP: Not permitted.

<sup>a</sup>Building protected throughout by an approved automatic sprinkler system installed in accordance with 9.7.1.1(1), and provided with quick-response or residential sprinklers throughout. (See 32.3.3.5.)

<sup>b</sup>See 4.6.3.

<sup>c</sup>Any building of Type I, Type II(222), or Type II(111) construction is permitted to include roofing systems involving combustible supports, decking, or roofing, provided that all of the following criteria are met:

- (1) The roof covering meets Class A requirements in accordance with ASTM E 108, *Standard Test Methods for Fire Tests of Roof Coverings*, or ANSI/UL 790, *Test Methods for Fire Tests of Roof Coverings*.
- (2) The roof is separated from all occupied portions of the building by a noncombustible floor assembly having not less than a 2-hour fire resistance rating that includes not less than 2½ in. (63 mm) of concrete or gypsum fill.
- (3) The structural elements supporting the 2-hour fire resistance-rated floor assembly specified in item (2) are required to have only the fire resistance rating required of the building.

<sup>d</sup>Any building of Type I, Type II(222), or Type II(111) construction is permitted to include roofing systems involving combustible supports, decking, or roofing, provided that all of the following criteria are met:

- (1) The roof covering meets Class A requirements in accordance with ASTM E 108, *Standard Test Methods for Fire Tests of Roof Coverings*, or ANSI/UL 790, *Test Methods for Fire Tests of Roof Coverings*.
- (2) The roof/ceiling assembly is constructed with fire-retardant-treated wood meeting the requirements of NFPA 220, *Standard on Types of Building Construction*.
- (3) The roof/ceiling assembly has the required fire resistance rating for the type of construction.

NP: Not permitted.

X: Permitted.

X1: Permitted if the interior walls are covered with lath and plaster or materials providing a 15-minute thermal barrier.

X2: Permitted if the interior walls are covered with lath and plaster or materials providing a 15-minute thermal barrier, and protected throughout by an approved automatic sprinkler system installed in accordance with 33.3.3.5.

<sup>a</sup>Building protected throughout by an approved, supervised automatic sprinkler system installed in accordance with Section 9.7. (See 33.3.3.5.)

<sup>b</sup>See 4.6.3.

<sup>c</sup>One-story prompt evacuation capability facilities having 30 or fewer residents, with egress directly to the exterior at the finished ground level, are permitted to be of any construction type.

<sup>d</sup>Any building of Type I, Type II(222), or Type II(111) construction is permitted to include roofing systems involving combustible supports, decking, or roofing, provided that all of the following criteria are met:

(1) The roof covering meets Class A requirements in accordance with ASTM E 108, *Standard Test Methods for Fire Tests of Roof Coverings*, or ANSI/UL 790, *Test Methods for Fire Tests of Roof Coverings*.

(2) The roof is separated from all occupied portions of the building by a noncombustible floor assembly having not less than a 2-hour fire resistance rating that includes not less than 2½ in. (63 mm) of concrete or gypsum fill, and the attic or other space so developed is either unused or protected throughout by an approved automatic sprinkler system in accordance with 33.3.3.5.1.

<sup>e</sup>Any building of Type I, Type II(222), or Type II(111) construction is permitted to include roofing systems involving combustible supports, decking, or roofing, provided that all of the following criteria are met:

(1) The roof covering meets Class A requirements in accordance with ASTM E 108, *Standard Test Methods for Fire Tests of Roof Coverings*, or ANSI/UL 790, *Test Methods for Fire Tests of Roof Coverings*.

(2) The roof/ceiling assembly is constructed with fire-retardant-treated wood meeting the requirements of NFPA 220, *Standard on Types of Building Construction*.

(3) The roof/ceiling assembly has the required fire resistance rating for the type of construction.

## CHAPTER 32 • New

- (3) No door, other than those meeting the requirement of 32.3.2.2.2(4), 32.3.2.2.2(5), or 32.3.2.2.2(6), shall be equipped with a lock or latch that requires the use of a tool or key from the egress side.
- (4) Delayed-egress locks in accordance with 7.2.1.6.1 shall be permitted.
- (5) Access-controlled egress door assemblies in accordance with 7.2.1.6.2 shall be permitted.
- (6) Door-locking arrangements shall be permitted where the clinical needs of residents require specialized security measures or where residents pose a security threat, provided both of the following conditions are met:
  - (a) Staff can readily unlock doors at all times in accordance with 32.3.2.2.2(7).
  - (b) The building is protected by an approved automatic sprinkler system in accordance with 32.3.3.5.
- (7) Doors located in the means of egress that are permitted to be locked under other provisions of Chapter 32, other than those meeting the requirement of 32.3.2.2.2(4) or 32.3.2.2.2(5), shall have adequate provisions made for the rapid removal of occupants by means such as remote control of locks, keying of all locks to keys carried by staff at all times, or other such reliable means available to staff at all times.
- (8) Only one such locking device, as described in 32.3.2.2.2(7), shall be permitted on each door.

**32.3.2.2.3 Stairs.** Stairs complying with 7.2.2 shall be permitted.

**32.3.2.2.4 Smokeproof Enclosures.** Smokeproof enclosures complying with 7.2.3 shall be permitted.

**32.3.2.2.5 Horizontal Exits.** Horizontal exits complying with 7.2.4 shall be permitted.

**32.3.2.2.6 Ramps.** Ramps complying with 7.2.5 shall be permitted.

**32.3.2.2.7 Exit Passageways.** Exit passageways complying with 7.2.6 shall be permitted.

**32.3.2.2.8 Fire Escape Ladders.** Fire escape ladders complying with 7.2.9 shall be permitted.

**32.3.2.2.9 Alternating Tread Devices.** Alternating tread devices complying with 7.2.11 shall be permitted.

**32.3.2.2.10 Areas of Refuge.** Areas of refuge complying with 7.2.12 shall be permitted.

A general reference to Chapter 7 is made in 32/33.3.2.1, rather than repeating its myriad provisions. Many of the requirements contained in 32/33.3.2 are Chapter 7 provisions that require

## CHAPTER 33 • Existing

- (3) No door in any means of egress, other than those meeting the requirement of 33.3.2.2.2(4), 33.3.2.2.2(5), or 33.3.2.2.2(6), shall be locked against egress when the building is occupied.
- (4) Delayed-egress locks in accordance with 7.2.1.6.1 shall be permitted.
- (5) Access-controlled egress door assemblies in accordance with 7.2.1.6.2 shall be permitted.
- (6) Door-locking arrangements shall be permitted where the clinical needs of residents require specialized security measures or where residents pose a security threat, provided both of the following conditions are met:
  - (a) Staff can readily unlock doors at all times in accordance with 33.3.2.2.2(7).
  - (b) The building is protected by an approved automatic sprinkler system in accordance with 33.3.3.5.
- (7) Doors located in the means of egress that are permitted to be locked under other provisions of Chapter 33, other than those meeting the requirement of 33.3.2.2.2(4) or 33.3.2.2.2(5), shall have adequate provisions made for the rapid removal of occupants by means such as remote control of locks, keying of all locks to keys carried by staff at all times, or other such reliable means available to staff at all times.
- (8) Only one such locking device, as described in 33.3.2.2.2(7), shall be permitted on each door.
- (9) Revolving doors complying with 7.2.1.10 shall be permitted.

**33.3.2.2.3 Stairs.** Stairs complying with 7.2.2 shall be permitted.

**33.3.2.2.4 Smokeproof Enclosures.** Smokeproof enclosures complying with 7.2.3 shall be permitted.

**33.3.2.2.5 Horizontal Exits.** Horizontal exits complying with 7.2.4 shall be permitted.

**33.3.2.2.6 Ramps.** Ramps complying with 7.2.5 shall be permitted.

**33.3.2.2.7 Exit Passageways.** Exit passageways complying with 7.2.6 shall be permitted.

**33.3.2.2.8 Fire Escape Ladders.** Fire escape ladders complying with 7.2.9 shall be permitted.

**33.3.2.2.9 Alternating Tread Devices.** Alternating tread devices complying with 7.2.11 shall be permitted.

**33.3.2.2.10 Areas of Refuge.** Areas of refuge complying with 7.2.12 shall be permitted.

occupancy chapter permission, such as in 32/33.3.2.2(4), which permits the use of delayed-egress locks in accordance with 7.2.1.6.1.

## CHAPTER 32 • New

Facilities are prohibited from having any door locked against egress while the building is occupied per 32/33.3.2.2.2(3), except as permitted by 32/33.3.2.2.2(6), which is new to the 2015 edition of the *Code*. This is consistent with a fundamental means of egress provision of Chapter 7. The requirement permits a door to have a locking device that allows the door to be opened from within the facility for the purpose of egress but does not allow the door to be opened from outside the facility. Ordinary double-cylinder locks and chain locks do not meet these provisions.

Prior to the 2012 edition of the *Code*, the use of delayed-egress locks in accordance with 7.2.1.6.1 was permitted in large board and care facilities only where not more than one delayed-egress device was encountered in any means of egress path. This restriction was deleted for the 2012 edition based on the reliability of, and experience with, delayed-egress locking systems [see 32/33.3.2.2.2(4)]. The use of delayed-egress locks requires the building to be either protected throughout by automatic sprinklers or equipped throughout with an automatic fire detection

**32.3.2.3 Capacity of Means of Egress.**

**32.3.2.3.1** The capacity of means of egress shall be in accordance with Section 7.3.

**32.3.2.3.2** Street floor exits shall be sufficient for the occupant load of the street floor plus the required capacity of stairs and ramps discharging onto the street floor.

**32.3.2.3.3** The width of corridors shall be sufficient for the occupant load served but shall be not less than 60 in. (1525 mm).

Corridors in new large board and care facilities must have a minimum clear width of at least 60 in. (1525 mm) based on the assumption of impractical evacuation capability and the need to move residents in beds, gurneys, and wheelchairs (see 32.3.2.3.3). The corridor width provisions for existing large facilities were

**32.3.2.4 Number of Means of Egress.**

**32.3.2.4.1** Means of egress shall comply with the following, except as otherwise permitted by 32.3.2.4.2:

- (1) The number of means of egress shall be in accordance with Section 7.4.
- (2) Not less than two separate exits shall be provided on every story.

## CHAPTER 33 • Existing

system. The 15-second or 30-second delay permitted by 7.2.1.6.1 does not affect the immediate release of the lock upon activation of the sprinklers or detectors or upon loss of power to the lock. The delayed-egress device helps provide security for infrequently used doors in board and care facilities, while doors remain available for emergency use. Chains and padlocks do not provide this feature.

The provisions of 32/33.3.2.2.2(6) permit doors to be locked in the direction of egress where necessary for the residents' safety, based on their clinical needs. Such locking arrangements are permitted only in buildings that are protected by automatic sprinkler systems and where means are provided to facilitate rapid unlocking of doors by staff as specified by 32/33.3.2.2.2(7). Facilities for which door locking might be appropriate include those for housing residents with dementia, who require the personal care services associated with a board and care facility and are at risk of wandering from the facility.

**33.3.2.3 Capacity of Means of Egress.**

**33.3.2.3.1** The capacity of means of egress shall be in accordance with Section 7.3.

**33.3.2.3.2** Street floor exits shall be sufficient for the occupant load of the street floor plus the required capacity of stairs and ramps discharging onto the street floor.

**33.3.2.3.3** The width of corridors serving an occupant load of 50 or more in facilities having prompt or slow evacuation capability, and all facilities having impractical evacuation capability, shall be sufficient for the occupant load served but shall be not less than 44 in. (1120 mm).

**33.3.2.3.4** The width of corridors serving an occupant load of less than 50 in facilities having prompt or slow evacuation capability shall be not less than 36 in. (915 mm).

revised for the 2012 edition to require at least 44 in. (1120 mm) if the evacuation capability is impractical or the occupant load is 50 or more, while previous editions of the *Code* required existing large facilities with impractical evacuation capability to meet the requirements of Chapter 19 for limited care facilities.

**33.3.2.4 Number of Means of Egress.**

**33.3.2.4.1** Means of egress shall comply with the following, except as otherwise permitted by 33.3.2.4.2:

- (1) The number of means of egress shall be in accordance with 7.4.1.1 and 7.4.1.3 through 7.4.1.6.
- (2) Not less than two separate exits shall be provided on every story.

## CHAPTER 32 • New

(3) Not less than two separate exits shall be accessible from every part of every story.

**32.3.2.4.2** Exit access, as required by 32.3.2.4.1(3), shall be permitted to include a single exit access path for the distances permitted as common paths of travel by 32.3.2.5.2.

**32.3.2.5 Arrangement of Means of Egress.**

**32.3.2.5.1** Access to all required exits shall be in accordance with Section 7.5.

**32.3.2.5.2** Common paths of travel shall not exceed 75 ft (23 m).

**32.3.2.5.3 Reserved.**

**32.3.2.5.4** Dead-end corridors shall not exceed 30 ft (9.1 m).

**32.3.2.5.5** Any room, or any suite of rooms, exceeding 2000 ft<sup>2</sup> (185 m<sup>2</sup>) shall be provided with not less than two exit access doors located remotely from each other.

**32.3.2.6 Travel Distance to Exits.** Travel distance from any point in a room to the nearest exit, measured in accordance with Section 7.6, shall not exceed 250 ft (76 m).

## CHAPTER 33 • Existing

(3) Not less than two separate exits shall be accessible from every part of every story.

**33.3.2.4.2** Exit access, as required by 33.3.2.4.1(3), shall be permitted to include a single exit access path for the distances permitted as common paths of travel by 33.3.2.5.2 and 33.3.2.5.3.

**33.3.2.5 Arrangement of Means of Egress.**

**33.3.2.5.1** Access to all required exits shall be in accordance with Section 7.5 unless otherwise modified by this chapter.

**33.3.2.5.2** Common paths of travel shall not exceed 110 ft (33.5 m) in buildings not protected throughout by an automatic sprinkler system in accordance with 33.3.3.5.

**33.3.2.5.3** In buildings protected throughout by automatic sprinkler systems in accordance with 33.3.3.5, common paths of travel shall not exceed 160 ft (48.8 m).

**33.3.2.5.4** Dead-end corridors shall not exceed 50 ft (15 m).

**33.3.2.6 Travel Distance to Exits.**

**33.3.2.6.1** Travel distance within a room, suite, or living unit to a corridor door shall not exceed 75 ft (23 m) in buildings not protected throughout by an approved automatic sprinkler system in accordance with 33.3.3.5.

**33.3.2.6.2** Travel distance within a room, suite, or living unit to a corridor door shall not exceed 125 ft (38 m) in buildings protected throughout by an approved automatic sprinkler system in accordance with 33.3.3.5.

**33.3.2.6.3** Travel distance from the corridor door of any room to the nearest exit shall be in accordance with 33.3.2.6.3.1, 33.3.2.6.3.2, or 33.3.2.6.3.3.

**33.3.2.6.3.1** Travel distance from the corridor door of any room to the nearest exit, measured in accordance with Section 7.6, shall not exceed 100 ft (30 m).

**33.3.2.6.3.2** Travel distance to exits shall not exceed 200 ft (61 m) for exterior ways of exit access arranged in accordance with 7.5.3.

**33.3.2.6.3.3** Travel distance to exits shall not exceed 200 ft (61 m) if the exit access and any portion of the building that is tributary to the exit access are protected throughout by approved automatic sprinkler systems in accordance with 33.3.3.5. In addition, the portion of the building in which 200 ft (61 m) travel distance is permitted shall be separated from the remainder of the building by construction having a minimum 1-hour fire

## CHAPTER 32 • New

**32.3.2.7 Discharge from Exits.** Exit discharge shall comply with [Section 7.7](#).

**32.3.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with [Section 7.8](#).

**32.3.2.9 Emergency Lighting.** Emergency lighting in accordance with [Section 7.9](#) shall be provided, unless each sleeping room has a direct exit to the outside at the finished ground level.

**32.3.2.10 Marking of Means of Egress.** Means of egress shall be marked in accordance with [Section 7.10](#).

**32.3.2.11 Special Means of Egress Features.**

**32.3.2.11.1 Reserved.**

**32.3.2.11.2 Lockups.** Lockups in residential board and care occupancies shall comply with the requirements of [22.4.5](#).

Street-floor egress capacity must be provided in accordance with [32/33.3.2.3.2](#), such that it is sufficient to accommodate the convergence of first-floor occupants with occupants leaving exit enclosures from the upper and lower floors and traversing areas of the first floor. This concept is common in hotel, apartment, business, and mercantile occupancies. See the commentary following [28/29.2.3.2](#) and [Exhibit 28/29.5](#).

The provisions of [32/33.3.2.4](#) are similar to those for hotels. No building or story is permitted to have a single exit. Note that [7.4.1.2](#) requires at least three exits for floors with more than 500 people and at least four exits are required for those floors with more than 1000 people. This requirement will probably have minimal impact on board and care facilities, because such large floors would probably need additional exits to meet travel distance limitations.

Common path of travel in board and care facilities is measured in the usual manner outlined in [A.7.5.1.5](#). Prior to the mid-1990s, the residential board and care occupancy chapters used a modified common path of travel for corridors similar to that currently used in the hotel and apartment occupancy chapters.

Travel distance to exits is addressed in [32/33.3.2.6](#). For new large board and care facilities, the travel distance limitation is straightforward: 250 ft (76 m) from any point to the nearest exit. For existing large board and care facilities, the travel distance limitations of [33.3.2.6](#) are divided into two segments — within a

## CHAPTER 33 • Existing

resistance rating, for buildings three or fewer stories in height, and a minimum 2-hour fire resistance rating for buildings four or more stories in height.

**33.3.2.7 Discharge from Exits.** Exit discharge shall comply with [Section 7.7](#).

**33.3.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with [Section 7.8](#).

**33.3.2.9 Emergency Lighting.** Emergency lighting in accordance with [Section 7.9](#) shall be provided in all facilities meeting any of the following criteria:

- (1) Facilities having an impractical evacuation capability
- (2) Facilities having a prompt or slow evacuation capability with more than 25 sleeping rooms, unless each sleeping room has a direct exit to the outside of the building at the finished ground level.

**33.3.2.10 Marking of Means of Egress.** Means of egress shall be marked in accordance with [Section 7.10](#).

**33.3.2.11 Special Means of Egress Features.**

**33.3.2.11.1 Reserved.**

**33.3.2.11.2 Lockups.** Lockups in residential board and care occupancies, other than approved existing lockups, shall comply with the requirements of [23.4.5](#).

room or suite and within the common corridor system or along the exterior exit access balcony.

[Exhibit 32/33.11](#) illustrates an existing large board and care facility with three separate sections, or wings. Wings B and C are nonsprinklered, and Wing A is protected by an automatic sprinkler system. In the nonsprinklered areas (B and C), [33.3.2.6.1](#) limits the travel distance within the room/suite to 75 ft (23 m). In the sprinklered area (A), the permitted travel distance within the room/suite is 125 ft (38 m) per [33.3.2.6.2](#). Once outside the room/suite, [33.3.2.6.3.1](#) limits the travel distance within a nonsprinklered interior corridor to an exit to 100 ft (30 m), as in area B of the building. However, the distance is permitted to be increased to 200 ft (61 m) if the travel is by way of exterior exit access (area C), or if the building is protected by an automatic sprinkler system (area A), per [33.3.2.6.3.2](#) and [33.3.2.6.3.3](#), respectively. Note that, where the increased travel distance is utilized in the sprinklered portion of a partially sprinklered building, the sprinklered and nonsprinklered areas must be separated by a 1-hour fire barrier if the building is three stories or fewer in height or a 2-hour fire barrier if the building is more than three stories in height.

The provision of [33.3.2.9\(2\)](#) that permits the omission of emergency lighting does not apply to facilities with exterior balconies that require travel on stairs to reach ground level; it applies only to facilities having doors opening directly at ground level.

Exhibit 32/33.11

Travel distance limitations.

### 32.3.3 Protection.

#### 32.3.3.1 Protection of Vertical Openings.

**32.3.3.1.1** Vertical openings shall be enclosed or protected in accordance with [Section 8.6](#).

**32.3.3.1.2** Unenclosed vertical openings in accordance with [8.6.9.1](#) shall be permitted.

### 33.3.3 Protection.

#### 33.3.3.1 Protection of Vertical Openings.

**33.3.3.1.1** Vertical openings shall comply with [33.3.3.1.1.1](#), [33.3.3.1.1.2](#), or [33.3.3.1.1.3](#).

**33.3.3.1.1.1** Vertical openings shall be enclosed or protected in accordance with [Section 8.6](#).

**33.3.3.1.1.2** Unprotected vertical openings not part of required egress shall be permitted by the authority having jurisdiction where such openings do not endanger required means of egress, provided that the building is protected throughout by an approved automatic sprinkler system in accordance with [33.3.3.5](#), and the exits and required ways of travel thereto are adequately safeguarded against fire and smoke within the building, or where every individual room has direct access to an exterior exit without passing through a public corridor.

**33.3.3.1.1.3** In buildings two or fewer stories in height, unprotected vertical openings shall be permitted by the authority having jurisdiction, provided that the building is protected throughout by an approved automatic sprinkler system in accordance with [33.3.3.5](#).

**33.3.3.1.2** Reserved.

## CHAPTER 32 • New

**32.3.3.1.3** No floor below the level of exit discharge used only for storage, heating equipment, or purposes other than residential occupancy shall have unprotected openings to floors used for residential occupancy.

Automatic sprinklers are not required in all existing board and care facilities. However, if automatic sprinklers are installed, **33.3.3.1.1.2** and **33.3.3.1.1.3** permit the authority having jurisdic-

### 32.3.3.2 Protection from Hazards.

**32.3.3.2.1** Hazardous areas shall be protected in accordance with **Section 8.7**.

**32.3.3.2.2** The areas described in **Table 32.3.3.2.2** shall be protected as indicated.

## CHAPTER 33 • Existing

**33.3.3.1.3** No floor below the level of exit discharge and used only for storage, heating equipment, or purposes other than residential occupancy shall have unprotected openings to floors used for residential occupancy.

tion to exempt the requirements for protection of vertical openings in certain circumstances.

### 33.3.3.2 Protection from Hazards.

**33.3.3.2.1** In other than buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with **9.7.1.1(1)**, rooms containing high-pressure boilers, refrigerating machinery, transformers, or other service equipment subject to possible explosion shall not be located directly under or adjacent to exits, and such rooms shall be effectively separated from other parts of the building as specified in **Section 8.7**.

**33.3.3.2.2** Hazardous areas, which shall include, but shall not be limited to, the following, shall be separated from other parts of the building by construction having a minimum 1-hour fire resistance rating, with communicating openings protected by approved self-closing fire doors, or such areas shall be equipped with automatic fire-extinguishing systems:

- (1) Boiler and heater rooms
- (2) Laundries
- (3) Repair shops
- (4) Rooms or spaces used for storage of combustible supplies and equipment in quantities deemed hazardous by the authority having jurisdiction

**Table 32.3.3.2.2 Hazardous Area Protection**

Hazardous Area Description	Separation/Protection <sup>†</sup>
Boiler and fuel-fired heater rooms	1 hour
Central/bulk laundries larger than 100 ft <sup>2</sup> (9.3 m <sup>2</sup> )	1 hour
Paint shops employing hazardous substances and materials in quantities less than those that would be classified as a severe hazard	1 hour
Physical plant maintenance shops	1 hour
Soiled linen rooms	1 hour
Storage rooms larger than 50 ft <sup>2</sup> (4.6 m <sup>2</sup> ), but not exceeding 100 ft <sup>2</sup> (9.3 m <sup>2</sup> ), storing combustible material	Smoke partition
Storage rooms larger than 100 ft <sup>2</sup> (9.3 m <sup>2</sup> ) storing combustible material	1 hour
Trash collection rooms	1 hour

<sup>†</sup>Minimum fire resistance rating.

## CHAPTER 32 • New

The lists that appear in [Table 32.3.3.2.2](#) and in [33.3.3.2.2](#) are not all-inclusive. Hazardous areas are those that contain materials that, because of their basic nature or the quantity of combustible materials involved, represent a significantly higher fire hazard than would otherwise be typical of the contents of a residential board and care occupancy.

Prior to the 2003 edition of the *Code*, most hazardous areas in new large board and care facilities were permitted to be enclosed by only smoke partitions due to the mandatory requirement for automatic sprinklers. However, due to the revisions to [Chapter 32](#) for the 2003 edition of the *Code*, which eliminated the requirement for evaluation of evacuation capability in new

**32.3.3.3\* Interior Finish.**

**A.32.3.3.3** The provisions in [10.2.8](#) to permit modifications to interior finish requirements where automatic sprinklers are provided are permitted.

**32.3.3.3.1 General.** Interior finish shall be in accordance with [Section 10.2](#).

**32.3.3.3.2 Interior Wall and Ceiling Finish.** Interior wall and ceiling finish materials complying with [Section 10.2](#) shall be in accordance with the following:

- (1) Exit enclosures — Class A
- (2) Lobbies and corridors — Class B
- (3) Rooms and enclosed spaces — Class B

**32.3.3.3.3 Interior Floor Finish.**

**32.3.3.3.3.1** Interior floor finish shall comply with [Section 10.2](#).

**32.3.3.3.3.2** Interior floor finish in exit enclosures and exit access corridors and spaces not separated from them by walls complying with [32.3.3.6](#) shall be not less than Class II.

**32.3.3.3.3.3** Interior floor finish shall comply with [10.2.7.1](#) or [10.2.7.2](#), as applicable.

**32.3.3.4 Detection, Alarm, and Communications Systems.**

**32.3.3.4.1 General.** A fire alarm system shall be provided in accordance with [Section 9.6](#).

## CHAPTER 33 • Existing

**33.3.3.2.3** In facilities having impractical evacuation capability, hazardous areas shall be separated from other parts of the building by smoke partitions in accordance with [Section 8.4](#).

facilities, it is assumed that facilities might contain occupants classified as having impractical evacuation capability. Therefore, the hazardous area protection requirements for new large board and care facilities closely mirror those in [Chapter 18](#) for new health care occupancies (see [18.3.2.1](#)). Other than small storage rooms, hazardous areas must be enclosed by 1-hour-rated fire barriers in addition to being protected by the automatic sprinkler system mandated by [32.3.3.5.1](#). Similarly, existing large board and care facilities with impractical evacuation capability must provide smoke partition separation between hazardous areas and the remainder of the building in accordance with [33.3.3.2.3](#).

**33.3.3.3 Interior Finish.**

**33.3.3.3.1 General.** Interior finish shall be in accordance with [Section 10.2](#).

**33.3.3.3.2 Interior Wall and Ceiling Finish.** Interior wall and ceiling finish materials complying with [Section 10.2](#) shall be Class A or Class B.

**33.3.3.3.3 Interior Floor Finish.** Interior floor finish, other than approved existing floor coverings, shall be Class I or Class II in corridors or exits.

**33.3.3.4 Detection, Alarm, and Communications Systems.**

**33.3.3.4.1 General.** A fire alarm system in accordance with [Section 9.6](#) shall be provided, unless all of the following conditions are met:

## CHAPTER 32 • New

**32.3.3.4.2 Initiation.** The required fire alarm system shall be initiated by each of the following:

- (1) Manual means in accordance with 9.6.2
- (2) Manual fire alarm box located at a convenient central control point under continuous supervision of responsible employees
- (3) Required automatic sprinkler system
- (4) Required detection system

**32.3.3.4.3 Annunciator Panel.** An annunciator panel, connected to the fire alarm system, shall be provided at a location readily accessible from the primary point of entry for emergency response personnel.

**32.3.3.4.4 Occupant Notification.** Occupant notification shall be provided automatically, without delay, in accordance with 9.6.3.

**32.3.3.4.5 High-Rise Buildings.** High-rise buildings shall be provided with an approved emergency voice communication/ alarm system in accordance with 11.8.4.

**32.3.3.4.6\* Emergency Forces Notification.** Emergency forces notification shall meet the following requirements:

- (1) Emergency forces notification shall be accomplished in accordance with 9.6.4.
- (2) Smoke detection devices or smoke detection systems shall be permitted to initiate a positive alarm sequence in accordance with 9.6.3.4 for not more than 120 seconds.

**A.32.3.3.4.6** Positive alarm sequence applies only to emergency forces notification. Occupant notification is required to occur immediately upon activation of the detection device or system.

## CHAPTER 33 • Existing

- (1) The facility has an evacuation capability of prompt or slow.
- (2) Each sleeping room has exterior exit access in accordance with 7.5.3.
- (3) The building does not exceed three stories in height.

**33.3.3.4.2 Initiation.** The required fire alarm system shall be initiated by each of the following means:

- (1) Manual means in accordance with 9.6.2, unless there are other effective means (such as a complete automatic sprinkler or detection system) for notification of fire as required
- (2) Manual fire alarm box located at a convenient central control point under continuous supervision of responsible employees
- (3) Automatic sprinkler system, other than that not required by another section of this *Code*
- (4) Required detection system, other than sleeping room smoke alarms

**33.3.3.4.3 Reserved.**

**33.3.3.4.4 Occupant Notification.** Occupant notification shall be provided automatically, without delay, by internal audible alarm in accordance with 9.6.3.

**33.3.3.4.5 Reserved.**

**33.3.3.4.6 Emergency Forces Notification.**

**33.3.3.4.6.1\*** Where the existing fire alarm system does not provide for automatic emergency forces notification in accordance with 9.6.4, provisions shall be made for the immediate notification of the public fire department by either telephone or other means, or, where there is no public fire department, notification shall be made to the private fire brigade.

**A.33.3.3.4.6.1** See A.29.3.4.3.6.

## CHAPTER 32 • New

**32.3.3.4.7 Smoke Alarms.** Approved smoke alarms shall be installed in accordance with 9.6.2.10 inside every sleeping room, outside every sleeping area in the immediate vicinity of the bedrooms, and on all levels within a resident unit.

#### 32.3.3.4.8 Smoke Detection Systems.

**32.3.3.4.8.1** Corridors and spaces open to the corridors, other than those meeting the requirement of 32.3.3.4.8.3, shall be provided with smoke detectors that comply with *NFPA 72, National Fire Alarm and Signaling Code*, and are arranged to initiate an alarm that is audible in all sleeping areas.

#### 32.3.3.4.8.2 Reserved.

**32.3.3.4.8.3** Smoke detection systems shall not be required in unenclosed corridors, passageways, balconies, colonnades, or other arrangements with one or more sides along the long dimension fully or extensively open to the exterior at all times.

In addition to the normal distribution of manual fire alarm boxes (see 9.6.2), 32/33.3.3.4.2(2) requires certain locations, such as that of the telephone operator, to be equipped with a manual fire alarm box. The intent is that a manual fire alarm box is to be available at the location where a report of an emergency phoned in by residents or staff would be received.

Sleeping room smoke alarms are exempt from activating the building fire alarm system. The detection devices installed in the sleeping rooms are usually single-station or multiple-station smoke alarms and are not part of a required automatic detection system. Therefore, such smoke alarms are intended to notify the occupants of the room of a smoke condition. The provision of 33.3.3.4.2(4) emphasizes this intent. The *Code*, in

## CHAPTER 33 • Existing

**33.3.3.4.6.2** Where a new fire alarm system is installed, or the existing fire alarm system is replaced, emergency forces notification shall be provided in accordance with 9.6.4.

**33.3.3.4.7 Smoke Alarms.** Smoke alarms shall be provided in accordance with 33.3.3.4.7.1, 33.3.3.4.7.2, or 33.3.3.4.7.3.

**33.3.3.4.7.1** Each sleeping room shall be provided with an approved smoke alarm in accordance with 9.6.2.10 that is powered from the building electrical system.

**33.3.3.4.7.2** Existing battery-powered smoke alarms, rather than building electrical service-powered smoke alarms, shall be accepted where, in the opinion of the authority having jurisdiction, the facility has demonstrated that testing, maintenance, and battery replacement programs ensure the reliability of power to the smoke alarms.

**33.3.3.4.7.3** Sleeping room smoke alarms shall not be required in facilities having an existing corridor smoke detection system that complies with Section 9.6 and is connected to the building fire alarm system.

#### 33.3.3.4.8 Smoke Detection Systems.

**33.3.3.4.8.1** All living areas, as defined in 3.3.21.5, and all corridors shall be provided with smoke detectors that comply with *NFPA 72, National Fire Alarm and Signaling Code*, and are arranged to initiate an alarm that is audible in all sleeping areas, as modified by 33.3.3.4.8.2 and 33.3.3.4.8.3.

**33.3.3.4.8.2** Smoke detection systems shall not be required in living areas of buildings having a prompt or slow evacuation capability protected throughout by an approved automatic sprinkler system installed in accordance with 33.3.3.5.

**33.3.3.4.8.3** Smoke detection systems shall not be required in unenclosed corridors, passageways, balconies, colonnades, or other arrangements with one or more sides along the long dimension fully or extensively open to the exterior at all times.

fact, prohibits sleeping room smoke alarms from activating the fire alarm system, as stated in 9.6.2.10.9, to prevent numerous nuisance alarms, which could pose a particular problem in large board and care facilities. Because the purpose of the sleeping room smoke alarms is to warn the occupants of an individual room, the notification of the management and other occupants is the occupant's responsibility. Therefore, manual alarm initiation should be emphasized in the required training for residents. See 32/33.7.2 for resident training requirements.

The location of audible alarm notification devices in residential board and care facilities affects their audibility. In most new construction, corridor walls are of such sound-insulating

## CHAPTER 32 • New

character that a sounding device would be needed in each room to meet the performance criterion for alarm audibility throughout the building. If sounding devices are installed only in the corridor, they might have to operate at dangerous sound levels to awaken residents in their rooms.

New large board and care facilities must be provided with means to automatically notify the fire department of an alarm condition (see 9.6.4) per 32.3.3.4.6. In existing facilities, automatic emergency forces notification is not required by 33.3.3.4.6 unless a new system is installed or the existing system is replaced; however, means must be provided for staff to call the fire department at a minimum. If a telephone is provided, the telephone must be equipped for direct outside dial without going through a switchboard; the telephone is not permitted to be a pay phone.

The purpose of placing smoke alarms in each sleeping room, as required by 32/33.3.3.4.7, is to alert the occupants of a room to the presence of smoke within that room. The alarms are not permitted to be connected to the building fire alarm system as previously discussed. When an occupant leaves a room, the door automatically closes behind the occupant, and the occupant is expected to pull a manual fire alarm box. If the occupant fails to sound the alarm manually, compensation is provided by corridor smoke detectors or by automatic sprinklers. See 32/33.3.3.4.8 and 32/33.3.3.5.

In existing board and care facilities, 33.3.3.4.7.2 applies only to existing battery-powered alarms — not to newly installed

### 32.3.3.5 Extinguishment Requirements.

**32.3.3.5.1 General.** All buildings shall be protected throughout by an approved automatic sprinkler system installed in accordance with 9.7.1.1(1) and provided with quick-response or residential sprinklers throughout.

## CHAPTER 33 • Existing

alarms in existing facilities. Smoke alarms powered by replaceable batteries are permitted only if they already exist and the facility can document that they are properly maintained and tested to ensure their reliability.

The provision of 33.3.3.4.7.3 recognizes that the installation of corridor smoke detection systems, rather than sleeping room smoke alarms, was a *Code* requirement in earlier editions. Note that the installation of a new corridor smoke detection system does not waive the need for single-station smoke alarms in each room. However, if an existing facility already has a corridor smoke detection system, single-station smoke alarms in bedrooms are not required.

New large board and care facilities must be provided with a corridor smoke detection system in accordance with 32.3.3.4.8.1. In existing facilities, 33.3.3.4.8 requires a system of smoke detectors in the corridors and living areas where the facilities are not fully sprinklered. Note that 33.3.3.4.8.2 does not exempt the requirement of 33.3.3.4.7 for the provision of smoke alarms in each sleeping room even when automatic sprinklers are installed. The *Code* is not equating sprinklers with smoke detectors but establishes that a fully sprinklered existing building is an adequate alternative to smoke detection in common spaces. If the facility uses exterior access corridors in the motel style, smoke detection is not required in the exterior corridors in accordance with 32/33.3.3.4.8.3.

### 33.3.3.5 Extinguishment Requirements.

**33.3.3.5.1\* General.** Where an automatic sprinkler system is installed, for either total or partial building coverage, the system shall be installed in accordance with Section 9.7, as modified by 33.3.3.5.1.1, 33.3.3.5.1.2, and 33.3.3.5.1.3.

**A.33.3.3.5.1** It is intended that this requirement apply to existing small facilities that are converted to large facilities.

**Chapter 33** permits the use of NFPA 13D, *Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes*, and NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*, outside of their scopes. This permission is based on a review of the occupancy and a recognition that the fires in board and care facilities are similar to those of other residential occupancies and that the level of protection is appropriate. In some circumstances, such as those for impractical evacuation capabilities, the requirements of NFPA 13D and NFPA 13R have been supplemented with requirements for additional water supplies to compensate for the special needs of the board and care occupancy.

**33.3.3.5.1.1** In buildings four or fewer stories above grade plane, systems in accordance with NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*, shall be permitted.

## CHAPTER 32 • New

32.3.3.5.2 Reserved.

32.3.3.5.3 Reserved.

32.3.3.5.4 Reserved.

**32.3.3.5.5 Supervision.** Automatic sprinkler systems shall be provided with electrical supervision in accordance with 9.7.2.

32.3.3.5.6 Reserved.

## CHAPTER 33 • Existing

**33.3.3.5.1.2** In facilities having prompt or slow evacuation capability, automatic sprinklers shall not be required in closets not exceeding 24 ft<sup>2</sup> (2.2 m<sup>2</sup>) and in bathrooms not exceeding 55 ft<sup>2</sup> (5.1 m<sup>2</sup>), provided that such spaces are finished with noncombustible or limited-combustible materials.

**33.3.3.5.1.3** Initiation of the fire alarm system shall not be required for existing installations in accordance with 33.3.3.5.6.

**33.3.3.5.2 Impractical Evacuation Capability.** All facilities having impractical evacuation capability shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1).

**33.3.3.5.3 High-Rise Buildings.** All high-rise buildings shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with 33.3.3.5. Such systems shall initiate the fire alarm system in accordance with Section 9.6.

**33.3.3.5.4** Attics shall be protected in accordance with 33.3.3.5.4.1 or 33.3.3.5.4.2.

**33.3.3.5.4.1** Where an automatic sprinkler system is installed, attics used for living purposes, storage, or fuel-fired equipment shall be protected with automatic sprinklers that are part of the required, approved automatic sprinkler system in accordance with 9.7.1.1.

**33.3.3.5.4.2** Where an automatic sprinkler system is installed, attics not used for living purposes, storage, or fuel-fired equipment shall meet one of the following criteria:

- (1) Attics shall be protected throughout by a heat detection system arranged to activate the building fire alarm system in accordance with Section 9.6.
- (2) Attics shall be protected with automatic sprinklers that are part of the required, approved automatic sprinkler system in accordance with 9.7.1.1.
- (3) Attics shall be of noncombustible or limited-combustible construction.
- (4) Attics shall be constructed of fire-retardant-treated wood in accordance with NFPA 703, *Standard for Fire Retardant-Treated Wood and Fire-Retardant Coatings for Building Materials*.

**33.3.3.5.5 Supervision.** Automatic sprinkler systems shall be supervised in accordance with Section 9.7; waterflow alarms shall not be required to be transmitted off-site.

**33.3.3.5.6 Domestic Water Supply Option.** Sprinkler piping serving not more than six sprinklers for any isolated hazardous area in accordance with 9.7.1.2 shall be permitted; in new installations where more than two sprinklers are installed in a single area, waterflow detection shall be provided to initiate the fire alarm system required by 33.3.3.4.1.

## CHAPTER 32 • New

Automatic sprinklers are required in all new large residential board and care facilities and all existing large facilities with impractical evacuation capability. Although not required, there are incentives for installing sprinklers in existing facilities with a prompt or slow evacuation capability. In new large facilities and existing large facilities with impractical evacuation capability, sprinkler systems must meet NFPA 13, *Standard for the Installation of Sprinkler Systems*. In prompt and slow existing facilities having not more than four stories, 33.3.3.5.1.1 permits sprinkler systems in accordance with NFPA 13R, *Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies*.

Prior to the 2003 edition of the *Code*, new large facilities were also permitted to be sprinklered in accordance with NFPA 13R. However, the *Code* now assumes new facilities might house residents without the ability to evacuate or relocate without assistance. Given the potential need to use the defend-in-place strategy of occupant protection, complete automatic sprinkler protection must be provided in accordance with NFPA 13, with

**32.3.3.5.7 Portable Fire Extinguishers.** Portable fire extinguishers shall be provided in accordance with Section 9.9.

### 32.3.3.6\* Corridors and Separation of Sleeping Rooms.

**A.32.3.3.6** It is not the intent to prohibit furniture in corridors and spaces open to corridors, provided that the minimum required width is maintained. Storage is not permitted in corridors or spaces open to corridors. It is also not the intent to require corridors to be defined by a change in flooring texture, material, or color to separate them from areas allowed to be open to corridors.

Cooking facilities complying with 32.3.3.8 are permitted to be open to corridors. Sleeping rooms are required to be separated from means of egress in accordance with 32.3.3.6.

**32.3.3.6.1** Access shall be provided from every resident use area to at least one means of egress that is separated from all sleeping rooms by walls complying with 32.3.3.6.3 through 32.3.3.6.6.

## CHAPTER 33 • Existing

quick-response or residential sprinklers throughout. This requirement recognizes the ability of quick-response and residential sprinklers to maintain tenability in the room of origin for most fire scenarios.

The provision of 33.3.3.5.1.2 applies to sprinkler systems installed in accordance with NFPA 13R and NFPA 13 in existing facilities with prompt or slow evacuation capability. The requirement for wall and ceiling surfaces to be noncombustible or limited-combustible where sprinklers are omitted includes the wall and ceiling sections behind prefabricated tub and shower enclosures. This provision helps to confine a fire that originates in a bathroom.

For existing facilities, 33.3.3.5.1 does not require quick-response or residential sprinklers. However, NFPA 13R and NFPA 13 require quick-response sprinklers if a sprinkler system is installed in the areas of a board and care facility designated as light hazard by those standards.

**33.3.3.5.7 Portable Fire Extinguishers.** Portable fire extinguishers in accordance with Section 9.9 shall be provided near hazardous areas.

### 33.3.3.6 Corridors and Separation of Sleeping Rooms.

**33.3.3.6.1** Access shall be provided from every resident use area to not less than one means of egress that is separated from all other rooms or spaces by walls complying with 33.3.3.6.3 through 33.3.3.6.6.3, unless otherwise indicated in 33.3.3.6.1.1 through 33.3.3.6.1.3.

**33.3.3.6.1.1** Rooms or spaces, other than sleeping rooms, protected throughout by an approved automatic sprinkler system in accordance with 33.3.3.5 shall not be required to comply with 33.3.3.6.1.

**33.3.3.6.1.2** The requirements of 33.3.3.6.1 shall not apply where all of the following are met:

- (1) The evacuation capability shall be prompt.
- (2) The building shall be two or fewer stories in height.

## CHAPTER 32 • New

**32.3.3.6.2** Sleeping rooms shall be separated from corridors, living areas, and kitchens by walls complying with **32.3.3.6.3** through **32.3.3.6.6**.

**32.3.3.6.3** Walls required by **32.3.3.6.1** or **32.3.3.6.2** shall be smoke partitions in accordance with **Section 8.4** having a minimum ½-hour fire resistance rating.

**32.3.3.6.4** Doors protecting corridor openings shall not be required to have a fire protection rating, but shall be constructed to resist the passage of smoke.

## CHAPTER 33 • Existing

(3) Not less than one required means of egress from each sleeping room shall provide a path of travel to the outside without traversing any corridor or other spaces exposed to unprotected vertical openings, living areas, and kitchens.

**33.3.3.6.1.3** Rooms or spaces, other than sleeping rooms, provided with a smoke detection and alarm system connected to activate the building evacuation alarm shall not be required to comply with **33.3.3.6.1**. Furnishings, finishes, and furniture, in combination with all other combustibles within the spaces, shall be of minimum quantity and arranged so that a fully developed fire is unlikely to occur.

**33.3.3.6.2** Sleeping rooms shall be separated from corridors, living areas, and kitchens by walls complying with **33.3.3.6.3** through **33.3.3.6.6.3**.

**33.3.3.6.3** Walls required by **33.3.3.6.1** or **33.3.3.6.2** shall comply with **33.3.3.6.3.1**, **33.3.3.6.3.2**, or **33.3.3.6.3.3**.

**33.3.3.6.3.1** Walls shall have a minimum ½-hour fire resistance rating.

**33.3.3.6.3.2** In buildings protected throughout by an approved automatic sprinkler system in accordance with **33.3.3.5**, walls shall be smoke partitions in accordance with **Section 8.4**, and the provisions of **8.4.3.5** shall not apply.

**33.3.3.6.3.3** In buildings two or fewer stories in height that are classified as prompt evacuation capability and that house not more than 30 residents, walls shall be smoke partitions in accordance with **Section 8.4**, and the provisions of **8.4.3.5** shall not apply.

**33.3.3.6.4** Doors in walls required by **33.3.3.6.1** or **33.3.3.6.2** shall comply with **33.3.3.6.4.1**, **33.3.3.6.4.2**, **33.3.3.6.4.3**, or **33.3.3.6.4.4**.

**33.3.3.6.4.1** Doors shall have a minimum 20-minute fire protection rating.

**33.3.3.6.4.2** Solid-bonded wood-core doors of not less than 1¾ in. (44 mm) thickness shall be permitted to continue in use.

**33.3.3.6.4.3** In buildings protected throughout by an approved automatic sprinkler system in accordance with **33.3.3.5**, doors that are nonrated shall be permitted to continue in use.

**33.3.3.6.4.4** Where automatic sprinkler protection is provided in the corridor in accordance with **31.3.5.8**, all of the following requirements shall be met:

- (1) Doors shall not be required to have a fire protection rating, but shall be in accordance with **8.4.3**.
- (2) The provisions of **8.4.3.5** shall not apply.
- (3) Doors shall be equipped with latches for keeping the doors tightly closed.

## CHAPTER 32 • New

**32.3.3.6.5** Door-closing devices shall not be required on doors in corridor wall openings, other than those serving exit enclosures, smoke barriers, enclosures of vertical openings, and hazardous areas.

**32.3.3.6.6** No louvers, transfer grilles, operable transoms, or other air passages, other than properly installed heating and utility installations, shall penetrate the walls or doors specified in [32.3.3.6](#).

Access to at least one exit that is separate from sleeping rooms must be provided per [32/33.3.3.6.1](#). For existing board and care facilities, [33.3.3.6.1](#) contains three provisions that address special circumstances for an access to an exit that passes through a sitting room, television room, living room, or other common use space. See [33.3.3.6.1.1](#) through [33.3.3.6.1.3](#).

[Exhibit 32/33.12](#) illustrates arrangements requiring egress travel through furnished day rooms that would be prohibited in existing board and care facilities, unless the space is sprinklered or provided with a combination of a smoke detection and alarm system and the combustibility of furnishings is controlled.

Sleeping rooms in new large board and care facilities must be separated from corridors by smoke partitions, in accordance with [32.3.3.6.3](#), that have a fire resistance rating of ½ hour (see [Section 8.4](#)). Doors in corridor walls to spaces other than exits, smoke barriers, or vertical opening or hazardous area enclosures must be smoke resistant; however, no fire protection rating is required per [32.3.3.6.4](#), and the doors are not required to be self-closing or automatic-closing per [32.3.3.6.5](#). The provision to omit self-closers on corridor doors mirrors the provisions for health care occupancies in [Chapters 18](#) and [19](#).

In nonsprinklered existing buildings, the corridor walls must have a fire resistance rating of ½ hour. The walls are permitted to

## CHAPTER 33 • Existing

**33.3.3.6.5** Where walls and doors are required by [33.3.3.6.1](#) and [33.3.3.6.2](#), all of the following requirements shall be met:

- (1) Such walls and doors shall be constructed as smoke partitions in accordance with [Section 8.4](#).
- (2) The provisions of [8.4.3.5](#) shall not apply.
- (3) No louvers, transfer grilles, operable transoms, or other air passages shall penetrate such walls or doors, except properly installed heating and utility installations.

**33.3.3.6.6** Doors in walls required by [33.3.3.6.1](#) and [33.3.3.6.2](#) shall comply with [33.3.3.6.6.1](#), [33.3.3.6.6.2](#), or [33.3.3.6.6.3](#).

**33.3.3.6.6.1** Doors shall be self-closing or automatic-closing in accordance with [7.2.1.8](#), and doors in walls separating sleeping rooms from corridors shall be automatic-closing in accordance with [7.2.1.8.2](#).

**33.3.3.6.6.2** Doors to sleeping rooms that have occupant-control locks such that access is normally restricted to the occupants or staff personnel shall be permitted to be self-closing.

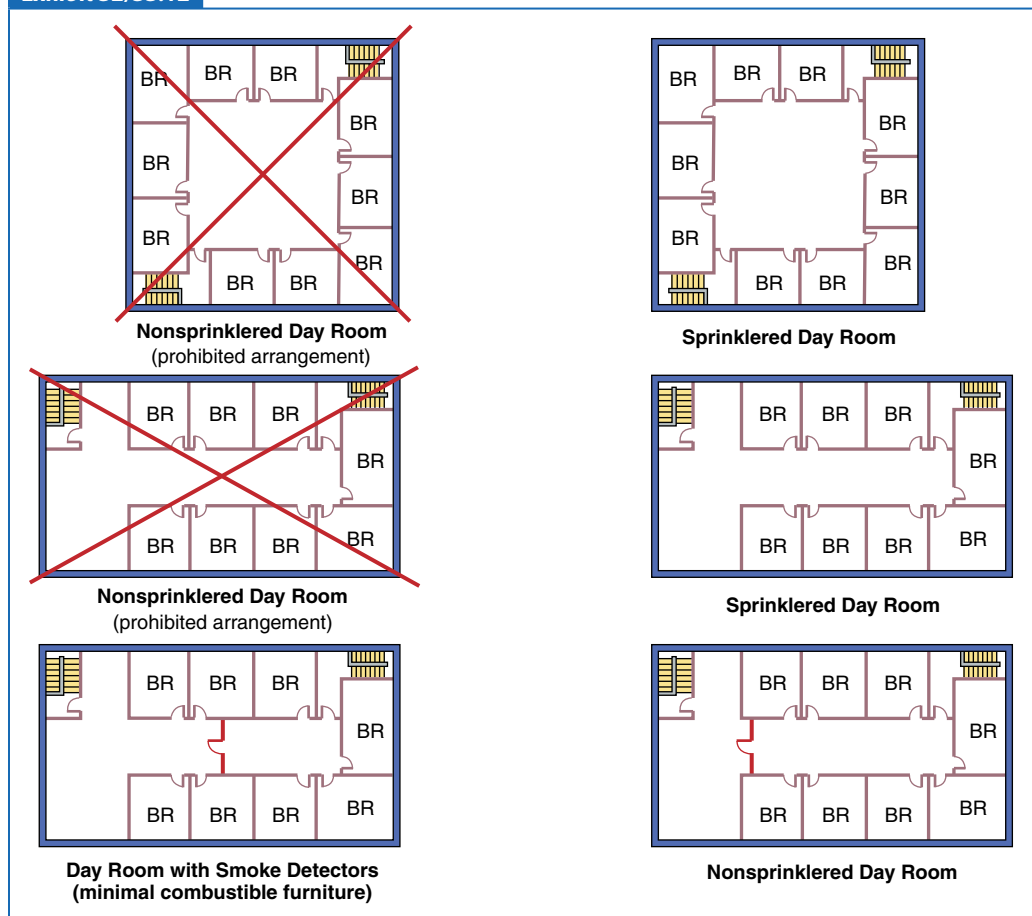

**33.3.3.6.6.3** In buildings protected throughout by an approved automatic sprinkler system installed in accordance with [33.3.3.5](#), doors, other than doors to hazardous areas, vertical openings, and exit enclosures, shall not be required to be self-closing or automatic-closing.

be smoke partitions with no fire resistance rating if the building is protected throughout by an automatic sprinkler system (see [33.3.3.6.3.2](#)) or if the facility is moderately sized with prompt evacuation capability (see [33.3.3.6.3.3](#)).

The intent of [33.3.3.6.4.2](#) is to minimize the impact of converting a health care facility or hotel to a board and care facility by permitting existing doors to remain in use under a variety of conditions.

Existing sleeping room doors are required to be automatic-closing in accordance with [33.3.3.6.6.1](#) if the building is not protected by an automatic sprinkler system. In nonsprinklered facilities in which the residents control the privacy lock on their own sleeping room doors, a self-closer (such as spring hinges or a hydraulic door check) is acceptable. Such a device is permitted because, in practice, such doors are usually kept closed. Therefore, the likelihood that the door will be chocked or held open is minimal. If the building is sprinklered, doors to spaces other than exits, smoke barriers, or vertical opening or hazardous area enclosures do not require self-closers. In such cases, staff should be trained to close doors in the event of a fire.

Exhibit 32/33.12

Alternate egress arrangements.

**32.3.3.7 Subdivision of Building Spaces.** Buildings shall be subdivided by smoke barriers in accordance with 32.3.3.7.1 through 32.3.3.7.21.

**32.3.3.7.1** Every story shall be divided into not less than two smoke compartments, unless it meets the requirement of 32.3.3.7.4, 32.3.3.7.5, 32.3.3.7.6, or 32.3.3.7.7.

**32.3.3.7.2** Each smoke compartment shall have an area not exceeding 22,500 ft<sup>2</sup> (2100 m<sup>2</sup>).

**32.3.3.7.3** The travel distance from any point to reach a door in the required smoke barrier shall be limited to a distance of 200 ft (61 m).

**32.3.3.7.4** Smoke barriers shall not be required on stories that do not contain a board and care occupancy located above the board and care occupancy.

**33.3.3.7 Subdivision of Building Spaces.** The requirements of 33.3.3.7.1 through 33.3.3.7.6 shall be met for all sleeping floors, unless otherwise permitted by 33.3.3.7.7.

**33.3.3.7.1** Every sleeping room floor shall be divided into not less than two smoke compartments of approximately the same size, with smoke barriers in accordance with Section 8.5, unless otherwise indicated in 33.3.3.7.4, 33.3.3.7.5, and 33.3.3.7.6.

**33.3.3.7.2** Smoke dampers shall not be required.

**33.3.3.7.3** Additional smoke barriers shall be provided such that the travel distance from a sleeping room corridor door to a smoke barrier shall not exceed 150 ft (46 m).

**33.3.3.7.4** Smoke barriers shall not be required in buildings having prompt or slow evacuation capability where protected throughout by an approved automatic sprinkler system installed in accordance with 33.3.3.5.

## CHAPTER 32 • New

**32.3.3.7.5** Smoke barriers shall not be required in areas that do not contain a board and care occupancy and that are separated from the board and care occupancy by a fire barrier complying with [Section 8.3](#).

**32.3.3.7.6** Smoke barriers shall not be required on stories that do not contain a board and care occupancy and that are more than one story below the board and care occupancy.

**32.3.3.7.7** Smoke barriers shall not be required in open parking structures protected throughout by an approved, supervised automatic sprinkler system in accordance with [32.3.3.5](#).

**32.3.3.7.8** Smoke barriers shall be constructed in accordance with [Section 8.5](#) and shall have a minimum 1-hour fire resistance rating, unless they meet the requirement of [32.3.3.7.9](#) or [32.3.3.7.10](#).

**32.3.3.7.9** Where an atrium is used, smoke barriers shall be permitted to terminate at an atrium wall constructed in accordance with [8.6.7\(1\)\(c\)](#), in which case not less than two separate smoke compartments shall be provided on each floor.

**32.3.3.7.10\*** Dampers shall not be required in duct penetrations of smoke barriers in fully ducted heating, ventilating, and air-conditioning systems.

**A.32.3.3.7.10** Where the smoke control system design requires dampers in order that the system functions effectively, it is not the intent of [32.3.3.7.10](#) to permit the damper to be omitted.

The term *fully ducted* means the supply and return-air systems are provided with continuous ducts from all air registers to the air-handling unit.

**32.3.3.7.11** Not less than 15 net ft<sup>2</sup> (1.4 net m<sup>2</sup>) per resident shall be provided within the aggregate area of corridors, lounge or dining areas, and other low hazard areas on each side of the smoke barrier.

**32.3.3.7.12** On stories not housing residents, not less than 6 net ft<sup>2</sup> (0.56 net m<sup>2</sup>) per occupant shall be provided on each side of the smoke barrier for the total number of occupants in adjoining compartments.

**32.3.3.7.13\*** Doors in smoke barriers shall be substantial doors, such as 1¾ in. (44 mm) thick, solid-bonded wood-core doors, or shall be of construction that resists fire for a minimum of 20 minutes.

**A.32.3.3.7.13** Smoke barrier doors are intended to provide access to adjacent zones. The pair of cross-corridor doors are required to be opposite swinging. Access to both zones is required.

**32.3.3.7.14** Nonrated factory- or field-applied protective plates extending not more than 48 in. (1220 mm) above the bottom of the door shall be permitted.

## CHAPTER 33 • Existing

**33.3.3.7.5** Smoke barriers shall not be required in buildings having prompt or slow evacuation capability where each sleeping room is provided with exterior ways of exit access arranged in accordance with [7.5.3](#).

**33.3.3.7.6** Smoke barriers shall not be required in buildings having prompt or slow evacuation capability where the aggregate corridor length on each floor is not more than 150 ft (46 m).

**33.3.3.7.7** Positive latching hardware shall not be required on smoke barrier doors.

**33.3.3.7.8** Smoke partitions in accordance with [Section 8.4](#) shall be permitted in lieu of smoke barriers on stories used for sleeping by not more than 30 residents.

## CHAPTER 32 • New

**32.3.3.7.15** Cross-corridor openings in smoke barriers shall be protected by a pair of swinging doors or a special-purpose horizontally sliding accordion or folding door assemblies complying with [7.2.1.14](#).

**32.3.3.7.16** Swinging doors shall be arranged so that each door swings in a direction opposite from the other.

**32.3.3.7.17\*** Doors in smoke barriers shall comply with [8.5.4](#) and shall be self-closing or automatic-closing in accordance with [7.2.1.8](#).

**A.32.3.3.7.17** Smoke barriers might include walls having door openings other than cross-corridor doors. There is no restriction in the *Code* regarding which doors or how many doors form part of a smoke barrier. For example, doors from the corridor to individual rooms are permitted to form part of a smoke barrier.

**32.3.3.7.18\*** Vision panels consisting of fire-rated glazing or wired glass panels in approved frames shall be provided in each cross-corridor swinging door and in each cross-corridor horizontal-sliding door in a smoke barrier.

**A.32.3.3.7.18** It is not the intent to require the frame to be a listed assembly.

**32.3.3.7.19** Rabbits, bevels, or astragals shall be required at the meeting edges, and stops shall be required at the head and sides of door frames in smoke barriers.

**32.3.3.7.20** Positive latching hardware shall not be required.

**32.3.3.7.21** Center mullions shall be prohibited.

Smoke barriers are required in new large residential board and care facilities due to the potential for occupancy by residents who might not be able to be readily evacuated to the outside. The smoke barrier provisions of [32.3.3.7](#) are nearly identical to those for health care occupancies, which also use the defend-in-place protection strategy for occupants. See [18.3.7](#) and its associated commentary for additional details.

The smoke barrier required by [33.3.3.7](#) for nonsprinklered existing facilities and those facilities with impractical evacuation capability provides for horizontal movement of occupants and limits the number of rooms and, therefore, the number of occupants exposed to a single fire that might block a corridor. Because no fire rating is required for the barrier, and because smoke dampers are not required, the provision of smoke barriers is not overly burdensome.

### 32.3.3.8 Cooking Facilities.

**32.3.3.8.1** Cooking facilities shall be protected in accordance with [9.2.3](#), unless otherwise permitted by [32.3.3.8.2](#), [32.3.3.8.3](#), or [32.3.3.8.4](#).

## CHAPTER 33 • Existing

A horizontal exit is permitted to be used to comply with [33.3.3.7](#) and, therefore, might serve more than one function. In addition, the smoke compartment is permitted to be considered a point of safety (see definition of the term *point of safety* in [3.3.213](#)) for the purpose of determining evacuation capability under the following conditions:

1. The smoke barrier has at least a ½-hour fire resistance rating.
2. Protection is provided by an automatic sprinkler system throughout the building.
3. The smoke compartment has access to an exit that does not require return to the fire area.

### 33.3.3.8 Cooking Facilities.

**33.3.3.8.1** Cooking facilities shall be protected in accordance with [9.2.3](#), unless otherwise permitted by [33.3.3.8.2](#), [33.3.3.8.3](#), or [33.3.3.8.4](#).

## CHAPTER 32 • New

**32.3.3.8.2\*** Where residential cooking equipment is used for food warming or limited cooking, the equipment shall not be required to be protected in accordance with 9.2.3, and the presence of the equipment shall not require the area to be protected as a hazardous area.

**A.32.3.3.8.2** This provision is intended to permit small appliances used for reheating, such as microwave ovens, hot plates, toasters, and nourishment centers to be exempt from the requirements for commercial cooking equipment and hazardous area protection.

**32.3.3.8.3\*** Compliance with 9.2.3 shall not be required where all of the following conditions are met:

- (1) Residential or commercial cooking equipment in a single kitchen per smoke compartment is used to prepare meals for 30 or fewer persons.
- (2) The portion of the board and care facility served by the cooking facility is limited to 30 beds and is separated from other portions of the board and care facility by a smoke barrier constructed in accordance with 32.3.3.7.8 and with 32.3.3.7.13 through 32.3.3.7.21.
- (3) The cooktop or range is equipped with a range hood of a width at least equal to the width of the cooking surface, with grease baffles or other grease-collecting and clean-out capability.
- (4)\* The hood systems have a minimum airflow of 500 cfm (14,000 L/min).
- (5) The hood systems that are not ducted to the exterior additionally have a charcoal filter to remove smoke and odor.
- (6) The cooktop or range complies with all of the following:
  - (a) The cooktop or range is protected with a fire suppression system listed in accordance with ANSI/UL 300, *Standard for Fire Testing of Fire Extinguishing Systems for Protection of Commercial Cooking Equipment*, or is tested and meets all requirements of UL 300A, *Extinguishing System Units for Residential Range Top Cooking Surfaces*, in accordance with the applicable testing document's scope.
  - (b) A manual release of the extinguishing system is provided in accordance with Section 10.5 of NFPA 96, *Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations*.
  - (c) An interlock is provided to turn off all sources of fuel and electrical power to the cooktop or range when the suppression system is activated.
- (7)\* The use of solid fuel for cooking is prohibited.
- (8)\* Deep-fat frying is prohibited.
- (9) Portable fire extinguishers in accordance with NFPA 96 are located in all kitchen areas.

## CHAPTER 33 • Existing

**33.3.3.8.2\*** Where residential cooking equipment is used for food warming or limited cooking, the equipment shall not be required to be protected in accordance with 9.2.3, and the presence of the equipment shall not require the area to be protected as a hazardous area.

**A.33.3.3.8.2** This provision is intended to permit small appliances used for reheating, such as microwave ovens, hot plates, toasters, and nourishment centers to be exempt from the requirements for commercial cooking equipment and hazardous area protection.

**33.3.3.8.3\*** Compliance with 9.2.3 shall not be required where all of the following conditions are met:

- (1) Residential or commercial cooking equipment in a single kitchen per smoke compartment is used to prepare meals for 30 or fewer persons.
- (2) The portion of the board and care facility served by the cooking facility is limited to 30 beds and is separated from other portions of the board and care facility by a smoke barrier constructed in accordance with 33.3.3.7.1 and with 33.3.3.7.7 through 33.3.3.7.8.
- (3) The cooktop or range is equipped with a range hood of a width at least equal to the width of the cooking surface, with grease baffles or other grease-collecting and clean-out capability.
- (4)\* The hood systems have a minimum airflow of 500 cfm (14,000 L/min).
- (5) The hood systems that are not ducted to the exterior additionally have a charcoal filter to remove smoke and odor.
- (6) The cooktop or range complies with all of the following:
  - (a) The cooktop or range is protected with a fire suppression system listed in accordance with ANSI/UL 300, *Standard for Fire Testing of Fire Extinguishing Systems for Protection of Commercial Cooking Equipment*, or is tested and meets all requirements of UL 300A, *Extinguishing System Units for Residential Range Top Cooking Surfaces*, in accordance with the applicable testing document's scope.
  - (b) A manual release of the extinguishing system is provided in accordance with Section 10.5 of NFPA 96, *Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations*.
  - (c) An interlock is provided to turn off all sources of fuel and electrical power to the cooktop or range when the suppression system is activated.
- (7)\* The use of solid fuel for cooking is prohibited.
- (8)\* Deep-fat frying is prohibited.
- (9) Portable fire extinguishers in accordance with NFPA 96 are located in all kitchen areas.

## CHAPTER 32 • New

- (10)\* A switch meeting all of the following is provided:
- A locked switch, or a switch located in a restricted location, is provided within the cooking facility that deactivates the cooktop or range.
  - The switch is used to deactivate the cooktop or range whenever the kitchen is not under staff supervision.
  - The switch is on a timer, not exceeding a 120-minute capacity, that automatically deactivates the cooktop or range, independent of staff action.
- (11) Procedures for the use, inspection, testing, and maintenance of the cooking equipment are in accordance with 11 of NFPA 96, and the manufacturer's instructions are followed.
- (12)\* No fewer than two ac-powered photoelectric smoke alarms, interconnected in accordance with 9.6.2.10.3 and equipped with a silence feature, are located not closer than 20 ft (6.1 m) and not farther than 25 ft (7.6 m) from the cooktop or range.
- (13) The smoke alarms required by 32.3.3.8.3(12) are permitted to be located outside the kitchen area where such placement is necessary for compliance with the 20 ft (6.1 m) minimum distance criterion.
- (14) A single system smoke detector is permitted to be installed in lieu of the smoke alarms required in 32.3.3.8.3(12), provided the following criteria are met:
- The detector is located not closer than 20 ft (6.1 m) and not farther than 25 ft (7.6 m) from the cooktop or range.
  - The detector is permitted to initiate a local audible alarm signal only.
  - The detector is not required to initiate a buildingwide occupant notification signal.
  - The detector is not required to notify emergency forces.
  - The local audible signal initiated by the detector is permitted to be silenced and reset by a button on the detector or by a switch installed within 10 ft (3.0 m) of the system smoke detector.
  - System smoke detectors that are required by other sections of the chapter to be installed in corridors or spaces open to the corridor are not used to meet the requirements of 32.3.3.8.3(12) and are located not closer than 25 ft (7.6 m) to the cooktop or range.

**A.32.3.3.8.3** The intent of 32.3.3.8.3 is to limit the number of persons for whom meals are routinely prepared to not more than 30. Staff and feeding assistants are not included in this number.

**A.32.3.3.8.3(4)** The minimum airflow of 500 cfm (14,000 L/m) is intended to require the use of residential hood equipment at the higher end of equipment capacities. It is also intended to draw

## CHAPTER 33 • Existing

- (10)\* A switch meeting all of the following is provided:
- A locked switch, or a switch located in a restricted location, is provided within the cooking facility that deactivates the cooktop or range.
  - The switch is used to deactivate the cooktop or range whenever the kitchen is not under staff supervision.
  - The switch is on a timer, not exceeding a 120-minute capacity, that automatically deactivates the cooktop or range, independent of staff action.
- (11) Procedures for the use, inspection, testing, and maintenance of the cooking equipment are in accordance with 11 of NFPA 96, and the manufacturer's instructions are followed.
- (12)\* No fewer than two ac-powered photoelectric smoke alarms, interconnected in accordance with 9.6.2.10.3 and equipped with a silence feature, are located not closer than 20 ft (6.1 m) and not farther than 25 ft (7.6 m) from the cooktop or range.
- (13) The smoke alarms required by 33.3.3.8.3(12) are permitted to be located outside the kitchen area where such placement is necessary for compliance with the 20 ft (6.1 m) minimum distance criterion.
- (14) A single system smoke detector is permitted to be installed in lieu of the smoke alarms required in 33.3.3.8.3(12), provided the following criteria are met:
- The detector is located not closer than 20 ft (6.1 m) and not farther than 25 ft (7.6 m) from the cooktop or range.
  - The detector is permitted to initiate a local audible alarm signal only.
  - The detector is not required to initiate a buildingwide occupant notification signal.
  - The detector is not required to notify emergency forces.
  - The local audible signal initiated by the detector is permitted to be silenced and reset by a button on the detector or by a switch installed within 10 ft (3.0 m) of the system smoke detector.
  - System smoke detectors that are required by other sections of this chapter to be installed in corridors or spaces open to the corridor are not used to meet the requirements of 33.3.3.8.3(12) and are located not closer than 25 ft (7.6 m) to the cooktop or range.

**A.33.3.3.8.3** The intent of 33.3.3.8.3 is to limit the number of persons for whom meals are routinely prepared to not more than 30. Staff and feeding assistants are not included in this number.

**A.33.3.3.8.3(4)** The minimum airflow of 500 cfm (14,000 L/m) is intended to require the use of residential hood equipment at the higher end of equipment capacities. It is also intended to draw

## CHAPTER 32 • New

a sufficient amount of the cooking vapors into the grease baffle and filter system to reduce migration beyond the hood.

**A.32.3.3.8.3(7)** The intent of this provision is to limit cooking fuel to gas or electricity. The prohibition of solid fuels for cooking is not intended to prohibit charcoal grilling on grills located outside the facility.

**A.32.3.3.8.3(8)** Deep-fat frying is defined as a cooking method that involves fully immersing food in hot oil.

**A.32.3.3.8.3(10)** The intent of this requirement is that the fuel source for the cooktop or range is to be turned on only when staff is present or aware that the kitchen is being used. The timer function is meant to provide an additional safeguard if the staff forgets to deactivate the cooktop or range. If a cooking activity lasts longer than 120 minutes, the timer would be required to be manually reset.

**A.32.3.3.8.3(12)** The intent of requiring smoke alarms instead of smoke detectors is to prevent false alarms from initiating the building fire alarm system and notifying the fire department. Smoke alarms should be maintained a minimum of 20 ft (6.1 m) away from the cooktop or range as studies have shown this distance to be the threshold for significantly reducing false alarms caused by cooking. The intent of the interconnected smoke alarms, with silence feature, is that while the devices would alert staff members to a potential problem, if it is a false alarm, the staff members can use the silence feature instead of disabling the alarm. The referenced study indicates that nuisance alarms are reduced with photoelectric smoke alarms. Providing two interconnected alarms provides a safety factor since they are not electrically supervised by the the fire alarm system (*Smoke Alarms — Pilot Study of Nuisance Alarms Associated with Cooking*).

**32.3.3.8.4\*** Within a smoke compartment, residential or commercial cooking equipment that is used to prepare meals for 30 or fewer persons shall be permitted, provided that the cooking facility complies with all of the following conditions:

- (1) The space containing the cooking equipment is not a sleeping room.
- (2) The space containing the cooking equipment is separated from the corridor by partitions complying with [32.3.3.6.2](#) through [32.3.3.6.5](#).
- (3) The requirements of [32.3.3.8.3\(1\)](#) through (10) are met.

**A.32.3.3.8.4** The provisions of [32.3.3.8.4](#) differ from those of [32.3.3.8.3](#), as they apply to cooking equipment that is separated from the corridor.

**32.3.3.8.5\*** Where cooking facilities are protected in accordance with [9.2.3](#), the presence of the cooking equipment shall not cause the room or space housing the equipment to be classified as a

## CHAPTER 33 • Existing

a sufficient amount of the cooking vapors into the grease baffle and filter system to reduce migration beyond the hood.

**A.33.3.3.8.3(7)** The intent of this provision is to limit cooking fuel to gas or electricity. The prohibition of solid fuels for cooking is not intended to prohibit charcoal grilling on grills located outside the facility.

**A.33.3.3.8.3(8)** Deep-fat frying is defined as a cooking method that involves fully immersing food in hot oil.

**A.33.3.3.8.3(10)** The intent of this requirement is that the fuel source for the cooktop or range is to be turned on only when staff is present or aware that the kitchen is being used. The timer function is meant to provide an additional safeguard if the staff forgets to deactivate the cooktop or range. If a cooking activity lasts longer than 120 minutes, the timer would be required to be manually reset.

**A.33.3.3.8.3(12)** The intent of requiring smoke alarms instead of smoke detectors is to prevent false alarms from initiating the building fire alarm system and notifying the fire department. Smoke alarms should be maintained a minimum of 20 ft (6.1 m) away from the cooktop or range as studies have shown this distance to be the threshold for significantly reducing false alarms caused by cooking. The intent of the interconnected smoke alarms, with silence feature, is that while the devices would alert staff members to a potential problem, if it is a false alarm, the staff members can use the silence feature instead of disabling the alarm. The referenced study indicates that nuisance alarms are reduced with photoelectric smoke alarms. Providing two interconnected alarms provides a safety factor since they are not electrically supervised by the the fire alarm system (*Smoke Alarms — Pilot Study of Nuisance Alarms Associated with Cooking*).

**33.3.3.8.4\*** Within a smoke compartment, residential or commercial cooking equipment that is used to prepare meals for 30 or fewer persons shall be permitted, provided that the cooking facility complies with all of the following conditions:

- (1) The space containing the cooking equipment is not a sleeping room.
- (2) The space containing the cooking equipment is separated from the corridor by partitions complying with [33.3.3.6.2](#) through [33.3.3.6.5](#).
- (3) The requirements of [33.3.3.8.3\(1\)](#) through (10) are met.

**A.33.3.3.8.4** The provisions of [33.3.3.8.4](#) differ from those of [33.3.3.8.3](#), as they apply to cooking equipment that is separated from the corridor.

**33.3.3.8.5\*** Where cooking facilities are protected in accordance with [9.2.3](#), the presence of the cooking equipment shall not cause the room or space housing the equipment to be classified as a

## CHAPTER 32 • New

hazardous area with respect to the requirements of [32.3.3.2](#), and the room or space shall not be permitted to be open to the corridor.

**A.32.3.3.8.5** The provision of [32.3.3.8.5](#) clarifies that protected commercial cooking equipment does not require an enclosure (separation) as a hazardous area in accordance with [Section 8.7](#), as is required by [32.3.3.2](#).

The provisions of [32/33.3.3.8](#) applicable to cooking facilities mandate compliance with NFPA 96, *Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations*,<sup>8</sup> via the reference to [9.2.3](#), for other than residential cooking equipment used for food warming as described in [A.32/A.33.3.3.8.2](#). The

### 32.3.3.9 Standpipes.

**32.3.3.9.1 General.** Where required, standpipe and hose systems shall be installed and maintained in accordance with [Section 9.10](#).

**32.3.3.9.2 In High-Rise Buildings.** Class I standpipe systems shall be installed throughout all high-rise buildings.

**32.3.3.9.3 Roof Outlets.** Roof outlets shall not be required on roofs having a slope of 3 in 12 or greater.

### 32.3.4 Special Provisions.

**32.3.4.1 High-Rise Buildings.** High-rise buildings shall comply with [Section 11.8](#).

**32.3.4.2 Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers in accordance with [8.7.3.3](#) shall be permitted.

The provision of [32/33.3.4.2](#) is new to the 2015 edition of the *Code*. It recognizes the use of alcohol-based hand-rub (ABHR)

### 32.3.5 Reserved.

### 32.3.6 Building Services.

**32.3.6.1 Utilities.** Utilities shall comply with [Section 9.1](#).

### 32.3.6.2 Heating, Ventilating, and Air-Conditioning.

**32.3.6.2.1** Heating, ventilating, and air-conditioning equipment shall comply with [Section 9.2](#).

## CHAPTER 33 • Existing

hazardous area with respect to the requirements of [32.3.3.2](#), and the room or space shall not be permitted to be open to the corridor.

**A.33.3.3.8.5** The provision of [33.3.3.8.5](#) clarifies that protected commercial cooking equipment does not require an enclosure (separation) as a hazardous area in accordance with [Section 8.7](#), as is required by [33.3.3.2](#).

provisions of [32/33.3.3.8.3](#) through [32/33.3.3.8.5](#) are new to the 2015 edition of the *Code* and are modeled after similar provisions in [Chapters 18](#) and [19](#) for health care occupancies. See [18/19.3.2.5.3](#) and its associated commentary for additional details.

### 33.3.4 Special Provisions.

#### 33.3.4.1 Reserved.

**33.3.4.2 Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers in accordance with [8.7.3.3](#) shall be permitted.

dispensers in large board and care facilities, provided that the detailed criteria of [8.7.3.3](#) are met.

### 33.3.5 Reserved.

### 33.3.6 Building Services.

**33.3.6.1 Utilities.** Utilities shall comply with the provisions of [Section 9.1](#).

### 33.3.6.2 Heating, Ventilating, and Air-Conditioning.

**33.3.6.2.1** Heating, ventilating, and air-conditioning equipment shall comply with the provisions of [Section 9.2](#).

## CHAPTER 32 • New

**32.3.6.2.2** No stove or combustion heater shall be located such that it blocks escape in case of fire caused by the malfunction of the stove or heater.

**32.3.6.2.3** Unvented fuel-fired heaters shall not be used in any board and care occupancy.

**32.3.6.3 Elevators, Dumbwaiters, and Vertical Conveyors.**

**32.3.6.3.1** Elevators, dumbwaiters, and vertical conveyors shall comply with [Section 9.4](#).

**32.3.6.3.2\*** In high-rise buildings, one elevator shall be provided with a protected power supply and shall be available for use by the fire department in case of emergency.

**A.32.3.6.3.2** “Protected power supply” means a source of electrical energy of sufficient capacity to allow proper operation of the elevator and its associated control and communications systems. The power supply’s point of origin, system of distribution, type and size of overcurrent protection, degree of isolation from other portions of the building electrical system, and degree of mechanical protection should be such that it is unlikely that the supply would be disrupted at any but the advanced stages of building fire involvement or by structural collapse.

A protected power supply might consist of, and should provide, not less than the level of reliability associated with an electrical distribution system with service equipment located and installed in accordance with 230.72(B) and 230.82(5) of *NFPA 70, National Electrical Code*. The distribution system is not to have any other connection to the building electrical distribution system. A protected power supply is not required to incorporate two sources of energy or automatic transfer capability from a normal to an emergency source; for example, an alternate set of service conductors.

The number and type of elevators to be connected to a protected power supply should be limited, or the characteristics of the protected power supply should be selected to ensure conformance with 230.95 of *NFPA 70*, without the provision of ground fault protection for the supply.

An elevator installation supplied by a protected power supply should comply with Article 620 of *NFPA 70*, except that the energy absorption means required by 620.91 of *NFPA 70* should always be connected on the load side of the disconnecting means. The energy absorption means should not consist of loads likely to become inoperative or disconnected under the conditions assumed to exist when the elevator is under the control of fire department personnel. Examples of such loads include light and power loads external to the elevator equipment room.

## CHAPTER 33 • Existing

**33.3.6.2.2** No stove or combustion heater shall be located such that it blocks escape in case of fire caused by the malfunction of the stove or heater.

**33.3.6.2.3** Unvented fuel-fired heaters shall not be used in any board and care occupancy.

**33.3.6.3 Elevators, Dumbwaiters, and Vertical Conveyors.** Elevators, dumbwaiters, and vertical conveyors shall comply with [Section 9.4](#).

## CHAPTER 32 • New

**32.3.6.4 Waste Chutes, Incinerators, and Laundry Chutes.** Waste chutes, incinerators, and laundry chutes shall comply with [Section 9.5](#).

### 32.4\* Suitability of an Apartment Building to House a Board and Care Occupancy

**A.32.4** Board and care occupancies in apartment buildings will usually be small facilities housing 16 or fewer residents. It is intended that the board and care occupancy conform to the requirements of [Section 32.2](#) for small board and care facilities. In the unusual case where an apartment houses a large board and care facility, it would be reasonable for the authority having jurisdiction, using the requirement of [4.6.1](#), to apply the provisions of [Section 32.3](#) to the apartment. In addition, the apartment building in which the facility is housed needs to comply with the requirements for apartment buildings in [Chapters 30](#) and [31](#) and the additional criteria presented in [Section 32.4](#).

A board and care facility located within an apartment building is usually a small facility housing 16 or fewer residents. It is intended that the board and care facility within the apartment building conform to the requirements of [Section 32/33.2](#) for small board and care facilities. In the unusual case where an apartment building houses a large board and care facility, it is reasonable for the

#### 32.4.1 General.

##### 32.4.1.1 Scope.

**32.4.1.1.1** [Section 32.4](#) shall apply to apartment buildings that have one or more individual apartments used as a board and care occupancy. (See [32.1.3.2](#).)

**32.4.1.1.2** The provisions of [Section 32.4](#) shall be used to determine the suitability of apartment buildings, other than those complying with [32.4.1.1.4](#), to house a residential board and care facility.

**32.4.1.1.3** The suitability of apartment buildings not used for board and care occupancies shall be determined in accordance with [Chapter 30](#).

**32.4.1.1.4** If a new board and care occupancy is created in an existing apartment building, the suitability of such a building for apartments not used for board and care occupancies shall be determined in accordance with [Chapter 31](#).

## CHAPTER 33 • Existing

**33.3.6.4 Waste Chutes, Incinerators, and Laundry Chutes.** Waste chutes, incinerators, and laundry chutes shall comply with the provisions of [Section 9.5](#).

### 33.4\* Suitability of an Apartment Building to House a Board and Care Occupancy

**A.33.4** Board and care occupancies in apartment buildings will usually be small facilities housing 16 or fewer residents. It is intended that the board and care occupancy conform to the requirements of [Section 33.2](#) for small board and care facilities. In the unusual case where an apartment houses a large board and care facility, it would be reasonable for the authority having jurisdiction, using the requirement of [4.6.1](#), to apply the provisions of [Section 33.3](#) to the apartment. In addition, the apartment building in which the facility is housed needs to comply with the requirements for apartment buildings in [Chapters 30](#) and [31](#) and the additional criteria presented in [Section 33.4](#).

authority having jurisdiction, in accordance with [Section 1.4](#), to apply the provisions of [Section 32/33.3](#) to the apartment unit. In addition, the apartment building in which the facility is housed is required to comply with the requirements for apartment buildings in [Chapters 30](#) and [31](#) and the additional criteria provided in [Section 32/33.4](#).

#### 33.4.1 General.

##### 33.4.1.1 Scope.

**33.4.1.1.1** [Section 33.4](#) shall apply to apartment buildings that have one or more individual apartments used as a board and care occupancy. (See [33.1.3.2](#).)

**33.4.1.1.2** The provisions of [Section 33.4](#) shall be used to determine the suitability of apartment buildings to house a residential board and care facility.

**33.4.1.1.3** The suitability of existing apartment buildings not used for board and care occupancies shall be determined in accordance with [Chapter 31](#).

## CHAPTER 32 • New

**32.4.1.2 Requirements for Individual Apartments.** Requirements for individual apartments used as residential board and care occupancies shall be as specified in [Section 32.2](#). Egress from the apartment into the common building corridor shall be considered acceptable egress from the board and care facility.

**32.4.1.3\* Additional Requirements.** Apartment buildings housing board and care facilities shall comply with the requirements of [Chapter 30](#) and the additional requirements of [Section 32.4](#), unless the authority having jurisdiction has determined that equivalent safety for housing a residential board and care facility is provided in accordance with [Section 1.4](#).

**A.32.4.1.3** In determining equivalency for conversions, modernizations, renovations, or unusual design concepts, the authority having jurisdiction might permit evaluations based on the residential board and care occupancies fire safety evaluation system (FSSES) of NFPA 101A, *Guide on Alternative Approaches to Life Safety*.

**32.4.1.4 Minimum Construction Requirements.**

**32.4.1.4.1** In addition to the requirements of [Chapter 30](#), apartment buildings, other than those complying with [32.4.1.4.2](#), housing residential board and care facilities shall meet the construction requirements of [32.3.1.3](#).

**32.4.1.4.2** If a new board and care occupancy is created in an existing apartment building, the construction requirements of [19.1.6](#) shall apply.

**32.4.2 Means of Egress.**

**32.4.2.1** The requirements of [Section 30.2](#) shall apply only to the parts of means of egress serving the apartment(s) used as a residential board and care occupancy, as modified by [32.4.2.2](#).

**32.4.2.2** If a new board and care occupancy is created in an existing apartment building, the requirements of [Section 31.2](#) shall apply to the parts of the means of egress serving the apartment(s) used as a residential board and care occupancy.

**32.4.3 Protection.**

**32.4.3.1 Interior Finish.**

**32.4.3.1.1** The requirements of [30.3.3](#) shall apply only to the parts of means of egress serving the apartment(s) used as a residential board and care occupancy, as modified by [32.4.3.1.2](#).

## CHAPTER 33 • Existing

**33.4.1.2 Requirements for Individual Apartments.** Requirements for individual apartments used as residential board and care occupancies shall be as specified in [Section 33.2](#). Egress from the apartment into the common building corridor shall be considered acceptable egress from the board and care facility.

**33.4.1.3 Additional Requirements.**

**33.4.1.3.1\*** Apartment buildings housing board and care facilities shall comply with the requirements of [Section 33.4](#), unless the authority having jurisdiction has determined that equivalent safety for housing a residential board and care facility is provided in accordance with [Section 1.4](#).

**A.33.4.1.3.1** In determining equivalency for existing buildings, conversions, modernizations, renovations, or unusual design concepts, the authority having jurisdiction might permit evaluations based on the residential board and care occupancies fire safety evaluation system (FSSES) of NFPA 101A, *Guide on Alternative Approaches to Life Safety*.

**33.4.1.3.2** All facilities shall meet the requirements of [Chapter 31](#) and the additional requirements of [Section 33.4](#).

**33.4.1.4 Minimum Construction Requirements.** In addition to the requirements of [Chapter 31](#), apartment buildings housing residential board and care facilities for groups classified as prompt or slow evacuation capability shall meet the construction requirements of [33.3.1.3](#), and those for groups classified as impractical evacuation capability shall meet the construction requirements of [19.1.6](#).

**33.4.2 Means of Egress.** The requirements of [Section 31.2](#) shall apply only to the parts of means of egress serving the apartment(s) used as a residential board and care occupancy.

**33.4.3 Protection.**

**33.4.3.1 Interior Finish.** The requirements of [31.3.3](#) shall apply only to the parts of means of egress serving the apartment(s) used as a residential board and care occupancy.

## CHAPTER 32 • New

**32.4.3.1.2** If a new board and care occupancy is created in an existing apartment building, the requirements of **31.3.3** shall apply to the parts of the means of egress serving the apartment(s) used as a residential board and care occupancy.

**32.4.3.2 Construction of Corridor Walls.**

**32.4.3.2.1** The requirements of **30.3.6** shall apply only to corridors serving the residential board and care facility, including that portion of the corridor wall separating the residential board and care facility from the common corridor, as modified by **32.4.3.2.2**.

**32.4.3.2.2** If a new board and care occupancy is created in an existing apartment building, the requirements of **31.3.6** shall apply to the corridor serving the residential board and care facility.

## 33.7 Operating Features

### 33.7.1 Emergency Action Plan.

**33.7.1.1** The administration of every residential board and care facility shall have, in effect and available to all supervisory personnel, written copies of a plan for protecting all persons in the event of fire, for keeping persons in place, for evacuating persons to areas of refuge, and for evacuating persons from the building when necessary.

**33.7.1.2** The emergency action plan shall include special staff response, including the fire protection procedures needed to ensure the safety of any resident, and shall be amended or revised whenever any resident with unusual needs is admitted to the home.

**33.7.1.3** All employees shall be periodically instructed and kept informed with respect to their duties and responsibilities under the plan, and such instruction shall be reviewed by the staff not less than every 2 months.

## CHAPTER 32 • New

**32.7.1.4** A copy of the plan shall be readily available at all times within the facility.

**32.7.2 Resident Training.**

**32.7.2.1** All residents participating in the emergency action plans shall be trained in the proper actions to be taken in the event of fire.

**32.7.2.2** The training required by [32.7.2.1](#) shall include actions to be taken if the primary escape route is blocked.

**32.7.2.3** If a resident is given rehabilitation or habilitation training, training in fire prevention and the actions to be taken in the event of a fire shall be a part of the training program.

**32.7.2.4** Residents shall be trained to assist each other in case of fire to the extent that their physical and mental abilities permit them to do so without additional personal risk.

**32.7.3 Emergency Egress and Relocation Drills.** Emergency egress and relocation drills shall be conducted in accordance with [32.7.3.1](#) through [32.7.3.6](#).

**32.7.3.1** Emergency egress and relocation drills shall be conducted not less than six times per year on a bimonthly basis, with not less than two drills conducted during the night when residents are sleeping, as modified by [32.7.3.5](#) and [32.7.3.6](#).

**32.7.3.2** The emergency drills shall be permitted to be announced to the residents in advance.

**32.7.3.3\*** The drills shall involve the actual evacuation of all residents to an assembly point, as specified in the emergency action plan, and shall provide residents with experience in egressing through all exits and means of escape required by the *Code*.

**A.32.7.3.3** An assembly point can be located outside the building, in a separate building, or in an adjacent smoke compartment in the same building.

**32.7.3.4** Exits and means of escape not used in any drill shall not be credited in meeting the requirements of this *Code* for board and care facilities.

**32.7.3.5** Actual exiting from windows shall not be required to comply with [32.7.3](#); opening the window and signaling for help shall be an acceptable alternative.

**32.7.3.6** Residents who cannot meaningfully assist in their own evacuation or who have special health problems shall not be required to actively participate in the drill. [Section 18.7](#) shall apply in such instances.

## CHAPTER 33 • Existing

**33.7.1.4** A copy of the plan shall be readily available at all times within the facility.

**33.7.2 Resident Training.**

**33.7.2.1** All residents participating in the emergency action plan shall be trained in the proper actions to be taken in the event of fire.

**33.7.2.2** The training required by [32.7.2.1](#) shall include actions to be taken if the primary escape route is blocked.

**33.7.2.3** If the resident is given rehabilitation or habilitation training, training in fire prevention and the actions to be taken in the event of a fire shall be a part of the training program.

**33.7.2.4** Residents shall be trained to assist each other in case of fire to the extent that their physical and mental abilities permit them to do so without additional personal risk.

**33.7.3 Emergency Egress and Relocation Drills.** Emergency egress and relocation drills shall be conducted in accordance with [33.7.3.1](#) through [33.7.3.6](#).

**33.7.3.1** Emergency egress and relocation drills shall be conducted not less than six times per year on a bimonthly basis, with not less than two drills conducted during the night when residents are sleeping, as modified by [33.7.3.5](#) and [33.7.3.6](#).

**33.7.3.2** The emergency drills shall be permitted to be announced to the residents in advance.

**33.7.3.3\*** The drills shall involve the actual evacuation of all residents to an assembly point, as specified in the emergency action plan, and shall provide residents with experience in egressing through all exits and means of escape required by this *Code*.

**A.33.7.3.3** An assembly point can be located outside the building, in a separate building, or in an adjacent smoke compartment in the same building.

**33.7.3.4** Exits and means of escape not used in any drill shall not be credited in meeting the requirements of this *Code* for board and care facilities.

**33.7.3.5** Actual exiting from windows shall not be required to comply with [33.7.3](#); opening the window and signaling for help shall be an acceptable alternative.

**33.7.3.6** If the board and care facility has an evacuation capability classification of impractical, those residents who cannot meaningfully assist in their own evacuation or who have special health problems shall not be required to actively participate in the drill.

## CHAPTER 32 • New

**32.7.4 Smoking.**

**32.7.4.1\*** Smoking regulations shall be adopted by the administration of board and care occupancies.

**A.32.7.4.1** Smoking regulations should include the following:

- (1) Smoking should be prohibited in any room, compartment, or area where flammable or combustible liquids, combustible gases, or oxygen is used or stored and in any other hazardous location, and the following also should apply:
  - (a) Such areas should be posted with signs that read NO SMOKING or the international symbol for no smoking.
  - (b) In residential board and care facilities where smoking is totally prohibited and signs so indicating are placed at all major entrances, secondary signs with language that prohibits smoking are not required.
- (2) Smoking by residents classified as not responsible with regard to their ability to safely use and dispose of smoking materials should be prohibited.
- (3) Where a resident, as specified in [A.32.7.4.1\(2\)](#), is under direct supervision by staff or by a person approved by the administration, smoking might be permitted.
- (4) Smoking materials should not be provided to residents or maintained by residents without the approval of the administration.
- (5) Areas where smoking is permitted should be clearly identified.
- (6) Ashtrays of noncombustible material and safe design should be provided and required to be used in all areas where smoking is permitted.
- (7) Self-closing cover devices into which ashtrays can be emptied should be made available to all areas where smoking is permitted and should be required to be used.

**32.7.4.2** Where smoking is permitted, noncombustible safety-type ashtrays or receptacles shall be provided in convenient locations.

**32.7.5\* Furnishings, Mattresses, and Decorations.**

**A.32.7.5** The requirements applicable to draperies/curtains, upholstered furniture, and mattresses apply only to new draperies/curtains, new upholstered furniture, and new mattresses. The term *new* means unused, normally via procurement from the marketplace, either by purchase or donation, of items not previously used. Many board and care facilities allow residents to bring into the board and care home upholstered furniture items from the resident's previous residence. Such items are not new and, thus, are not regulated. On the other hand, some of the larger board and care homes purchase contract furniture, as is done in hotels. Such new, unused furniture, whether purchased or received as a donation, is regulated by the requirements of [32.7.5.2](#). By federal law, mattresses manufactured and sold within the United States must pass testing per 16 CFR 1632,

**33.7.4 Smoking.**

**33.7.4.1\*** Smoking regulations shall be adopted by the administration of board and care occupancies.

**A.33.7.4.1** Smoking regulations should include the following:

- (1) Smoking should be prohibited in any room, compartment, or area where flammable or combustible liquids, combustible gases, or oxygen is used or stored and in any other hazardous location, and the following also should apply:
  - (a) Such areas should be posted with signs that read NO SMOKING or the international symbol for no smoking.
  - (b) In residential board and care facilities where smoking is totally prohibited and signs so indicating are placed at all major entrances, secondary signs with language that prohibits smoking are not required.
- (2) Smoking by residents classified as not responsible with regard to their ability to safely use and dispose of smoking materials should be prohibited.
- (3) Where a resident, as specified in [A.33.7.4.1\(2\)](#), is under direct supervision by staff or by a person approved by the administration, smoking might be permitted.
- (4) Smoking materials should not be provided to residents or maintained by residents without the approval of the administration.
- (5) Areas where smoking is permitted should be clearly identified.
- (6) Ashtrays of noncombustible material and safe design should be provided and required to be used in all areas where smoking is permitted.
- (7) Self-closing cover devices into which ashtrays can be emptied should be made available to all areas where smoking is permitted and should be required to be used.

**33.7.4.2** Where smoking is permitted, noncombustible safety-type ashtrays or receptacles shall be provided in convenient locations.

**33.7.5\* Furnishings, Mattresses, and Decorations.**

**A.33.7.5** The requirements applicable to draperies/curtains, upholstered furniture, and mattresses apply only to new draperies/curtains, new upholstered furniture, and new mattresses. The term *new* means unused, normally via procurement from the marketplace, either by purchase or donation, of items not previously used. Many board and care facilities allow residents to bring into the board and care home upholstered furniture items from the resident's previous residence. Such items are not new and, thus, are not regulated. On the other hand, some of the larger board and care homes purchase contract furniture, as is done in hotels. Such new, unused furniture, whether purchased or received as a donation, is regulated by the requirements of [33.7.5.2](#). By federal law, mattresses manufactured and sold within the United States must pass testing per 16 CFR 1632,

## CHAPTER 32 • New

“Standard for the Flammability of Mattresses and Mattress Pads” (FF4-72).

**32.7.5.1** New draperies, curtains, and other similar loosely hanging furnishings and decorations shall comply with **32.7.5.1.1** and **32.7.5.1.2**.

**32.7.5.1.1** New draperies, curtains, and other similar loosely hanging furnishings and decorations in board and care facilities shall be in accordance with the provisions of **10.3.1**, unless otherwise permitted by **32.7.5.1.2**.

**32.7.5.1.2** In other than common areas, new draperies, curtains, and other similar loosely hanging furnishings and decorations shall not be required to comply with **32.7.5.1.1** where the building is protected throughout by an approved automatic sprinkler system installed in accordance with **32.2.3.5** for small facilities or **32.3.3.5** for large facilities.

**32.7.5.2\*** New upholstered furniture within board and care facilities shall comply with **32.7.5.2.1** or **32.7.5.2.2**.

**A.32.7.5.2** New upholstered furniture within board and care homes should be tested for rates of heat release in accordance with **10.3.3**.

**32.7.5.2.1** New upholstered furniture shall be tested in accordance with the provisions of **10.3.2.1(1)** and **10.3.3**.

**32.7.5.2.2** Upholstered furniture belonging to residents in sleeping rooms shall not be required to be tested, provided that a smoke alarm is installed in such rooms; battery-powered single-station smoke alarms shall be permitted in such rooms.

**32.7.5.3\*** Newly introduced mattresses within board and care facilities shall comply with **32.7.5.3.1** or **32.7.5.3.2**.

**A.32.7.5.3** New mattresses within board and care homes should be tested for rates of heat release in accordance with **10.3.4**.

**32.7.5.3.1** Newly introduced mattresses shall be tested in accordance with the provisions of **10.3.2.2** and **10.3.4**.

**32.7.5.3.2** Mattresses belonging to residents in sleeping rooms shall not be required to be tested, provided that a smoke alarm is installed in such rooms; battery-powered single-station smoke alarms shall be permitted in such rooms.

The provisions of **32/33.7.5** extend the level of life safety provided to a residential board and care facility by further attempting to prevent room flashover. However, rather than impose these requirements retroactively on existing facilities, the requirement applies to new upholstered furniture and mattresses. The text of **A.32/A.33.7.5** sufficiently details the meaning of the term *new* in this context.

Draperies must be flame resistant in accordance with **10.3.1**, unless they are located in other than common areas (e.g.,

## CHAPTER 33 • Existing

“Standard for the Flammability of Mattresses and Mattress Pads” (FF 4-72).

**33.7.5.1** New draperies, curtains, and other similar loosely hanging furnishings and decorations shall comply with **33.7.5.1.1** and **33.7.5.1.2**.

**33.7.5.1.1** New draperies, curtains, and other similar loosely hanging furnishings and decorations in board and care facilities shall be in accordance with the provisions of **10.3.1**, unless otherwise permitted by **33.7.5.1.2**.

**33.7.5.1.2** In other than common areas, new draperies, curtains, and other similar loosely hanging furnishings and decorations shall not be required to comply with **33.7.5.1.1** where the building is protected throughout by an approved automatic sprinkler system installed in accordance with **33.2.3.5** for small facilities or **33.3.3.5** for large facilities.

**33.7.5.2\*** New upholstered furniture within board and care facilities shall comply with **33.7.5.2.1** or **33.7.5.2.2**.

**A.33.7.5.2** New upholstered furniture within board and care homes should be tested for rates of heat release in accordance with **10.3.3**.

**33.7.5.2.1** New upholstered furniture shall be tested in accordance with the provisions of **10.3.2.1(1)** and **10.3.3**.

**33.7.5.2.2** Upholstered furniture belonging to residents in sleeping rooms shall not be required to be tested, provided that a smoke alarm is installed in such rooms; battery-powered single-station smoke alarms shall be permitted in such rooms.

**33.7.5.3\*** Newly introduced mattresses within board and care facilities shall comply with **33.7.5.3.1** or **33.7.5.3.2**.

**A.33.7.5.3** New mattresses within board and care homes should be tested for rates of heat release in accordance with **10.3.4**.

**33.7.5.3.1** Newly introduced mattresses shall be tested in accordance with the provisions of **10.3.2.2** and **10.3.4**.

**33.7.5.3.2** Mattresses belonging to residents in sleeping rooms shall not be required to be tested, provided that a smoke alarm is installed in such rooms; battery-powered single-station smoke alarms shall be permitted in such rooms.

sleeping rooms) of sprinklered facilities (see **32/33.7.5.1.2**). Newly introduced upholstered furniture and mattresses must be resistant to cigarette ignition in accordance with **10.3.2**. Newly introduced upholstered furniture and mattresses must have limited rates of heat release in accordance with **10.3.3** and **10.3.4**, unless the building is sprinklered. See the commentary on **Section 10.3**.

## CHAPTER 32 • New

**32.7.6 Staff.** Staff shall be on duty and in the facility at all times when residents requiring evacuation assistance are present.

**32.7.7 Inspection of Door Openings.** Door assemblies for which the door leaf is required to swing in the direction of egress travel shall be inspected and tested not less than annually in accordance with 7.2.1.15.

Doors in board and care facilities that are required to swing in the direction of egress travel must be annually inspected using the criteria specified in 7.2.1.15, as required by 32/33.7.7. Such doors include those that serve areas with occupant loads of 50 or more and those that serve exit enclosures. The inspection criteria are intended to ensure that such doors will function as needed during a fire emergency. See 7.2.1.15 and its associated commentary for additional details.

- Chapter 34
- Chapter 35

# New and Existing Mercantile Occupancies

Mercantile occupancies include stores, markets, and other rooms, buildings, or structures used for the display and sale of merchandise. This occupancy classification includes, but is not limited to, the following:

1. Supermarkets
2. Convenience stores
3. Department stores
4. Hardware stores
5. Video sales/rental stores
6. Pharmacies
7. Rental equipment centers
8. Automobile sales showrooms
9. Flea markets and craft centers
10. Building materials/supplies centers
11. Shopping centers/malls
12. Office supply stores
13. Computer and electronics stores
14. Sporting goods stores
15. Warehouse club stores

Minor merchandising operations in buildings that house other predominant occupancies, such as a newsstand in an office building, are typically classified as incidental uses and must, therefore, meet the *Code* requirements of the predominant occupancy (see 6.1.14.1.3).

The life safety provisions for mercantile occupancies are based on their characteristic of displaying merchandise for sales purposes, which introduces significant quantities of fuel in sales areas occupied by persons who are mostly unfamiliar with the building. Mercantile occupancies are also characterized by the use of layouts of merchandise displays and store fixtures that can confuse the egress path. Fires in department stores, mall buildings, and similar mercantile occupancies that resulted in occupant fatalities have been practically unheard of in the United States over the past two decades. Although some serious fires have occurred in such properties, the established *Code* provisions have served the life safety needs of the occupants very well.

As marketing techniques change to meet consumer demands — beginning in the 1960s when the first covered shopping malls were built — store design and layout also change. Consumers are offered choices that include everything from one-stop shopping to unique specialty stores. As the big-box store concept became popular in the early 1980s, the general public

found itself shopping in warehouse-type surroundings. The *Code* provisions that apply to mercantile occupancies have recognized these challenges to providing adequate life safety via a combination of flexible general requirements and specialized provisions, such as those contained in 36/37.4.4 for mall buildings and 36/37.4.5 for bulk merchandising retail buildings.

The life safety measures needed for mercantile occupancies are as diverse as the types of mercantile facilities. Although the nature of the actual store design — as well as the merchandise that is found in the stores — drives much of the *Code* criteria, the ongoing need to prevent the theft of merchandise also affects the protection requirements.

The features of a mercantile occupancy that determine the needed protection include the items for sale, the location of the areas occupied by the public with respect to the level of exit discharge, and the size (i.e., gross area) of the facility. Guidance on establishing the appropriate subclassification for mercantile occupancies is provided by 36/37.1.2.2.

Establishing and controlling the widths of aisles that lead to exits is an important consideration. For example, 36/37.2.5.5 establishes minimum widths, which are based on the clear width, to prevent boxed or loose merchandise from obstructing the egress path. In certain larger stores, minimum 60 in. (1525 mm) aisles might be the norm to accommodate shopping carts as well as large numbers of occupants. Automatic sprinkler protection and a manual fire alarm system complement the major features of the protection package for the larger Class A stores.

The requirements for bulk merchandising retail buildings found in 36/37.4.5 establish criteria that meet the special needs of such stores. The typical bulk merchandising retail store includes display and storage racks that are often more than 20 ft (6100 mm) high. Display merchandise is typically maintained at the lower levels, while the excess inventory of merchandise is stored on the upper tiers of the rack systems. In such cases, the range of materials in the occupancies is extensive and can include building materials, paint, electrical equipment, and indoor/outdoor power equipment and appliances. In some cases, the store inventory might consist of foodstuffs as well as household goods. Due to the crossover nature of such occupancies — which are part warehouse and part retail store — 36/37.4.5.2 and 36/37.4.5.3 establish requirements for providing the egress measures needed for an occupancy with a large occupant load and the fire protection measures needed for a warehouse.

## CHAPTER 36 • New

## 36.1 General Requirements

### 36.1.1 Application.

**36.1.1.1** The requirements of this chapter shall apply to new buildings or portions thereof used as mercantile occupancies. (See 1.3.1.)

**36.1.1.2 Administration.** The provisions of Chapter 1, Administration, shall apply.

**36.1.1.3 General.** The provisions of Chapter 4, General, shall apply.

**36.1.1.4** The provisions of this chapter shall apply to life safety requirements for all new mercantile buildings. Specific requirements shall apply to suboccupancy groups, such as Class A, Class B, and Class C mercantile occupancies; mall buildings; and bulk merchandising retail buildings, and are contained in paragraphs pertaining thereto.

**36.1.1.5** Additions to existing buildings shall comply with 36.1.1.5.1, 36.1.1.5.2, and 36.1.1.5.3.

**36.1.1.5.1** Additions to existing buildings shall conform to the requirements of 4.6.7.

**36.1.1.5.2** Existing portions of the structure shall not be required to be modified, provided that the new construction has not diminished the fire safety features of the facility.

**36.1.1.5.3** Existing portions shall be upgraded if the addition results in a change of mercantile subclassification. (See 36.1.2.2.)

**36.1.1.6** When a mercantile occupancy changes from Class C to Class A or Class B, or from Class B to Class A, the provisions of this chapter shall apply.

The provisions for new mercantile occupancies are addressed in Chapter 36; the provisions for existing mercantile occupancies (i.e., existing conditions in mercantile occupancies) are addressed in Chapter 37.

Prior to the 2006 edition of the Code, renovations, additions, and changes of occupancy were always required to comply with the requirements for new construction. For mercantile occupancies, such renovations, additions, and changes of occupancy were required to meet the provisions of Chapter 36, while existing conditions were subject to the provisions of Chapter 37.

## CHAPTER 37 • Existing

## 37.1 General Requirements

### 37.1.1 Application.

**37.1.1.1** The requirements of this chapter shall apply to existing buildings or portions thereof currently occupied as mercantile occupancies.

**37.1.1.2 Administration.** The provisions of Chapter 1, Administration, shall apply.

**37.1.1.3 General.** The provisions of Chapter 4, General, shall apply.

**37.1.1.4** The provisions of this chapter shall apply to life safety requirements for all existing mercantile buildings. Specific requirements shall apply to suboccupancy groups, such as Class A, Class B, and Class C mercantile occupancies; mall buildings; and bulk merchandising retail buildings, and are contained in paragraphs pertaining thereto.

**37.1.1.5** Additions to existing buildings shall comply with 37.1.1.5.1, 37.1.1.5.2, and 37.1.1.5.3.

**37.1.1.5.1** Additions to existing buildings shall conform to the requirements of 4.6.7.

**37.1.1.5.2** Existing portions of the structure shall not be required to be modified, provided that the new construction has not diminished the fire safety features of the facility.

**37.1.1.5.3** Existing portions shall be upgraded if the addition results in a change of mercantile subclassification. (See 37.1.2.2.)

**37.1.1.6** When a change in mercantile occupancy subclassification occurs, either of the following requirements shall be met:

- (1) When a mercantile occupancy changes from Class A to Class B or Class C, or from Class B to Class C, the provisions of this chapter shall apply.
- (2) When a mercantile occupancy changes from Class C to Class A or Class B, or from Class B to Class A, the provisions of Chapter 36 shall apply.

Chapter 43, Building Rehabilitation, was added for the 2006 edition of the Code. Chapter 43 was written to promote the adaptive reuse of existing buildings without sacrificing the needed level of life safety. The provisions of Chapter 43 blend the requirements for new construction with those for existing conditions, so as to require additional life safety features as the rehabilitation work category increases in complexity. The rehabilitation work categories are repair, renovation, modification, reconstruction, change of use, change of occupancy classification, and addition. See 4.6.7, 4.6.11, and Chapter 43.

## CHAPTER 36 • New

To understand the full intent and scope of 37.1.1.1, it is necessary to review it concurrently with Sections 1.2 and 1.3. Although a building code might permit existing buildings to be excluded from coverage under some form of a grandfather clause, the *Life Safety Code*, by virtue of its interest in safety to life, requires that existing building arrangements comply with the *Code* requirements that apply to existing buildings. The requirements applicable to existing mercantile occupancies are contained in Chapter 37.

If a building complies with an earlier edition of the *Code*, it is not grandfathered and, thereby, exempted from compliance with a more current edition that has been adopted as law in the building's jurisdiction. The NFPA technical committees on safety to life are especially careful to avoid adopting requirements for existing buildings that become more stringent from one edition of the *Code* to the next, unless the change is absolutely necessary to meet the level of safety to life intended. Thus, the old adage of "once in compliance, always in compliance" does not hold.

Commentary Table 36/37.1 summarizes the definitions of Class A, Class B, and Class C mercantile occupancies presented in 36/37.1.2.2.1 and further explained in its associated commentary.

Additions to existing mercantile occupancies must conform to the requirements for new construction in accordance with 36/37.1.1.5 via the reference to 4.6.7. However, the existing portion of the occupancy generally is permitted to continue to comply with the provisions of Chapter 37. If, however, the addition results in a change in the mercantile occupancy subclassification (see 36/37.1.2.2) — such as a change from Class C to Class B or from Class B to Class A — the existing portion of the enlarged overall facility must be upgraded to meet the provisions that apply to new construction. Note that these provisions supersede

**Commentary Table 36/37.1 Subclassification of Mercantile Occupancies**

Store Class	Height	Aggregate Gross Area ft <sup>2</sup> (m <sup>2</sup> ) <sup>1</sup>
A	>3 stories <sup>2</sup>	>30,000 (>2800)
B	≤3 stories <sup>2</sup>	>3000 (>280) and ≤30,000 (≤2800)
C	One story only <sup>3</sup>	≤3000 (≤280)

<sup>1</sup>Sections of floors not used for sales purposes are not counted in the area classification.

<sup>2</sup>Stories not used for sales above or below sales floor are not counted in the height classification.

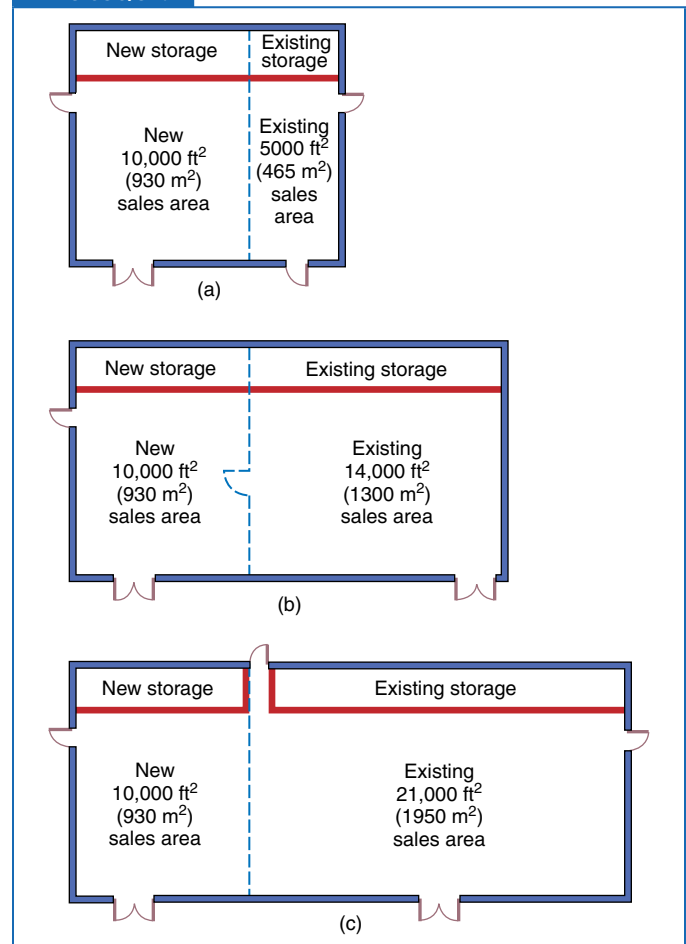

<sup>3</sup>A mezzanine less than or equal to one-third the area (new) or less than or equal to one-half the area (existing) of the floor below is permitted (see 8.6.10 and 36/37.1.2.2.3)

## CHAPTER 37 • Existing

the requirements for change of use and change of occupancy in Chapter 43. The provisions of 36/37.1.1.5 are illustrated in the paragraphs that follow and in Exhibit 36/37.1.

In Exhibit 36/37.1, Part (a), the new construction, which includes 10,000 ft<sup>2</sup> (930 m<sup>2</sup>) of additional sales area and approximately 2000 ft<sup>2</sup> (186 m<sup>2</sup>) of new storage area, is added to an existing Class B mercantile occupancy with 5000 ft<sup>2</sup> (465 m<sup>2</sup>) of existing sales area. The size and placement of the new addition neither change the Class B mercantile subclassification of the enlarged overall facility nor diminish the fire safety features of the existing portion of the facility. Therefore, the addition is constructed in accordance with the requirements of Chapter 36, and the existing portion of the building is permitted to continue to be used, without upgrade, if it meets the requirements of Chapter 37. If the existing portion of the building does not meet the requirements of Chapter 37, it must be upgraded to meet those requirements.

**Exhibit 36/37.1**

*Additions to existing mercantile occupancies.*

## CHAPTER 36 • New

**Exhibit 36/37.1**, Part (b), depicts new construction, identical to that of Part (a), that is added to an existing Class B mercantile occupancy with 14,000 ft<sup>2</sup> (1300 m<sup>2</sup>) of existing sales area. Although the size of the addition does not change the Class B mercantile subclassification of the overall facility, the placement of the new addition appears to have diminished the fire safety of the existing portion of the building with respect to travel distance. The broken line in Part (b) represents what had been an exterior wall and exit door in the existing mercantile occupancy prior to construction of the addition. The door allowed occupants in the upper left portion of the existing building to reach an exit within the allowable 150 ft (46 m) travel distance specified for existing nonsprinklered mercantile occupancies in accordance with 37.2.6.2. Without the exit door, occupants of the existing portion of the building must be able to reach an exit — one of the three doors in the perimeter of the enlarged facility — within the same 150 ft (46 m) travel distance limitation. If this is not possible, an additional exit within that distance must be

### 36.1.2 Classification of Occupancy.

**36.1.2.1 General.** Mercantile occupancies shall include all buildings and structures or parts thereof with occupancy as defined in 6.1.10.

#### 36.1.2.2 Subclassification of Occupancy.

**36.1.2.2.1** Mercantile occupancies shall be subclassified as follows:

- (1) Class A, all mercantile occupancies having an aggregate gross area of more than 30,000 ft<sup>2</sup> (2800 m<sup>2</sup>) or occupying more than three stories for sales purposes
- (2) Class B, as follows:
  - (a) All mercantile occupancies of more than 3000 ft<sup>2</sup> (280 m<sup>2</sup>), but not more than 30,000 ft<sup>2</sup> (2800 m<sup>2</sup>), aggregate gross area and occupying not more than three stories for sales purposes
  - (b) All mercantile occupancies of not more than 3000 ft<sup>2</sup> (280 m<sup>2</sup>) gross area and occupying two or three stories for sales purposes
- (3) Class C, all mercantile occupancies of not more than 3000 ft<sup>2</sup> (280 m<sup>2</sup>) gross area and used for sales purposes occupying one story only

**36.1.2.2.2** For the purpose of the classification required in 36.1.2.2.1, the requirements of 36.1.2.2.2.1, 36.1.2.2.2.2, and 36.1.2.2.2.3 shall be met.

**36.1.2.2.2.1** The aggregate gross area shall be the total gross area of all floors used for mercantile purposes.

**36.1.2.2.2.2** Where a mercantile occupancy is divided into sections, regardless of fire separation, the aggregate gross area shall include the area of all sections used for sales purposes.

## CHAPTER 37 • Existing

constructed, or the building must be sprinklered to increase the allowable travel distance to 250 ft (76 m). Because the new construction must meet the provisions of Chapter 36, the entire building — new and existing portions — must be sprinklered in accordance with 36.3.5.1(2), because the building exceeds 12,000 ft<sup>2</sup> (1115 m<sup>2</sup>) in gross area.

**Exhibit 36/37.1**, Part (c), depicts new construction, identical to that of Part (a) and Part (b), that is added to an existing Class B mercantile occupancy with 21,000 ft<sup>2</sup> (1950 m<sup>2</sup>) of existing sales area. The size of the new sales area, when added to that of the existing mercantile occupancy, exceeds 30,000 ft<sup>2</sup> (2800 m<sup>2</sup>) and results in a change in mercantile subclassification from Class B to Class A [see 36/37.1.2.2.1(1)]. In accordance with the provisions of 36/37.1.1.5 and the clarification of intent offered in 36/37.1.1.6, the entire building — new and existing portions — must meet the requirements for new mercantile occupancies as detailed in Chapter 36.

### 37.1.2 Classification of Occupancy.

**37.1.2.1 General.** Mercantile occupancies shall include all buildings and structures or parts thereof with occupancy as defined in 6.1.10.

#### 37.1.2.2 Subclassification of Occupancy.

**37.1.2.2.1** Mercantile occupancies shall be subclassified as follows:

- (1) Class A, all mercantile occupancies having an aggregate gross area of more than 30,000 ft<sup>2</sup> (2800 m<sup>2</sup>) or occupying more than three stories for sales purposes
- (2) Class B, as follows:
  - (a) All mercantile occupancies of more than 3000 ft<sup>2</sup> (280 m<sup>2</sup>), but not more than 30,000 ft<sup>2</sup> (2800 m<sup>2</sup>), aggregate gross area and occupying not more than three stories for sales purposes
  - (b) All mercantile occupancies of not more than 3000 ft<sup>2</sup> (280 m<sup>2</sup>) gross area and occupying two or three stories for sales purposes
- (3) Class C, all mercantile occupancies of not more than 3000 ft<sup>2</sup> (280 m<sup>2</sup>) gross area used for sales purposes and occupying one story only, excluding mezzanines

**37.1.2.2.2** For the purpose of the classification required in 37.1.2.2.1, the requirements of 37.1.2.2.2.1, 37.1.2.2.2.2, and 37.1.2.2.2.3 shall be met.

**37.1.2.2.2.1** The aggregate gross area shall be the total gross area of all floors used for mercantile purposes.

**37.1.2.2.2.2** Where a mercantile occupancy is divided into sections, regardless of fire separation, the aggregate gross area shall include the area of all sections used for sales purposes.

## CHAPTER 36 • New

**36.1.2.2.2.3** Areas of floors not used for sales purposes, such as an area used only for storage and not open to the public, shall not be counted for the purposes of the classifications in **36.1.2.2.1**(1), (2), and (3), but means of egress shall be provided for such nonsales areas in accordance with their occupancy, as specified by other chapters of this *Code*.

**36.1.2.2.3** Mezzanines shall comply with **8.6.10**.

**36.1.2.2.4** Where a number of tenant spaces under different management are located in the same building, the aggregate gross area for subclassification shall be one of the following:

- (1) Where tenant spaces are not separated, the aggregate gross floor area of all such tenant spaces shall be used in determining classification per **36.1.2.2.1**.
- (2) Where individual tenant spaces are separated by fire barriers with a 2-hour fire resistance rating, each tenant space shall be individually classified.
- (3) Where tenant spaces are separated by fire barriers with a 1-hour fire resistance rating, and the building is protected throughout by an approved, supervised automatic sprinkler system in accordance with **9.7.1.1**(1), each tenant space shall be individually classified.
- (4) The tenant spaces in a mall building in accordance with **36.4.4** shall be classified individually.

As noted in **36/37.1.2.1**, guidance on the classification of a mercantile occupancy is provided by the definition in **6.1.10.1**. Note that, per **6.1.14.1.3**, minor merchandising operations in buildings that house other predominant occupancies are permitted to comply with the requirements of the predominant occupancy. For example, a newsstand located in an office building could be treated under the same business occupancy requirements (**Chapters 38 and 39**) as the office building.

Further clarification of the subclassification of stores as Class A, Class B, or Class C is provided by **36/37.1.2.2.1** through **36/37.1.2.2.4**. Most of these provisions are included in the footnotes to **Commentary Table 36/37.1**. The following should also be noted:

1. The aggregate gross area is the sum of the gross areas of all floors used for mercantile (sales) purposes.
2. If the store is divided so that some portions are not used for sales purposes, such as shipping/receiving/storage areas, only the sales areas are included in the aggregate gross area.
3. With the exception of mall buildings (see **36/37.4.4**), the aggregate gross area of stores must be used in determining

## CHAPTER 37 • Existing

**37.1.2.2.2.3** Areas of floors not used for sales purposes, such as an area used only for storage and not open to the public, shall not be counted for the purposes of the classifications in **37.1.2.2.1**(1), (2), and (3), but means of egress shall be provided for such nonsales areas in accordance with their occupancy, as specified by other chapters of this *Code*.

**37.1.2.2.3** The floor area of a mezzanine, or the aggregate floor area of multiple mezzanines, shall not exceed one-half of the floor area of the room or story in which the mezzanines are located; otherwise, such mezzanine or aggregated mezzanines shall be treated as floors.

**37.1.2.2.4** Where a number of tenant spaces under different management are located in the same building, the aggregate gross area for subclassification shall be one of the following:

- (1) Where tenant spaces are not separated, the aggregate gross floor area of all such tenant spaces shall be used in determining classification per **37.1.2.2.1**.
- (2) Where individual tenant spaces are separated by fire barriers with a 1-hour fire resistance rating, each tenant space shall be individually classified.
- (3) The tenant spaces in a mall building in accordance with **37.4.4** shall be classified individually.

the subclassification of a mercantile occupancy in accordance with **36/37.1.2.2.1** under the following conditions:

- a. If stores are contiguous to one another (even if under different ownership or management and occupying numerous buildings)
- b. If sections or floors used for sales within any building are considered as separate stores (e.g., because they are under different management)
- c. If the contiguous or intermixed stores described in items 3(a) and (b) are not separated from each other by the 2-hour or 1-hour fire barriers specified in **36/37.1.2.2.4**

Mezzanines are addressed by the “one-third area rule” of **36.1.2.2.3** and **8.6.10** for new construction and the “one-half area rule” of **37.1.2.2.3** for existing mercantile occupancies. A mezzanine with an area that does not exceed the applicable one-third or one-half area rule does not constitute a story and, therefore, is not a factor in determining mercantile occupancy subclassification based on the number of floors used for sales purposes. The area of such mezzanines used for sales purposes (see **36/37.1.2.2.2**) is, however, a factor in determining occupancy subclassification based on floor area devoted to sales purposes.

## CHAPTER 36 • New

For example, a new mercantile occupancy with a 2100 ft<sup>2</sup> (195 m<sup>2</sup>) main sales floor and a 700 ft<sup>2</sup> (65 m<sup>2</sup>) sales mezzanine has a gross floor area of 2800 ft<sup>2</sup> (260 m<sup>2</sup>) and is, therefore, a Class C mercantile occupancy. A store with a 2400 ft<sup>2</sup> (225 m<sup>2</sup>) main sales floor and an 800 ft<sup>2</sup> (75 m<sup>2</sup>) sales mezzanine has a gross floor area of 3200 ft<sup>2</sup> (300 m<sup>2</sup>) and, so, is a Class B mercantile occupancy. In each case, the mezzanine meets the maximum one-third area rule and is not considered a story.

Mezzanines with areas in excess of the maximum one-third or one-half area rule constitute stories and, thus, sales levels. Therefore, such mezzanines must be considered when determining mercantile occupancy subclassification. For example, a set of plans might show a proposed store with three floor levels of 8000 ft<sup>2</sup> (740 m<sup>2</sup>), each used for sales purposes, and a single 4000 ft<sup>2</sup> (370 m<sup>2</sup>) sales mezzanine. Because this so-called mezzanine is not — based on the maximum one-third area rule of 8.6.10 referenced by 36.1.2.2.3 — a mezzanine, the store will actually use four floor levels for sales purposes. Although its 28,000 ft<sup>2</sup> (2590 m<sup>2</sup>) sales area would seem to indicate the store is a Class B occupancy, the four floor levels used for sales purposes result in a Class A subclassification in accordance with the definition in 36/37.1.2.2.1(1).

The Class A, Class B, and Class C mercantile occupancy subclassifications are summarized in **Commentary Table 36/37.1**. The classification process is important, because specific life safety requirements vary in degree of stringency for each mercantile class. A store's subclassification, while based directly on the size of the sales areas and number of stories, is indirectly a measure of the number of occupants at risk from any given fire.

Some mercantile occupancies locate their sales and storage areas together (e.g., furniture warehouse sales areas). In such cases, the mercantile occupancy subclassification is determined using the total aggregate gross area that is open to public use. The same procedure should be followed for bulk merchandising retail buildings.

The mezzanine measurement provisions of 37.1.2.2.3 for existing mercantile occupancies use a one-half area rule, as opposed to the one-third area rule for new mercantile occupancies. The one-third rule for new mercantile occupancy mezzanines correlates with the requirements in 8.6.10.2. Because the one-half area rule was applied to mercantile occupancies long before the general provisions for mezzanines were added to **Chapter 8**, it has been retained only for existing (but not new) mercantile occupancies. Mezzanines in existing mercantile occupancies continue to be evaluated on the basis of the previously applicable one-half area criterion to prevent the abrupt non-compliance of existing buildings due to an issue that does not significantly lower the level of safety to life.

Examples of mezzanine arrangements to which the maximum one-third area rule can be applied are depicted in **Exhibit 36/37.2**. **Exhibit 36/37.3** shows examples of mezzanine arrangements to which the maximum one-half area rule of

## CHAPTER 37 • Existing

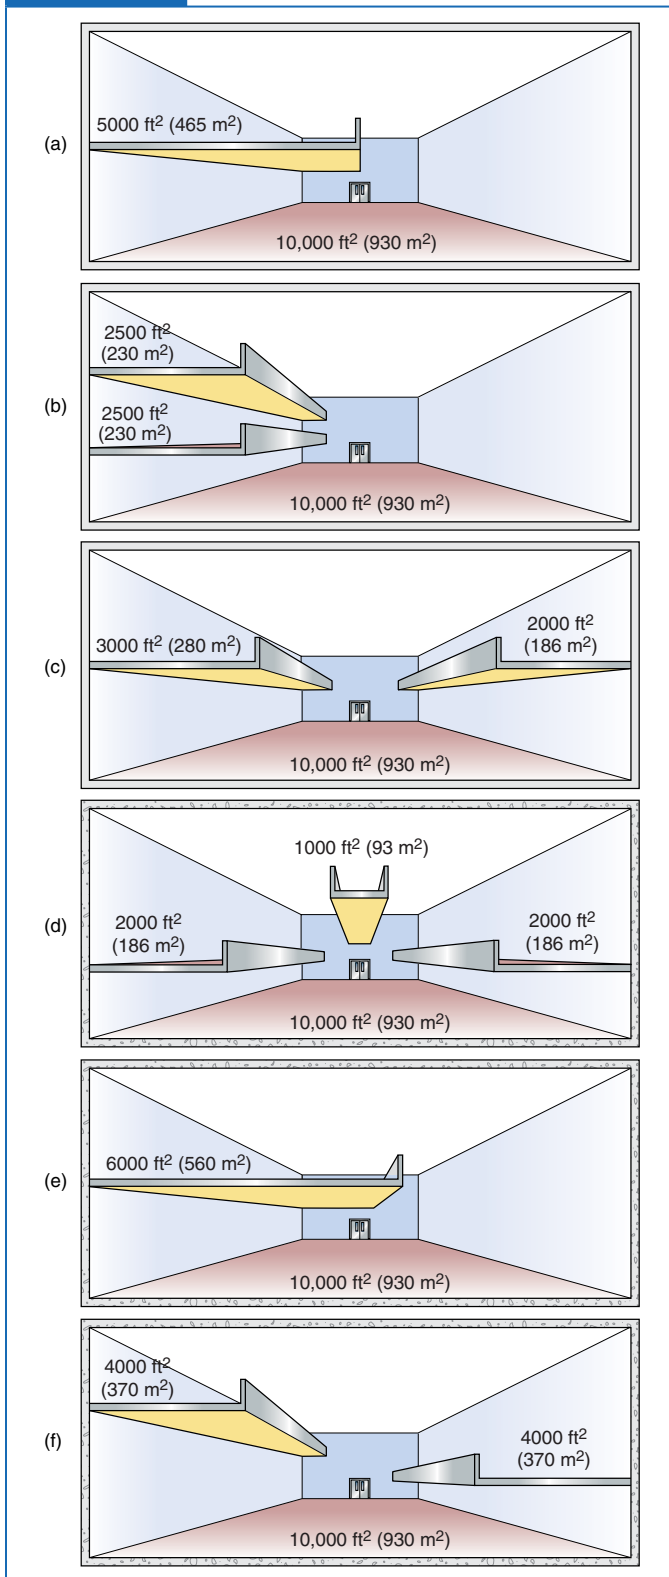

**Exhibit 36/37.2**

*Elevation views of new mercantile occupancy mezzanine arrangements.*

## CHAPTER 36 • New

## CHAPTER 37 • Existing

Exhibit 36/37.3

Elevation views of existing mercantile occupancy mezzanine arrangements.

37.1.2.2.3 for existing mercantile occupancies can be applied. For purpose of illustration, assume that all the mezzanines, as well as the entire main floor level, are used for sales purposes. Part (a) through Part (d) of Exhibit 36/37.2 depict a new single story or single floor level with mezzanine, because the aggregate areas of the mezzanines [3000 ft<sup>2</sup> (280 m<sup>2</sup>)] do not exceed one-third of the floor area [10,000 ft<sup>2</sup> (930 m<sup>2</sup>)] of the room or story in which the mezzanine is located. Similarly, Part (a) through Part (d) of Exhibit 36/37.3 depict an existing single story or single floor level with mezzanine, because the aggregate areas of the mezzanines [5000 ft<sup>2</sup> (465 m<sup>2</sup>)] do not exceed one-half of the floor area [10,000 ft<sup>2</sup> (930 m<sup>2</sup>)] of the room or story in which the mezzanine is located.

In Part (e) of Exhibit 36/37.2, the new single 4000 ft<sup>2</sup> (370 m<sup>2</sup>) intermediate level referred to by occupants as a mezzanine exceeds the one-third area rule. Similarly, in Part (e) of Exhibit 36/37.3, the existing single 6000 ft<sup>2</sup> (560 m<sup>2</sup>) intermediate level referred to by occupants as a mezzanine exceeds the one-half area rule. Therefore, in both cases, the intermediate level is not a mezzanine for *Life Safety Code* purposes but is a story. Part (e) of Exhibit 36/37.2 and Part (e) of Exhibit 36/37.3, therefore, depict two-story mercantile occupancies.

In Part (f) of Exhibit 36/37.2, one of the 3000 ft<sup>2</sup> (280 m<sup>2</sup>) mezzanines fits within the maximum one-third area allowance for new mezzanines and can be called a mezzanine without constituting a floor level. Similarly, in Part (f) of Exhibit 36/37.3, one of the 4000 ft<sup>2</sup> (370 m<sup>2</sup>) mezzanines fits within the maximum one-half area allowance for existing mercantile occupancies and can be called a mezzanine without constituting a floor level. In both cases, however, the other mezzanine, although of the same size and, thus, by itself, not in excess of the one-third or one-half area rule, does create a story, because the sum of the areas of the two mezzanines [6000 ft<sup>2</sup> (560 m<sup>2</sup>) in Exhibit 36/37.2 and 8000 ft<sup>2</sup> (740 m<sup>2</sup>) in Exhibit 36/37.3] exceeds one-third and one-half, respectively, of the 10,000 ft<sup>2</sup> (930 m<sup>2</sup>) lower floor level. Thus, Part (f) of Exhibit 36/37.2 and Part (f) of Exhibit 36/37.3 each depict a two-story mercantile occupancy with a mezzanine.

Although the mezzanines in Part (a) through Part (d) of Exhibit 36/37.2 and Part (a) through Part (d) of Exhibit 36/37.3 do not establish separate stories, their areas, because they are used for sales, are included in the total gross sales area used to establish mercantile occupancy subclassification in accordance with 36/37.1.2.2.1. Part (a) through Part (d) of Exhibit 36/37.2 show 13,000 ft<sup>2</sup> (1200 m<sup>2</sup>) of sales area and would be classified as Class B mercantile occupancies. Similarly, Part (a) through Part (d) of Exhibit 36/37.3 show 15,000 ft<sup>2</sup> (1400 m<sup>2</sup>) of sales area and would be classified as Class B mercantile occupancies.

In addition to the maximum one-third and one-half area limitations of 36/37.1.2.2.3, the provisions of 8.6.10 also apply to mezzanines. For example, a mezzanine used for sales purposes that meets the one-third or one-half area rule would not affect the mercantile occupancy subclassification with respect

## CHAPTER 36 • New

to number of stories used for sales purposes; however, the mezzanine would be required to be sufficiently open, in accordance with 8.6.10.3, to avoid treatment as a separate floor in terms of number of means of egress (see 36/37.2.4) and the other egress arrangement requirements that apply to floors or stories.

Note that, for existing mercantile occupancies [see 37.1.2.2.4(2)], the fire barrier separation required to waive aggregate gross area

### 36.1.3 Multiple Occupancies.

#### 36.1.3.1 General.

**36.1.3.1.1** All multiple occupancies shall be in accordance with 6.1.14 and 36.1.3.

**36.1.3.1.2** Where there are differences in the specific requirements in this chapter and provisions for mixed occupancies or separated occupancies as specified in 6.1.14.3 and 6.1.14.4, the requirements of this chapter shall apply.

**36.1.3.1.3** In other than bulk merchandising mercantile occupancies, atrium walls in accordance with 6.1.14.4.6 shall be permitted to serve as part of the separation required by 6.1.14.4.1 for creating separated occupancies on a story-by-story basis from nonhazardous spaces in assembly, educational, day care, health care, ambulatory health care, residential, residential board and care occupancies, and business occupancies.

The provision of 36/37.1.3.1.3 permits a mercantile occupancy that is part of a separated, multiple occupancy building to utilize an atrium as a portion of the occupancy separation in accordance with 6.1.14.4.6. These criteria are new to the 2015

#### 36.1.3.2 Combined Mercantile Occupancies and Parking Structures.

**36.1.3.2.1** The fire barrier separating parking structures from a building classified as a mercantile occupancy shall be a fire barrier having a minimum 2-hour fire resistance rating.

**36.1.3.2.2** Openings in the fire barrier required by 36.1.3.2.1 shall not be required to be protected with fire protection-rated opening protectives in enclosed parking structures that are protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1), or in open parking structures, provided that all of the following conditions are met:

- (1) The openings do not exceed 25 percent of the area of the fire barrier in which they are located.
- (2) The openings are used as a public entrance and for associated sidelight functions.
- (3) The building containing the mercantile occupancy is protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1).

## CHAPTER 37 • Existing

is 1 hour, rather than the 2-hour rating required for new mercantile occupancies via the provision of 36.1.2.2.4(2). The same 1-hour rating applies to new construction only if the building is sprinklered [see 36.1.2.2.4(3)].

### 37.1.3 Multiple Occupancies.

#### 37.1.3.1 General.

**37.1.3.1.1** All multiple occupancies shall be in accordance with 6.1.14 and 37.1.3.

**37.1.3.1.2** Where there are differences in the specific requirements in this chapter and provisions for mixed occupancies or separated occupancies as specified in 6.1.14.3 and 6.1.14.4, the requirements of this chapter shall apply.

**37.1.3.1.3** In other than bulk merchandising mercantile occupancies, atrium walls in accordance with 6.1.14.4.6 shall be permitted to serve as part of the separation required by 6.1.14.4.1 for creating separated occupancies on a story-by-story basis from nonhazardous spaces in assembly, educational, day care, health care, ambulatory health care, residential, residential board and care occupancies, and business occupancies.

edition of the *Code*. See the commentary following 6.1.14.4.6 for additional details on the use of an atrium as an occupancy separation.

#### 37.1.3.2 Combined Mercantile Occupancies and Parking Structures.

**37.1.3.2.1** The fire barrier separating parking structures from a building classified as a mercantile occupancy shall be a fire barrier having a minimum 2-hour fire resistance rating.

**37.1.3.2.2** Openings in the fire barrier required by 37.1.3.2.1 shall not be required to be protected with fire protection-rated opening protectives in enclosed parking structures that are protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1), or in open parking structures, provided that all of the following conditions are met:

- (1) The openings do not exceed 25 percent of the area of the fire barrier in which they are located.
- (2) The openings are used as a public entrance and for associated sidelight functions.
- (3) The building containing the mercantile occupancy is protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1).

## CHAPTER 36 • New

- (4)\* Means are provided to prevent spilled fuel from accumulating adjacent to the openings and entering the building.
- (5) Physical means are provided to prevent vehicles from being parked or driven within 10 ft (3050 mm) of the openings.
- (6) The openings are protected as a smoke partition in accordance with [Section 8.4](#), with no minimum fire protection rating required.

**A.36.1.3.2.2(4)** Means to prevent spilled fuel from accumulating and entering the mercantile occupancy building can be by curbs, scuppers, special drainage systems, sloping the floor away from the door openings, or floor elevation differences of not less than 4 in. (100 mm).

The provisions of [36/37.1.3.2](#) address combined mercantile occupancies and parking structures and are very similar to the requirements of [38/39.1.3.2](#), which address combined business occupancies and parking structures. It is common for multistory mercantile occupancies (such as department stores and mall buildings) and multistory business occupancies (such as office buildings) to be attached to multistory parking garages. Such garages provide access to the mercantile or business occupancy at multiple levels. To allow flexibility in the number and types of openings and in the degree of stringency required for opening protectives, such as fire doors and fire windows, the criteria in [36/37.1.3.2.2](#) outline a set of provisions that, where applied in total, will safely permit a reduction in the 2-hour fire resistance

### 36.1.4 Definitions.

**36.1.4.1 General.** For definitions, see [Chapter 3](#), Definitions.

**36.1.4.2 Special Definitions.** A list of special terms used in this chapter follows:

- (1) **Anchor Building.** See [3.3.36.2](#).
- (2) **Bulk Merchandising Retail Building.** See [3.3.36.4](#).
- (3) **Gross Leasable Area.** See [3.3.21.3](#).
- (4) **Major Tenant.** See [3.3.168](#).
- (5) **Mall.** See [3.3.169](#).
- (6) **Mall Building.** See [3.3.36.9](#).
- (7) **Open-Air Mercantile Operation.** See [3.3.199](#).

In the 2003 edition of the *Code*, the term *anchor store* was replaced with the term *anchor building*, as defined in [3.3.36.2](#), recognizing that such a building might contain other than mercantile occupancies. From a merchandising viewpoint, a shopping mall developer or operator might refer to any of the large tenants that have vast expanses of floor space and instant name recognition — and that are often positioned at the ends and corners of the mall building — as anchor buildings. However, the *Code* reserves the use of the term *anchor building* for those

## CHAPTER 37 • Existing

- (4)\* Means are provided to prevent spilled fuel from accumulating adjacent to the openings and entering the building.
- (5) Physical means are provided to prevent vehicles from being parked or driven within 10 ft (3050 mm) of the openings.
- (6) The openings are protected as a smoke partition in accordance with [Section 8.4](#), with no minimum fire protection rating required.

**A.37.1.3.2.2(4)** Means to prevent spilled fuel from accumulating and entering the mercantile occupancy building can be by curbs, scuppers, special drainage systems, sloping the floor away from the door openings, or elevation differences of not less than 4 in. (100 mm).

rating required by [36/37.1.3.2.1](#). The reduction permits the use of nonrated glazing and opening protectives. This reduction permits the use of glass doors and sidelights in the barrier between the mercantile occupancy and the garage, which increases security in the garage, because customers and staff can view the parking area through the glass doors or sidelights.

Note that all seven requirements mandated by [36/37.1.3.2.2](#) — the sprinkler requirement for enclosed garages in the base paragraph and the six requirements of [36/37.1.3.2.2\(1\)](#) through (6) — must be met as a whole to apply the exemption. Otherwise, a continuous 2-hour fire barrier with properly protected openings between the mercantile occupancy and the parking structure is required.

### 37.1.4 Definitions.

**37.1.4.1 General.** For definitions, see [Chapter 3](#), Definitions.

**37.1.4.2 Special Definitions.** A list of special terms used in this chapter follows:

- (1) **Anchor Building.** See [3.3.36.2](#).
- (2) **Bulk Merchandising Retail Building.** See [3.3.36.4](#).
- (3) **Gross Leasable Area.** See [3.3.21.3](#).
- (4) **Major Tenant.** See [3.3.168](#).
- (5) **Mall.** See [3.3.169](#).
- (6) **Mall Building.** See [3.3.36.9](#).
- (7) **Open-Air Mercantile Operation.** See [3.3.199](#).

perimeter buildings whose means of egress requirements are met without requiring travel into the mall.

[Exhibit 36/37.4](#) illustrates the difference between an anchor building and a store that, while large, is not an anchor building. Required means of egress from an anchor building is not permitted to pass through the mall. The store at the left of the exhibit satisfies this requirement and, therefore, is an anchor building. The opening between the anchor building and the mall is permitted over and above the egress width satisfied by the store's

Exhibit 36/37.4

Anchor building and non-anchor building.

required means of egress. The store at the right of the exhibit relies on exits from the mall as part of its required egress capacity and, therefore, is not an anchor building.

The term *bulk merchandising retail building* (see definition in 3.3.36.4) applies to the special provisions of 36/37.4.5 for mercantile occupancies characterized by warehouse-type sales areas where merchandise is stored on pallets, in solid piles, or in racks extending far above head height. The storage arrangement and quantities of combustible materials pose challenges that differ from those typically found in department stores and supermarkets and, therefore, warrant special protection criteria.

The 2009 edition of the Code introduced the term *major tenant* (see definition in 3.3.168), which is a tenant space that has at least one main entrance from the outside that also serves as an exit. The intent of this definition and the corresponding provision in 36/37.4.4.6.6 is to avoid needlessly oversizing the means of egress from the mall, given that some occupants of the major tenants will egress directly to the outside. The required means of egress capacity from the mall is based on the occupant load calculated in accordance with Figure 7.3.1.2(a) or Figure 7.3.1.2(b).

### 36.1.5 Classification of Hazard of Contents.

**36.1.5.1** The contents of mercantile occupancies shall be classified in accordance with Section 6.2.

**36.1.5.2** Mercantile occupancies classified as high hazard in accordance with Section 6.2 shall meet all of the following additional requirements:

- (1) Exits shall be located so that not more than 75 ft (23 m) of travel from any point is needed to reach the nearest exit.
- (2) From every point, there shall be not less than two exits accessible by travel in different directions (no common path of travel).
- (3) All vertical openings shall be enclosed.

The occupant load of the mall for which means of egress must be provided is based on the gross leasable area of the mall building, excluding anchor buildings. By definition, the gross leasable area of the mall building includes the tenant spaces and one-half of the area of major tenants [see 3.3.21.3 and 36/37.4.4.2(3)]. The provision of 36/37.4.4.6.6 regarding means of egress from major tenants that are independent of the mall relieves the mall from having to be provided with excessive means of egress.

The terms *mall* (see definition in 3.3.169) and *mall building* (see definition in 3.3.36.9) differ from each other so that certain requirements apply only to the covered pedestrian way (the mall), while other requirements apply to the entire building, including all tenant spaces and common areas (the mall building). For example, the provisions of 36/37.4.4 require automatic sprinkler protection throughout the mall building but require an alarm system — and, under certain conditions, a smoke control system — only within the mall.

Open-air mercantile operations (see definition in 3.3.199) are addressed in 36/37.4.3.

### 37.1.5 Classification of Hazard of Contents.

**37.1.5.1** The contents of mercantile occupancies shall be classified in accordance with Section 6.2.

**37.1.5.2** Mercantile occupancies classified as high hazard in accordance with Section 6.2 shall meet all of the following additional requirements:

- (1) Exits shall be located so that not more than 75 ft (23 m) of travel from any point is needed to reach the nearest exit.
- (2) From every point, there shall be not less than two exits accessible by travel in different directions (no common path of travel).
- (3) All vertical openings shall be enclosed.

## CHAPTER 36 • New

**36.1.6 Minimum Construction Requirements. (Reserved)**

**36.1.7 Occupant Load.** The occupant load, in number of persons for whom means of egress and other provisions are required, shall be determined on the basis of the occupant load factors of [Table 7.3.1.2](#) that are characteristic of the use of the space, or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

Classification of hazard of contents is addressed in [36/37.1.5](#), which refers to [Section 6.2](#). Typically, unless an unusually hazardous situation exists, the contents of mercantile occupancies are classified as ordinary hazard.

Because the total package of life safety provided by the requirements of [Chapters 36 and 37](#) anticipates the display of significant quantities of combustibles, it provides an acceptable level of safety without making it necessary to classify the typical mercantile occupancy environment as highly hazardous. Specifically, the requirements of [Chapters 36 and 37](#) are adequate without imposing the stringent high hazard contents requirements of [36/37.1.5.2](#) on all but the most hazardous of mercantile occupancies.

Operations that would require classification of a mercantile occupancy as high hazard include dispensing gunpowder or other explosives in bulk or dispensing gasoline or flammable solvents by pouring them into open containers. NFPA 30, *Flammable and Combustible Liquids Code*,<sup>1</sup> regulates the sale of flammable liquids, such as camp stove fuel and rubbing alcohol, with regard to display configuration, total amount, and separation from ignition sources.

[Exhibit 36/37.5](#) illustrates an egress arrangement from a high hazard area of a mercantile occupancy that meets the

Egress arrangement from area of mercantile occupancy classified as high hazard.

## CHAPTER 37 • Existing

**37.1.6 Minimum Construction Requirements. (Reserved)**

**37.1.7 Occupant Load.** The occupant load, in number of persons for whom means of egress and other provisions are required, shall be determined on the basis of the occupant load factors of [Table 7.3.1.2](#) that are characteristic of the use of the space, or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

requirements of [36/37.1.5.2](#)(1) and (2), which address limited travel distance and the exclusion of common path of travel. Doors 1 and 2 lead to remote corridor segments that provide access to independent and remote exits. Travel in two independent directions is possible from any point within the high hazard contents room. Travel distance from any point within the high hazard contents room to the nearest exit does not exceed 75 ft (23 m). Although mercantile occupancy requirements are generally lenient in permitting unprotected vertical openings (see [36/37.3.1](#)), all vertical openings in high hazard mercantile occupancies are required to be fully enclosed (see [Section 8.6](#)) in accordance with [36/37.1.5.2](#)(3).

The term *minimum construction*, as used in [36/37.1.6](#), describes the construction of the building housing the occupancy. Some occupancy chapters, such as [Chapters 18 and 19](#), which address the life safety needs of nonambulatory occupants of health care occupancies, require a minimum building construction type to help ensure structural integrity for a prolonged evacuation or for safe refuge within the building. Because mercantile occupancies characteristically are used by ambulatory customers and employees (note that mobility-impaired occupants are not necessarily nonambulatory or incapable of self-preservation) and do not provide sleeping accommodations, no minimum construction requirements are imposed.

The occupant load factors for mercantile uses specified in [Table 7.3.1.2](#) are based on the observation that, during the normal use of a mercantile occupancy, the largest number of customers usually occupies the street floor or a basement sales area. In assigning a higher occupant load to the street floor, the *Code* recognizes merchandising techniques that arrange merchandise to take advantage of the heavy flow of traffic on the street floor. Customers are attracted to merchandise displays as they walk through portions of the street floor to reach escalators, elevators, and stairs to other floors. Thus, larger numbers of occupants are expected to occupy the street floor.

The street floor, as distinguished from other sales floors, is any floor that has an entrance/exit that is directly accessible from the street with not more than three risers of ascent or descent. The term *street floor* is defined in [3.3.271](#). If differences in the ground level on different sides of a store create several floors of this nature (street floors), the *Code* treats them all as street floors;

## CHAPTER 36 • New

however, a slightly different occupant load factor is used in accordance with footnote b to [Table 7.3.1.2](#). If the only access to a store from the street is by means of stairs or escalators, the principal sales floor, rather than the street level, must be considered the street floor for the purpose of choosing an occupant load factor and calculating the occupant load.

The terms *mall* and *mall building* have different meanings [see commentary following [36/37.1.4.2\(7\)](#)]. Therefore, the intent of footnote e to [Table 7.3.1.2](#) is that the egress capacity of the overall mall building is to be sized to handle an occupant load that is calculated in two steps. First, the occupant load is calculated individually for each store and tenant space using the occupant load factors of [Table 7.3.1.2](#). Second, the required egress capacity for the mall itself (the covered pedestrian way) is calculated using the occupant load factors shown in [Figure 7.3.1.2\(a\)](#) or [Figure 7.3.1.2\(b\)](#). Each store or tenant space must have sufficient egress capacity for its occupant load. The egress capacity of the mall must be based on [Figure 7.3.1.2\(a\)](#) or [Figure 7.3.1.2\(b\)](#), which, in effect, automatically accounts for those persons who are in the mall (the covered pedestrian way) and those persons who discharge from stores into the mall as part of the stores' means of egress.

## 36.2 Means of Egress Requirements

### 36.2.1 General.

**36.2.1.1** All means of egress shall be in accordance with [Chapter 7](#) and this chapter.

**36.2.1.2** No inside open stairway or inside open ramp shall be permitted to serve as a component of the required means of egress system for more than one floor.

**36.2.1.3** Where there are two or more floors below the street floor, the same stairway or other exit shall be permitted to serve all floors, but all required exits from such areas shall be independent of any open stairways between the street floor and the floor below it.

**36.2.1.4** Where exits from the upper floor also serve as an entrance from a principal street, the upper floor shall be classified as a street floor in accordance with the definition of street floor in [3.3.271](#) and shall be subject to the requirements of this chapter for street floors.

**36.2.1.5** High hazard mercantile occupancies shall be arranged in accordance with [36.1.5.2](#).

Even where unenclosed interior stairs or ramps are permitted by [36/37.3.1](#), the use of such stairs or ramps as exit access for more than one floor is prohibited by [36/37.2.1.2](#).

## CHAPTER 37 • Existing

For example, consider a mall building with 21 tenant stores located on the street floor. Each store uses 6000 ft<sup>2</sup> (560 m<sup>2</sup>) of the 7500 ft<sup>2</sup> (700 m<sup>2</sup>) of gross leasable area as sales area [assume that the other 1500 ft<sup>2</sup> (140 m<sup>2</sup>) is storage area]. Using an occupant load factor of 30 ft<sup>2</sup> (2.8 m<sup>2</sup>) per person for the sales areas and 300 ft<sup>2</sup> (27.9 m<sup>2</sup>) for the storage areas, in accordance with [Table 7.3.1.2](#), each store must size its means of egress system to handle 205 persons [6000/30 + 1500/300 (560/2.8 + 140/27.9) = 205]. Store occupants use the mall as part of the required means of egress from each store. With 21 tenant stores, each with 7500 ft<sup>2</sup> (700 m<sup>2</sup>) of gross leasable area, the mall has a gross leasable area of 157,500 ft<sup>2</sup> (14,700 m<sup>2</sup>), which is the basis on which the means of egress from the mall must be sized. [Figure 7.3.1.2\(a\)](#) and [Figure 7.3.1.2\(b\)](#) indicate that, for a gross leasable area of 157,500 ft<sup>2</sup> (14,700 m<sup>2</sup>), the occupant load factor is 36 ft<sup>2</sup> (3.34 m<sup>2</sup>) per person. The mall must, therefore, provide a means of egress system for 157,500 ft<sup>2</sup>/36 ft<sup>2</sup> per person (14,700 m<sup>2</sup>/3.34 m<sup>2</sup> per person), or 4375 persons (or 4400 persons if using SI units, due to rounding).

## 37.2 Means of Egress Requirements

### 37.2.1 General.

**37.2.1.1** All means of egress shall be in accordance with [Chapter 7](#) and this chapter.

**37.2.1.2** No inside open stairway, inside open escalator, or inside open ramp shall be permitted to serve as a component of the required means of egress system for more than one floor.

**37.2.1.3** Where there are two or more floors below the street floor, the same stairway or other exit shall be permitted to serve all floors, but all required exits from such areas shall be independent of any open stairways between the street floor and the floor below it.

**37.2.1.4** Where exits from the upper floor also serve as an entrance from a principal street, the upper floor shall be classified as a street floor in accordance with the definition of street floor in [3.3.271](#) and shall be subject to the requirements of this chapter for street floors.

**37.2.1.5** High hazard mercantile occupancies shall be arranged in accordance with [37.1.5.2](#).

Street floors are addressed by [36/37.2.1.4](#). [Exhibit 36/37.6](#) illustrates a case where two floors qualify as street floors because each has one side located at a ground level. Note, however, that

## CHAPTER 36 • New

## CHAPTER 37 • Existing

Exhibit 36/37.6

Mercantile occupancy with two street floors.

### 36.2.2 Means of Egress Components.

**36.2.2.1 Components Permitted.** Components of means of egress shall be limited to the types described in 36.2.2.2 through 36.2.2.12.

#### 36.2.2.2 Doors.

**36.2.2.2.1** Doors complying with 7.2.1 shall be permitted.

**36.2.2.2.2\*** Locks complying with 7.2.1.5.5 shall be permitted only on principal entrance/exit doors.

**A.36.2.2.2.2** The words “principal entrance/exit doors” describe doors that the authority having jurisdiction can reasonably expect to be unlocked in order for the facility to do business.

**36.2.2.2.3** Elevator lobby exit access door-locking arrangements in accordance with 7.2.1.6.3 shall be permitted.

#### 36.2.2.2.4 Reserved.

**36.2.2.2.5** Delayed-egress locks complying with 7.2.1.6.1 shall be permitted.

**36.2.2.2.6** Access-controlled egress doors complying with 7.2.1.6.2 shall be permitted in buildings protected throughout by an approved, supervised fire detection system in accordance with Section 9.6 or an approved automatic sprinkler system in accordance with 9.7.1.1(1).

**36.2.2.2.7** Horizontal or vertical security grilles or doors complying with 7.2.1.4.1(3) shall be permitted to be used as a part of the required means of egress from a tenant space.

each street floor has its other sides located either above or below the building’s other ground level. As a result, these floors must have their exits arranged to allow horizontal travel to the exterior at one end of the floor and vertical travel (either up or down to ground level) at the other end of the floor. The egress capacity of the doors to the exterior on floor 1 must accommodate that portion of the occupant load from an upper floor that is expected to travel down to and through the exits to the exterior from floor 1. This egress capacity is in addition to the assigned portion of the floor 1 occupant load. The reverse is true for floor 2, which must increase the size of its exterior exit door capacity to accommodate occupants traveling up from floor 1, as well as those traveling down to and through the exterior exits on floor 2. The provisions of 7.3.1.5, 7.3.1.6, and 36/37.2.3.2 explain how to add egress capacity based on the number of occupants expected to discharge from floors above and below the street floor. Exhibit 36/37.11, which is included in the commentary that follows 36/37.2.3.2, provides an example of how to calculate egress capacity for a street floor similar to that illustrated by floor 2 in Exhibit 36/37.6.

### 37.2.2 Means of Egress Components.

**37.2.2.1 Components Permitted.** Components of means of egress shall be limited to the types described in 37.2.2.2 through 37.2.2.12.

#### 37.2.2.2 Doors.

**37.2.2.2.1** Doors complying with 7.2.1 shall be permitted.

**37.2.2.2.2\*** Locks complying with 7.2.1.5.5 shall be permitted only on principal entrance/exit doors.

**A.37.2.2.2.2** The words “principal entrance/exit doors” describe doors that the authority having jurisdiction can reasonably expect to be unlocked in order for the facility to do business.

**37.2.2.2.3** Elevator lobby exit access door-locking arrangements in accordance with 7.2.1.6.3 shall be permitted.

**37.2.2.2.4** The re-entry provisions of 7.2.1.5.8 shall not apply. [See 7.2.1.5.8.2(1).]

**37.2.2.2.5** Delayed-egress locks complying with 7.2.1.6.1 shall be permitted.

**37.2.2.2.6** Access-controlled egress doors complying with 7.2.1.6.2 shall be permitted in buildings protected throughout by an approved, supervised fire detection system in accordance with Section 9.6 or an approved automatic sprinkler system in accordance with 9.7.1.1(1).

**37.2.2.2.7** Horizontal or vertical security grilles or doors complying with 7.2.1.4.1(3) shall be permitted to be used as part of the required means of egress from a tenant space.

## CHAPTER 36 • New

**36.2.2.2.8** All doors at the foot of stairs from upper floors or at the head of stairs leading to floors below the street floor shall swing in the direction of egress travel.

**36.2.2.2.9** Revolving doors complying with 7.2.1.10 shall be permitted.

### 36.2.2.3 Stairs.

**36.2.2.3.1** Stairs complying with 7.2.2 shall be permitted.

**36.2.2.3.2** Spiral stairs complying with 7.2.2.2.3 shall be permitted.

**36.2.2.4 Smokeproof Enclosures.** Smokeproof enclosures complying with 7.2.3 shall be permitted.

**36.2.2.5 Horizontal Exits.** Horizontal exits complying with 7.2.4 shall be permitted.

**36.2.2.6 Ramps.** Ramps complying with 7.2.5 shall be permitted.

### 36.2.2.7 Exit Passageways.

**36.2.2.7.1** Exit passageways complying with 7.2.6 shall be permitted.

**36.2.2.7.2\*** Exit passageways in a mall building shall be permitted to accommodate the following occupant loads independently:

- (1) Portion of the occupant load assigned to the exit passageway from only the mall/pedestrian way
- (2) Largest occupant load assigned to the exit passageway from a single tenant space

**A.36.2.2.7.2** Egress from a mall building should be designed as follows:

- (1) The mall/pedestrian way has been assigned no occupant load, but it is required to be provided with means of egress sized to accommodate the total occupant load of the mall building based on the gross leasable area.
- (2) The exits for the mall/pedestrian way are permitted to be provided by a combination of exterior exit doors and exit passageways.
- (3) After completion of A.36.2.2.7.2(1), each tenant space is to be judged individually for occupant load and egress capacity, and the following also apply:
  - (a) The step specified in A.36.2.2.7.2(3) normally sends a portion or all (per 36.4.4.4.2) of the tenant space's occupant load into the mall.

## CHAPTER 37 • Existing

**37.2.2.2.8** All doors at the foot of stairs from upper floors or at the head of stairs leading to floors below the street floor shall swing in the direction of egress travel.

**37.2.2.2.9** Revolving doors complying with 7.2.1.10 shall be permitted.

**37.2.2.2.10** In Class C mercantile occupancies, doors shall be permitted to swing inward against the direction of egress travel where such doors serve only the street floor area.

### 37.2.2.3 Stairs.

**37.2.2.3.1** Stairs complying with 7.2.2 shall be permitted.

**37.2.2.3.2** Spiral stairs complying with 7.2.2.2.3 shall be permitted.

**37.2.2.3.3** Winders complying with 7.2.2.2.4 shall be permitted.

**37.2.2.4 Smokeproof Enclosures.** Smokeproof enclosures complying with 7.2.3 shall be permitted.

**37.2.2.5 Horizontal Exits.** Horizontal exits complying with 7.2.4 shall be permitted.

**37.2.2.6 Ramps.** Ramps complying with 7.2.5 shall be permitted.

### 37.2.2.7 Exit Passageways.

**37.2.2.7.1** Exit passageways complying with 7.2.6 shall be permitted.

**37.2.2.7.2\*** Exit passageways in a mall building shall be permitted to accommodate the following occupant loads independently:

- (1) Portion of the occupant load assigned to the exit passageway from only the mall/pedestrian way
- (2) Largest occupant load assigned to the exit passageway from a single tenant space

**A.37.2.2.7.2** Egress from a mall building should be designed as follows:

- (1) The mall/pedestrian way has been assigned no occupant load, but it is required to be provided with means of egress sized to accommodate the total occupant load of the mall building based on the gross leasable area.
- (2) The exits for the mall/pedestrian way are permitted to be provided by a combination of exterior exit doors and exit passageways.
- (3) After completion of A.37.2.2.7.2(1), each tenant space is to be judged individually for occupant load and egress capacity, and the following also apply:
  - (a) The step specified in A.37.2.2.7.2(3) normally sends a portion or all (per 37.4.4.4.2) of the tenant space's occupant load into the mall.

## CHAPTER 36 • New

- (b) Any remaining occupants are sent through the back of the tenant space into an exit passageway that might serve multiple tenant spaces and the mall.
- (4) The width of the exit passageway is required to be sized for the most restrictive of the following:
  - (a) Width of not less than 66 in. (1675 mm) per 36.4.4.4.2(3)
  - (b) Portion of the egress capacity from the largest single tenant space being served by the exit passageway
  - (c) Portion of the egress capacity from the mall being provided by the exit passageway

The concepts used in A.36.2.2.7.2(4)(a) through (c) include the following:

- (1) After proper egress capacity is provided for the mall/pedestrian way, each tenant space is then required to independently provide egress capacity for its occupants.
- (2) The mall required exit passageway width and the tenant space required exit passageway width are not required to be added together.
- (3) The required exit passageway width for a tenant space is not required to be added to that of other tenant spaces using the same exit passageway.

**36.2.2.8 Reserved.****36.2.2.9 Reserved.**

**36.2.2.10 Fire Escape Ladders.** Fire escape ladders complying with 7.2.9 shall be permitted.

**36.2.2.11 Alternating Tread Devices.** Alternating tread devices complying with 7.2.11 shall be permitted.

**36.2.2.12 Areas of Refuge.**

**36.2.2.12.1** Areas of refuge complying with 7.2.12 shall be permitted.

**36.2.2.12.2** In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1), two rooms or spaces separated from each other by smoke-resistant partitions in accordance with the definition of area of refuge in 3.3.22 shall not be required.

Only the principal entrance/exit doors of a mercantile occupancy are permitted to be equipped with the special key-operated dead bolt lock described by 7.2.1.5.5, per 36/37.2.2.2.2. See Exhibit 36/37.7. It must be easy to determine that the device is locked by using means such as a flag indicator that can be seen at the door. Other exit doors are prohibited from being equipped with key-operated dead bolt locks, because the probability is low that these doors will be consistently unlocked when the

## CHAPTER 37 • Existing

- (b) Any remaining occupants are sent through the back of the tenant space into an exit passageway that might serve multiple tenant spaces and the mall.
- (4) The width of the exit passageway is required to be sized for the most restrictive of the following:
  - (a) Width of not less than 66 in. (1675 mm) per 37.4.4.4.2(3)
  - (b) Portion of the egress capacity from the largest single tenant space being served by the exit passageway
  - (c) Portion of the egress capacity from the mall being provided by the exit passageway

The concepts used in A.37.2.2.7.2(4)(a) through (c) include the following:

- (1) After proper egress capacity is provided for the mall/pedestrian way, each tenant space is then required to independently provide egress capacity for its occupants.
- (2) The mall required exit passageway width and the tenant space required exit passageway width are not required to be added together.
- (3) The required exit passageway width for a tenant space is not required to be added to that of other tenant spaces using the same exit passageway.

**37.2.2.8 Escalators and Moving Walks.** Escalators and moving walks complying with 7.2.7 shall be permitted.

**37.2.2.9 Fire Escape Stairs.** Fire escape stairs complying with 7.2.8 shall be permitted.

**37.2.2.10 Fire Escape Ladders.** Fire escape ladders complying with 7.2.9 shall be permitted.

**37.2.2.11 Alternating Tread Devices.** Alternating tread devices complying with 7.2.11 shall be permitted.

**37.2.2.12 Areas of Refuge.**

**37.2.2.12.1** Areas of refuge complying with 7.2.12 shall be permitted.

**37.2.2.12.2** In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1), two rooms or spaces separated from each other by smoke-resistant partitions in accordance with the definition of area of refuge in 3.3.22 shall not be required.

occupancy opens to the public for business, whereas the principal entrance/exit doors must be unlocked each day to accommodate customers. Locked egress doors have contributed to many fire deaths; the criteria in 7.2.1.5.5 and 36/37.2.2.2.2 provide for building security while ensuring that occupants will be able to open required egress doors and leave the building in the event of a fire.

## CHAPTER 36 • New

Exhibit 36/37.7

Principal entrance/exit.

Although Chapter 36 does not address stairwell re-entry, the re-entry provisions of 7.2.1.5.8 apply to new mercantile occupancies. Stairs connecting five or more stories must provide either re-entry from the stair enclosure back onto all floors at any time or similar re-entry following automatic release of locking devices initiated by the building fire alarm system per 7.2.1.5.8(2). Selected stairwell doors are permitted by 7.2.1.5.8.1 to remain locked from the stairwell side of the door to provide building security, while other doors must allow re-entry. The location and number of re-entry points provide the same overall level of life safety for this type of occupancy as that intended by the base provisions of 7.2.1.5.8. Existing mercantile occupancies are exempted by 37.2.2.2.4 from the stair enclosure re-entry provisions.

In recognition of the security needs of a mercantile occupancy, 36/37.2.2.2.5 permits the use of the delayed-egress locking device covered by 7.2.1.6.1 on any door, provided that the building is protected throughout by an approved, supervised automatic sprinkler system or an approved, supervised automatic fire detection system. In effect, the allowable 15-second or 30-second delay will be experienced only under non-fire conditions or very early in the fire development, because the door must be usable immediately upon sprinkler operation, smoke or heat detection, or loss of power that controls the locking mechanism.

In mercantile occupancies with either complete sprinkler or fire detection systems, 36/37.2.2.2.6 recognizes access-controlled egress doors as security measures that do not compromise the use of the means of egress system.

Although 7.2.1.4.1(3) establishes provisions for the arrangement and use of security grilles or doors, it requires the applicable occupancy chapter to specifically permit the use of such measures. For mercantile occupancies, 36/37.2.2.2.7 provides that recognition.

## CHAPTER 37 • Existing

The provision of 36/37.2.2.2.8 supplements the door provisions of 7.2.1.4 by requiring doors that otherwise would not have to swing in the direction of egress travel to do so, based on their location. The queuing and accumulation of people at doors in locations such as at the bottom of a stair serving upper floors makes it difficult for occupants to step back to allow the door to swing inward.

Revolving doors are addressed by 36/37.2.2.2.9. The provisions of 7.2.1.10 specify that the use of a revolving door, regardless of whether it is permitted as part of the required means of egress, requires a conforming side-hinged swinging door to be positioned and usable within the same wall as, and to be located within 10 ft (3050 mm) of, the revolving door. This requirement helps to ensure that, once people move toward the door, if the collapsibility and other safety features of the door fail and render it unusable, egress from the vicinity is still possible without retracing steps and traveling toward the fire. Existing revolving doors are permitted to continue to be used without having to meet some of the more stringent requirements that apply to new revolving doors. See the provisions of 7.2.1.10.1.

Paragraph 36/37.2.2.4 does not mandate the use of smokeproof enclosures in a mercantile occupancy, but it does recognize a smokeproof enclosure as part of the means of egress system, provided that the smokeproof enclosure meets the requirements of 7.2.3. For an example of an occupancy requiring a smokeproof enclosure, see 31.2.11.1, in which existing nonsprinklered or partially sprinklered high-rise apartment buildings are required to be provided with smokeproof enclosures in accordance with 7.2.3.

Exit passageways are addressed in 36/37.2.2.7 and are frequently used within the means of egress system of mall buildings as a way of meeting the travel distance limitations or avoiding numerous exit doors along exterior walls located at the rear of tenant spaces. In effect, the exit passageway labeled A in Exhibit 36/37.8 moves the exit closer to the occupants to create a building arrangement that would otherwise require occupants

Exhibit 36/37.8

Typical uses of exit passageways in mall buildings.

## CHAPTER 36 • New

to travel farther than allowable to reach an exit door in an exterior wall. The exit passageway labeled *B* in [Exhibit 36/37.8](#) runs along the rear of multiple-tenant spaces and provides access to the exterior only at each end of the exit passageway for security reasons. In both cases, the exit passageway is a *Code*-complying exit in accordance with [7.2.6](#) and provides the same degree of safety that an exit stair enclosure would provide an occupant of an upper floor in a multistory building. Because an exit passageway might not be readily recognized as an exit, it must be maintained clear of storage or any other items that might impede its use as an exit. While signage indicating the prohibition of such storage is not required, it can help increase the probability that exit passageways will be maintained clear and unobstructed.

Although the provisions of [7.2.6.4](#) require an exit passageway to be sized to accommodate the aggregate required capacity of all exits discharging through the exit passageway, [36/37.2.2.7.2](#) permits some reduction in the required width of exit passageways in mall buildings. The provision recognizes that the sizing of the means of egress from the mall — calculated in accordance with the provisions of [Figure 7.3.1.2\(a\)](#) or [Figure 7.3.1.2\(b\)](#) — provides egress capacity for occupants of the mall and occupants of the adjoining tenant spaces within the mall building. Requiring an exit passageway in a mall building to be of sufficient size to accommodate both its assigned mall occupant load and the occupant load of all tenant spaces discharging through the exit passageway would be equivalent to counting a portion of the building's occupants twice and, thereby, needlessly oversizing the means of egress system.

Existing escalators and moving walks are recognized by [37.2.2.8](#) as part of the means of egress in accordance with [7.2.7](#). To qualify as exits, existing escalators and moving walks must also meet the requirements of [7.2.2.5](#) that address enclosure. [Exhibit 36/37.9](#) depicts an escalator in a mall undergoing repairs with its treads removed. For this reason, escalators are not permitted to serve as required means of egress components in new occupancies.

Existing fire escape stairs are recognized by [37.2.2.9](#) as part of the means of egress. Note that [7.2.8.1.2](#) permits only those

### 36.2.3 Capacity of Means of Egress.

**36.2.3.1** The capacity of means of egress shall be in accordance with [Section 7.3](#).

**36.2.3.2** In Class A and Class B mercantile occupancies, street floor exits shall be sufficient for the occupant load of the street floor plus the required capacity of stairs and ramps discharging through the street floor.

## CHAPTER 37 • Existing

#### Exhibit 36/37.9

*Escalator in a mall undergoing repairs.*

occupancy chapters that apply to existing buildings to locate a fire escape stair within the required means of egress. Furthermore, [7.2.8.1.2.1](#) permits existing buildings to use fire escape stairs for not more than 50 percent of the building's required egress capacity.

In accordance with the provisions of [36/37.2.2.10](#) and [36/37.2.2.11](#), both fire escape ladders and alternating tread devices are permitted within the means of egress of mercantile occupancies, but only as permitted by the relatively narrow provisions of [7.2.9](#) and [7.2.11](#). The provisions of [7.2.11](#), in effect, restrict the use of alternating tread devices to locations where the *Code* recognizes the use of fire escape ladders.

### 37.2.3 Capacity of Means of Egress.

**37.2.3.1** The capacity of means of egress shall be in accordance with [Section 7.3](#).

**37.2.3.2** In Class A and Class B mercantile occupancies, street floor exits shall be sufficient for the occupant load of the street floor plus the required capacity of stairs, ramps, escalators, and moving walks discharging through the street floor.

## CHAPTER 36 • New

The provisions of 7.3.1.6 mandate that any required egress capacity from a mezzanine that passes through the room below must be added to the required egress capacity of the room through which the egress passes.

Exhibit 36/37.10 illustrates a case in which a mezzanine is open to the street floor. The exits from the street floor must accommodate the following:

1. Occupant load of the street floor
2. Occupant load of the mezzanine in accordance with 7.3.1.6
3. Required capacity provided by the stairs from other floors discharging through the street floor in accordance with 36/37.2.3.2

To determine the egress capacity for the street floor, the occupant load of the mezzanine (1000 persons) is added to the occupant load of the street floor (2000 persons). In addition, because one-half of the exits from the upper floors discharge through the street floor, the egress capacity of the street floor must accommodate the capacity of the exit stair enclosure that discharges through that floor. The maximum occupant load on any upper floor is 2000 (second floor), and 36/37.2.7.2 permits a maximum of one-half of the exits (and one-half of the egress capacity in new mercantile occupancies) to discharge through the street floor, provided that the building is sprinklered. Therefore, the street floor must be provided with egress capacity for 4000 persons (2000 for street floor + 1000 for mezzanine + 1000 for upper floors = 4000) or 800 in. [66 ft 8 in. (20 m)] of exit width using the factor of 0.2 in. (5 mm) per person for level egress components found in Table 7.3.3.1.

Exhibit 36/37.10

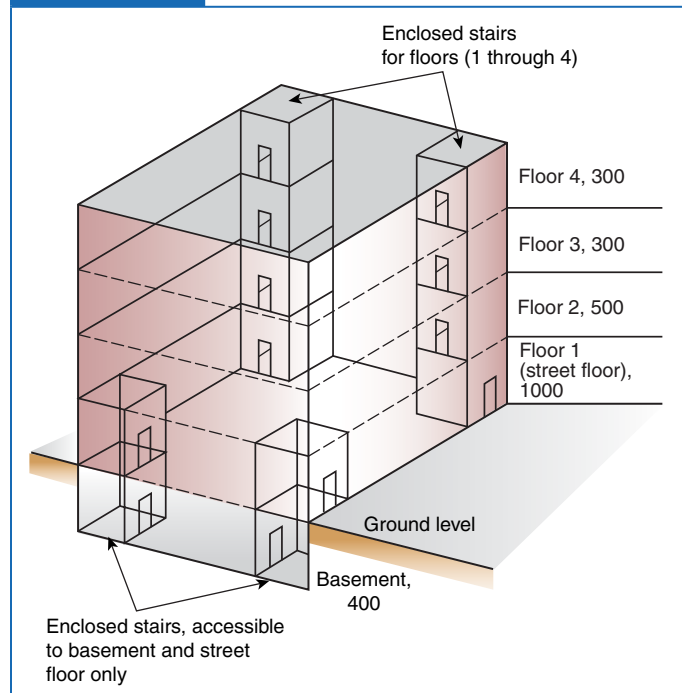

Mercantile occupancy with mezzanine open to the street floor.

## CHAPTER 37 • Existing

The provisions of 36/37.2.3.2 require that the exits for the street floor of a Class A or Class B mercantile occupancy have sufficient capacity to accommodate the occupant load of the street floor and the capacity of the exits discharging through the street floor, such as an enclosed exit stair that accommodates occupants who, when exiting the building during an emergency, must travel up from the basement sales area or down from the upper sales floors and mix with the customers already occupying the street floor.

Because people move more quickly in the horizontal direction than in the vertical direction, it is permissible to provide less door width than stair width for a given number of occupants within any given egress path. For example, in mercantile occupancies, in accordance with the egress capacity factors of Table 7.3.3.1, level components and ramps require only 0.2 in. (5 mm) of width per person, whereas stairs require 0.3 in. (7.6 mm) of width per person. As a rough approximation, for every 44 in. (1120 mm) of stair discharging through the street floor, an additional 30 in. (760 mm) of door width opening to the outside must be added to the street floor. Exhibit 36/37.11 illustrates an example of the calculation method for determining the required exit capacity for the street floor, which follows.

Exhibit 36/37.11

Calculation of exit capacity required for a street floor in accordance with 36/37.2.3.2.

## CHAPTER 36 • New

Street floor occupant load alone	1000
Maximum upper floor occupant load discharging back through street floor (500/2)	+ 250
Basement occupant load discharging back through street floor (400/2)	+ 200
Total occupant load	1450

**36.2.4 Number of Means of Egress.**

**36.2.4.1** Means of egress shall comply with all of the following, except as otherwise permitted by 36.2.4.2 through 36.2.4.5:

- (1) The number of means of egress shall be in accordance with Section 7.4.
- (2) Not less than two separate exits shall be provided on every story.
- (3) Not less than two separate exits shall be accessible from every part of every story.

**36.2.4.2** Exit access, as required by 36.2.4.1(3), shall be permitted to include a single exit access path for the distances permitted as common paths of travel by 36.2.5.3.

**36.2.4.3** A single means of egress shall be permitted in a Class C mercantile occupancy, provided that the travel distance to the exit or to a mall pedestrian way (see 36.4.4.2) does not exceed 75 ft (23 m).

**36.2.4.4** A single means of egress shall be permitted in a Class C mercantile occupancy, provided that the travel distance to the exit or to a mall does not exceed 100 ft (30 m), and the story on which the occupancy is located, and all communicating levels that are traversed to reach the exit or mall, are protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1).

**36.2.4.5** A single means of egress to an exit or to a mall shall be permitted from a mezzanine within any Class A, Class B, or Class C mercantile occupancy, provided that the common path of travel does not exceed 75 ft (23 m), or does not exceed 100 ft (30 m) if protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1).

The provisions of 36/37.2.4, which apply to the required number of exits for mercantile occupancies, clarify that any level that constitutes a story must have at least two exits located on that story. This means that the occupants of the story must be able to enter two exits (such as an enclosed exit stair on an upper floor of a multistory building) without having to travel to another

## CHAPTER 37 • Existing

1450 persons  $\times$  0.2 in. (5 mm) per person for level exit components per Table 7.3.3.1 = 290 in., or 24 ft 2 in. (7250 mm) of exit width required from the street floor egress system.

**37.2.4 Number of Means of Egress.**

**37.2.4.1** Means of egress shall comply with all of the following, except as otherwise permitted by 37.2.4.2 through 37.2.4.5:

- (1) The number of means of egress shall be in accordance with Section 7.4.
- (2) Not less than two separate exits shall be provided on every story.
- (3) Not less than two separate exits shall be accessible from every part of every story.

**37.2.4.2** Exit access as required by 37.2.4.1(3) shall be permitted to include a single exit access path for the distances permitted as common paths of travel by 37.2.5.3.

**37.2.4.3** A single means of egress shall be permitted in a Class C mercantile occupancy, provided that the travel distance to the exit or to a mall pedestrian way (see 37.4.4.2) does not exceed 75 ft (23 m).

**37.2.4.4** A single means of egress shall be permitted in a Class C mercantile occupancy, provided that the travel distance to the exit or to a mall does not exceed 100 ft (30 m), and the story on which the occupancy is located, and all communicating levels that are traversed to reach the exit or mall, are protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1).

**37.2.4.5** A single means of egress to an exit or to a mall shall be permitted from a mezzanine within any Class A, Class B, or Class C mercantile occupancy, provided that the common path of travel does not exceed 75 ft (23 m), or does not exceed 100 ft (30 m) if protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1).

story to reach the entrances to the exits. Because a mezzanine that meets the maximum one-third or one-half area rule of 36/37.1.2.2.3 does not constitute a story [see the commentary following 36.1.2.2.4(4) and 37.1.2.2.4(3)], two exits are not required on the mezzanine. However, the criteria of 36/37.2.4.1(3) must be met with respect to providing access to two separate

## CHAPTER 36 • New

exits, or the single means of egress provisions of 36/37.2.4.3, 36/37.2.4.4, or 36/37.2.4.5 must be met.

The provision of 36/37.2.5.3 allows the occupant to travel in one direction for a maximum distance (the common path allowance) before requiring exit access in two separate directions. Therefore, although the story or mezzanine must eventually provide access to two exits in accordance with 36/37.2.4.1(3), the access is required to be available only at the point where the allowable common path is expended. (See 36/37.2.5.3 for permitted common path of travel distances.)

Although the basic requirement of 36/37.2.4 mandates that a mercantile occupancy is to be provided with at least two remotely located exits, 36/37.2.4.3 permits a single means of egress for Class C mercantile occupancies, such as small convenience stores. If the travel distance from any point in such a store to an exit is 75 ft (23 m) or less, the likelihood that a fire might surprise and overcome the customers before they could escape is low (see Exhibit 36/37.12). The provision of 36/37.2.4.4 permits a single exit in small, sprinklered mercantile occupancies if travel to an exit is not more than 100 ft (30 m). Furthermore, a single exit is permitted in Class C occupancies where travel distance to a mall that qualifies as a pedestrian way in accordance with 36/37.4.4.2 does not exceed 100 ft (30 m). The provisions of 36/37.4.4.2 include an automatic sprinkler system requirement for the entire mall building. Additional flexibility and a potential increase in security is provided by 36/37.2.4.4 for those small stores protected by means of automatic sprinkler installations within the store and for those portions of the overall building that occupants must traverse to reach an exit or pedestrian way.

### 36.2.5 Arrangement of Means of Egress.

**36.2.5.1** Means of egress shall be arranged in accordance with Section 7.5.

**36.2.5.2** Dead-end corridors shall comply with 36.2.5.2.1 or 36.2.5.2.2.

**36.2.5.2.1** In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1), dead-end corridors shall not exceed 50 ft (15 m).

## CHAPTER 37 • Existing

Exhibit 36/37.12

Single exit permitted in a Class C mercantile occupancy if travel distance is limited.

### 37.2.5 Arrangement of Means of Egress.

**37.2.5.1** Means of egress shall be arranged in accordance with Section 7.5.

**37.2.5.2\*** Dead-end corridors shall not exceed 50 ft (15 m).

**A.37.2.5.2** The purpose of 37.2.5.2 is to avoid pockets or dead ends of such size that they pose an undue danger of persons becoming trapped in case of fire.

It is recognized that dead ends exceeding the permitted limits exist and, in some cases, are impractical to eliminate. The authority having jurisdiction might permit such dead ends to continue to exist, taking into consideration any or all of the following:

- (1) Tenant arrangement
- (2) Automatic sprinkler protection
- (3) Smoke detection
- (4) Exit remoteness

## CHAPTER 36 • New

**36.2.5.2.2** In all buildings not complying with **36.2.5.2.1**, dead-end corridors shall not exceed 20 ft (6100 mm).

**36.2.5.3** Common paths of travel shall be limited by any of the following:

- (1) Common paths of travel shall not exceed 75 ft (23 m) in mercantile occupancies classified as low or ordinary hazard.
- (2) Common paths of travel shall not exceed 100 ft (30 m) in mercantile occupancies classified as low or ordinary hazard where the building is protected throughout by an approved, supervised automatic sprinkler system in accordance with **9.7.1.1(1)**.
- (3) Common paths of travel shall not be permitted in mercantile occupancies classified as high hazard.

**36.2.5.4** Aisles leading to each exit shall be required, and the aggregate width of such aisles shall be not less than the required width of the exit.

**36.2.5.5** Required aisles shall be not less than 36 in. (915 mm) in clear width.

**36.2.5.6** In Class A mercantile occupancies, not less than one aisle of a 60 in. (1525 mm) minimum clear width shall lead directly to an exit.

**36.2.5.7** In mercantile occupancies other than bulk merchandising retail buildings, if the only means of customer entrance is through one exterior wall of the building, one-half of the required egress width from the street floor shall be located in such wall. Means of egress from floors above or below the street floor shall be arranged in accordance with **Section 7.5**.

**36.2.5.8** Not less than one-half of the required exits shall be located so as to be reached without passing through checkout stands.

**36.2.5.9** Checkout stands or associated railings or barriers shall not obstruct exits, required aisles, or approaches thereto.

**36.2.5.10\*** Where wheeled carts or buggies are used by customers, adequate provision shall be made for the transit and parking of such carts to minimize the possibility that they might obstruct means of egress.

**A.36.2.5.10** To eliminate the obstruction to the means of egress of the interior exit access and the exterior exit discharge, it is the intent to provide adequate area for transit and parking of wheeled carts or buggies used by customers. This area includes corral

## CHAPTER 37 • Existing

**37.2.5.3\*** Common paths of travel shall be limited in accordance with **37.2.5.3.1** or **37.2.5.3.2**.

**A.37.2.5.3** It is recognized that common paths of travel exceeding the permitted limits exist and, in some cases, are impractical to eliminate. The authority having jurisdiction might permit such paths of travel to continue to exist, taking into consideration any or all of the following:

- (1) Tenant arrangement
- (2) Automatic sprinkler protection
- (3) Smoke detection
- (4) Exit remoteness

**37.2.5.3.1** In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with **9.7.1.1(1)**, common paths of travel shall not exceed 100 ft (30 m).

**37.2.5.3.2** In buildings not complying with **37.2.5.3.1**, common paths of travel shall not exceed 75 ft (23 m).

**37.2.5.4** Aisles leading to each exit shall be required, and the aggregate width of such aisles shall be not less than the required width of the exit.

**37.2.5.5** Required aisles shall be not less than 28 in. (710 mm) in clear width.

**37.2.5.6** In Class A mercantile occupancies, not less than one aisle of a 60 in. (1525 mm) minimum clear width shall lead directly to an exit.

**37.2.5.7** In mercantile occupancies other than bulk merchandising retail buildings, if the only means of customer entrance is through one exterior wall of the building, one-half of the required egress width from the street floor shall be located in such wall. Means of egress from floors above or below the street floor shall be arranged in accordance with **Section 7.5**.

**37.2.5.8** Not less than one-half of the required exits shall be located so as to be reached without passing through checkout stands.

**37.2.5.9** Checkout stands or associated railings or barriers shall not obstruct exits, required aisles, or approaches thereto.

**37.2.5.10\*** Where wheeled carts or buggies are used by customers, adequate provision shall be made for the transit and parking of such carts to minimize the possibility that they might obstruct means of egress.

**A.37.2.5.10** To eliminate the obstruction to the means of egress of the interior exit access and the exterior exit discharge, it is the intent to provide adequate area for transit and parking of wheeled carts or buggies used by customers. This area includes corral

## CHAPTER 36 • New

areas adjacent to exits that are constructed to restrict the movement of wheeled carts or buggies therefrom.

**36.2.5.11** Exit access in Class A and Class B mercantile occupancies that are protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1), and exit access in all Class C mercantile occupancies, shall be permitted to pass through storerooms, provided that all of the following conditions are met:

- (1) Not more than 50 percent of exit access shall be provided through the storeroom.
- (2) The storeroom shall not be subject to locking.
- (3) The main aisle through the storeroom shall be not less than 44 in. (1120 mm) wide.
- (4) The path of travel through the storeroom shall be defined, direct, and continuously maintained in an unobstructed condition.

The provision of 36.2.5.2.1 recognizes the additional level of safety to life provided by a complete automatic sprinkler system and allows added flexibility when designing the location of corridors and exits in buildings where approved sprinkler systems are installed. The provision allows dead-end corridor pockets in new sprinklered mercantile occupancies to be as long as 50 ft (15 m). Dead-end corridor pockets in existing mercantile occupancies are allowed to be 50 ft (15 m) long without any requirement for sprinklers.

Common path of travel limits are provided in 36/37.2.5.3. See the commentary following A.7.5.1.5 for a detailed discussion on common path of travel. Also see 36/37.2.4.2, which permits the access to a single exit or a portion of the access to multiple exits to be common.

The provisions of 36/37.2.5.4 are intended to prevent constrictions in the means of egress system that would delay the egress of building occupants. The aggregate width of aisles leading to an exit is required to provide egress width at least equal to that required of the exit to which they lead. Without this provision, occupants could be forced to squeeze through a relatively narrow aisle or similar constriction before reaching, for example, an expansive bank of doors to the outside. The egress capacity at the doors, rather than providing simultaneous egress for the large number of occupants assigned to that exit, would not be fully utilized. Occupants would move through the doors a few at a time as they passed slowly through the constriction. The requirement of 36/37.2.5.4 is illustrated in Exhibit 36/37.13 in the upper left and right corners of the floor plan of the mercantile occupancy.

The minimum 36 in. (915 mm) aisle width required for new mercantile occupancies by 36.2.5.5, and the minimum 28 in. (710 mm)

## CHAPTER 37 • Existing

areas adjacent to exits that are constructed to restrict the movement of wheeled carts or buggies therefrom.

**37.2.5.11** Exit access in Class A mercantile occupancies that are protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1), and exit access in all Class B and Class C mercantile occupancies, shall be permitted to pass through storerooms, provided that all of the following conditions are met:

- (1) Not more than 50 percent of exit access shall be provided through the storeroom.
- (2) The storeroom shall not be subject to locking.
- (3) The main aisle through the storeroom shall be not less than 44 in. (1120 mm) wide.
- (4) The path of travel through the storeroom shall be defined, direct, and continuously maintained in an unobstructed condition.

Means of egress arrangement in a Class A mercantile occupancy.

aisle width required for existing mercantile occupancies by 37.2.5.5, are illustrated in Exhibit 36/37.13. These minimum widths are consistent with those prescribed by 7.3.4.1(2) and 7.3.4.1.2.

The intent of 36/37.2.5.4 through 36/37.2.5.6 is to ensure that the interior arrangement of counters, racks, and displays of merchandise does not block or obscure access to an exit. The

## CHAPTER 36 • New

arrangement illustrated in [Exhibit 36/37.13](#) meets the requirements for a Class A store. Essentially, the width of the exit determines the minimum widths of the aisles, with the added proviso that one of the aisles must have a clear width of at least 60 in. (1525 mm) and lead directly to an exit.

In establishing the requirements of [36/37.2.5.7](#), the *Code* demonstrates its concern regarding the arrangement of many discount and variety stores that have one large main exit/entrance located in the front of the store and the other exits (which cannot be used as entrances) situated at points unfamiliar to the public. In these mercantile occupancy arrangements, the wall containing the main exit/entrance must be sized to accommodate one-half of the required egress capacity of the store, because the public is familiar with this entrance/exit, and most customers will use it as an exit under emergency conditions. This requirement is illustrated in the lower portion of [Exhibit 36/37.13](#). Note that, prior to the 2006 edition, the *Code* required two-thirds of the required egress capacity to be provided via the wall containing the main exit/entrance. This requirement was deemed to be onerous given the overall good life safety record associated with mercantile occupancies and was, thus, revised to the current one-half criteria.

A frequently violated provision of [Chapters 36 and 37](#) is contained in [36/37.2.5.8](#). In many supermarkets and discount and variety stores, it is necessary to pass through checkout counters, around shopping carts, and through turnstiles to exit the facility. This process causes congestion or blockage during an emergency. The *Code* requires at least one-half of all exits to be located so that occupants can avoid passing through or around these impediments to egress. See [Exhibit 36/37.13](#).

The potential encroachment on egress width by shopping carts is addressed by [36/37.2.5.10](#). In jurisdictions where returnable beverage bottle legislation has been enacted, stores and markets have had to create space for collecting empty bottles and refunding deposit charges. An area commonly used is located near the entrance/exit where wheeled shopping carts were formerly stored to be clear of the path of egress travel. The displaced carts are now sometimes stored so that they obstruct the means of egress. This is an example of a situation where a properly designed, installed, and complying means of egress might be compromised abruptly by unexpected changes.

The provisions of [36/37.2.5.11](#) address egress paths through storerooms in the following occupancies:

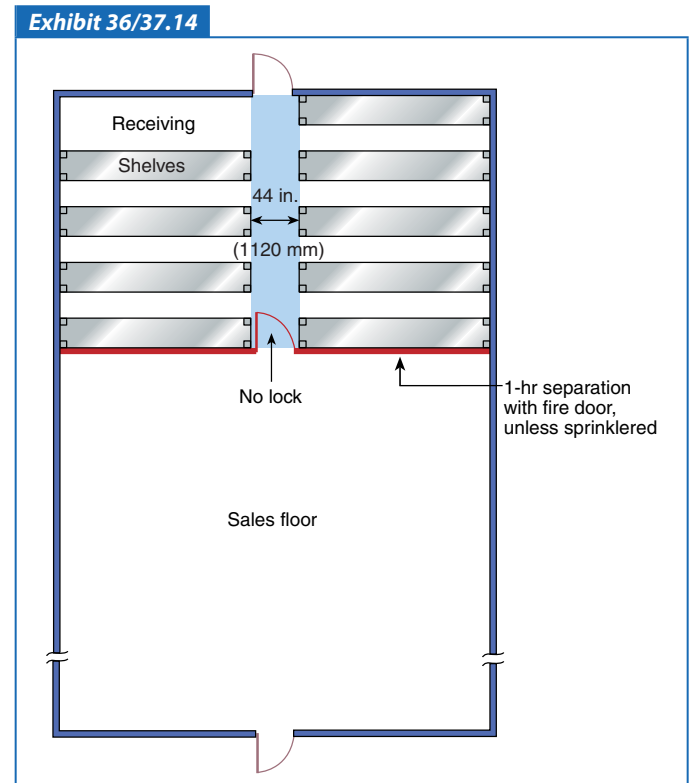

1. All Class C mercantile occupancies
2. Existing Class B mercantile occupancies
3. New Class B mercantile occupancies protected throughout by an approved, supervised automatic sprinkler system
4. All Class A mercantile occupancies protected throughout by an approved, supervised automatic sprinkler system

## CHAPTER 37 • Existing

The storeroom is limited by [36/37.2.5.11\(1\)](#) to providing a maximum of 50 percent of the store's exit access in number of exits and exit capacity. Therefore, because two exits are required, neither of the following limits can be exceeded:

1. Only one of the two required exits can be reached by exit access travel through the storeroom.
2. A maximum of one-half of the store's occupant load is permitted to egress through the storeroom.

[Exhibit 36/37.14](#) illustrates the application of the provisions of [36/37.2.5.11](#). The exit access path through the storeroom must be defined. Prior to the 2009 edition, the *Code* required fixed barriers, such as guardrails, to define the aisle. It was found, however, that the rails were sometimes used to support merchandise and other storage, thus rendering the aisle useless. Maintenance of the required exit access path depends on the education of store management and employees. Aisles can be defined by painting stripes on the floor and providing signage; however, if such means prove to be ineffective, the authority having jurisdiction has the authority to require whatever is necessary to maintain the means of egress unobstructed.

Exit access through a storeroom as permitted by [36/37.2.5.11](#).

## CHAPTER 36 • New

**36.2.6 Travel Distance to Exits.** Travel distance shall be as specified in 36.2.6.1, 36.2.6.2, and 36.2.6.3 and shall be measured in accordance with Section 7.6.

**36.2.6.1** In mercantile occupancies classified as ordinary hazard, travel distance shall not exceed 150 ft (46 m).

**36.2.6.2** In mercantile occupancies classified as ordinary hazard in buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1), travel distance shall not exceed 250 ft (76 m).

**36.2.6.3** In mercantile occupancies classified as high hazard, travel distance shall not exceed 75 ft (23 m).

In accordance with Section 7.6, travel distance limitations apply to only the first (or nearest) exit from a given point in the building. In other words, the 150 ft (46 m) travel distance limit for non-sprinklered mercantile occupancies [250 ft (76 m) for sprinklered occupancies] requires that at least one exit must be located within 150 ft (46 m) [250 ft (76 m) if sprinklered] of a point in the

### 36.2.7 Discharge from Exits.

**36.2.7.1** Exit discharge shall comply with Section 7.7 and 36.2.7.2.

**36.2.7.2\*** Fifty percent of the exits shall be permitted to discharge through the level of exit discharge in accordance with 7.7.2 only where the building is protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1).

**A.36.2.7.2** The basis for the exemption to the general rule on complete enclosure of exits up to their point of discharge to the outside of the building is that, with the specified safeguards, reasonable safety is maintained.

A stairway is not considered to discharge through the street floor area if it leads to the street through a fire resistance-rated enclosure (exit passageway) separating it from the main area, even though there are doors between the first-floor stairway landing and the main area.

The provisions of 36.2.7.2 should not be confused with those for open stairways, as permitted by 36.3.1(1).

The restriction imposed by 36/37.2.7.2 is intended to prevent more than 50 percent of the exits from any floor from discharging through the street floor. Furthermore, such exit discharge is permitted only where the building is sprinklered throughout. The remaining 50 percent of the exits must discharge directly to the exterior. The requirements of 36/37.2.7.2 are more stringent than those of 7.7.2, as they mandate automatic sprinkler protection throughout the building in recognition of the potentially

## CHAPTER 37 • Existing

**37.2.6 Travel Distance to Exits.** Travel distance shall be as specified in 37.2.6.1 and 37.2.6.2 and shall be measured in accordance with Section 7.6.

**37.2.6.1** In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1), travel distance shall not exceed 250 ft (76 m).

**37.2.6.2** In buildings not complying with 37.2.6.1, the travel distance shall not exceed 150 ft (46 m).

building; it does not require that all exits must be within the prescribed travel distance limitations from any point. Note that these travel distance limitations were increased from those found prior to the 2003 edition of the Code, recognizing the good life safety history associated with mercantile occupancies.

### 37.2.7 Discharge from Exits.

**37.2.7.1** Exit discharge shall comply with Section 7.7 and 37.2.7.2.

**37.2.7.2\*** Fifty percent of the exits shall be permitted to discharge through the level of exit discharge in accordance with 7.7.2 only where the building is protected throughout by an approved automatic sprinkler system in accordance with 9.7.1.1(1).

**A.37.2.7.2** The basis for the exemption to the general rule on complete enclosure of exits up to their point of discharge to the outside of the building is that, with the specified safeguards, reasonable safety is maintained.

A stairway is not considered to discharge through the street floor area if it leads to the street through a fire resistance-rated enclosure (exit passageway) separating it from the main area, even though there are doors between the first floor stairway landing and the main area.

The provisions of 37.2.7.2 should not be confused with those for open stairways, as permitted by 37.3.1(1) and (2).

high combustible fuel load of merchandise on display characteristic of mercantile occupancies. Prior to the 2009 edition, the Code also limited the path of travel from the stair discharge to the exit to 50 ft (15 m); this travel distance limit was deleted based on the good life safety record associated with mercantile occupancies and the significant restriction in design flexibility caused by such a limit. The provisions of 7.7.2 adequately address the path of travel to the exit.

## CHAPTER 36 • New

**36.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with [Section 7.8](#).

**36.2.9 Emergency Lighting.** Class A and Class B mercantile occupancies and mall buildings shall have emergency lighting facilities in accordance with [Section 7.9](#).

**36.2.10 Marking of Means of Egress.** Where an exit is not immediately apparent from all portions of the sales area, means of egress shall have signs in accordance with [Section 7.10](#).

### 36.2.11 Special Means of Egress Features.

**36.2.11.1 Reserved.**

**36.2.11.2 Lockups.** Lockups in mercantile occupancies shall comply with the requirements of [22.4.5](#).

Illumination for the means of egress, addressed in [36/37.2.8](#), is not the same as emergency lighting. Failure of the building power supply might cause failure of the means of egress illumination system, which is not required to have a backup, an auxiliary, or a secondary power supply unless mandated by [36/37.2.9](#), which addresses emergency lighting. Due to their small size and small occupant load, Class C mercantile occupancies are not required by the *Code* to be provided with emergency lighting.

The intent of [36/37.2.10](#) is to avoid requiring exit signs in small areas where the exit is readily apparent. For example, exit signs should not be required in the office of a service station, the

## CHAPTER 37 • Existing

**37.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with [Section 7.8](#).

**37.2.9 Emergency Lighting.** Class A and Class B mercantile occupancies and mall buildings shall have emergency lighting facilities in accordance with [Section 7.9](#).

**37.2.10 Marking of Means of Egress.** Where an exit is not immediately apparent from all portions of the sales area, means of egress shall have signs in accordance with [Section 7.10](#).

### 37.2.11 Special Means of Egress Features.

**37.2.11.1 Reserved.**

**37.2.11.2 Lockups.** Lockups in mercantile occupancies, other than approved existing lockups, shall comply with the requirements of [23.4.5](#).

purchase and dining areas of a small fast-food restaurant, or a Class C store where size and arrangement comply with the single-exit provisions of [36/37.2.4.3](#) or [36/37.2.4.4](#).

If a mercantile occupancy is provided with a lockup for detaining suspected shoplifters, it must meet the provisions of [22/23.4.5](#), as specified in [36/37.2.11.2](#). The lockup criteria require the application of some of the concepts of detention and correctional occupancies to other occupancies where persons might be detained for security purposes, without classifying the lockup as a detention and correctional occupancy. See [22/23.4.5](#) and related commentary for details on the lockup provisions.

---

## 36.3 Protection

**36.3.1 Protection of Vertical Openings.** Any vertical opening shall be protected in accordance with [Section 8.6](#), except under any of the following conditions:

- (1) In Class A or Class B mercantile occupancies protected throughout by an approved, supervised automatic sprinkler system in accordance with [9.7.1.1\(1\)](#), unprotected vertical openings shall be permitted at one of the following locations:
  - (a) Between any two floors
  - (b) Among the street floor, the first adjacent floor below, and the adjacent floor (or mezzanine) above
- (2) In Class C mercantile occupancies, unprotected openings shall be permitted between the street floor and the mezzanine.
- (3) The draft stop and closely spaced sprinkler requirements of NFPA 13, *Standard for the Installation of Sprinkler Systems*, shall not be required for unenclosed vertical openings permitted in [36.3.1\(1\)](#) and [36.3.1\(2\)](#).

---

## 37.3 Protection

**37.3.1 Protection of Vertical Openings.** Any vertical opening shall be protected in accordance with [Section 8.6](#), except under any of the following conditions:

- (1) In Class A or Class B mercantile occupancies protected throughout by an approved, supervised automatic sprinkler system in accordance with [9.7.1.1\(1\)](#), unprotected vertical openings shall be permitted at one of the following locations:
  - (a) Between any two floors
  - (b) Among the street floor, the first adjacent floor below, and the adjacent floor (or mezzanine) above
- (2) In Class C mercantile occupancies, unprotected openings shall be permitted between the street floor and the mezzanine.
- (3) The draft stop and closely spaced sprinkler requirements of NFPA 13, *Standard for the Installation of Sprinkler Systems*, shall not be required for unenclosed vertical openings permitted in [36.3.1\(1\)](#) and (2).

## CHAPTER 36 • New

- (4) Unenclosed vertical openings in accordance with 8.6.9.2 shall be permitted and the provision of 8.6.9.2(5) shall not apply.
- (5) Unenclosed vertical openings in accordance with 8.6.9.7 shall be permitted and the number of contiguous stories shall not be limited.

**36.3.2 Protection from Hazards.**

**36.3.2.1\* General.** Hazardous areas shall be protected in accordance with 36.3.2.1.1 or 36.3.2.1.2.

**A.36.3.2.1** It is the intent to permit a suspended natural gas-fired unit heater that complies with the requirements of 9.2.2 to be installed and used in a mercantile occupancy without classifying the area in which it is located as hazardous.

**36.3.2.1.1\*** Hazardous areas shall be protected in accordance with Section 8.7.

**A.36.3.2.1.1** These areas can include, but are not limited to, areas used for general storage, boiler or furnace rooms, and maintenance shops that include woodworking and painting areas.

**36.3.2.1.2** In general storage and stock areas protected by an automatic extinguishing system in accordance with 9.7.1.1(1) or 9.7.1.2, an enclosure shall be exempt from the provisions of 8.7.1.2.

**36.3.2.2\* High Hazard Contents Areas.** High hazard contents areas, as classified in Section 6.2, shall meet all of the following criteria:

- (1) The area shall be separated from other parts of the building by fire barriers having a minimum 1-hour fire resistance rating, with all openings therein protected by self-closing fire door assemblies having a minimum ¾-hour fire protection rating.
- (2) The area shall be protected by an automatic extinguishing system in accordance with 9.7.1.1(1) or 9.7.1.2.
- (3) In high hazard areas, all vertical openings shall be enclosed.

**A.36.3.2.2** The requirement for separating high hazard contents areas from other parts of the building is intended to isolate the hazard, and 8.2.3.3 is applicable.

**36.3.2.3\* Commercial Cooking Operations.** Commercial cooking operations shall be protected in accordance with 9.2.3, unless the cooking equipment is one of the following types:

- (1) Outdoor equipment
- (2) Equipment used only for food warming

**A.36.3.2.3** It is not the intent to prohibit the use of equipment that is used less frequently and does not produce significant grease-laden vapors such as that equipment used for cooking demonstrations.

## CHAPTER 37 • Existing

- (4) Unenclosed vertical openings in accordance with 8.6.9.2 shall be permitted.

**37.3.2 Protection from Hazards.**

**37.3.2.1\* General.** Hazardous areas shall be protected in accordance with 37.3.2.1.1 or 37.3.2.1.2.

**A.37.3.2.1** It is the intent to permit a suspended natural gas-fired unit heater that complies with the requirements of 9.2.2 to be installed and used in a mercantile occupancy without classifying the area in which it is located as hazardous.

**37.3.2.1.1\*** Hazardous areas shall be protected in accordance with Section 8.7.

**A.37.3.2.1.1** These areas can include, but are not limited to, areas used for general storage, boiler or furnace rooms, and maintenance shops that include woodworking and painting areas.

**37.3.2.1.2** In general storage and stock areas protected by an automatic extinguishing system in accordance with 9.7.1.1(1) or 9.7.1.2, an enclosure shall be exempt from the provisions of 8.7.1.2.

**37.3.2.2\* High Hazard Contents Areas.** High hazard contents areas, as classified in Section 6.2, shall meet all of the following criteria:

- (1) The area shall be separated from other parts of the building by fire barriers having a minimum 1-hour fire resistance rating, with all openings therein protected by self-closing fire door assemblies having a minimum ¾-hour fire protection rating.
- (2) The area shall be protected by an automatic extinguishing system in accordance with 9.7.1.1(1) or 9.7.1.2.

**A.37.3.2.2** The requirement for separating high hazard contents areas from other parts of the building is intended to isolate the hazard, and 8.2.3.3 is applicable.

**37.3.2.3\* Commercial Cooking Operations.** Commercial cooking operations shall be protected in accordance with 9.2.3, unless the cooking equipment is one of the following types:

- (1) Outdoor equipment
- (2) Equipment used only for food warming

**A.37.3.2.3** It is not the intent to prohibit the use of equipment that is used less frequently and does not produce significant grease-laden vapors such as that equipment used for cooking demonstrations.

## CHAPTER 36 • New

**36.3.3 Interior Finish.**

**36.3.3.1 General.** Interior finish shall be in accordance with [Section 10.2](#).

**36.3.3.2 Interior Wall and Ceiling Finish.** Interior wall and ceiling finish materials complying with [Section 10.2](#) shall be Class A, Class B, or Class C.

**36.3.3.3 Interior Floor Finish.**

**36.3.3.3.1** Interior floor finish shall comply with [Section 10.2](#).

**36.3.3.3.2** Interior floor finish in exit enclosures shall be Class I or Class II.

**36.3.3.3.3** Interior floor finish shall comply with [10.2.7.1](#) or [10.2.7.2](#), as applicable.

[Paragraph 36/37.3.1](#) addresses vertical openings. The criteria in [36/37.3.1\(1\)](#) specify conditions under which such openings are permitted in sprinklered Class A and Class B mercantile occupancies. New to the 2015 edition of the *Code*, [36/37.3.1\(4\)](#) and [36.3.1\(5\)](#) recognize the protection of convenience stairs and escalators using draftstops and closely spaced sprinklers at the floor opening (see [8.6.9.2](#) and [8.6.9.7](#)), with no limit on the number of stories exposed to the vertical opening.

[Paragraph 36/37.3.2](#) addresses the protection of hazardous areas. The requirements in [8.7.1.2](#) normally mandate that a hazardous area protected by automatic sprinklers, rather than by enclosure with fire barriers with a 1-hour fire resistance rating and doors with a 45-minute fire protection rating, is to be enclosed by walls and doors that are at least smoke resisting. Hazardous areas composed of general storage and stock areas in a mercantile occupancy are permitted to be protected by automatic sprinklers without the need for a smoke-resisting enclosure per [36/37.3.2.1.2](#). In a shoe store, for example, where the shoe storage area is sprinklered, no door would be required on the opening between the sales floor and the storage area.

**36.3.4 Detection, Alarm, and Communications Systems.**

**36.3.4.1 General.** Class A mercantile occupancies shall be provided with a fire alarm system in accordance with [Section 9.6](#).

**36.3.4.2 Initiation.** Initiation of the required fire alarm system shall be by any one of the following means:

- (1) Manual means in accordance with [9.6.2.1\(1\)](#)
- (2) Approved automatic fire detection system in accordance with [9.6.2.1\(2\)](#) that provides protection throughout the building and the provision of [9.6.2.6](#) shall apply.
- (3) Approved automatic sprinkler system in accordance with [9.6.2.1\(3\)](#) that provides protection throughout the building and the provision of [9.6.2.6](#) shall apply.

## CHAPTER 37 • Existing

**37.3.3 Interior Finish.**

**37.3.3.1 General.** Interior finish shall be in accordance with [Section 10.2](#).

**37.3.3.2 Interior Wall and Ceiling Finish.** Interior wall and ceiling finish materials complying with [Section 10.2](#) shall be Class A, Class B, or Class C.

**37.3.3.3 Interior Floor Finish.** (No requirements.)

[Section 8.7](#), as referenced by [36/37.3.2.1.1](#), requires one of the following:

1. Separation of a hazardous contents area from the remainder of the occupancy by means of suitable construction
2. Installation of an automatic sprinkler system in a hazardous area
3. Both items 1 and 2 where the hazard is severe

[Paragraph 36/37.3.3](#) addresses interior finish. The limits on interior wall and ceiling finish materials were relaxed for the 2012 edition of the *Code*. Both new and existing mercantile occupancies are permitted to use materials classified as Class A, Class B, or Class C with no restrictions. Previous editions of the *Code* limited the use of Class C materials to sprinklered mercantile occupancies, and existing nonsprinklered mercantile occupancies, only under certain conditions. Such limitation was deemed to be onerous based on the quantity of combustible materials typically present in mercantile occupancies.

**37.3.4 Detection, Alarm, and Communications Systems.**

**37.3.4.1 General.** Class A mercantile occupancies shall be provided with a fire alarm system in accordance with [Section 9.6](#).

**37.3.4.2 Initiation.** Initiation of the required fire alarm system shall be by one of the following means:

- (1) Manual means in accordance with [9.6.2.1\(1\)](#)
- (2) Approved automatic fire detection system in accordance with [9.6.2.1\(2\)](#) that provides protection throughout the building and the provision of [9.6.2.6](#) shall apply.
- (3) Approved automatic sprinkler system in accordance with [9.6.2.1\(3\)](#) that provides protection throughout the building and the provision of [9.6.2.6](#) shall apply.

## CHAPTER 36 • New

**36.3.4.3 Notification.**

**36.3.4.3.1 Occupant Notification.** During all times that the mercantile occupancy is occupied, the required fire alarm system, once initiated, shall perform one of the following functions:

- (1) It shall activate an alarm in accordance with 9.6.3 throughout the mercantile occupancy.
- (2) Positive alarm sequence in accordance with 9.6.3.4 shall be permitted.

**36.3.4.3.2 Emergency Forces Notification.** Emergency forces notification shall be provided and shall include notifying both of the following:

- (1) Fire department in accordance with 9.6.4
- (2) Local emergency organization, if provided

Neither Class B nor Class C mercantile occupancies are required to have a fire alarm system.

Because all new Class A stores and most existing Class A stores must be sprinklered based on gross floor area (see 36/37.3.5.1), it is logical that the sprinkler system waterflow method described in 36/37.3.4.2(3) will be used most commonly to activate the fire alarm system. The requirement for manual fire alarm boxes is waived if the sprinkler waterflow activates the fire alarm system. Eliminating the manual fire alarm boxes and satisfying the initiation requirements by means of waterflow through the sprinkler system may reduce the number of nuisance alarms. However, in accordance with 9.6.2.6, at least one manual fire alarm box must be provided at a location acceptable to the authority having jurisdiction.

Positive alarm sequence, which is an updated form of a presignal system for which numerous safeguards must be pro-

**36.3.5 Extinguishment Requirements.**

**36.3.5.1** Mercantile occupancies shall be protected by an approved automatic sprinkler system in accordance with 9.7.1.1(1) in any of the following specified locations:

- (1) Throughout all mercantile occupancies three or more stories in height
- (2) Throughout all mercantile occupancies exceeding 12,000 ft<sup>2</sup> (1115 m<sup>2</sup>) in gross area
- (3) Throughout stories below the level of exit discharge where such stories have an area exceeding 2500 ft<sup>2</sup> (232 m<sup>2</sup>) and

## CHAPTER 37 • Existing

**37.3.4.3 Notification.**

**37.3.4.3.1 Occupant Notification.** During all times that the mercantile occupancy is occupied, the required fire alarm system, once initiated, shall perform one of the following functions:

- (1) It shall activate an alarm in accordance with 9.6.3 throughout the mercantile occupancy, and both of the following also shall apply:
  - (a) Positive alarm sequence in accordance with 9.6.3.4 shall be permitted.
  - (b) A presignal system in accordance with 9.6.3.3 shall be permitted.
- (2) Occupant notification shall be made via a voice communication or public address system in accordance with 9.6.3.9.2.

**37.3.4.3.2 Emergency Forces Notification.** Emergency forces notification shall be provided and shall include notifying both of the following:

- (1) Fire department in accordance with 9.6.4
- (2) Local emergency organization, if provided

vided, is recognized by 36/37.3.4.3.1. Presignal systems, as recognized by 37.3.4.3.1(1), are only permitted in existing mercantile occupancies.

Note that 37.3.4.3.1 provides a choice between two methods of notification for existing mercantile occupancies only. Many Class A stores are provided with a continuously attended location; 37.3.4.3.1(2) can, therefore, be used. If such a location is not provided or not considered reliable by the AHJ, 37.3.4.3.1(1) must be applied to provide an automatic general alarm in accordance with 9.6.3. In all new mercantile occupancies, other than mall buildings, occupant notification must be provided automatically in accordance with 9.6.3.

If a fire alarm system is required, emergency forces notification must also be provided, as specified by 36/37.3.4.3.2. Several different methods of automatically notifying the fire department are permitted by 9.6.4.

**37.3.5 Extinguishment Requirements.**

**37.3.5.1** Mercantile occupancies, other than one-story buildings that meet the requirements of a street floor, as defined in 3.3.270, shall be protected by an approved automatic sprinkler system in accordance with 9.7.1.1(1) in any of the following specified locations:

- (1) Throughout all mercantile occupancies with a story over 15,000 ft<sup>2</sup> (1400 m<sup>2</sup>) in area
- (2) Throughout all mercantile occupancies exceeding 30,000 ft<sup>2</sup> (2800 m<sup>2</sup>) in gross area
- (3) Throughout stories below the level of exit discharge where such stories have an area exceeding 2500 ft<sup>2</sup> (232 m<sup>2</sup>) and

## CHAPTER 36 • New

are used for the sale, storage, or handling of combustible goods and merchandise

- (4) Throughout multiple occupancies protected as mixed occupancies in accordance with 6.1.14 where the conditions of 36.3.5.1(1), (2), or (3) apply to the mercantile occupancy

**36.3.5.2** Automatic sprinkler systems in Class A mercantile occupancies shall be supervised in accordance with 9.7.2.

**36.3.5.3** Portable fire extinguishers shall be provided in all mercantile occupancies in accordance with Section 9.9.

For information on the proper criteria for an approved automatic sprinkler system, refer to the following:

1. NFPA 13, *Standard for the Installation of Sprinkler Systems*<sup>2</sup>
2. NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems*<sup>3</sup>
3. *Automatic Sprinkler and Standpipe Systems*<sup>4</sup>

All basement areas larger than 2500 ft<sup>2</sup> (232 m<sup>2</sup>) and used for the sales, storage, or handling of combustible merchandise must be sprinklered per 36/37.3.5.1(3) to avoid the potential threat to occupants of the floors above. Studies have shown that there is a higher rate of fire incidence in basements than in other areas of stores. Because smoke and heat rise, a fire in a basement can quickly render exits and exit discharges located on the street floor unusable. This danger is especially acute in mercantile

### 36.3.6 Corridors.

**36.3.6.1\*** Where access to exits is provided by corridors, such corridors shall be separated from use areas by fire barriers in accordance with Section 8.3 having a minimum 1-hour fire resistance rating, except under any of the following conditions:

- (1) Where exits are available from an open floor area
- (2) Within a space occupied by a single tenant
- (3) Within buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1)

**A.36.3.6.1** The intent of 36.3.6.1(2) and (3) is to permit spaces within single tenant spaces, or within buildings protected throughout by an approved, supervised automatic sprinkler system, to be open to the exit access corridor without separation.

**36.3.6.2** Openings in corridor walls required by 36.3.6.1 to have a fire resistance rating shall be protected in accordance with Section 8.3.

**36.3.7 Subdivision of Building Spaces.** (No special requirements.)

## CHAPTER 37 • Existing

are used for the sale, storage, or handling of combustible goods and merchandise

- (4) Throughout multiple occupancies protected as mixed occupancies in accordance with 6.1.14 where the conditions of 37.3.5.1(1), (2), or (3) apply to the mercantile occupancy

**37.3.5.2 Reserved.**

**37.3.5.3** Portable fire extinguishers shall be provided in all mercantile occupancies in accordance with Section 9.9.

occupancies, where allowances for various vertical openings in accordance with the provisions of 36/37.3.1 are more lenient than those for many other occupancies:

The sprinkler exemption in 37.3.5.1 applies to existing buildings only. It is believed that, in existing, one-story street-floor buildings that comply with all other provisions of the Code, including exit travel distance limitations, adequate life safety is provided. Therefore, requiring a building to be sprinklered retroactively is unnecessary. The term *street floor* is defined in 3.3.271 and includes a maximum of three risers of ascent or descent to reach the ground level.

The portable fire extinguishers required by 36/37.3.5.3 are intended to be used by employees of the mercantile occupancy who have received extinguisher training as required by 36/37.7.3.

**37.3.6 Corridors.** (No requirements.)

**37.3.7 Subdivision of Building Spaces.** (No special requirements.)

## CHAPTER 36 • New

**36.4 Special Provisions**

**36.4.1 Limited Access or Underground Buildings.** See Section 11.7.

**36.4.2 High-Rise Buildings.** High-rise buildings shall comply with the requirements of Section 11.8.

**36.4.3 Open-Air Mercantile Operations.**

**36.4.3.1** Open-air mercantile operations, such as open-air markets, gasoline filling stations, roadside stands for the sale of farm produce, and other outdoor mercantile operations, shall be arranged and conducted to maintain free and unobstructed ways of travel at all times.

**36.4.3.2** Ways of travel shall allow prompt escape from any point of danger in case of fire or other emergency, with no dead ends in which persons might be trapped due to display stands, adjoining buildings, fences, vehicles, or other obstructions.

**36.4.3.3** Mercantile operations that are conducted in roofed-over areas shall be treated as mercantile buildings, provided that canopies over individual small stands to protect merchandise from the weather are not construed as constituting buildings for the purpose of this Code.

The provisions of Section 11.8 for high-rise buildings, whether applied singly, in various combinations, or in total, must be mandated by specific occupancy chapter requirements. In new high-rise mercantile occupancies, 36.4.2 requires compliance with the entire “high-rise package” contained in Section 11.8.

The performance requirements of 36/37.4.3.1 and 36/37.4.3.2 are virtually open-ended provisions that provide guidance for the arrangement, use, and display of merchandise for sale in open-air mercantile operations. The phrase “ways of travel” is purposely used to avoid confusion with the term *means of egress*. The term *means of egress* is strictly defined (see 3.3.172), and its use implies the application of the minimum requirements

**36.4.4 Mall Buildings.**

**36.4.4.1** The provisions of 36.4.4 shall apply to mall buildings three or fewer stories in height and any number of anchor buildings.

**36.4.4.2 Special Definitions.** The following is a list of special terms used in this chapter:

- (1) **Anchor Building.** A building housing any occupancy having low- or ordinary-hazard contents and having direct access to a mall building, but having all required means of egress independent of the mall. (See 3.3.36.2.)

## CHAPTER 37 • Existing

**37.4 Special Provisions**

**37.4.1 Limited Access or Underground Buildings.** See Section 11.7.

**37.4.2 High-Rise Buildings.** (No additional requirements.)

**37.4.3 Open-Air Mercantile Operations.**

**37.4.3.1** Open-air mercantile operations, such as open-air markets, gasoline filling stations, roadside stands for the sale of farm produce, and other outdoor mercantile operations, shall be arranged and conducted to maintain free and unobstructed ways of travel at all times.

**37.4.3.2** Ways of travel shall allow prompt escape from any point of danger in case of fire or other emergency, with no dead ends in which persons might be trapped due to display stands, adjoining buildings, fences, vehicles, or other obstructions.

**37.4.3.3** Mercantile operations that are conducted in roofed-over areas shall be treated as mercantile buildings, provided that canopies over individual small stands to protect merchandise from the weather are not construed as constituting buildings for the purpose of this Code.

of Chapter 7. The phrase “ways of travel” is not defined and implies no specific minimum Code provisions. Most open-air mercantile operations have unlimited means of entering and evacuating the areas used to display goods. For this reason, it is not necessary to provide specific Code requirements beyond the precautionary measures expressed in this commentary.

The intent of 36/37.4.3.3 is to exempt small merchandise stands with canopies from classification as mercantile buildings. All other roofed-over areas should be treated as buildings classified by area and height as Class A, Class B, or Class C mercantile occupancies and are subject to the appropriate provisions of Chapters 36 and 37.

**37.4.4 Mall Buildings.**

**37.4.4.1** The provisions of 37.4.4 shall apply to mall buildings and any number of anchor buildings.

**37.4.4.2 Special Definitions.** The following is a list of special terms used in this chapter:

- (1) **Anchor Building.** A building housing any occupancy having low- or ordinary-hazard contents and having direct access to a mall building, but having all required means of egress independent of the mall. (See 3.3.36.2.)

## CHAPTER 36 • New

- (2) **Food Court.** A public seating area located in a mall that serves adjacent food preparation tenant spaces. (See 3.3.50.2.)
- (3) **Gross Leasable Area.** Fifty percent of major tenant areas, and 100 percent of all other floor areas designated for tenant occupancy and exclusive use, including storage areas. The area of tenant occupancy is measured from the centerlines of joint partitions to the outside of the tenant walls. (See 3.3.21.3.)
- (4) **Mall.** A roofed or covered common pedestrian area within a mall building that serves as access for two or more tenants and does not exceed three levels that are open to each other. (See 3.3.169.)
- (5)\* **Mall Building.** A single building enclosing a number of tenants and occupancies wherein two or more tenants have a main entrance into one or more malls. For the purpose of this chapter, anchor buildings shall not be considered as a part of the mall building. (See 3.3.36.9.)
- (6) **Major Tenant.** A tenant space, in a mall building, with one or more main entrances from the exterior that also serve as exits and are independent of the mall. (See 3.3.168.)

**A.36.4.4.2(5)** A mall building might enclose one or more uses, such as retail and wholesale stores, drinking and dining establishments, entertainment and amusement facilities, transportation facilities, offices, and other similar uses.

**36.4.4.3 General.** The mall building shall be treated as a single building for the purpose of calculation of means of egress and shall be subject to the requirements for appropriate occupancies, except as modified by the provisions of 36.4.4; and the mall shall be of a clear width not less than that needed to accommodate egress requirements as set forth in other sections of this Code.

**36.4.4.4 Pedestrian Way.** The mall shall be permitted to be considered a pedestrian way, provided that the criteria of 36.4.4.4.1 and 36.4.4.4.2 are met.

**36.4.4.4.1** The travel distance within a tenant space to an exit or to the mall shall not exceed the maximum travel distance permitted by the occupancy chapter.

**36.4.4.4.2** An additional 200 ft (61 m) shall be permitted for travel through the mall space, provided that all the following requirements are met:

- (1) The mall shall be of a clear width not less than that needed to accommodate egress requirements, as set forth in other sections of this chapter, but shall be not less than 20 ft (6100 mm) wide in its narrowest dimension.
- (2) On each side of the mall floor area, the mall shall be provided with an unobstructed exit access of not less than 10 ft (3050 mm) in clear width parallel to, and adjacent to, the mall tenant front.

## CHAPTER 37 • Existing

- (2) **Food Court.** A public seating area located in a mall that serves adjacent food preparation tenant spaces. (See 3.3.50.2.)
- (3) **Gross Leasable Area.** Fifty percent of major tenant areas, and 100 percent of all other floor areas designated for tenant occupancy and exclusive use, including storage areas. The area of tenant occupancy is measured from the centerlines of joint partitions to the outside of the tenant walls. (See 3.3.21.3.)
- (4) **Mall.** A roofed or covered common pedestrian area within a mall building that serves as access for two or more tenants and does not exceed three levels that are open to each other. (See 3.3.169.)
- (5)\* **Mall Building.** A single building enclosing a number of tenants and occupancies wherein two or more tenants have a main entrance into one or more malls. For the purpose of this chapter, anchor buildings shall not be considered as a part of the mall building. (See 3.3.36.9.)
- (6) **Major Tenant.** A tenant space, in a mall building, with one or more main entrances from the exterior that also serve as exits and are independent of the mall. (See 3.3.168.)

**A.37.4.4.2(5)** A mall building might enclose one or more uses, such as retail and wholesale stores, drinking and dining establishments, entertainment and amusement facilities, transportation facilities, offices, and other similar uses.

**37.4.4.3 General.** The mall building shall be treated as a single building for the purpose of calculation of means of egress and shall be subject to the requirements for appropriate occupancies, except as modified by the provisions of 37.4.4; and the mall shall be of a clear width not less than that needed to accommodate egress requirements as set forth in other sections of this Code.

**37.4.4.4 Pedestrian Way.** The mall shall be permitted to be considered a pedestrian way, provided that the criteria of 37.4.4.4.1 and 37.4.4.4.2 are met.

**37.4.4.4.1** The travel distance within a tenant space to an exit or to the mall shall not exceed the maximum travel distance permitted by the occupancy chapter.

**37.4.4.4.2** An additional 200 ft (61 m) shall be permitted for travel through the mall space, provided that all the following requirements are met:

- (1) The mall shall be of a clear width not less than that needed to accommodate egress requirements, as set forth in other sections of this chapter, but shall be not less than 20 ft (6100 mm) wide in its narrowest dimension.
- (2) On each side of the mall floor area, the mall shall be provided with an unobstructed exit access of not less than 10 ft (3050 mm) in clear width parallel to, and adjacent to, the mall tenant front.

## CHAPTER 36 • New

- (3)\* The exit access specified in 36.4.4.4.2(2) shall lead to an exit having a width of not less than 66 in. (1675 mm).
- (4) The mall, and all buildings connected thereto, except open parking structures, shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1), which shall be installed in such a manner that any portion of the system serving tenant spaces can be taken out of service without affecting the operation of the portion of the system serving the mall.
- (5)\* Walls dividing tenant spaces from each other shall have a fire resistance rating of not less than 1 hour, and all of the following also shall apply:
  - (a) The partition shall extend to the underside of the ceiling or to the roof or floor above.
  - (b) No separation shall be required between a tenant space and the mall.
- (6)\* Malls with a floor opening connecting more than two levels shall be provided with a smoke control system.

**A.36.4.4.4.2(3)** The minimum requirement for terminating mall exit access in not less than 66 in. (1675 mm) of egress width relates to the minimum requirement for not less than one aisle in Class A mercantile occupancies with 30,000 ft<sup>2</sup> (2800 m<sup>2</sup>) or greater sales area to be 60 in. (1525 mm) in width.

**A.36.4.4.4.2(5)** Walls providing tenant separations are only required to extend to the underside of the ceiling assembly, regardless of the ceiling's fire-resistive rating. If a ceiling is not provided in either of the tenant spaces, then the wall should extend to the underside of the roof or floor above.

**A.36.4.4.4.2(6)** Fire experience in mall shopping centers indicates that the most likely place of fire origin is in the tenant space, where the combustible fire load is far greater than in the mall. Furthermore, any fires resulting from the comparatively low fire load in the mall are more likely to be detected and extinguished in their incipient stages. Early detection is likely due to the nature of the mall as a high-traffic pedestrian way. Such fires produce less smoke development in a greater volume of space than fires in the more confined adjacent tenant space. Smoke control systems that address fire experience in malls are necessary to ensure the integrity of the mall as a pedestrian way by maintaining it reasonably free of the products of combustion for a duration not less than that required to evacuate the area of the building that is affected by the fire. Secondary considerations should include the following:

- (1) Confinement of the products of combustion to the area of origin

## CHAPTER 37 • Existing

- (3)\* The exit access specified in 37.4.4.4.2(2) shall lead to an exit having a width of not less than 66 in. (1675 mm).
- (4) The mall, and all buildings connected thereto, except open parking structures, shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1).
- (5) Walls dividing tenant spaces from each other shall extend from the floor to the underside of the roof deck, to the floor deck above, or to the ceiling where the ceiling is constructed to limit the transfer of smoke, and all of the following also shall apply:
  - (a) Where the tenant areas are provided with an engineered smoke control system, walls shall not be required to divide tenant spaces from each other.
  - (b) No separation shall be required between a tenant space and the mall.
- (6)\* Malls with a floor opening connecting more than two levels shall be provided with a smoke control system.

**A.37.4.4.4.2(3)** The minimum requirement for terminating mall exit access in not less than 66 in. (1675 mm) of egress width relates to the minimum requirement for not less than one aisle in Class A mercantile occupancies with 30,000 ft<sup>2</sup> (2800 m<sup>2</sup>) or greater sales area to be 60 in. (1525 mm) in width.

**A.37.4.4.4.2(6)** Fire experience in mall shopping centers indicates that the most likely place of fire origin is in the tenant space, where the combustible fire load is far greater than in the mall. Furthermore, any fires resulting from the comparatively low fire load in the mall are more likely to be detected and extinguished in their incipient stages. Early detection is likely due to the nature of the mall as a high-traffic pedestrian way. Such fires produce less smoke development in a greater volume of space than fires in the more confined adjacent tenant space. Smoke control systems that address fire experience in malls are necessary to ensure the integrity of the mall as a pedestrian way by maintaining it reasonably free of the products of combustion for a duration not less than that required to evacuate the area of the building that is affected by the fire. Secondary considerations should include the following:

- (1) Confinement of the products of combustion to the area of origin

## CHAPTER 36 • New

- (2) Removal of the products of combustion, with a minimum of migration of such products of combustion from one tenant space to another
- (3) Achievement of evacuation without the need for smoke control in one- and two-level mall buildings protected by automatic sprinklers

Systems, or combinations of systems, that can be engineered to address fires in malls of three or more levels include the following:

- (1) Separate mechanical exhaust or control systems
- (2) Mechanical exhaust or control systems in conjunction with heating, ventilating, and air-conditioning systems
- (3) Automatically or manually released gravity roof vent devices, such as skylights, relief dampers, or smoke vents
- (4) Combinations of items (1), (2), and (3) in this list, or any other engineered system designed to accomplish the purpose of this section

**36.4.4.5 Mixed Occupancies.** Assembly occupancies, other than stadiums and arenas, and business and mercantile occupancies located in mall buildings shall not be required to comply with the provisions of [6.1.14.4](#).

#### 36.4.4.6 Means of Egress Details.

**36.4.4.6.1** Dead ends not exceeding a length equal to twice the width of the mall, measured at the narrowest location within the dead-end portion of the mall, shall be permitted.

**36.4.4.6.2** Every story of a mall building shall be provided with the number of means of egress specified by [Section 7.4](#) and as modified by [36.4.4.6.2.1](#) or [36.4.4.6.2.2](#).

**36.4.4.6.2.1** Exit access travel shall be permitted to be common for the distances permitted as common paths of travel by [36.2.5.3](#).

**36.4.4.6.2.2** A single means of egress shall be permitted in a Class C mercantile occupancy or a business occupancy, provided that the travel distance to the exit or to a mall (*see* [36.4.4.2](#)) does not exceed 100 ft (30 m).

**36.4.4.6.3** Every floor of a mall shall be provided with the number of means of egress specified by [Section 7.4](#), with not less than two means of egress remotely located from each other.

**36.4.4.6.4** Class A and Class B mercantile occupancies connected to a mall shall be provided with the number of means of egress required by [Section 7.4](#), with not less than two means of egress remotely located from one another.

**36.4.4.6.5\*** Each individual anchor building shall have means of egress independent of the mall.

## CHAPTER 37 • Existing

- (2) Removal of the products of combustion, with a minimum of migration of such products of combustion from one tenant space to another
- (3) Achievement of evacuation without the need for smoke control in one- and two-level mall buildings protected by automatic sprinklers

Systems, or combinations of systems, that can be engineered to address fires in malls of three or more levels include the following:

- (1) Separate mechanical exhaust or control systems
- (2) Mechanical exhaust or control systems in conjunction with heating, ventilating, and air-conditioning systems
- (3) Automatically or manually released gravity roof vent devices, such as skylights, relief dampers, or smoke vents
- (4) Combinations of items (1), (2), and (3) in this list, or any other engineered system designed to accomplish the purpose of this section

**37.4.4.5 Mixed Occupancies.** Assembly occupancies, other than stadiums and arenas, and business and mercantile occupancies located in mall buildings shall not be required to comply with the provisions of [6.1.14.4](#).

#### 37.4.4.6 Means of Egress Details.

**37.4.4.6.1** Dead ends not exceeding a length equal to twice the width of the mall, measured at the narrowest location within the dead-end portion of the mall, shall be permitted.

**37.4.4.6.2** Every story of a covered mall building shall be provided with the number of means of egress specified by [Section 7.4](#) and as modified by [37.4.4.6.2.1](#) or [37.4.4.6.2.2](#).

**37.4.4.6.2.1** Exit access travel shall be permitted to be common for the distances permitted as common paths of travel by [37.2.5.3](#).

**37.4.4.6.2.2** A single means of egress shall be permitted in a Class C mercantile occupancy or a business occupancy, provided that the travel distance to the exit or to a mall (*see* [37.4.4.2](#)) does not exceed 100 ft (30 m).

**37.4.4.6.3** Every floor of a mall shall be provided with the number of means of egress specified by [Section 7.4](#), with not less than two means of egress remotely located from each other.

**37.4.4.6.4** Class A and Class B mercantile occupancies connected to a mall shall be provided with the number of means of egress required by [Section 7.4](#), with not less than two means of egress remotely located from one another.

**37.4.4.6.5\*** Each individual anchor building shall have means of egress independent of the mall.

## CHAPTER 36 • New

**A.36.4.4.6.5** It is not the intent of **36.4.4.6.5** to require that large tenant spaces be considered anchor stores. A tenant space not considered in determining the occupant load of the mall is required to be arranged so that all of its means of egress will be independent of the mall.

**36.4.4.6.6** Each individual major tenant of a mall building shall have a minimum of one-half of its required means of egress independent of the mall.

**36.4.4.6.7** Each assembly occupancy with an occupant load of 500 or more shall have not less than one-half of its required means of egress independent of the mall.

**36.4.4.6.8** Emergency lighting shall be provided in accordance with **36.2.9**.

#### **36.4.4.7 Detection, Alarm, and Communications Systems.**

**36.4.4.7.1 General.** Malls shall be provided with a fire alarm system in accordance with **Section 9.6**.

**36.4.4.7.2 Initiation.** Initiation of the required fire alarm system shall be by means of the required automatic sprinkler system in accordance with **9.6.2.1(3)**.

#### **36.4.4.7.3 Notification.**

**36.4.4.7.3.1 Occupant Notification.** During all times that the mall is occupied, the required fire alarm system, once initiated, shall perform one of the following functions:

- (1) It shall activate a general alarm in accordance with **9.6.3** throughout the mall, and positive alarm sequence in accordance with **9.6.3.4** shall be permitted.
- (2) Occupant notification shall be made via a voice communication or public address system in accordance with **9.6.3.9.2**

**36.4.4.7.3.2\*** Visible signals shall not be required in malls. (*See 9.6.3.5.7 and 9.6.3.5.8.*)

**A.36.4.4.7.3.2** It is the intent to permit the omission of visible alarm notification appliances from the mall or pedestrian way in mall buildings. It is anticipated that occupants with hearing impairments will receive cues from other building occupants and respond accordingly. Visible signals should be provided in public restrooms and other adjunct spaces in the mall subject to occupancy solely by persons with hearing impairments.

**36.4.4.7.3.3 Emergency Forces Notification.** Emergency forces notification shall be provided and shall include notifying all of the following:

- (1) Fire department in accordance with **9.6.4**
- (2) Local emergency organization, if provided

## CHAPTER 37 • Existing

**A.37.4.4.6.5** It is not the intent of **37.4.4.6.5** to require that large tenant spaces be considered anchor stores. A tenant space not considered in determining the occupant load of the mall is required to be arranged so that all of its means of egress will be independent of the mall.

**37.4.4.6.6** Each individual major tenant of a mall building shall have a minimum of one-half of its required means of egress independent of the mall.

#### **37.4.4.6.7 Reserved.**

**37.4.4.6.8** Emergency lighting shall be provided in accordance with **37.2.9**.

#### **37.4.4.7 Detection, Alarm, and Communications Systems.**

**37.4.4.7.1 General.** Malls shall be provided with a fire alarm system in accordance with **Section 9.6**.

**37.4.4.7.2 Initiation.** Initiation of the required fire alarm system shall be by means of the required automatic sprinkler system in accordance with **9.6.2.1(3)**.

#### **37.4.4.7.3 Notification.**

**37.4.4.7.3.1 Occupant Notification.** During all times that the mall is occupied, the required fire alarm system, once initiated, shall perform one of the following functions:

- (1) It shall activate an alarm in accordance with **9.6.3** throughout the mall, and positive alarm sequence in accordance with **9.6.3.4** shall be permitted.
- (2) Occupant notification shall be permitted to be made via a voice communication or public address system in accordance with **9.6.3.9.2**.

**37.4.4.7.3.2** (*See 9.6.3.5.3.*)

**37.4.4.7.3.3 Emergency Forces Notification.** Emergency forces notification shall be provided and shall include notifying all of the following:

- (1) Fire department in accordance with **9.6.4**
- (2) Local emergency organization, if provided

## CHAPTER 36 • New

**36.4.4.7.4 Emergency Control.** The fire alarm system shall be arranged to automatically actuate smoke management or smoke control systems in accordance with 9.6.5.2(3).

**36.4.4.8 Tenant Spaces.** Each individual tenant space shall have means of egress to the outside or to the mall, based on occupant load calculated by using Table 7.3.1.2.

**36.4.4.9 Exit Passageways.** Exit passageways shall comply with 36.4.4.9.1 and 36.4.4.9.2.

**36.4.4.9.1** Exit passageways in a mall building shall be permitted to accommodate the following occupant loads independently:

- (1) Portion of the occupant load assigned to the exit passageway from only the mall
- (2) Largest occupant load assigned to the exit passageway from a single tenant space

**36.4.4.9.2\*** Rooms housing building service equipment, janitor closets, and service elevators shall be permitted to open directly onto exit passageways, provided that all of the following criteria are met:

- (1) The required fire resistance rating between such rooms or areas and the exit passageway shall be maintained in accordance with 7.1.3.2.
- (2) Such rooms or areas shall be protected by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1), but the exceptions in NFPA 13, *Standard for the Installation of Sprinkler Systems*, allowing the omission of sprinklers from such rooms shall not be permitted.
- (3) Service elevators opening into the exit passageway shall not open into areas other than exit passageways.
- (4) Where exit stair enclosures discharge into the exit passageway, the provisions of 7.2.1.5.8 shall apply, regardless of the number of stories served.

**A.36.4.4.9.2** Rooms opening onto the exit passageway are intended to include building service elevators, elevator machine rooms, electrical rooms, telephone rooms, janitor closets, restrooms, and similar normally unoccupied spaces not requiring hazardous area protection in accordance with Section 8.7.

**36.4.4.10 Plastic Signs.** Within every store or level, and from sidewall to sidewall of each tenant space facing the mall, plastic signs shall comply with all of the following:

- (1) Plastic signs shall not exceed 20 percent of the wall area facing the mall.
- (2) Plastic signs shall not exceed a height of 36 in. (915 mm), except if the sign is vertical, in which case the height shall not exceed 8 ft (2440 mm) and the width shall not exceed 36 in. (915 mm).

## CHAPTER 37 • Existing

**37.4.4.7.4 Emergency Control.** The fire alarm system shall be arranged to automatically actuate smoke management or smoke control systems in accordance with 9.6.5.2(3).

**37.4.4.8 Tenant Spaces.** Each individual tenant space shall have means of egress to the outside or to the mall based on occupant load calculated by using Table 7.3.1.2.

**37.4.4.9 Exit Passageways.** Exit passageways shall comply with 37.4.4.9.1 and 37.4.4.9.2.

**37.4.4.9.1** Exit passageways in a mall building shall be permitted to accommodate the following occupant loads independently:

- (1) Portion of the occupant load assigned to the exit passageway from only the mall
- (2) Largest occupant load assigned to the exit passageway from a single tenant space

**37.4.4.9.2\*** Rooms housing building service equipment, janitor closets, and service elevators shall be permitted to open directly onto exit passageways, provided that all of the following criteria are met:

- (1) The required fire resistance rating between such rooms or areas and the exit passageway shall be maintained in accordance with 7.1.3.2.
- (2) Such rooms or areas shall be protected by an approved automatic sprinkler system in accordance with 9.7.1.1(1), but the exceptions in NFPA 13, *Standard for the Installation of Sprinkler Systems*, allowing the omission of sprinklers from such rooms shall not be permitted.
- (3) Service elevators opening into the exit passageway shall not open into areas other than exit passageways.
- (4) Where exit stair enclosures discharge into the exit passageway, the provisions of 7.2.1.5.8 shall apply, regardless of the number of stories served.

**A.37.4.4.9.2** Rooms opening onto the exit passageway are intended to include building service elevators, elevator machine rooms, electrical rooms, telephone rooms, janitor closets, restrooms, and similar normally unoccupied spaces not requiring hazardous area protection in accordance with Section 8.7.

**37.4.4.10 Plastic Signs.** Within every store or level, and from sidewall to sidewall of each tenant space facing the mall, plastic signs shall comply with all of the following:

- (1) Plastic signs shall not exceed 20 percent of the wall area facing the mall.
- (2) Plastic signs shall not exceed a height of 36 in. (915 mm), except if the sign is vertical, in which case the height shall not exceed 8 ft (2440 mm) and the width shall not exceed 36 in. (915 mm).

## CHAPTER 36 • New

- (3) Plastic signs shall be located a minimum distance of 18 in. (455 mm) from adjacent tenants.
- (4) Plastics, other than foamed plastics, shall meet one of the following criteria:
  - (a) They shall be light-transmitting plastics.
  - (b) They shall have a self-ignition temperature of 650°F (343°C) or greater when tested in accordance with ASTM D 1929, *Standard Test Method for Determining Ignition Temperatures of Plastic*, and a flame spread index not greater than 75 and a smoke developed index not greater than 450 when tested in the manner intended for use in accordance with ASTM E 84, *Standard Test Method for Surface Burning Characteristics of Building Materials*, or ANSI/UL 723, *Standard for Test for Surface Burning Characteristics of Building Materials*.
- (5) The edges and backs of plastic signs in the mall shall be fully encased in metal.
- (6) Foamed plastics shall have a maximum heat release rate of 150 kW when tested in accordance with ANSI/UL 1975, *Standard for Fire Tests for Foamed Plastics Used for Decorative Purposes*, or in accordance with NFPA 289, *Standard Method of Fire Test for Individual Fuel Packages*, using the 20 kW ignition source.
- (7) Foamed plastics shall comply with all of the following:
  - (a) The density of foamed plastic signs shall be not less than 20 lb/ft<sup>3</sup> (320 kg/m<sup>3</sup>).
  - (b) The thickness of foamed plastic signs shall be not greater than ½ in. (13 mm).

**36.4.4.11 Kiosks.** Kiosks and similar structures (temporary or permanent) shall not be considered tenant spaces and shall meet all of the following requirements:

- (1) Combustible kiosks and similar structures shall be constructed of any of the following materials:
  - (a) Fire-retardant-treated wood complying with the requirements for fire-retardant-impregnated wood in NFPA 703, *Standard for Fire Retardant-Treated Wood and Fire-Retardant Coatings for Building Materials*
  - (b) Light-transmitting plastics complying with the building code
  - (c) Foamed plastics having a maximum heat release rate not greater than 100 kW when tested in accordance with ANSI/UL 1975, *Standard for Fire Tests for Foamed Plastics Used for Decorative Purposes*, or in accordance with NFPA 289, *Standard Method of Fire Test for Individual Fuel Packages*, using the 20 kW ignition source
  - (d) Metal composite material (MCM) having a flame spread index not greater than 25 and a smoke developed index not greater than 450 in accordance with ASTM E 84, *Standard Test Method for Surface Burning*

## CHAPTER 37 • Existing

- (3) Plastic signs shall be located a minimum distance of 18 in. (455 mm) from adjacent tenants.
- (4) Plastics, other than foamed plastics, shall meet one of the following criteria:
  - (a) They shall be light-transmitting plastics.
  - (b) They shall have a self-ignition temperature of 650°F (343°C) or greater when tested in accordance with ASTM D 1929, *Standard Test Method for Determining Ignition Temperatures of Plastic*, and a flame spread index not greater than 75 and a smoke developed index not greater than 450 when tested in the manner intended for use in accordance with ASTM E 84, *Standard Test Method for Surface Burning Characteristics of Building Materials*, or ANSI/UL 723, *Standard for Test for Surface Burning Characteristics of Building Materials*.
- (5) The edges and backs of plastic signs in the mall shall be fully encased in metal.
- (6) Foamed plastics shall have a maximum heat release rate of 150 kW when tested in accordance with ANSI/UL 1975, *Standard for Fire Tests for Foamed Plastics Used for Decorative Purposes*, or in accordance with NFPA 289, *Standard Method of Fire Test for Individual Fuel Packages*, using the 20 kW ignition source.
- (7) Foamed plastics shall comply with all of the following:
  - (a) The density of foamed plastic signs shall be not less than 20 lb/ft<sup>3</sup> (320 kg/m<sup>3</sup>).
  - (b) The thickness of foamed plastic signs shall be not greater than ½ in. (13 mm).

**37.4.4.11 Kiosks.** Kiosks and similar structures (temporary or permanent) shall not be considered as tenant spaces and shall meet all of the following requirements:

- (1) Combustible kiosks and similar structures shall be constructed of any of the following materials:
  - (a) Fire-retardant-treated wood complying with the requirements for fire-retardant-impregnated wood in NFPA 703, *Standard for Fire Retardant-Treated Wood and Fire-Retardant Coatings for Building Materials*
  - (b) Light-transmitting plastics complying with the building code
  - (c) Foamed plastics having a maximum heat release rate not greater than 100 kW when tested in accordance with ANSI/UL 1975, *Standard for Fire Tests for Foamed Plastics Used for Decorative Purposes*, or in accordance with NFPA 289, *Standard Method of Fire Test for Individual Fuel Packages*, using the 20 kW ignition source
  - (d) Metal composite material (MCM) having a flame spread index not greater than 25 and a smoke developed index not greater than 450 in accordance with ASTM E 84, *Standard Test Method for Surface Burning*

## CHAPTER 36 • New

*Characteristics of Building Materials*, or ANSI/UL 723, *Standard for Test for Surface Burning Characteristics of Building Materials*, when tested as an assembly in the maximum thickness intended for use.

- (e) Textiles and films meeting the flame propagation performance criteria contained in Test Method 1 or Test Method 2, as appropriate, of NFPA 701, *Standard Methods of Fire Tests for Flame Propagation of Textiles and Films*
- (2) Kiosks or similar structures located within the mall shall be protected with approved fire suppression and detection devices.
- (3) The minimum horizontal separation between kiosks, or groups of kiosks, and other structures within the mall shall be 20 ft (6100 mm).
- (4) Each kiosk, or group of kiosks, or similar structure shall have a maximum area of 300 ft<sup>2</sup> (27.8 m<sup>2</sup>).

**36.4.4.12\* Smoke Control.** Smoke control in accordance with [Section 9.3](#) and complying with [8.6.7\(5\)](#) shall be provided in a mall with floor openings connecting more than two levels.

**A.36.4.4.12** Fire experience in mall shopping centers indicates that the most likely place of fire origin is in the tenant space where the combustible fire load is far greater than in the mall.

Furthermore, any fires resulting from the comparatively low fire load in the mall are more likely to be detected and extinguished in their incipient stages. Early detection is likely due to the nature of the mall as a high-traffic pedestrian way. Such fires produce less smoke development in a greater volume of space than fires in the more confined adjacent tenant space.

Smoke control systems that address fire experience in malls are necessary in order to achieve the following:

- (1) Ensure the integrity of the mall as a pedestrian way by maintaining it reasonably free of the products of combustion for a duration not less than that required to evacuate the building
- (2) Confine the products of combustion to the area of origin
- (3) Remove the products of combustion with a minimum of migration of such products of combustion from one tenant to another

Systems, or combinations of systems, that can be engineered to address fires in malls include the following:

- (1) Separate mechanical exhaust or control systems
- (2) Mechanical exhaust or control systems in conjunction with heating, ventilating, and air-conditioning systems
- (3) Automatically or manually released gravity roof vent devices, such as skylights, relief dampers, or smoke vents
- (4) Combinations of items (1), (2), and (3) in this list, or any other engineered system designed to accomplish the purpose of this section

## CHAPTER 37 • Existing

*Characteristics of Building Materials*, or ANSI/UL 723, *Standard for Test for Surface Burning Characteristics of Building Materials*, when tested as an assembly in the maximum thickness intended for use

- (e) Textiles and films meeting the flame propagation performance criteria contained in Test Method 1 or Test Method 2, as appropriate, of NFPA 701, *Standard Methods of Fire Tests for Flame Propagation of Textiles and Films*
- (2) Kiosks or similar structures located within the mall shall be protected with approved fire suppression and detection devices.
- (3) The minimum horizontal separation between kiosks, or groups of kiosks, and other structures within the mall shall be 20 ft (6100 mm).
- (4) Each kiosk, or group of kiosks, or similar structure shall have a maximum area of 300 ft<sup>2</sup> (27.8 m<sup>2</sup>).

## CHAPTER 36 • New

**36.4.4.13 Automatic Extinguishing Systems.**

**36.4.4.13.1** The mall building and all anchor buildings shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1) and 36.4.4.13.2.

**36.4.4.13.2** The system shall be installed in such a manner that any portion of the system serving tenant spaces can be taken out of service without affecting the operation of the portion of the system serving the mall.

The provisions for new mall buildings in 36.4.4 apply only to buildings up to three stories in height. For new mall buildings with more than three stories, the equivalency concept of Section 1.4 or performance-based design option of Chapter 5 should be used to engineer a unique life safety system that meets the goals and objectives of the Code (see Chapter 4). For existing mall buildings, the provisions of 37.4.4 apply, regardless of number of stories.

It is common for mall buildings to have food courts and areas for live performances. Such spaces with occupant loads of 50 or more are considered assembly occupancies. The provision of 36/37.4.4.3 clarifies that the requirements for the applicable occupancies need to be followed, except as modified by 36/37.4.4. One of the modifications relates to sizing the means of egress from the mall using a calculation based on gross leasable area (GLA). The use of the gross leasable area concept for sizing the means of egress for the mall typically will result in adequate capacity, even where large assembly occupancies are located in part of the mall building.

Consider the examples that follow. (In these examples, it is noted that using SI values will sometimes yield results that differ from those using the traditional inch-pound values, due to rounding. Use of either the SI or inch-pound values is deemed acceptable per Section 1.5.)

**Example 1**

A 5000-seat cinema complex (i.e., a large assembly occupancy) is to be housed within a new mall building. The cinema seating area, lobby, and circulation space will occupy 100,000 ft<sup>2</sup> (9290 m<sup>2</sup>). The mall building will have 550,000 ft<sup>2</sup> (51,100 m<sup>2</sup>) of GLA [450,000 ft<sup>2</sup> (41,800 m<sup>2</sup>) for mercantile use and 100,000 ft<sup>2</sup> (9290 m<sup>2</sup>) for the cinema complex].

Using Figure 7.3.1.2(a) or Figure 7.3.1.2(b), the GLA of the cinema will require that the mall have sufficient egress capacity to accommodate 2000 persons from the 5000-seat cinema. This is based on a calculation in which 100,000 ft<sup>2</sup> (9290 m<sup>2</sup>) is divided by 55 ft<sup>2</sup> (5.1 m<sup>2</sup>) per person, because the mall building's GLA exceeds 400,000 ft<sup>2</sup> (37,160 m<sup>2</sup>). Also, the mall must have adequate egress capacity for another 8180 persons due to the GLA associated with the mercantile areas. This additional capacity is

## CHAPTER 37 • Existing

based on a calculation in which 450,000 ft<sup>2</sup> (41,800 m<sup>2</sup>) is divided by 55 ft<sup>2</sup> (5.1 m<sup>2</sup>) per person. Given the main entrance/exit requirement of Chapters 12 and 13, egress for half the cinema occupant load (i.e., 2500 persons) will be provided through doors leading directly to the outside or through exit passageways. If the cinema were occupied at 100 percent capacity, the other 2500 persons would be expected to use the mall as exit access. Note that 36.4.4.6.7, which applies to new malls, permits not more than 50 percent of the occupant load of an assembly occupancy with an occupant load of 500 or more to egress through the mall; the remaining 50 percent of the occupant load must egress independent of the mall. Although there might appear to be a capacity deficiency of 500 persons, the system provides safeguards that follow in paragraphs 1 through 3.

**1.** Cinemas do not normally operate at 100 percent capacity. Management typically stops selling tickets at 80 percent capacity, because the larger crowds make for inefficient access to the highly profitable concession stands, thus reducing revenue. Yet, the occupant load is established by counting all seats.

**2.** The mall, and not the entire mall building, is required to have a fire alarm system. This requirement considers that it is very unusual to evacuate the entire mall building due to a fire in either the mall or one of the tenant spaces. Thus, the mall egress capacity is not fully used simultaneously, although the mall has excess capacity that easily absorbs the cinema occupants not otherwise considered.

**3.** If the number of persons entering the mall from the tenant space — for emergency egress — is greater than that for which the mall's egress system was sized, it doesn't mean that the additional persons are unable to leave the building. Rather, it means that it takes longer to discharge all occupants to the outside. The requirements for sprinkler protection throughout the mall building, and for smoke control within the mall, help to maintain tenable conditions to allow a longer egress time. The mall provides for safe exit access similar to that provided within an atrium.

**Example 2**

A restaurant with an occupant load of 300 persons is to be located within a new mall building that has GLA of 200,000 ft<sup>2</sup>

## CHAPTER 36 • New

(18,580 m<sup>2</sup>). The restaurant's 300-person occupant load is derived by dividing the 4500 ft<sup>2</sup> (418 m<sup>2</sup>) of net area usable for patron standing and seating by the 15 ft<sup>2</sup> (1.4 m<sup>2</sup>) per person occupant load factor characteristic of the assembly use. However, the restaurant occupies a total GLA of 6000 ft<sup>2</sup> (557 m<sup>2</sup>).

Using [Figure 7.3.1.2\(a\)](#) or [Figure 7.3.1.2\(b\)](#), the GLA of the restaurant requires the mall to provide sufficient egress capacity to accommodate 150 persons from the 300-person restaurant. This egress capacity is based on a calculation in which 6000 ft<sup>2</sup> (557 m<sup>2</sup>) is divided by 40 ft<sup>2</sup> (3.7 m<sup>2</sup>) per person, because the mall building's GLA is 200,000 ft<sup>2</sup> (18,580 m<sup>2</sup>). Also, the mall must have adequate egress capacity for another 4850 persons due to the GLA associated with the mercantile areas. This additional capacity is based on a calculation in which 194,000 ft<sup>2</sup> (18,020 m<sup>2</sup>) is divided by 40 ft<sup>2</sup> (3.7 m<sup>2</sup>) per person. Given the main entrance/exit requirement of [Chapters 12](#) and [13](#), egress for one-half the restaurant occupant load (i.e., 150 persons) will be provided through doors leading directly to the outside or through exit passageways. The other 150 persons would be expected to use the mall as exit access. This results in a perfect match between the 150 persons who egress from the restaurant into the mall and the 150-person egress capacity imposed on the mall based on the GLA of the restaurant.

In recent years, mall shopping areas have increased in both number and size. Two approaches in addressing the life safety aspects of these complexes were developed. The first approach (described in [36/37.4.4.3](#)) treats the mall and the attached stores essentially as one large Class A store subject to all the provisions of [Chapters 36](#) and [37](#). If viewed in this way, the mall would be treated as an aisle of a store.

The second approach allows the mall to be considered as a pedestrian way through which occupants of the attached stores are permitted to egress during a fire. The phrase "pedestrian way" is intended to convey the meaning of the term *exit access* (defined in [3.3.84](#)).

The provisions of [36/37.4.4.4](#) recognize that, if the mall and all the buildings attached to the mall are protected by automatic sprinklers, occupants fleeing into the mall from a fire in a store are then moving into a space whose volume, size, and arrangement affords most of the benefits provided by an enclosed stair or a horizontal exit, as well as providing many of the benefits of an outdoor area. This criterion considers the mall to be a safe area for the occupants of the tenant spaces attached to it, despite the fact that the mall is not separated from these attached spaces by the type of construction normally provided for an exit as required by [7.1.3.2](#).

If a mall is considered as a pedestrian way, the maximum travel distance to an exit or to the mall from any point within a tenant space attached to the mall is that permitted by the applicable occupancy chapter. The reasoning behind this provision is that use of the mall for egress is as acceptable as the use of an exit. A

## CHAPTER 37 • Existing

travel distance of up to 200 ft (61 m), in addition to the travel distance allowed within the tenant space, is permitted within the mall if the conditions of 1 through 6, which follow, are met.

**1.** The mall building (the mall and all tenant spaces and attached buildings) is sprinklered. The sprinkler system must be electrically supervised. Note that, if the shopping complex is considered as one building, rather than as a mall building with a complying pedestrian way, sprinkler protection most likely is also required under the 12,000 ft<sup>2</sup> (1115 m<sup>2</sup>) gross area criterion of [36.3.5.1\(2\)](#).

**2.** The clear width of the mall is at least 20 ft (6100 mm) or wider if mandated by the egress capacity. Note that, where the mall is considered as a pedestrian way, an occupant load is not calculated for the mall based on its area. The required capacity of the means of egress for the mall is calculated on the basis of the aggregate gross leasable area of the attached stores (excluding anchor buildings).

**3.** At least 10 ft (3050 mm) of clear, unobstructed space is available for exit access in front of all store fronts. This requirement is designed to prohibit displays of merchandise, kiosks, or small sales stands from being located directly in front of the store fronts and ensures that the mall will have a minimum clear width of 20 ft (6100 mm).

**4.** Each exit access terminates at an exit with a minimum width of 66 in. (1675 mm).

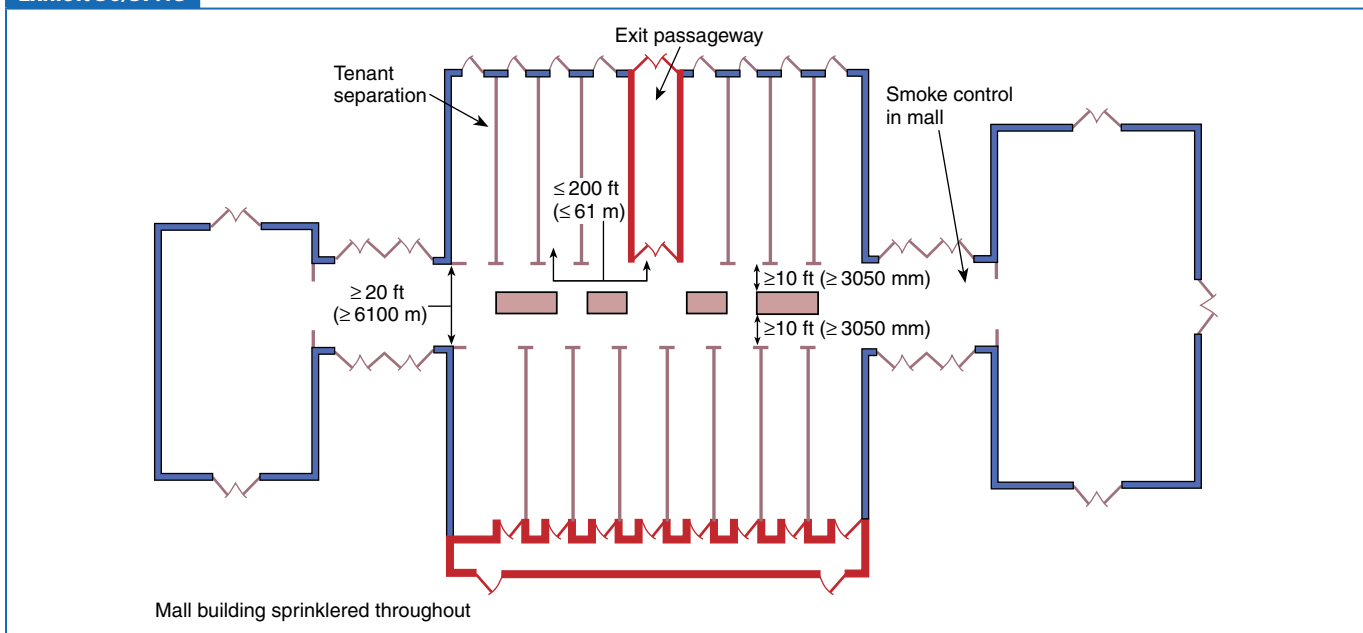

**5.** Walls separating stores have a fire resistance rating of at least 1 hour. Such walls are permitted to terminate at the underside of a nonrated ceiling. If the tenant space has no finished ceiling, the wall must terminate at the underside of the floor or roof above. The store front is permitted to be open to the mall; no separating construction is required.

**6.** A smoke control system is provided in the mall if it has a floor opening connecting two or more stories. Since the tenant spaces are generally open to the mall, this requirement is essential if the mall is to be used as a safe means of egress. For detailed requirements on the design, installation, and maintenance of smoke control systems in malls, see NFPA 92, *Standard for Smoke Control Systems*.<sup>5</sup>

If the conditions of 1 through 6 are not met, the mall is still permitted to be used as part of the exit access from the mall building, but the additional travel distance to an exit would not be permitted. Therefore, from any point within the overall mall building, which includes the stores and the mall, travel distance would be limited to 150 ft (46 m) for nonsprinklered buildings or 250 ft (76 m) for sprinklered mercantile occupancies (see [36/37.2.6](#)), or as otherwise required by the applicable occupancy chapter, depending on the use of the tenant space. In the majority of configurations, this restriction would preclude the use of the mall as an exit access.

Exhibit 36/37.15

Mall meeting the requirements of a pedestrian way.

Exhibit 36/37.15 illustrates many of the requirements necessary to qualify a mall as a pedestrian way.

Paragraph 36/37.4.4.6.2 reaffirms the fundamental Code requirement for providing at least two independent means of egress — more if the occupant load exceeds 500 persons, in accordance with 7.4.1.2.

Note that, in larger stores (Class A and Class B mercantile occupancies), the second exit must be remote from the first exit. This requirement is usually met by evacuating occupants directly from the store to the outside or directly into an exit passageway without entering the mall.

The provision of 36/37.4.4.6.6 for a *major tenant* (see definition in 3.3.168) prevents oversizing the means of egress from the mall where such major tenant spaces have means of egress directly to the outside but don't meet the criteria for an *anchor building* (see definition in 3.3.36.2). The required egress capacity of the mall is based on its gross leasable area (see 7.3.1.2), which, by definition (see 3.3.21.3), includes the aggregate area of the tenant spaces and 50 percent of the major tenant areas. If 100 percent of the major tenant areas were included in the gross leasable area, the mall egress capacity would be unnecessarily excessive, since major tenant spaces are provided with substantial means of egress independent of the mall.

Although the provisions of 36/37.4.4 address the overall mall building, the provisions of 36/37.4.4.7.1, which apply to alarm systems, require only that the alarm system be provided for the mall (the covered pedestrian way). In addition, the provisions of 36/37.3.4.1 require that any Class A mercantile occu-

pancy within the mall building also be provided with an alarm system. Therefore, Class B and Class C mercantile occupancies within the mall building are not required to have alarm systems.

Note that, per 36/37.4.4.7.2, manual fire alarm boxes are not required, but the sprinkler system must have a waterflow device that initiates the fire alarm system. However, in accordance with the provisions of 9.6.2.6, at least one manual fire alarm box must be provided at a location acceptable to the authority having jurisdiction.

Note that 36/37.4.4.7.3.1 provides a choice between two methods of notification. Many large shopping malls do have a continuously attended location, and 36/37.4.4.7.3.1(2), which permits the use of a voice communication or public address system meeting 9.6.3.9.2, can be used. If such a location is not provided or the AHJ does not consider the location reliable, 36/37.4.4.7.3.1(1) must be applied. If the general alarm option is used, positive alarm sequence is permitted by 36/37.4.4.7.3.1(1). In either case, the notification must be provided to the occupants of the mall but is not required to be provided within the individual tenant spaces.

Visible alarm notification appliances are not required in malls per 36.4.4.7.3.2. The effectiveness of visible notification appliances in large-volume spaces such as malls is questionable. It is reasonable to assume that, in the event of a fire, hearing-impaired occupants will follow the cues of other occupants in the process of evacuating. While the omission of visible signals in malls is permitted, they should be provided in adjunct mall spaces, such as public restrooms.

## CHAPTER 36 • New

**Subsection 9.6.4** permits several different methods of automatically notifying the fire department, as required by **36/37.4.4.7.3.3**.

Although the requirements of **Chapter 7** prohibit normally unoccupied rooms from having doors open directly into an exit enclosure, **36/37.4.4.9.2** specifically permits rooms housing building service equipment, janitor closets, and service elevators to open directly into exit passageways in mall buildings, provided that the additional criteria specified in **36/37.4.4.9.2(1)** through (4) are met. The *Code* permits this allowance in recognition of operational needs and the incorporation of current design criteria in mall buildings. The conditions that are unique to this type of facility include the following:

1. Limitation on the number of floors (not more than three for new construction)
2. Main concourse for occupant movement, with specific requirements for size and smoke control, that leads to multiple points of egress
3. Facilities required to be fully protected by an automatic sprinkler system

The provision of **36/37.4.4.9.2(1)** states that the exit passageway with door openings from support spaces is not to be treated as a corridor but as an exit passageway meeting the fire-rated separation requirements of **7.1.3.2**.

All areas that open onto the exit passageway must be protected by an automatic sprinkler system per **36/37.4.4.9.2(2)**. This requirement is qualified to prevent use of the provisions in NFPA 13, *Standard for the Installation of Sprinkler Systems*, which permit the omission of sprinkler protection if certain conditions are met.

**Paragraph 36/37.4.4.9.2(3)** addresses communication among floors by elevator shafts and their associated openings. This requirement permits only those openings associated with an elevator that opens onto an exit passageway. This limitation would prohibit an elevator from opening to another use area,

**36.4.5 Bulk Merchandising Retail Buildings.** New bulk merchandising retail buildings exceeding 12,000 ft<sup>2</sup> (1115 m<sup>2</sup>) in area shall comply with the requirements of this chapter, as modified by **36.4.5.1** through **36.4.5.6.2**.

**36.4.5.1 Minimum Construction Requirements.** Bulk merchandising retail buildings shall have a distance of not less than 16 ft (4875 mm) from the floor to the ceiling, from the floor to the floor above, or from the floor to the roof of any story.

**36.4.5.2 Means of Egress Requirements.**

**36.4.5.2.1** All means of egress shall be in accordance with **Chapter 7** and this chapter.

## CHAPTER 37 • Existing

such as a storage or loading area, thereby limiting the exposure from the effects of fire from areas other than exit passageways.

The provision of **36/37.4.4.9.2(4)** requires that stairwell re-entry is maintained in continuous occupant control in accordance with **7.2.1.5.8**. It prohibits the use of the exemption in **7.2.1.5.8**, which permits doors to be locked from the stairwell side if the building does not exceed four stories.

The text of **A.36/A.37.4.4.9.2** clarifies the types of spaces that are permitted to have doors that open directly onto the exit passageway. Such spaces include rooms with contents that are no more hazardous than those typically found in a mall building. These spaces are usually small and are associated with limited amounts of combustibles.

In a mall building, it is necessary to provide for services to the tenant spaces that are maintained by the mall management (e.g., water, electricity, telephone, fire protection). These services must be located in a common space controlled by the mall management and, therefore, cannot be located within the tenant spaces. Frequently, these services are logically located with direct access to service corridors or exit passageways/corridors at the rear of the tenant spaces.

This common design practice has prompted many designers to seek specific approval of such designs from local authorities to permit numerous buildings to be built in this manner. There is a long history of mall buildings built in this manner with no adverse experience.

Smoke control systems meeting **Section 9.3** are required in all new mall buildings with floor openings connecting more than two levels, regardless of the mall's use as a pedestrian way, per **36.4.4.12**. In addition, electrically supervised automatic sprinkler systems are required in all new mall buildings per **36.4.4.13**. Sprinkler systems must be arranged with control valves to allow the sprinklers serving the tenant spaces to be taken out of service without affecting the sprinklers serving the mall, because the tenant spaces are expected to undergo relatively frequent renovations over the life of the building.

**37.4.5 Bulk Merchandising Retail Buildings.** Existing bulk merchandising retail buildings exceeding 15,000 ft<sup>2</sup> (1400 m<sup>2</sup>) in area shall comply with the requirements of this chapter, as modified by **37.4.5.1** through **37.4.5.6.2**.

**37.4.5.1 Minimum Construction Requirements.** (No requirements.)

**37.4.5.2 Means of Egress Requirements.**

**37.4.5.2.1** All means of egress shall be in accordance with **Chapter 7** and this chapter.

## CHAPTER 36 • New

**36.4.5.2.2** Not less than 50 percent of the required egress capacity shall be located independent of the main entrance/exit doors.

**Paragraph 36.4.5.3** was revised by a tentative interim amendment (TIA).

**36.4.5.3 Storage, Arrangement, Protection, and Quantities of Hazardous Commodities.** The storage, arrangement, protection, and quantities of hazardous commodities shall be in accordance with the applicable provisions of the following:

- (1) The fire code (*see 3.3.96*)
- (2) NFPA 13, *Standard for the Installation of Sprinkler Systems*
- (3) NFPA 30, *Flammable and Combustible Liquids Code*
- (4) NFPA 30B, *Code for the Manufacture and Storage of Aerosol Products*
- (5) NFPA 400, *Hazardous Materials Code*, Chapter 14, for organic peroxide formulations
- (6) NFPA 400, *Hazardous Materials Code*, Chapter 15, for oxidizer solids and liquids
- (7) NFPA 400, *Hazardous Materials Code*, various chapters, depending on characteristics of a particular pesticide

**36.4.5.4 Detection, Alarm, and Communications Systems.**

**36.4.5.4.1 General.** Bulk merchandising retail buildings shall be provided with a fire alarm system in accordance with **Section 9.6**.

**36.4.5.4.2 Initiation.** Initiation of the required fire alarm system shall be by means of the required approved automatic sprinkler system (*see 36.4.5.5*) in accordance with **9.6.2.1(3)**.

**36.4.5.4.3 Occupant Notification.** During all times that the mercantile occupancy is occupied, the required fire alarm system, once initiated, shall activate an alarm in accordance with **9.6.3** throughout the mercantile occupancy, and positive alarm sequence in accordance with **9.6.3.4** shall be permitted.

**36.4.5.4.4 Emergency Forces Notification.** Emergency forces notification shall be provided and shall include notifying both of the following:

- (1) Fire department in accordance with **9.6.4**
- (2) Approved local emergency organization, if provided

**36.4.5.5 Extinguishing Requirements.** Bulk merchandising retail buildings shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with **9.7.1.1(1)** and the applicable provisions of the following:

- (1) The fire code (*see 3.3.96*)
- (2) NFPA 13, *Standard for the Installation of Sprinkler Systems*

## CHAPTER 37 • Existing

**37.4.5.2.2** Not less than 50 percent of the required egress capacity shall be located independent of the main entrance/exit doors.

**Paragraph 37.4.5.3** was revised by a tentative interim amendment (TIA).

**37.4.5.3 Storage, Arrangement, Protection, and Quantities of Hazardous Commodities.** The storage, arrangement, protection, and quantities of hazardous commodities shall be in accordance with the applicable provisions of the following:

- (1) The fire code (*see 3.3.96*)
- (2) NFPA 13, *Standard for the Installation of Sprinkler Systems*
- (3) NFPA 30, *Flammable and Combustible Liquids Code*
- (4) NFPA 30B, *Code for the Manufacture and Storage of Aerosol Products*
- (5) NFPA 400, *Hazardous Materials Code*, Chapter 14, for organic peroxide formulations
- (6) NFPA 400, *Hazardous Materials Code*, Chapter 15, for oxidizer solids and liquids
- (7) NFPA 400, *Hazardous Materials Code*, various chapters, depending on characteristics of a particular pesticide

**37.4.5.4 Detection, Alarm, and Communications Systems.**

**37.4.5.4.1 General.** Bulk merchandising retail buildings shall be provided with a fire alarm system in accordance with **Section 9.6**.

**37.4.5.4.2 Initiation.** Initiation of the required fire alarm system shall be by means of the required approved automatic sprinkler system (*see 37.4.5.5*) in accordance with **9.6.2.1(3)**.

**37.4.5.4.3 Occupant Notification.** During all times that the mercantile occupancy is occupied, the required fire alarm system, once initiated, shall perform one of the following functions:

- (1) It shall activate an alarm in accordance with **9.6.3** throughout the mercantile occupancy, and positive alarm sequence in accordance with **9.6.3.4** shall be permitted.
- (2) Occupant notification shall be permitted to be made via a voice communication or public address system in accordance with **9.6.3.9.2**.

**37.4.5.4.4 Emergency Forces Notification.** Emergency forces notification shall be provided and shall include notifying both of the following:

- (1) Fire department in accordance with **9.6.4**
- (2) Approved local emergency organization, if provided

**37.4.5.5 Extinguishing Requirements.** Bulk merchandising retail buildings shall be protected throughout by an approved, supervised automatic sprinkler system in accordance with **9.7.1.1(1)** and the applicable provisions of the following:

- (1) The fire code (*see 3.3.96*)
- (2) NFPA 13, *Standard for the Installation of Sprinkler Systems*

## CHAPTER 36 • New

- (3) NFPA 30, *Flammable and Combustible Liquids Code*
- (4) NFPA 30B, *Code for the Manufacture and Storage of Aerosol Products*

**36.4.5.6 Emergency Action Plan and Employee Training.**

**36.4.5.6.1** There shall be in effect an approved written plan for the emergency egress and relocation of occupants.

**36.4.5.6.2** All employees shall be instructed and periodically drilled with respect to their duties under the plan.

Bulk merchandising retail buildings provide life safety challenges that differ from typical mercantile occupancies. Fires in bulk merchandising retail buildings demonstrate the need for specific requirements to help ensure the adequate life safety of building occupants. The provisions of [36/37.4.5](#) apply to new bulk merchandising retail buildings exceeding 12,000 ft<sup>2</sup> (1115 m<sup>2</sup>) and existing facilities exceeding 15,000 ft<sup>2</sup> (1400 m<sup>2</sup>).

The term *bulk merchandising retail building* (see definition in [3.3.36.4](#)) refers to occupancies with storage height in excess of 12 ft (3660 mm), which differentiates such a building from typical mercantile occupancies. If the storage and display of combustible materials exceeds 12 ft (3660 mm) in height, the requirements of [36/37.4.5](#) are to be applied.

The minimum 16 ft (4875 mm) ceiling height requirement for new construction (see [36.4.5.1](#)) is intended to provide a full 10 ft (3050 mm) of clearance above the heads of building occupants to allow for smoke accumulation early in the fire while building evacuation takes place.

The requirement that not less than 50 percent of the required egress capacity be located independent of the main

Paragraph 36.4.6 was deleted by a tentative interim amendment (TIA).

**36.4.6 Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers in accordance with [8.7.3.3](#) shall be permitted.

The provision of [36/37.4.6](#) is new to the 2015 edition of the *Code*. It recognizes the use of alcohol-based hand-rub (ABHR)

---

## 36.5 Building Services

**36.5.1 Utilities.** Utilities shall comply with the provisions of [Section 9.1](#).

**36.5.2 Heating, Ventilating, and Air-Conditioning.** Heating, ventilating, and air-conditioning equipment shall comply with the provisions of [Section 9.2](#).

**36.5.3 Elevators, Escalators, and Conveyors.** Elevators, escalators, and conveyors shall comply with the provisions of [Section 9.4](#).

## CHAPTER 37 • Existing

- (3) NFPA 30, *Flammable and Combustible Liquids Code*
- (4) NFPA 30B, *Code for the Manufacture and Storage of Aerosol Products*

**37.4.5.6 Emergency Action Plans and Employee Training.**

**37.4.5.6.1** There shall be in effect an approved written plan for the emergency egress and relocation of occupants.

**37.4.5.6.2** All employees shall be instructed and periodically drilled with respect to their duties under the plan.

entrance/exit doors (see [36/37.4.5.2.2](#)) will help provide better distribution of egress capacity around the perimeter of the building, thus providing occupants with multiple, independent routes for egress.

Bulk merchandising retail buildings are characterized by the storage and display of significant quantities of hazardous commodities. Thus, reference is made to numerous NFPA documents that address hazardous materials (see [36/37.4.5.3](#)). Some of the documents include specific requirements that address the display of such materials.

The extinguishing requirements refer to [9.7.1.1\(1\)](#) (see [36/37.4.5.5](#)) and, therefore, include the requirements of NFPA 13, *Standard for the Installation of Sprinkler Systems*. In addition, the companion standards for flammable liquids and aerosols are mandatorily referenced.

As the history of fires in bulk merchandising retail buildings has shown, it is important to have an approved, written emergency action plan with employees instructed and periodically drilled in their duties (see [36/37.4.5.6](#)).

Paragraph 37.4.6 was deleted by a tentative interim amendment (TIA).

**37.4.6 Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers in accordance with [8.7.3.3](#) shall be permitted.

dispensers in mercantile occupancies, provided that the detailed criteria of [8.7.3.3](#) are met.

---

## 37.5 Building Services

**37.5.1 Utilities.** Utilities shall comply with the provisions of [Section 9.1](#).

**37.5.2 Heating, Ventilating, and Air-Conditioning.** Heating, ventilating, and air-conditioning equipment shall comply with the provisions of [Section 9.2](#).

**37.5.3 Elevators, Escalators, and Conveyors.** Elevators, escalators, and conveyors shall comply with the provisions of [Section 9.4](#).

## CHAPTER 36 • New

**36.5.4 Waste Chutes, Incinerators, and Laundry Chutes.** Waste chutes, incinerators, and laundry chutes shall comply with the provisions of [Section 9.5](#).

---

## 36.6 Reserved

---

## 36.7 Operating Features

**36.7.1 Emergency Action Plans.** Emergency action plans complying with [Section 4.8](#) shall be provided in high-rise buildings.

**36.7.2 Drills.** In every Class A or Class B mercantile occupancy, employees shall be periodically trained in accordance with [Section 4.7](#).

**36.7.3 Extinguisher Training.** Employees of mercantile occupancies shall be periodically instructed in the use of portable fire extinguishers.

**36.7.4 Food Service Operations.** Food service operations shall comply with [12.7.2](#).

**36.7.5 Upholstered Furniture and Mattresses.** The provisions of [10.3.2](#) shall not apply to upholstered furniture and mattresses.

**36.7.6 Soiled Linen and Trash Receptacles.** The requirements of [10.3.9](#) for containers for waste, or linen with a capacity of 20 gal (75.7 L) or more shall not apply.

**36.7.7 Inspection of Door Openings.** Door openings shall be inspected in accordance with [7.2.1.15](#).

The authority having jurisdiction determines the extent of the extinguisher training required by [36/37.7.3](#) (e.g., instruction only or instruction and hands-on use).

New to the 2015 edition of the *Code*, [36/37.7.7](#) mandates the annual inspection of egress doors equipped with panic hardware or fire exit hardware, doors in exit enclosures, electrically controlled egress doors, and doors with special locking arrangements, via the reference to [7.2.1.15](#). The intent is to ensure that such doors, which might not be used routinely, operate properly in an emergency. See [7.2.1.15](#) and its associated commentary for additional details on the required inspection.

# New and Existing Business Occupancies

Persons who are awake and ready to begin emergency egress or relocation, with little or no staff assistance, as soon as they become aware of a fire typically occupy business occupancies. Historical evidence validates that the package of life safety features imposed on business occupancies by the *Code* does not need to be very extensive. Nonetheless, several notable multiple-death fires have occurred in business occupancies in the United States in recent years. (The term *multiple-death* means three or more fatalities for the purpose of fire data analysis.)

On October 17, 2003, a fire broke out on the twelfth floor of the 37-story, nonsprinklered Cook County Administration Building in Chicago, Illinois. Six occupants perished after becoming trapped in an exit stair. On February 9, 2000, a fire took place in a three-story (with a basement), partially sprinklered building in Newton, Massachusetts, and resulted in five deaths. The fire, of undetermined cause, started in a second-floor nonsprinklered office. Smoke spread quickly throughout the building, making escape impossible for those victims who perished. Another noteworthy fire resulting in five deaths took place in an Atlanta, Georgia, high-rise office building in 1989. One of the fire victims was intimate with the fire source in an electrical vault; the other four victims were occupying their areas on the same floor when the fire began. This was the first office building fire in 17 years to result in more than three fatalities.

The bombing of the Alfred Murrah Federal Office Building in Oklahoma City, Oklahoma, in 1995 killed 168 people and injured 475. The bomb caused about one-third of the floor area of the nine-story building to collapse. The September 11, 2001, attacks on the World Trade Center in New York City and the Pentagon in Arlington, Virginia, killed some 2800 and 125 building occupants, respectively. Thousands more were injured. The *Code* cannot protect against the effects of terrorist attacks, such as the bombing of a building, or the intentional collision of a com-

mercial airliner into a building. Such incidents will, however, continue to be discussed by code-development organizations for many years to come.

It is common for business occupancies to occupy high-rise buildings. Where business occupancies are located in new high-rise buildings, the complete protection package detailed in [Section 11.8](#) is mandated; for existing business occupancies in high-rise buildings, either sprinkler protection or an engineered life safety system that provides protection equivalent to that of sprinklers is required.

The life safety features in [Chapters 38](#) and [39](#) center on arrangement of the means of egress, as well as alarm and occupant notification provisions. The travel distance and common path of travel allowances are generous. Fire resistance-rated corridor walls or other mitigating features, such as sprinkler protection, are required in an effort to keep the means of egress system usable.

[Exhibit 38/39.1](#) depicts a typical business occupancy building.

**Exhibit 38/39.1**

*Typical business occupancy building.*

## 38.1 General Requirements

### 38.1.1 Application.

**38.1.1.1** The requirements of this chapter shall apply to new buildings or portions thereof used as business occupancies. (See [1.3.1](#).)

**38.1.1.2 Administration.** The provisions of [Chapter 1](#), Administration, shall apply.

**38.1.1.3 General.** The provisions of [Chapter 4](#), General, shall apply.

## 39.1 General Requirements

### 39.1.1 Application.

**39.1.1.1** The requirements of this chapter shall apply to existing buildings or portions thereof currently occupied as business occupancies.

**39.1.1.2 Administration.** The provisions of [Chapter 1](#), Administration, shall apply.

**39.1.1.3 General.** The provisions of [Chapter 4](#), General, shall apply.

## CHAPTER 38 • New

**38.1.1.4** The provisions of this chapter shall apply to life safety requirements for all new business buildings.

**38.1.1.5** Additions to existing buildings shall conform to the requirements of 4.6.7. Existing portions of the structure shall not be required to be modified, provided that the new construction has not diminished the fire safety features of the facility.

The provisions for new business occupancies are addressed in [Chapter 38](#); the provisions for existing business occupancies (i.e., existing conditions in business occupancies) are addressed in [Chapter 39](#).

Prior to the 2006 edition of the *Code*, renovations, additions, and changes of occupancy were always required to comply with the requirements for new construction. For business occupancies, such renovations, additions, and changes of occupancy were required to meet the provisions of [Chapter 38](#), while existing conditions were subject to the provisions of [Chapter 39](#). [Chapter 43](#), Building Rehabilitation, was added for the 2006 edition of the *Code*. [Chapter 43](#) was written to promote the adaptive reuse of existing buildings without sacrificing the needed level of life safety. The provisions of [Chapter 43](#) blend the requirements for new construction with those for existing conditions, so as to require additional life safety features as the rehabilitation work category increases in complexity. The rehabilitation work categories are repair, renovation, modification, reconstruction, change of use or occupancy classification, and addition. See [4.6.7](#), [4.6.11](#), and [Chapter 43](#).

To understand the full intent and scope of [39.1.1.1](#) for existing buildings, it is necessary to review it concurrently with [Sections 1.2](#) and [1.3](#). Although a building code might exclude existing buildings from coverage under some form of a grandfather clause, the *Life Safety Code*, by virtue of its interest in safety to life, does not condone existing building arrangements that do not comply with the *Code* requirements that apply to existing buildings. The requirements that apply to existing business occupancies are contained in [Chapter 39](#).

If a building complies with an earlier edition of the *Code*, it is not grandfathered and, thereby, not exempted from compliance with a more current edition of the *Code* that has been adopted as law in the building's jurisdiction. The NFPA technical committees on safety to life are especially careful to avoid adopting requirements for existing buildings that become more stringent from one edition of the *Code* to the next, unless the change is absolutely necessary to enhance the overall package of safety to life intended by the *Code*. Thus, the old adage of "once in compliance, always in compliance" does not hold.

The provisions of [Chapter 39](#) are intended to be applied retroactively. Due consideration has been given to the practical

## CHAPTER 39 • Existing

**39.1.1.4** The provisions of this chapter shall apply to life safety requirements for existing business buildings. Specific requirements shall apply to high-rise buildings (*see definition in 3.3.36.7*) and are contained in paragraphs pertaining thereto.

difficulties of making alterations in existing functioning facilities. The specified provisions, viewed as a whole, establish minimum, acceptable criteria for safety to life that reasonably minimize the likelihood of a life-threatening fire.

The requirements of [Chapter 39](#) are permitted to be modified in instances where compliance is impractical or where alternate but equal provisions are proposed. The modifications must provide a level of protection equivalent to that achieved by compliance with the corresponding *Code* provisions. Note that [Section 1.4](#) permits alternatives to literal *Code* compliance that maintain a building design as *Code* conforming. However, the authority having jurisdiction (AHJ) ultimately determines whether equivalent safety has been provided.

The *Code* does not limit the methods that an AHJ might use to determine equivalency. However, NFPA 101A, *Guide on Alternative Approaches to Life Safety*,<sup>1</sup> provides an equivalency system that uses numerical values to analyze the fire safety effectiveness of a building design. This system, known as the fire safety evaluation system (FSSES), provides a method by which alternative designs can be evaluated as options to literal *Code* compliance.

The 2016 edition of NFPA 101A, although published one year after the 2015 edition of the *Life Safety Code*, is the proper edition of NFPA 101A to consult for one potential equivalency system for business occupancies. Its measurement system has been calibrated against the requirements of the 2015 edition of the *Code*, whereas the fire safety evaluation systems contained in the 2013 edition of NFPA 101A were calibrated against the requirements of the 2012 edition of the *Code*.

In providing the equivalency concept, the *Code* does not limit equivalency evaluations to those based solely on the system presented for business occupancies in NFPA 101A. The AHJ retains the power to evaluate and approve alternative designs on the basis of appropriate supporting data. The FSSES is permitted to be used to aid in this evaluation. Use of the FSSES is in no way mandated, nor is the AHJ required to accept the results of an evaluation using the NFPA 101A equivalency system.

Although the FSSES was primarily developed to evaluate alternative designs in existing buildings, it is particularly useful for determining equivalency for conversions, modernizations, renovations, or unusual design concepts. However, the FSSES is only a tool to help determine equivalency — it should not be

## CHAPTER 38 • New

used to circumvent *Code* requirements. *Code* requirements must be met, or equivalent safety must be provided by alternative means approved by the AHJ.

Additions to existing buildings are addressed by 38.1.1.5. Although construction of an addition generally does not require existing portions of the building to be modified, Exhibit 38/39.2 illustrates a case where the planned new construction would diminish the fire safety features of the existing building and, thus, necessitate corrective action within the existing portion of the building. The location of new room A creates an excessively long dead-end corridor, B, which must be corrected.

In addition to creating an unacceptable dead-end corridor, the construction of room A in Exhibit 38/39.2 diminishes the fire safety features in two other ways; however, both are negligible and do not warrant correction. The door from corridor B into room A was formerly an exit door to the outside. Thus, with the new addition, the number of exits has been decreased from three to two; also, the travel distance for occupants in some of the rooms off corridor B has been increased, because the nearest exit for those occupants becomes the pair of doors at the front of the building (i.e., at the bottom of the exhibit). If the occupant load of the floor doesn't exceed 500 persons, only two exits are required (see 7.4.1.2), and the loss of one of the three exits is permitted without further correction. Also, if the maximum allowable travel distance [200 ft (61 m) where the building is not sprinklered or 300 ft (91 m) where the building is sprinklered, in accordance with 38/39.2.6] is not exceeded, the travel distance increase caused by the addition of room A is permitted without further correction. Thus, only the newly created, excessively long dead-end corridor needs to be corrected.

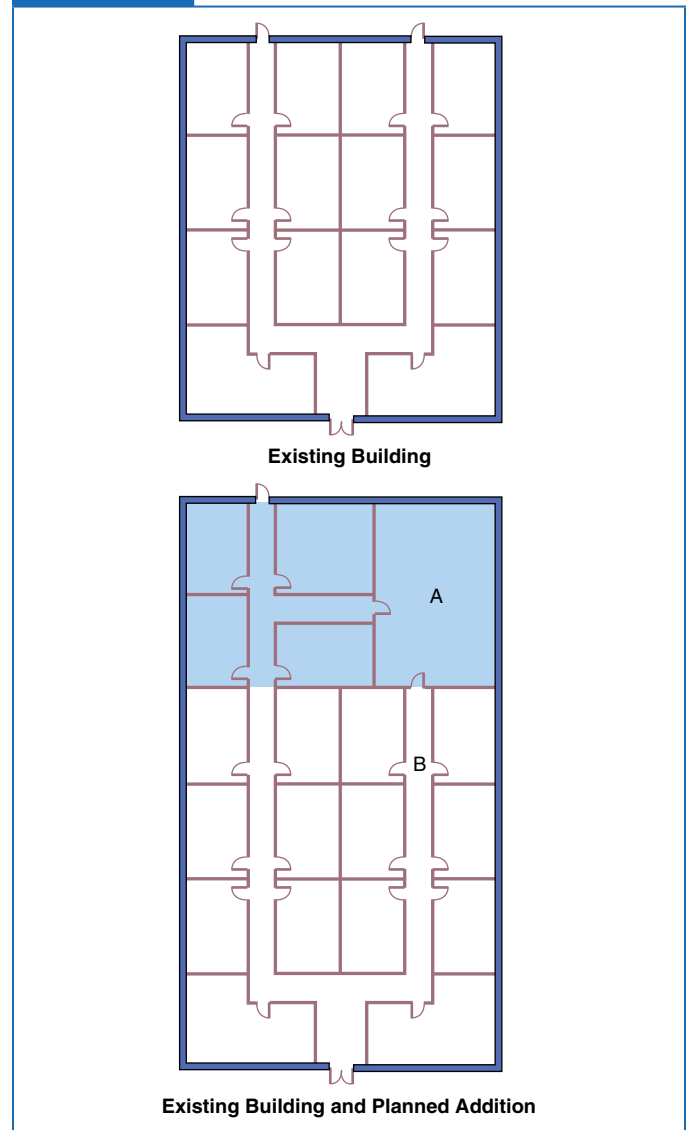

**38.1.2 Classification of Occupancy.** Business occupancies shall include all buildings and structures or parts thereof with occupancy as defined in 6.1.11.

Per the *Code's* definition of a business occupancy (see 6.1.11.1), an occupancy used for the transaction of business (other than that classified as a mercantile occupancy) is covered by the provisions of Chapters 38 and 39.

Business occupancies include doctors' offices, dentists' offices (see Chapters 20 and 21 for ambulatory health care occupancies),

## CHAPTER 39 • Existing

Exhibit 38/39.2

*An addition that diminishes existing life safety features.*

**39.1.2 Classification of Occupancy.** Business occupancies shall include all buildings and structures or parts thereof with occupancy as defined in 6.1.11.

and general offices, as well as city halls, town halls, and courthouses, all of which have areas for keeping books and records and transacting business. Other occupancies included under the definition of business occupancies are service facilities common to office buildings, such as newsstands, lunch counters (with seating areas for fewer than 50 people), barber shops, and beauty parlors.

## CHAPTER 38 • New

Birth centers occupied by fewer than four patients, not including infants, at any one time are classified as business occupancies in accordance with the guidelines of [A.6.1.11.1](#) and the definition of the term *birth center* in [3.3.33](#) and its corresponding text in [A.3.3.33](#).

Note that the *Code's* definition of a business occupancy does not include types of stores that, although considered

### 38.1.3 Multiple Occupancies.

#### 38.1.3.1 General.

**38.1.3.1.1** All multiple occupancies shall be in accordance with [6.1.14](#) and [38.1.3](#).

**38.1.3.1.2** Where there are differences in the specific requirements in this chapter and provisions for mixed occupancies or separated occupancies as specified in [6.1.14.3](#) and [6.1.14.4](#), the requirements of this chapter shall apply.

#### 38.1.3.2 Combined Business Occupancies and Parking Structures.

**38.1.3.2.1** The fire barrier separating parking structures from a building classified as a business occupancy shall be a fire barrier having a minimum 2-hour fire resistance rating.

**38.1.3.2.2** Openings in the fire barrier required by [38.1.3.2.1](#) shall not be required to be protected with fire protection-rated opening protectives in enclosed parking structures that are protected throughout by an approved, supervised automatic sprinkler system in accordance with [9.7.1.1\(1\)](#), or in open parking structures, provided that all of the following conditions are met:

- (1) The openings do not exceed 25 percent of the area of the fire barrier in which they are located.
- (2) The openings are used as a public entrance and for associated sidelight functions.
- (3) The building containing the business occupancy is protected throughout by an approved, supervised automatic sprinkler system in accordance with [9.7.1.1\(1\)](#).
- (4)\* Means are provided to prevent spilled fuel from accumulating adjacent to the openings and entering the building.
- (5) Physical means are provided to prevent vehicles from being parked or driven within 10 ft (3050 mm) of the openings.
- (6) The openings are protected as a smoke partition in accordance with [Section 8.4](#), with no minimum fire protection rating required.

**A.38.1.3.2.2(4)** Means to prevent spilled fuel from accumulating and entering the business occupancy building can be by curbs, scuppers, special drainage systems, sloping the floor away from the door openings, or elevation differences not less than 4 in. (100 mm).

## CHAPTER 39 • Existing

businesses, are covered under the provisions of [Chapters 36](#) and [37](#). For example, supermarkets, department stores, and other occupancies that display and sell merchandise are not considered business occupancies. The assembly portions of city halls, town halls, and courthouses with seating for 50 or more people are classified as assembly occupancies, which are covered by [Chapters 12](#) and [13](#).

### 39.1.3 Multiple Occupancies.

#### 39.1.3.1 General.

**39.1.3.1.1** All multiple occupancies shall be in accordance with [6.1.14](#) and [39.1.3](#).

**39.1.3.1.2** Where there are differences in the specific requirements in this chapter and provisions for mixed occupancies or separated occupancies as specified in [6.1.14.3](#) and [6.1.14.4](#), the requirements of this chapter shall apply.

#### 39.1.3.2 Combined Business Occupancies and Parking Structures.

**39.1.3.2.1** The fire barrier separating parking structures from a building classified as a business occupancy shall be a fire barrier having a minimum 2-hour fire resistance rating.

**39.1.3.2.2** Openings in the fire barrier required by [39.1.3.2.1](#) shall not be required to be protected with fire protection-rated opening protectives in enclosed parking structures that are protected throughout by an approved, supervised automatic sprinkler system in accordance with [9.7.1.1\(1\)](#), or in open parking structures, provided that all of the following conditions are met:

- (1) The openings do not exceed 25 percent of the area of the fire barrier in which they are located.
- (2) The openings are used as a public entrance and for associated sidelight functions.
- (3) The building containing the business occupancy is protected throughout by an approved, supervised automatic sprinkler system in accordance with [9.7.1.1\(1\)](#).
- (4)\* Means are provided to prevent spilled fuel from accumulating adjacent to the openings and entering the building.
- (5) Physical means are provided to prevent vehicles from being parked or driven within 10 ft (3050 mm) of the openings.
- (6) The openings are protected as a smoke partition in accordance with [Section 8.4](#), with no minimum fire protection rating required.

**A.39.1.3.2.2(4)** Means to prevent spilled fuel from accumulating and entering the business occupancy building can be by curbs, scuppers, special drainage systems, sloping the floor away from the door openings, or elevation differences not less than 4 in. (100 mm).

## CHAPTER 38 • New

Minor office occupancies that are incidental to operations in other than business occupancies are permitted to be considered incidental to the predominant occupancy, rather than part of a multiple occupancy, and are subject to the *Code* provisions that apply to the predominant occupancy.

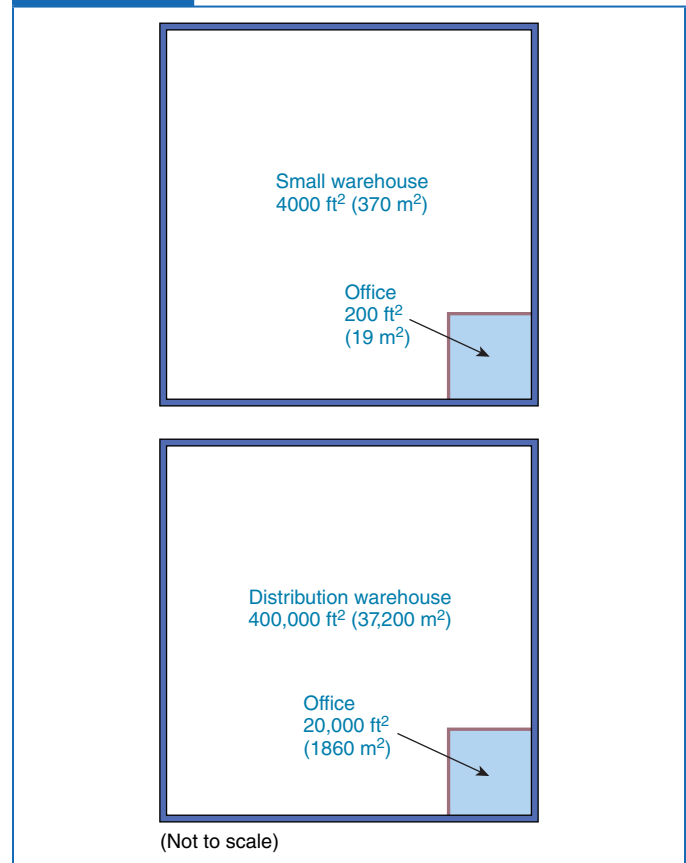

The determination of those criteria that constitute a minor or incidental office area cannot be based solely on percentage of business area in comparison to overall building area. For example, a 200 ft<sup>2</sup> (19 m<sup>2</sup>) office area in a 4000 ft<sup>2</sup> (370 m<sup>2</sup>) warehouse can reasonably be judged as incidental to the storage operations and result in the building being classified as a storage occupancy. However, a 20,000 ft<sup>2</sup> (1860 m<sup>2</sup>) office area in a 400,000 ft<sup>2</sup> (37,200 m<sup>2</sup>) distribution warehouse represents the same proportion of business use but cannot be judged as incidental (see Exhibit 38/39.3). The 20,000 ft<sup>2</sup> (1860 m<sup>2</sup>) office area probably has an occupant load of approximately 200 persons. The *Code* requirements that apply to business occupancies, which are more stringent than those that apply to storage occupancies, are needed to protect the occupants of the office area adequately. The distribution warehouse is classified as a multiple occupancy that is part storage occupancy and part business occupancy. If packaging operations take place in the warehouse, it might also be classified as part industrial occupancy. Consequently, the requirements of 6.1.14 for either mixed or separated multiple occupancies apply.

The provisions of 38/39.1.3.2 address combined business occupancies and parking structures and are very similar to the requirements of 36/37.1.3.2, which address combined mercantile occupancies and parking structures. It is very common for multistory business occupancies, such as office buildings, and multistory mercantile occupancies, such as department stores and shopping mall buildings, to be attached to multistory parking garages. These garages provide access to the business or mercantile occupancy at multiple levels. The provisions of 38/39.1.3.2.2 outline a set of provisions that, if applied in total, will safely permit a reduction in the 2-hour fire resistance-rated separation requirement of 38/39.1.3.2.1. This reduction allows flexibility in the number and types of openings and considers the stringent requirements for opening protectives, such as fire doors and windows. The reduction also permits the use of non-rated glazing and opening protectives, which allows the use of glass doors and sidelights in the barrier between the business

**38.1.3.3** Atrium walls in accordance with 6.1.14.4.6 shall be permitted to serve as part of the separation required by 6.1.14.4.1 for creating separated occupancies on a story-by-story basis from nonhazardous spaces in assembly, educational, day care, health care, ambulatory health care, residential, residential board and care occupancies, and mercantile occupancies other than bulk merchandise buildings.

## CHAPTER 39 • Existing

Exhibit 38/39.3

Incidental and nonincidental office use.

occupancy and the garage. Security in the garage is thereby increased, because occupants can view the area through the glass doors or sidelights. This feature, in turn, helps to meet the security concerns of office building managers and tenants.

Note that all seven requirements mandated by 38/39.1.3.2.2 — the sprinkler requirement for enclosed garages per the base paragraph and its six subparts — must be met as a whole to apply the exemption. Otherwise, a 2-hour fire resistance-rated separation between the business occupancy and the parking structure is required.

**39.1.3.3** Atrium walls in accordance with 6.1.14.4.6 shall be permitted to serve as part of the separation required by 6.1.14.4.1 for creating separated occupancies on a story-by-story basis from nonhazardous spaces in assembly, educational, daycare, health care, ambulatory health care, residential, residential board and care occupancies, and mercantile occupancies other than bulk merchandise buildings.

## CHAPTER 38 • New

The provision of 38/39.1.3.3 permits a business occupancy that is part of a separated, multiple occupancy building to utilize an atrium as a portion of the occupancy separation in accordance

### 38.1.4 Definitions.

**38.1.4.1 General.** For definitions, see Chapter 3, Definitions.

**38.1.4.2 Special Definitions.** Special terms applicable to this chapter are defined in Chapter 3.

**38.1.5 Classification of Hazard of Contents.** The contents of business occupancies shall be classified as ordinary hazard in accordance with Section 6.2.

### 38.1.6 Minimum Construction Requirements. (Reserved)

**38.1.7 Occupant Load.** The occupant load, in number of persons for whom means of egress and other provisions are required, shall be determined on the basis of the occupant load factors that are characteristic of the use of the space or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

Classification of hazard of contents is addressed in 38/39.1.5. Most occupancy chapters refer to Section 6.2 for classification of hazard of contents. However, the requirement of 38/39.1.5 emphasizes that, unless an extraordinarily hazardous situation exists, the contents of business occupancies are to be classified as ordinary hazard. This requirement is intended to prevent the user from classifying the hazard of contents as high hazard, except where a combustible load far in excess of the usual, yet considerable, quantity of boxed records and paper files exists. Isolated hazardous contents areas within the overall ordinary hazard business occupancy, such as storage rooms, must be protected or separated in accordance with the requirements of 38/39.3.2.

Building contents classified by the Code as ordinary hazard for the purpose of life safety are not always classified as ordinary hazard by other codes or standards, such as NFPA 13, *Standard for the Installation of Sprinkler Systems*.<sup>2</sup> For purposes of sprinkler system design, the anticipated fuel load of business occupancies is classified as light hazard.

There are no construction requirements for business occupancies; therefore, 38/39.1.6 serves as a placeholder. Some occupancy chapters, such as Chapters 18 and 19, which address the life safety needs of nonambulatory health care occupants, require a minimum building construction type to help ensure the structural integrity required for a lengthy evacuation or for

## CHAPTER 39 • Existing

with 6.1.14.4.6. These criteria are new to the 2015 edition of the Code. See the commentary following 6.1.14.4.6 for additional details on the use of an atrium as an occupancy separation.

### 39.1.4 Definitions.

**39.1.4.1 General.** For definitions, see Chapter 3, Definitions.

**39.1.4.2 Special Definitions.** Special terms applicable to this chapter are defined in Chapter 3.

**39.1.5 Classification of Hazard of Contents.** The contents of business occupancies shall be classified as ordinary hazard in accordance with Section 6.2.

### 39.1.6 Minimum Construction Requirements. (Reserved)

**39.1.7 Occupant Load.** The occupant load, in number of persons for whom means of egress and other provisions are required, shall be determined on the basis of the occupant load factors that are characteristic of the use of the space or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

safe refuge within the building. Because business occupancies are normally occupied by those who are ambulatory, and because they do not typically provide sleeping accommodations, no minimum construction requirements are imposed.

Subsection 38/39.1.7 references Table 7.3.1.2 for determining the occupant load factors that apply to the use areas of a business occupancy. Because the number of people expected to occupy certain types of office buildings can be determined with a great degree of accuracy (such as by means of a company's detailed account of its office space), it might be beneficial to compare such an occupant load with an occupant load calculated on the basis of one person per 100 ft<sup>2</sup> (9.3 m<sup>2</sup>) of gross floor area (see Table 7.3.1.2). New to the 2015 edition of the Code, where people work in highly concentrated groups (such as a customer service call center or secretarial pool area), Table 7.3.1.2 specifies an occupant load factor of 50 ft<sup>2</sup> (4.6 m<sup>2</sup>) per person for concentrated business use. See A.7.3.1.2 for additional details. As emphasized in Section 7.3, where the actual number of occupants exceeds the calculated occupant load, the egress capacity must be designed to accommodate the actual (larger) occupant load. Note that the converse is not true; that is, if the actual occupant load is less than the gross area calculation, the Code still requires that the gross area calculation (i.e., the larger occupant load) be used to determine the occupant load for which the egress capacity must be provided.

## CHAPTER 38 • New

## 38.2 Means of Egress Requirements

### 38.2.1 General.

**38.2.1.1** All means of egress shall be in accordance with [Chapter 7](#) and this chapter.

**38.2.1.2** If, owing to differences in the finished ground level, any street floor exits are located at points above or below the street or the finished ground level, such exits shall comply with the provisions for exits from upper floors or floors below the street floor.

**38.2.1.3** Stairs and ramps serving two or more floors below a street floor occupied for business use shall be permitted in accordance with [38.2.1.3.1](#) and [38.2.1.3.2](#).

**38.2.1.3.1** Where two or more floors below the street floor are occupied for business use, the same stairs or ramps shall be permitted to serve each floor.

**38.2.1.3.2** An inside open stairway or inside open ramp shall be permitted to serve as a component of the required means of egress system from not more than one floor level below the street floor.

**38.2.1.4** Floor levels that are below the street floor; are used only for storage, heating, and other service equipment; and are not subject to business occupancy shall have means of egress in accordance with [Chapter 42](#).

[Exhibit 38/39.4](#) illustrates a case where two floors qualify as street floors in accordance with [38/39.2.1.2](#), because each floor has one side located at a ground level. Note, however, that each of the two floors has its other sides located either above or below the building's other ground level. As a result, floors 1 and 2 must have their exits arranged to allow horizontal travel to the exterior at one end of the floor and vertical travel (either up or down to ground level) at the other end of the floor. The egress capacity of the doors to the exterior on floor 1 must accommodate that portion of the occupant load from an upper floor that is expected to travel down to and through the exits to the exterior from floor 1. This portion of the occupant load is to be added to the portion of the floor 1 occupant load assigned to a given exit. The reverse is true for floor 2, which must increase the size of its exterior exit capacity to accommodate occupants traveling up from floor 1, as well as those traveling down to and through the exterior exits on floor 2. The provisions of [7.3.1.5](#), [7.3.1.6](#), and [38/39.2.3.3](#) explain how to add egress capacity based on the number of occupants expected to discharge from floors above and below the street floor.

[Paragraph 38/39.2.1.3.2](#) prohibits the use of unenclosed interior stairs or unenclosed interior ramps as exit access for

## CHAPTER 39 • Existing

## 39.2 Means of Egress Requirements

### 39.2.1 General.

**39.2.1.1** All means of egress shall be in accordance with [Chapter 7](#) and this chapter.

**39.2.1.2** If, owing to differences in the finished ground level, any street floor exits are located at points above or below the street or the finished ground level, such exits shall comply with the provisions for exits from upper floors or floors below the street floor.

**39.2.1.3** Stairs and ramps serving two or more floors below a street floor occupied for business use shall be permitted in accordance with [39.2.1.3.1](#) and [39.2.1.3.2](#).

**39.2.1.3.1** Where two or more floors below the street floor are occupied for business use, the same stairs, escalators, or ramps shall be permitted to serve each floor.

**39.2.1.3.2** An inside open stairway, inside open escalator, or inside open ramp shall be permitted to serve as a component of the required means of egress system from not more than one floor level below the street floor.

**39.2.1.4** Floor levels that are below the street floor; are used only for storage, heating, and other service equipment; and are not subject to business occupancy shall have means of egress in accordance with [Chapter 42](#).

**Exhibit 38/39.4***Business occupancy with two street floors.*

more than one floor below the street floor; it does not establish permission for the presence of an open stairway or open ramp. See [38/39.3.1](#), which addresses the protection of vertical openings in business occupancies, to determine if the stair or ramp is

## CHAPTER 38 • New

permitted to be unenclosed. The floor with the largest occupant load is used to determine the required width of the stair or ramp serving multiple floors. This requirement ensures that a stair or other component of a means of egress will accommodate its assigned portion of the population of any floor it serves.

The implementation of 38/39.2.1.4 results in a significant reduction in the number and size of exits for floors located below

### 38.2.2 Means of Egress Components.

**38.2.2.1 General.** Means of egress components shall be limited to the types described in 38.2.2.2 through 38.2.2.12.

#### 38.2.2.2 Doors.

**38.2.2.2.1** Doors complying with 7.2.1 shall be permitted.

**38.2.2.2.2\*** Locks complying with 7.2.1.5.5 shall be permitted only on principal entrance/exit doors.

**A.38.2.2.2.2** The words “principal entrance/exit doors” describe doors that the authority having jurisdiction can reasonably expect to be unlocked in order for the facility to do business.

**38.2.2.2.3** Elevator lobby exit access door-locking arrangements in accordance with 7.2.1.6.3 shall be permitted.

#### 38.2.2.2.4 Reserved.

**38.2.2.2.5** Delayed-egress locks complying with 7.2.1.6.1 shall be permitted.

**38.2.2.2.6** Access-controlled egress doors complying with 7.2.1.6.2 shall be permitted.

**38.2.2.2.7** Horizontal or vertical security grilles or doors complying with 7.2.1.4.1(3) shall be permitted to be used as part of the required means of egress from a tenant space.

#### 38.2.2.2.8 Reserved.

## CHAPTER 39 • Existing

the street floor that are used only for storage or for heating and service equipment and that are not subject to business occupancy use. These reductions are permitted, because the expected population of such floors will be well below that of a floor used as a typical business occupancy. Also see Section 7.12, which specifically regulates means of egress from boiler rooms and similar spaces.

### 39.2.2 Means of Egress Components.

**39.2.2.1 Components Permitted.** Means of egress components shall be limited to the types described in 39.2.2.2 through 39.2.2.12.

#### 39.2.2.2 Doors.

**39.2.2.2.1** Doors complying with 7.2.1 shall be permitted.

**39.2.2.2.2\*** Locks complying with 7.2.1.5.5 shall be permitted only on principal entrance/exit doors.

**A.39.2.2.2.2** The words “principal entrance/exit doors” describe doors that the authority having jurisdiction can reasonably expect to be unlocked in order for the facility to do business.

**39.2.2.2.3** Elevator lobby exit access door-locking arrangements in accordance with 7.2.1.6.3 shall be permitted.

**39.2.2.2.4** The re-entry provisions of 7.2.1.5.8 shall not apply to any of the following:

- (1) Existing business occupancies that are not high-rise buildings
- (2) Existing high-rise business occupancy buildings that are protected throughout by an approved automatic sprinkler system in accordance with 9.7.1.1(1)
- (3) Existing high-rise business occupancy buildings having approved existing means for providing stair re-entry

**39.2.2.2.5** Delayed-egress locks complying with 7.2.1.6.1 shall be permitted.

**39.2.2.2.6** Access-controlled egress doors complying with 7.2.1.6.2 shall be permitted.

**39.2.2.2.7** Horizontal or vertical security grilles or doors complying with 7.2.1.4.1(3) shall be permitted to be used as part of the required means of egress from a tenant space.

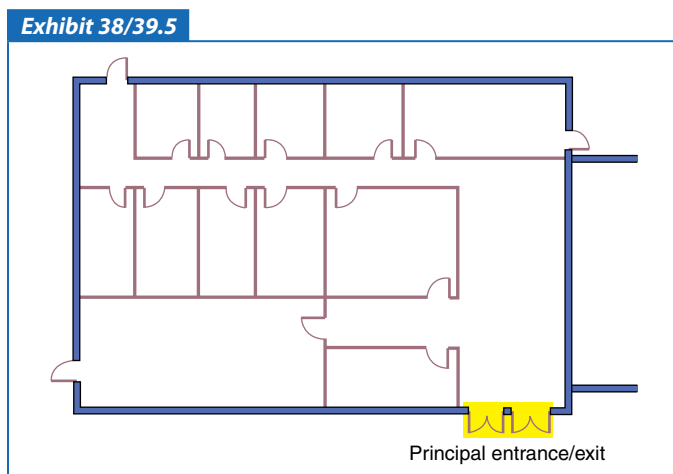

**39.2.2.2.8** Approved existing horizontal-sliding or vertical-rolling fire doors shall be permitted in the means of egress where they comply with all of the following conditions:

- (1) They are held open by fusible links.
- (2) The fusible links are rated at not less than 165°F (74°C).
- (3) The fusible links are located not more than 10 ft (3050 mm) above the floor.

## CHAPTER 38 • New

**38.2.2.2.9** Revolving doors complying with 7.2.1.10 shall be permitted.

Only the principal entrance/exit doors of a business occupancy are permitted by 38/39.2.2.2.2 to be equipped with the special key-operated lock described by the provisions of 7.2.1.5.5. It must be easy to determine that the device is locked by using means such as a flag indicator that can be seen at the door. Other exit doors are prohibited from being equipped with key-operated locks, because the probability is low that these doors will be consistently unlocked when the occupancy opens for business, whereas the principal entrance/exit doors must be unlocked each day to accommodate staff and visitors. See Exhibit 38/39.5 for an example of the principal entrance/exit in a business occupancy.

Key-operated lock at the principal entrance/exit in accordance with 38/39.2.2.2.2.

Prior to the 2009 edition of the *Code*, all elevator lobbies were required to provide direct access to not less than one exit (typically a stair) without requiring occupants to pass through any space subject to locking. The 2009 edition introduced the concept of elevator lobby exit access door-locking arrangements in 7.2.1.6.3. These criteria permit elevators to open to lobbies that are secured from the remainder of the floor; to reach an exit, occupants in the elevator lobby are required to travel through the secured area. The requirements of 7.2.1.6.3, which

## CHAPTER 39 • Existing

- (4) The fusible links are in immediate proximity to the door opening.
- (5) The fusible links are not located above a ceiling.
- (6) The door is not credited with providing any protection under this *Code*.

**39.2.2.2.9** Revolving doors complying with 7.2.1.10 shall be permitted.

include the installation of an approved, supervised automatic sprinkler system throughout the building, ensure that the doors will unlock to allow occupants to reach an exit in the event of a fire. The provisions of 7.2.1.6.3 are permitted to be used only where specifically referenced by the applicable occupancy chapter; such arrangement is permitted in business occupancies by 38/39.2.2.2.3. See 7.2.1.6.3 and its associated commentary for additional details on elevator lobby exit access door-locking arrangements.

Note that, per 39.2.2.2.4, existing business occupancies that are not high-rise buildings are exempt from the re-entry provisions of 7.2.1.5.8, which apply to exit stair enclosure doors. Existing high-rise business occupancies are required to be provided with stairway re-entry in accordance with 7.2.1.5.8, unless the building is sprinklered or the building is provided with an approved existing means for providing re-entry. The criteria applicable to existing high-rise business occupancies were new to the 2009 edition of the *Code* and were added in direct response to the 2003 Cook County Administration Building fire in Chicago that resulted in six deaths. The fire occurred on the twelfth floor of the 37-story, nonsprinklered high-rise building. The exit stairs were provided with no means for re-entry to the building — an arrangement previously permitted by the *Code* for all existing business occupancies. The six victims all perished when they became trapped in an exit stair and encountered heavy smoke. The subsequent fire investigation determined that the fatalities could have been prevented if the building had been sprinklered or if stairway re-entry had been provided; thus, 39.2.2.2.4 requires existing high-rise business occupancies to be provided with sprinkler protection or stairway re-entry. It is noted that this requirement is intended to be applied retroactively; existing buildings without such provision are not grandfathered. See 4.6.6 for details on the time allowed for compliance for existing buildings. All new business occupancies must meet the re-entry provisions of 7.2.1.5.8; thus, 38.2.2.2.4 is reserved as a placeholder.

The use of delayed-egress locks covered by 7.2.1.6.1 is permitted on any door by 38/39.2.2.2.5 in recognition of the security needs of a business occupancy. Per 7.2.1.6.1, the building must be protected throughout by an approved, supervised automatic sprinkler system or an approved, supervised automatic fire detection system. In effect, the allowable 15-second or 30-second

## CHAPTER 38 • New

delay will be experienced only under non-fire conditions or very early in a fire's growth, because the door must be usable immediately upon sprinkler operation, smoke or heat detection, or loss of power that controls the locking mechanism.

Access-controlled egress doors in business occupancies are recognized by 38/39.2.2.2.6 as security measures that do not compromise the use of the means of egress system, provided that they meet the criteria specified in 7.2.1.6.2.

Paragraph 7.2.1.4.1(3) establishes provisions for the arrangement and use of horizontal or vertical security grilles or doors if such features are specifically recognized by an occupancy chapter. For business occupancies, such recognition is provided by 38/39.2.2.2.7.

Horizontal-sliding or vertical-rolling fire doors exist in many business occupancies for purposes of property protection. Although the Code normally does not recognize these doors within the required means of egress, 39.2.2.2.8 provides an exemption for existing horizontal-sliding or vertical-rolling fire doors. By requiring the fusible link to be positioned in immediate proximity to the door opening, rated 165°F (74°C) or higher, and located not more than 10 ft (3050 mm) above the floor, the Code helps to ensure that the door will remain open until rising temperatures make it unsafe to pass through the door opening. The door will not close early in the fire development; therefore, it cannot be credited as a fire door for life safety purposes. However, the door might be provided for purposes of property protection. See Exhibit 38/39.6 for an example of an existing vertical-rolling fire door as permitted by 39.2.2.2.8.

Paragraph 38/39.2.2.2.9 addresses revolving doors. The provisions of 7.2.1.10 specify that the use of a revolving door,

### 38.2.2.3 Stairs.

38.2.2.3.1 Stairs complying with 7.2.2 shall be permitted.

38.2.2.3.2 Spiral stairs complying with 7.2.2.2.3 shall be permitted.

38.2.2.4 **Smokeproof Enclosures.** Smokeproof enclosures complying with 7.2.3 shall be permitted.

38.2.2.5 **Horizontal Exits.** Horizontal exits complying with 7.2.4 shall be permitted.

38.2.2.6 **Ramps.** Ramps complying with 7.2.5 shall be permitted.

38.2.2.7 **Exit Passageways.** Exit passageways complying with 7.2.6 shall be permitted.

38.2.2.8 **Reserved.**

## CHAPTER 39 • Existing

regardless of whether it is permitted as part of the required means of egress, requires a conforming side-hinged swinging door to be positioned and usable within the same wall as, and to be located within 10 ft (3050 mm) of, the revolving door. This requirement helps to ensure that, once people move toward the door, if the collapsibility and other safety features of the door fail and render it unusable, egress from the vicinity is still possible without retracing steps and requiring travel toward the fire.

Existing vertical-rolling fire door in accordance with 39.2.2.2.8.

### 39.2.2.3 Stairs.

39.2.2.3.1 Stairs complying with 7.2.2 shall be permitted.

39.2.2.3.2 Spiral stairs complying with 7.2.2.2.3 shall be permitted.

39.2.2.3.3 Winders complying with 7.2.2.2.4 shall be permitted.

39.2.2.4 **Smokeproof Enclosures.** Smokeproof enclosures complying with 7.2.3 shall be permitted.

39.2.2.5 **Horizontal Exits.** Horizontal exits complying with 7.2.4 shall be permitted.

39.2.2.6 **Ramps.** Ramps complying with 7.2.5 shall be permitted.

39.2.2.7 **Exit Passageways.** Exit passageways complying with 7.2.6 shall be permitted.

39.2.2.8 **Escalators and Moving Walks.** Escalators and moving walks complying with 7.2.7 shall be permitted.

## CHAPTER 38 • New

**38.2.2.9 Reserved.**

**38.2.2.10 Fire Escape Ladders.** Fire escape ladders complying with 7.2.9 shall be permitted.

**38.2.2.11 Alternating Tread Devices.** Alternating tread devices complying with 7.2.11 shall be permitted.

**38.2.2.12 Areas of Refuge.**

**38.2.2.12.1** Areas of refuge complying with 7.2.12 shall be permitted.

**38.2.2.12.2** In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1), two rooms or spaces separated from each other by smoke-resistant partitions in accordance with the definition of area of refuge in 3.3.22 shall not be required.

Paragraph 38/39.2.2.4 does not mandate smokeproof enclosures. However, smokeproof enclosures are recognized as part of the means of egress system in business occupancies if they meet the requirements of 7.2.3. For an example of an occupancy requiring a smokeproof enclosure, see 31.2.11.1, which specifies that existing nonsprinklered or partially sprinklered high-rise apartment buildings are required to be provided with smokeproof enclosures in accordance with 7.2.3.

Existing escalators and moving walks are permitted to serve within the means of egress of existing business occupancies per 39.2.2.8. Note that 7.2.7 permits escalators and moving walks to continue to be located within the required means of egress if permitted by the applicable occupancy chapter. In earlier editions of the Code, such escalators and moving walks might have been permitted and credited with providing egress capacity for 75 persons. To qualify as exits, existing escalators and moving walks must also meet the requirements of 7.1.3.2, which address exit enclosures. Escalators protected using the sprinkler-vent, spray nozzle, rolling shutter, or partial enclosure method do not constitute acceptable exits but could continue to serve as exit access if previously approved as such.

Existing fire escape stairs are permitted to serve within the means of egress of existing business occupancies per 39.2.2.9. Note that 7.2.8.1.2.1 permits existing buildings to

**38.2.3 Capacity of Means of Egress.**

**38.2.3.1** The capacity of means of egress shall be in accordance with Section 7.3.

**38.2.3.2\*** The clear width of any corridor or passageway serving an occupant load of 50 or more shall be not less than 44 in. (1120 mm).

## CHAPTER 39 • Existing

**39.2.2.9 Fire Escape Stairs.** Fire escape stairs complying with 7.2.8 shall be permitted.

**39.2.2.10 Fire Escape Ladders.** Fire escape ladders complying with 7.2.9 shall be permitted.

**39.2.2.11 Alternating Tread Devices.** Alternating tread devices complying with 7.2.11 shall be permitted.

**39.2.2.12 Areas of Refuge.**

**39.2.2.12.1** Areas of refuge complying with 7.2.12 shall be permitted.

**39.2.2.12.2** In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1), two rooms or spaces separated from each other by smoke-resistant partitions in accordance with the definition of area of refuge in 3.3.22 shall not be required.

continue to use fire escape stairs for not more than 50 percent of their required egress capacity.

Paragraph 38/39.2.2.11 addresses alternating tread devices. The provisions of 7.2.11, in effect, restrict the use of alternating tread devices to locations where the Code recognizes the use of fire escape ladders. See 38/39.2.2.10, 7.2.9, and 7.2.11.

Paragraph 38/39.2.2.12 addresses areas of refuge. Areas accessible to persons with severe mobility impairment in new buildings must be provided with accessible means of egress in accordance with 7.5.4.1. Existing business occupancies are exempt from the provisions of 7.5.4.1. For the stories above the level of exit discharge, where providing ramps is usually not feasible, areas of refuge (see 7.2.12) are typically used to meet the requirements for accessible means of egress in new construction. The provision of 38/39.2.2.12.2 permits a sprinklered story of a business occupancy building to be considered an area of refuge, even if an occupant does not have access to any of the tenant spaces. The effectiveness of sprinkler systems should allow an occupant with mobility impairment to remain on the floor of fire origin without experiencing untenable conditions. Doors to tenant spaces that are locked create inaccessibility to spaces other than the corridor, so the corridor effectively serves as the area of refuge, even though it does not necessarily meet the detailed requirements of 7.2.12.

**39.2.3 Capacity of Means of Egress.**

**39.2.3.1** The capacity of means of egress shall be in accordance with Section 7.3.

**39.2.3.2** The clear width of any corridor or passageway serving an occupant load of 50 or more shall be not less than 44 in. (1120 mm).

## CHAPTER 38 • New

**A.38.2.3.2** It is not the intent that this provision apply to noncorridor or nonpassageway areas of exit access, such as the spaces between rows of desks created by office layout or low-height partitions.

**38.2.3.3** Street floor exits shall be sufficient for the occupant load of the street floor plus the required capacity of open stairs and ramps discharging through the street floor.

**Chapter 7** mandates that any required egress capacity from a mezzanine that passes through the room below must be added to the required egress capacity of the room through which the egress passes.

**Exhibit 38/39.7** illustrates a case in which a mezzanine is open to the street floor. The exits from the street floor must accommodate the following:

1. Occupant load of the street floor
2. Occupant load of the mezzanine in accordance with **7.3.1.6**
3. Required capacity provided by open stairs from other floors discharging through the street floor in accordance with **38/39.2.3.3**

Corridors in business occupancies must have a clear width of at least 44 in. (1120 mm) only if serving an occupant load of 50 or more persons per **38/39.2.3.2**. If a corridor serves fewer than 50 persons, the minimum 36 in. (915 mm) width — mandated by **7.3.4.1** for egress components in general — would apply [or 28 in. (710 mm) in existing buildings per **7.3.4.1.2**].

A corridor with the minimum 44 in. (1120 mm) width required by **38/39.2.3.2** has sufficient egress capacity, where calculated using the 0.2 in. (5 mm) per person capacity factor of **Table 7.3.3.1** for level components, for approximately 220 persons; that is, 44 in./0.2 in. per person (1120 mm/5 mm per person). For example, in a corridor that runs from one end of a building to the other end with an exit stair located at each end,

### 38.2.4 Number of Means of Egress.

**38.2.4.1** Means of egress shall comply with all of the following, except as otherwise permitted by **38.2.4.2** through **38.2.4.6**:

- (1) The number of means of egress shall be in accordance with **Section 7.4**.
- (2) Not less than two separate exits shall be provided on every story.
- (3) Not less than two separate exits shall be accessible from every part of every story.

**38.2.4.2** Exit access, as required by **38.2.4.1(3)**, shall be permitted to include a single exit access path for the distances permitted as common paths of travel by **38.2.5.3**.

## CHAPTER 39 • Existing

**39.2.3.3** Street floor exits shall be sufficient for the occupant load of the street floor plus the required capacity of open stairs, ramps, escalators, and moving walks discharging through the street floor.

**Exhibit 38/39.7**

*Business occupancy with a mezzanine open to the street floor.*

220 persons can travel from the midpoint of that corridor to the exit enclosure at one end. Another 220 persons can travel to the exit enclosure at the other end. Therefore, in this example, the occupant load of the floor would have to exceed 440 persons before the minimum 44 in. (1120 mm) corridor width would be required to be increased.

### 39.2.4 Number of Means of Egress.

**39.2.4.1** Means of egress shall comply with all of the following, except as otherwise permitted by **39.2.4.2** through **39.2.4.6**:

- (1) The number of means of egress shall be in accordance with **7.4.1.1** and **7.4.1.3** through **7.4.1.6**.
- (2) Not less than two separate exits shall be provided on every story.
- (3) Not less than two separate exits shall be accessible from every part of every story.

**39.2.4.2** Exit access, as required by **39.2.4.1(3)**, shall be permitted to include a single exit access path for the distances permitted as common paths of travel by **39.2.5.3**.

## CHAPTER 38 • New

**38.2.4.3** A single exit shall be permitted for a room or area with a total occupant load of less than 100 persons, provided that all of the following criteria are met:

- (1) The exit shall discharge directly to the outside at the level of exit discharge for the building.
- (2) The total distance of travel from any point, including travel within the exit, shall not exceed 100 ft (30 m).
- (3) The total distance of travel specified in 38.2.4.3(2) shall be on the same story, or, if traversing of stairs is necessary, such stairs shall not exceed 15 ft (4570 mm) in height, and both of the following also shall apply:
  - (a) Interior stairs shall be provided with complete enclosures to separate them from any other part of the building, with no door openings therein.
  - (b) A single outside stair in accordance with 7.2.2 shall be permitted to serve all stories permitted within the 15 ft (4570 mm) vertical travel limitation.

**38.2.4.4** Any business occupancy three or fewer stories in height, and not exceeding an occupant load of 30 people per story, shall be permitted a single separate exit to each story, provided that all of the following criteria are met:

- (1) The exit shall discharge directly to the outside.
- (2) The total travel distance to the outside of the building shall not exceed 100 ft (30 m).
- (3) The exit shall be enclosed in accordance with 7.1.3.2, and both of the following also shall apply:
  - (a) The stair shall serve as an exit from no other stories.
  - (b) A single outside stair in accordance with 7.2.2 shall be permitted to service all stories.

**38.2.4.5** A single means of egress shall be permitted from a mezzanine within a business occupancy, provided that the common path of travel does not exceed 75 ft (23 m), or 100 ft (30 m) if protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1).

**38.2.4.6** A single means of egress shall be permitted for a maximum two-story, single-tenant space or building provided that both of the following criteria are met:

- (1) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1).
- (2) The total travel to the outside does not exceed 100 ft (30 m).

**39.2.4.3** A single exit shall be permitted for a room or area with a total occupant load of less than 100 persons, provided that all of the following criteria are met:

- (1) The exit shall discharge directly to the outside at the level of exit discharge for the building.
- (2) The total distance of travel from any point, including travel within the exit, shall not exceed 100 ft (30 m).
- (3) The total distance of travel specified in 39.2.4.3(2) shall be on the same story, or, if traversing of stairs is necessary, such stairs shall not exceed 15 ft (4570 mm) in height, and both of the following also shall apply:
  - (a) Interior stairs shall be provided with complete enclosures to separate them from any other part of the building, with no door openings therein.
  - (b) A single outside stair in accordance with 7.2.2 shall be permitted to serve all stories permitted within the 15 ft (4570 mm) vertical travel limitation.

**39.2.4.4** Any business occupancy three or fewer stories in height, and not exceeding an occupant load of 30 people per story, shall be permitted a single separate exit to each story, provided that all of the following criteria are met:

- (1) The exit shall discharge directly to the outside.
- (2) The total travel distance to the outside of the building shall not exceed 100 ft (30 m).
- (3) The exit shall be enclosed in accordance with 7.1.3.2, and both of the following also shall apply:
  - (a) The stair shall serve as an exit from no other stories.
  - (b) A single outside stair in accordance with 7.2.2 shall be permitted to service all stories.

**39.2.4.5** A single means of egress shall be permitted from a mezzanine within a business occupancy, provided that the common path of travel does not exceed 75 ft (23 m), or 100 ft (30 m) if protected throughout by an approved automatic sprinkler system in accordance with 9.7.1.1(1).

**39.2.4.6** A single means of egress shall be permitted for a maximum two-story, single-tenant space or building provided that both of the following criteria are met:

- (1) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1).
- (2) The total travel to the outside does not exceed 100 ft (30 m).

**39.2.4.7** A single exit shall be permitted for a single-tenant building three or fewer stories in height and not exceeding an occupant load of 15 people per story, provided that all of the following criteria are met:

- (1) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with

## CHAPTER 38 • New

Paragraph 38/39.2.4.1 requires a minimum of two exits. For new business occupancies, see 7.4.1.2, which requires a minimum of three means of egress or a minimum of four means of egress where the occupant load exceeds 500 or 1000, respectively.

The provisions of 38/39.2.4.1(2), which apply to the required number of exits for business occupancies, mandate that any level that constitutes a story must have at least two exits located on that story. The occupants of the story must be able to enter an exit (such as an enclosed exit stair on an upper floor of a multistory building) without having to travel to another story to reach the exit to the outside or the entrance to the exit enclosure. Because a mezzanine that meets the maximum one-third area rule of 8.6.10 does not constitute a story (see 8.6.10.2.1), two exits are not required on the mezzanine. However, the criteria of 38/39.2.4.1(3) must be met with respect to providing access to two separate exits, or the provisions for common path of travel in 38/39.2.4.2 or 38/39.2.4.5 must be met.

The provision for common path of travel in 38/39.2.4.2 applies only to 38/39.2.4.1(3), which requires access to two separate exits from every part of every story. Occupants are allowed to travel in one direction for a maximum distance (the common path allowance) before requiring exit access in two separate directions. Therefore, although access to two exits in accordance with 38/39.2.4.1(3) must eventually be provided, that access is required to be available only at the point where the allowable common path is expended.

Exhibit 38/39.8 and Exhibit 38/39.9 illustrate two cases where a single exit from a room or area in a business occupancy is permitted in accordance with 38/39.2.4.3. In the first case, the travel distance from the area is located on the same floor level as the exit. In the second case, stairs must be traversed.

To use the single-exit provision of 38/39.2.4.3, all five of the following criteria must be met:

1. Occupant load fewer than 100 persons
2. Direct exit to a street or to an open exterior area at ground level
3. Total distance of not more than 100 ft (30 m) from any point in the room to the exterior [note that this is total distance from any point to the exterior, not travel distance as measured in Section 7.6; therefore, total distance includes the distance traveled on enclosed stairs (exit)]
4. Stairs not more than 15 ft (4570 mm) in height

## CHAPTER 39 • Existing

- 9.7.1.1(1) and an automatic smoke-detection system in accordance with Section 9.6.
- (2) Activation of the building sprinkler or smoke detection system shall provide occupant notification throughout the building.
- (3) The total travel to the outside does not exceed 100 ft (30 m).

Exhibit 38/39.8

Single exit from area or room in business occupancy in accordance with 38/39.2.4.3 — travel from area to exit without stairs.

5. Stairs completely enclosed with no door openings between the stair enclosure and the rest of the building, or stairs meeting requirements applicable to outside stairs (see 7.2.2.6.3)

Exhibit 38/39.10 illustrates a single exit from the third floor of a business occupancy in accordance with 38/39.2.4.4. The stair is totally enclosed, has an opening onto a building floor only at the third floor, and discharges directly to the exterior with no openings at the second and first floors. A similar, but separate, arrangement could be provided for the second floor of the same building.

To use the single-exit provision of 38/39.2.4.4, all five of the following criteria must be met:

1. Building height not more than three stories
2. Occupant load of each floor served by the single exit not more than 30
3. Total distance from any point served by the single exit to exterior at ground level not more than 100 ft (30 m), including travel over stairs [note that this is total distance from any point to the exterior, not travel distance as measured in Section 7.6; therefore, total distance includes the distance traveled on enclosed stairs (exit)]
4. Stair fully enclosed with no openings to any other floor
5. Stair totally enclosed or meeting requirements applicable to outside stairs (see 7.2.2.6.3)

## CHAPTER 38 • New

## CHAPTER 39 • Existing

Exhibit 38/39.9

Single exit from area or room in business occupancy in accordance with 38/39.2.4.3 — stairs traversed in traveling from the area to the exit.

Exhibit 38/39.10

Single exit from third floor of a business occupancy in accordance with 38/39.2.4.4.

It is noted that, when referring to the single-exit stair, 38/39.2.4.3(3) uses the words “with no door openings therein,” and 38/39.2.4.4(3) uses the words “shall serve as an exit from no

other stories.” While the two provisions use different language, the intent is the same: no openings to other levels are permitted in the single-exit stair enclosure, regardless of whether it serves as an exit from the other levels or it is intended to be used for convenience only. The presence of doors in the enclosure, even if properly rated, introduces the potential for the single exit to be rendered unusable by a fire on another floor, thus trapping the occupants for which the single exit is intended.

Although 38/39.2.4.2 permits common access to the two required means of egress for limited distances, 38/39.2.4.5 exempts a mezzanine in a business occupancy from providing a point where access to two exits is available if the single means of egress leads to an exit within the same limited distances as those allowed for common path of travel.

The provision of 38/39.2.4.6 provides some relief from the requirement that mandates two separate exits on every story, which affects town house–type, sprinklered business occupancies. These town house–type business occupancies typically have two stories with an open interior stair and are of such limited size that, if a second stair were added, little usable space would remain, and the two stairs would, in effect, be located side by side. The provision offers any single-tenant space in a fully sprinklered building with a maximum of two stories, or any sprinklered single-tenant building with a maximum of two stories, the option of providing only one exit if the total travel distance to the outside does not exceed 100 ft (30 m). Note that a

## CHAPTER 38 • New

companion provision in 38/39.3.1.1(4) that addresses vertical opening protection permits the open interior stair in town house–style business occupancies.

The provision of 39.2.4.7 permits relatively small existing business occupancy buildings to have a single exit, provided that the following six items are met:

1. Building not more than three stories in height
2. Occupant load of each story not more than 15 persons
3. Building sprinklered in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*
4. Building provided with a complete smoke detection system in accordance with NFPA 72®, *National Fire Alarm and Signaling Code*<sup>3</sup>
5. Activation of sprinkler and smoke detection system provides occupant notification throughout
6. Travel distance to building exterior not greater than 100 ft (30 m)

It is the intent of 39.2.4.7 to permit the conversion of an existing residential dwelling with a single, open, interior stair, to a business occupancy and utilize the open, interior stair as the sole means of egress from the upper floors. The protection afforded by the required automatic sprinkler system and early notification provided by the complete smoke detection system should permit occupants on the upper floors to safely evacuate using the interior open stair. A companion provision in 39.3.1.1(4), which

### 38.2.5 Arrangement of Means of Egress.

**38.2.5.1** Means of egress shall be arranged in accordance with Section 7.5.

**38.2.5.2** Dead-end corridors shall be permitted in accordance with 38.2.5.2.1 or 38.2.5.2.2.

**38.2.5.2.1** In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1), dead-end corridors shall not exceed 50 ft (15 m).

**38.2.5.2.2** In buildings other than those complying with 38.2.5.2.1, dead-end corridors shall not exceed 20 ft (6100 mm).

**38.2.5.3** Limitations on common path of travel shall be in accordance with 38.2.5.3.1, 38.2.5.3.2, and 38.2.5.3.3.

## CHAPTER 39 • Existing

addresses vertical opening protection, permits stairs in buildings complying with 39.2.4.7 to remain unenclosed. It is noted that, in accordance with Chapter 43, a change of occupancy classification from a residential occupancy to a business occupancy requires compliance with Chapter 39 (see 43.7.2).

Exhibit 38/39.11 depicts a former residential dwelling that has been converted into a business occupancy on a medical center campus.

Exhibit 38/39.11

Former residential dwelling converted into a business occupancy.

### 39.2.5 Arrangement of Means of Egress.

**39.2.5.1** Means of egress shall be arranged in accordance with Section 7.5.

**39.2.5.2\*** Dead-end corridors shall not exceed 50 ft (15 m).

**A.39.2.5.2** It is recognized that dead ends exceeding the permitted limits exist and, in some cases, are impractical to eliminate. The authority having jurisdiction might permit such dead ends to continue to exist, taking into consideration any or all of the following:

- (1) Tenant arrangement
- (2) Automatic sprinkler protection
- (3) Smoke detection
- (4) Exit remoteness

**39.2.5.3\*** Limitations on common path of travel shall be in accordance with 39.2.5.3.1, 39.2.5.3.2, and 39.2.5.3.3.

## CHAPTER 38 • New

**38.2.5.3.1** Common path of travel shall not exceed 100 ft (30 m) in a building protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1).

**38.2.5.3.2** Common path of travel shall not exceed 100 ft (30 m) within a single tenant space having an occupant load not exceeding 30 persons.

**38.2.5.3.3** In buildings other than those complying with 38.2.5.3.1 or 38.2.5.3.2, common path of travel shall not exceed 75 ft (23 m).

Because they have separate and distinct requirements, the Code separates dead-end corridors and common path of travel into distinct and separate subsections. Dead-end corridors are limited to 20 ft (6100 mm) in new business occupancies that are not protected throughout by an approved, supervised automatic sprinkler system. The provision of 38.2.5.2.1 recognizes the additional level of safety to life that a complete automatic sprinkler system provides; it, therefore, allows added flexibility when designing the location of corridors and exits in buildings where approved sprinkler systems are installed by permitting the dead-end corridor pocket to be as long as 50 ft (15 m). Existing business occupancies are permitted a 50 ft (15 m) dead-end corridor, regardless of the presence of sprinklers.

Three typical dead-end corridors are illustrated in Exhibit 38/39.12. Dead-end pockets are located in the corridor between points B and C, F and G, and H and I. They are limited to a maximum length of 20 ft (6100 mm) [50 ft (15 m) for existing business occupancies or sprinklered new business occupancies].

See the commentary associated with A.7.5.1.5 for a detailed discussion on common path of travel. Also see the commentary associated with 38/39.2.4.2, following 38.2.4.6 and 39.2.4.7, which permits a portion of the access to a single exit or multiple exits to be common.

The restriction on common path of travel is separate and distinct from the restriction on dead-end corridors. A common path of travel might sometimes involve a dead-end corridor, and dead ends might involve common path of travel, but not in every case. For example, the elevator lobby shown in Exhibit 38/39.12 is a dead-end corridor but not a common path of travel.

## CHAPTER 39 • Existing

**A.39.2.5.3** It is recognized that common paths of travel exceeding the permitted limits exist and, in some cases, are impractical to eliminate. The authority having jurisdiction might permit such common paths of travel to continue to exist, taking into consideration any or all of the following:

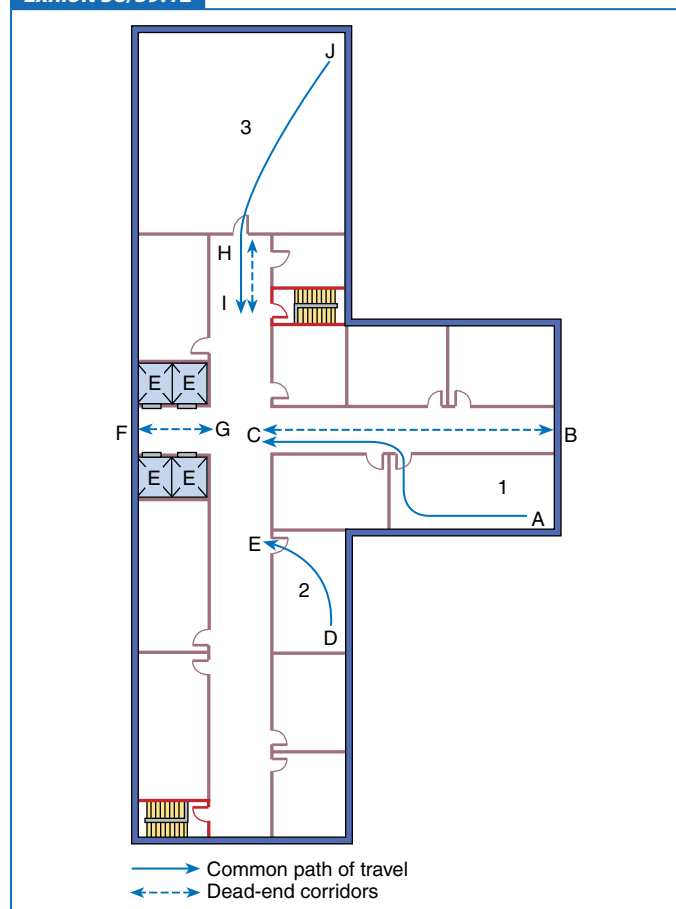

- (1) Tenant arrangement
- (2) Automatic sprinkler protection
- (3) Smoke detection
- (4) Exit remoteness

**39.2.5.3.1** Common path of travel shall not exceed 100 ft (30 m) on a story protected throughout by an approved automatic sprinkler system in accordance with 9.7.1.1(1).

**39.2.5.3.2** Common path of travel shall not be limited in a single-tenant space with an occupant load not exceeding 30 people.

**39.2.5.3.3** In buildings other than those complying with 39.2.5.3.1 or 39.2.5.3.2, common path of travel shall not exceed 75 ft (23 m).

Exhibit 38/39.12

Dead-end corridor pockets and common paths of travel.

## CHAPTER 38 • New

The method for measuring common path of travel is similar to that for measuring travel distance (see [Section 7.6](#)). The starting point for measurement of common path of travel is the same as the starting point for travel distance measurement — the most remote point of any occupiable area. The difference is that, instead of terminating at the entrance to an exit, common path of travel measurement often ends before the exit, because it terminates at the point where the occupant has a choice of two distinct and separate paths to an exit (see the definition of the term *common path of travel* in [3.3.47](#)). See rooms 1, 2, and 3 in [Exhibit 38/39.12](#), where common paths of travel occur between points A and C, D and E, and J and I.

The provision of [38/39.2.5.3.1](#) permits the common path of travel to be extended from 75 ft (23 m) to 100 ft (30 m) if sprinklers are provided. For new business occupancies, the building must be protected throughout by an approved, supervised automatic sprinkler system to utilize the provision for increased common path of travel; for existing business occupancies, the sprinkler system is not required to be supervised and is not required to protect the entire building but only the floor on which the increased common path is located. This provision recognizes the additional level of safety to life that automatic sprinkler protection provides and allows added flexibility when designing the location of corridors and exits in buildings where approved sprinkler systems are installed.

The provision of [38.2.5.3.2](#) permits common path of travel in a new business occupancy to be extended from 75 ft (23 m) to 100 ft (30 m), without requiring the sprinkler protection addressed in [38.2.5.3.1](#), provided that the common path of travel occurs wholly within a maximum 30-person [normally, approximately 3000 ft<sup>2</sup> (279 m<sup>2</sup>), based on the business occupant load factor of 100 ft<sup>2</sup> (9.3 m<sup>2</sup>) per person] single-tenant space, with no additional common path encountered once the common space, such as the corridor, is reached. In [Exhibit 38/39.12](#), [38.2.5.3.2](#) could be applied to room 2 but not to room 1 or room 3, because, upon leaving those rooms, additional common path of travel is encountered within the corridor.

The criterion in [39.2.5.3.2](#) exempts a single-tenant space with a maximum occupant load of not more than 30 people from the common path of travel requirement. The tenant space would normally have an area of approximately 3000 ft<sup>2</sup> (279 m<sup>2</sup>), based on the business occupant load factor of 100 ft<sup>2</sup> (9.3 m<sup>2</sup>) per person. This provision can be used only if the single door from that tenant space leads to a corridor that does not have a dead end in excess of 50 ft (15 m) in accordance with [39.2.5.2](#).

[Exhibit 38/39.13](#) shows additional examples of common paths of travel in a business occupancy. Also see the commentary associated with [Section 7.5](#) on arrangement of means of egress.

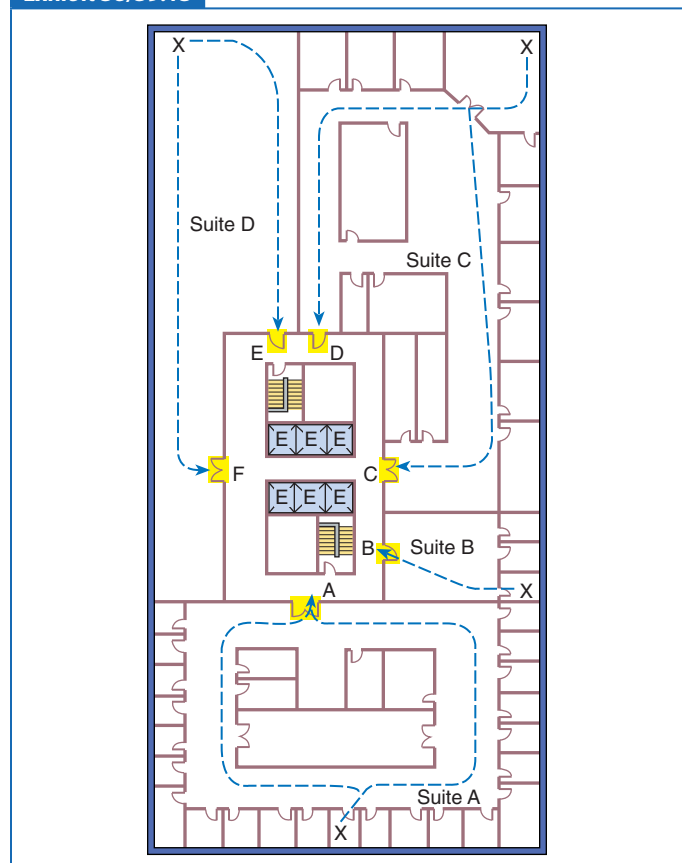

In suite A of [Exhibit 38/39.13](#), the travel from point X to point A is a common path of travel; although there are two routes

## CHAPTER 39 • Existing

to reach the main corridor, they both merge at common point A. In suite B, the travel from point X to point B is common path of travel and does not appear to exceed the 75 ft (23 m) maximum; if it were in excess of 75 ft (23 m) but not more than 100 ft (30 m), it would be permitted by either [38/39.2.5.3.1](#) (involving sprinkler protection) or [38/39.2.5.3.2](#) (involving single-tenant space). Although suites C and D do not have common paths of travel, the remoteness of the two exit access doors from each suite is questionable. See [7.5.1.3](#) for details on means of egress remoteness.

The common path of travel restriction regulates where an office space requires two exit access doors. If the common path of travel is exceeded, a second door from the office space is required. The door must be positioned so that any resulting common path of travel complies with the allowable distances. In addition, the second door must be remotely located from the first door (see [7.5.1.3](#)), and each door must lead to remote exits by means of remote paths. Therefore, in a single requirement, the *Code* regulates not only the number of exit access doors required from an office area but also the arrangement of those doors.

Exhibit 38/39.13

Common path of travel.

## CHAPTER 38 • New

**38.2.6 Travel Distance to Exits.** Travel distance shall comply with 38.2.6.1 through 38.2.6.3.

**38.2.6.1** Travel distance shall be measured in accordance with Section 7.6.

**38.2.6.2** Travel distance to an exit shall not exceed 200 ft (61 m) from any point in a building, unless otherwise permitted by 38.2.6.3.

**38.2.6.3** Travel distance shall not exceed 300 ft (91 m) in business occupancies protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.

**38.2.7 Discharge from Exits.** Exit discharge shall comply with Section 7.7.

**38.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with Section 7.8.

### 38.2.9 Emergency Lighting.

**38.2.9.1** Emergency lighting shall be provided in accordance with Section 7.9 in any building where any one of the following conditions exists:

- (1) The building is three or more stories in height.
- (2) The occupancy is subject to 50 or more occupants above or below the level of exit discharge.
- (3) The occupancy is subject to 300 or more total occupants.

**38.2.9.2** Emergency lighting in accordance with Section 7.9 shall be provided for all underground and limited access structures, as defined in 3.3.272.11 and 3.3.272.3, respectively.

**38.2.10 Marking of Means of Egress.** Means of egress shall have signs in accordance with Section 7.10.

### 38.2.11 Special Means of Egress Features.

#### 38.2.11.1 Reserved.

**38.2.11.2 Lockups.** Lockups in business occupancies shall comply with the requirements of 22.4.5.

Subsection 38/39.2.6 addresses travel distance. In accordance with Section 7.6, travel distance limits apply to only the first (or nearest) exit from a given point in a building. In other words, the 200 ft (61 m) travel distance limit requires that at least one exit is to be located within 200 ft (61 m) of any point in the building; it does not require that all exits be within 200 ft (61 m) of any point in the building.

The provision of 38/39.2.6.3 permits the travel distance to be increased to 300 ft (91 m) if the building is protected

## CHAPTER 39 • Existing

**39.2.6 Travel Distance to Exits.** Travel distance shall comply with 39.2.6.1 through 39.2.6.3.

**39.2.6.1** Travel distance shall be measured in accordance with Section 7.6.

**39.2.6.2** Travel distance to an exit shall not exceed 200 ft (61 m) from any point in a building, unless otherwise permitted by 39.2.6.3.

**39.2.6.3** Travel distance shall not exceed 300 ft (91 m) in business occupancies protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.

**39.2.7 Discharge from Exits.** Exit discharge shall comply with Section 7.7.

**39.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with Section 7.8.

### 39.2.9 Emergency Lighting.

**39.2.9.1** Emergency lighting shall be provided in accordance with Section 7.9 in any building where any one of the following conditions exists:

- (1) The building is three or more stories in height.
- (2) The occupancy is subject to 100 or more occupants above or below the level of exit discharge.
- (3) The occupancy is subject to 1000 or more total occupants.

**39.2.9.2** Emergency lighting in accordance with Section 7.9 shall be provided for all underground and limited access structures, as defined in 3.3.272.11 and 3.3.272.3, respectively.

**39.2.10 Marking of Means of Egress.** Means of egress shall have signs in accordance with Section 7.10.

### 39.2.11 Special Means of Egress Features.

#### 39.2.11.1 Reserved.

**39.2.11.2 Lockups.** Lockups in business occupancies, other than approved existing lockups, shall comply with the requirements of 23.4.5.

throughout by an approved, electrically supervised automatic sprinkler system. This provision recognizes the additional level of safety to life that a complete automatic sprinkler system provides and allows added flexibility in the design and arrangement of the means of egress.

If any of the three conditions of 38/39.2.9.1 exists, emergency lighting as specified in Section 7.9 is required for the business occupancy. Note that the thresholds for fire alarm systems in business occupancies are the same as those for emergency

## CHAPTER 38 • New

lighting (see 38/39.3.4.1). If a business occupancy is required to be provided with emergency lighting, a fire alarm system is also required.

If a business occupancy is provided with a lockup for security purposes, it must meet the provisions of 22/23.4.5, as specified in 38/39.2.11.2. The lockup criteria require the application of

## 38.3 Protection

### 38.3.1 Protection of Vertical Openings.

**38.3.1.1** Vertical openings shall be enclosed or protected in accordance with Section 8.6, unless otherwise permitted by any of the following:

- (1) Unenclosed vertical openings in accordance with 8.6.9.1 shall be permitted.
- (2) Unenclosed vertical openings in accordance with 8.6.9.2 shall be permitted and the provisions of 8.6.9.2(5) shall not apply.
- (3) Unenclosed vertical openings in accordance with 8.6.9.7 shall be permitted and the number of contiguous stories shall not be limited.
- (4) Exit access stairs in accordance with 38.2.4.6 shall be permitted to be unenclosed.

**38.3.1.2** Floors that are below the street floor and are used for storage or other than a business occupancy shall have no unprotected openings to business occupancy floors.

The provisions for vertical openings in 38/39.3.1.1 reference Section 8.6. Paragraph 8.6.6 permits the maximum three-story communicating space (sometimes referred to as a “mini-atrium”), unless there is a prohibition on such use in the applicable occupancy chapter. Neither Chapter 38 nor Chapter 39 prohibits the use of 8.6.6. Note that 8.6.6(5) requires the communicating space (the vertical opening and all areas open to it) to contain only low hazard contents, unless it is protected by automatic sprinklers. In accordance with 38/39.1.5, contents within business occupancies are typically classified as ordinary hazard.

## CHAPTER 39 • Existing

some of the concepts of detention and correctional occupancies to other occupancies where persons might be detained for security purposes, without classifying the lockup as a detention and correctional occupancy. See 22/23.4.5 and related commentary for details on the lockup provisions.

## 39.3 Protection

### 39.3.1 Protection of Vertical Openings.

**39.3.1.1** Vertical openings shall be enclosed or protected in accordance with Section 8.6, unless otherwise permitted by any of the following:

- (1) Unenclosed vertical openings in accordance with 8.6.9.1 shall be permitted.
- (2) Unenclosed vertical openings in accordance with 8.6.9.2(5) shall be permitted.
- (3) Unenclosed vertical openings in accordance with 8.6.9.7 shall be permitted.
- (4) Exit access stairs in accordance with 39.2.4.6 or 39.2.4.7 shall be permitted to be unenclosed.
- (5) Unprotected vertical openings shall be permitted in buildings complying with all of the following:
  - (a) Where protected throughout by an approved automatic sprinkler system in accordance with 9.7.1.1(1)
  - (b) Where no unprotected vertical opening serves as any part of any required means of egress
  - (c) Where required exits consist of exit doors that discharge directly to the finished ground level in accordance with 7.2.1, outside stairs in accordance with 7.2.2, smoke-proof enclosures in accordance with 7.2.3, or horizontal exits in accordance with 7.2.4

**39.3.1.2** Floors that are below the street floor and are used for storage or other than a business occupancy shall have no unprotected openings to business occupancy floors.

The provision of 38/39.3.1.1(1) — via its reference to 8.6.9.1 — permits, for example, a two-level office or a reference library in an office building to have an unenclosed convenience stair.

New to the 2015 edition of the Code, the provision of 38/39.3.1.1(2) — via its reference to 8.6.9.2 — permits a convenience stair to be protected by draftstops and closely-spaced sprinklers as detailed in NFPA 13, *Standard for the Installation of Sprinkler Systems*, in lieu of enclosure by fire barriers. By exempting 8.6.9.2(5), the convenience stair is permitted to be open to an unlimited number of stories in both new and existing buildings.

## CHAPTER 38 • New

Also new to the 2015 edition of the *Code*, 38.3.1.1(3) permits escalator openings to be protected by the same sprinkler-draftstop method described in the previous paragraph, regardless of the number of stories exposed to the vertical opening.

The provision of 38/39.3.1.1(4) completes the single-exit package for town house-type and similarly arranged business occupancies by permitting the single means of egress to include an unenclosed stair. See the commentary that follows 38.2.4.6 and 39.2.4.7.

Application of 39.3.1.1(5), which permits existing, unprotected vertical openings in existing business occupancies, requires not only that the building housing the existing business occupancy be protected with complete automatic sprinkler

### 38.3.2 Protection from Hazards.

**38.3.2.1\* General.** Hazardous areas including, but not limited to, areas used for general storage, boiler or furnace rooms, and maintenance shops that include woodworking and painting areas shall be protected in accordance with Section 8.7.

**A.38.3.2.1** It is not the intent of this provision that rooms inside individual tenant spaces that are used to store routine office supplies for that tenant be required to be either separated or sprinklered.

**38.3.2.2\* High Hazard Contents Areas.** High hazard contents areas, as classified in Section 6.2, shall meet all of the following criteria:

- (1) The area shall be separated from other parts of the building by fire barriers having a minimum 1-hour fire resistance rating, with all openings therein protected by self-closing fire door assemblies having a minimum ¾-hour fire protection rating.
- (2) The area shall be protected by an automatic extinguishing system in accordance with 9.7.1.1(1) or 9.7.1.2.

**A.38.3.2.2** The requirement for separating high hazard contents areas from other parts of the building is intended to isolate the hazard, and 8.2.3.3 is applicable.

**38.3.2.3\* Commercial Cooking Operations.** Commercial cooking operations shall be protected in accordance with 9.2.3, unless the cooking equipment is one of the following types:

- (1) Outdoor equipment
- (2) Equipment used only for food warming

**A.38.3.2.3** It is not the intent to prohibit the use of equipment that is used less frequently and does not produce significant grease-laden vapors such as that equipment used for cooking demonstrations.

## CHAPTER 39 • Existing

protection, but also that all building exits be either smokeproof enclosures, outside stairs, horizontal exits, or doors leading directly to the outside at ground level. Otherwise, the unprotected vertical openings must be suitably enclosed.

The separation requirement of 38/39.3.1.2 prevents the possibility that a fire in a basement housing a hazardous area with a high fuel load (such as areas used for workshops, repairs, or storage of maintenance supplies, files, and records) might directly expose the floor of exit discharge through an unprotected vertical opening. A fire in a basement can quickly cause exits and exit discharges located on the street floor to become unusable when smoke and heat rise.

### 39.3.2 Protection from Hazards.

**39.3.2.1\* General.** Hazardous areas including, but not limited to, areas used for general storage, boiler or furnace rooms, and maintenance shops that include woodworking and painting areas shall be protected in accordance with Section 8.7.

**A.39.3.2.1** It is not the intent of this provision that rooms inside individual tenant spaces that are used to store routine office supplies for that tenant be required to be separated or sprinklered.

**39.3.2.2\* High Hazard Contents Areas.** High hazard contents areas, as classified in Section 6.2, shall meet all of the following criteria:

- (1) The area shall be separated from other parts of the building by fire barriers having a minimum 1-hour fire resistance rating, with all openings therein protected by self-closing fire door assemblies having a minimum ¾-hour fire protection rating.
- (2) The area shall be protected by an automatic extinguishing system in accordance with 9.7.1.1(1) or 9.7.1.2.

**A.39.3.2.2** The requirement for separating high hazard contents areas from other parts of the building is intended to isolate the hazard, and 8.2.3.3 is applicable.

**39.3.2.3\* Commercial Cooking Operations.** Commercial cooking operations shall be protected in accordance with 9.2.3, unless the cooking equipment is one of the following types:

- (1) Outdoor equipment
- (2) Equipment used only for food warming

**A.39.3.2.3** It is not the intent to prohibit the use of equipment that is used less frequently and does not produce significant grease-laden vapors such as that equipment used for cooking demonstrations.

## CHAPTER 38 • New

The provisions of 38/39.3.2 reflect the intent of Section 8.7, which requires one of the following:

1. Separation of a hazardous area from the remainder of the occupancy by means of fire-rated construction
2. Installation of automatic sprinklers in the hazardous area
3. Protection by both items 1 and 2 where the hazard is severe

### 38.3.3 Interior Finish.

**38.3.3.1 General.** Interior finish shall be in accordance with Section 10.2.

#### 38.3.3.2 Interior Wall and Ceiling Finish.

**38.3.3.2.1** Interior wall and ceiling finish material complying with Section 10.2 shall be Class A or Class B in exits and in exit access corridors.

**38.3.3.2.2** Interior wall and ceiling finishes shall be Class A, Class B, or Class C in areas other than those specified in 38.3.3.2.1.

#### 38.3.3.3 Interior Floor Finish.

**38.3.3.3.1** Interior floor finish shall comply with Section 10.2.

**38.3.3.3.2** Interior floor finish in exit enclosures shall be Class I or Class II.

**38.3.3.3.3** Interior floor finish shall comply with 10.2.7.1 or 10.2.7.2, as applicable.

The requirement that interior floor finish be Class I or Class II (see Section 10.2) applies only to exits, such as enclosed stairs, in new business occupancies. The intent is that the interior floor finish materials used in exits are to resist the spread of fire if exposed to the radiant energy from a fully developed room fire by means of an open door. The provision of 10.2.8.2 permits a reduction of one class of interior floor finish (i.e., from Class I to Class II, or from Class II to no classification required) in sprinklered buildings.

### 38.3.4 Detection, Alarm, and Communications Systems.

**38.3.4.1 General.** A fire alarm system in accordance with Section 9.6 shall be provided in all business occupancies where any one of the following conditions exists:

- (1) The building is three or more stories in height.
- (2) The occupancy is subject to 50 or more occupants above or below the level of exit discharge.
- (3) The occupancy is subject to 300 or more total occupants.

## CHAPTER 39 • Existing

Where a new hazardous area in a business occupancy is protected by automatic sprinklers, that area is required to be enclosed by walls and doors meeting the requirements for smoke partitions in Section 8.4. See 8.7.1.2.

### 39.3.3 Interior Finish.

**39.3.3.1 General.** Interior finish shall be in accordance with Section 10.2.

#### 39.3.3.2 Interior Wall and Ceiling Finish.

**39.3.3.2.1** Interior wall and ceiling finish materials complying with Section 10.2 shall be Class A or Class B in exits and in exit access corridors.

**39.3.3.2.2** Interior wall and ceiling finishes shall be Class A, Class B, or Class C in areas other than those specified in 39.3.3.2.1.

#### 39.3.3.3 Interior Floor Finish. (No requirements.)

In all cases, regardless of sprinkler protection, new carpet and carpetlike floor finishes must comply with ASTM D 2859, *Standard Test Method for Ignition Characteristics of Finished Textile Floor Covering Materials*,<sup>4</sup> as referenced in 10.2.7.1 via 38.3.3.3.3. Other floor finish materials must have a minimum critical radiant flux of 0.1 W/cm<sup>2</sup> per 10.2.7.2. Existing business occupancies have no interior floor finish requirements (see 39.3.3.3).

### 39.3.4 Detection, Alarm, and Communications Systems.

**39.3.4.1 General.** A fire alarm system in accordance with Section 9.6 shall be provided in all business occupancies where any one of the following conditions exists:

- (1) The building is three or more stories in height.
- (2) The occupancy is subject to 100 or more occupants above or below the level of exit discharge.
- (3) The occupancy is subject to 1000 or more total occupants.

## CHAPTER 38 • New

**38.3.4.2 Initiation.** Initiation of the required fire alarm system shall be by any one of the following means:

- (1) Manual means in accordance with 9.6.2.1(1)
- (2) Approved automatic fire detection system in accordance with 9.6.2.1(2) that provides protection throughout the building and the provision of 9.6.2.6 shall apply.
- (3) Approved automatic sprinkler system in accordance with 9.6.2.1(3) that provides protection throughout the building and the provision of 9.6.2.6 shall apply.

**38.3.4.3 Occupant Notification.** During all times that the building is occupied (see 7.2.1.1.3), the required fire alarm system, once initiated, shall perform one of the following functions:

- (1) It shall activate a general alarm in accordance with 9.6.3.
- (2) A positive alarm sequence in accordance with 9.6.3.4 shall be permitted.

**38.3.4.4 Emergency Forces Notification.** Emergency forces notification shall be provided and shall include notifying both of the following:

- (1) Fire department in accordance with 9.6.4
- (2) Approved local emergency organization, if provided

A fire alarm system is required in a business occupancy under the same conditions as those under which emergency lighting is required (see 38/39.2.9.1). If any one of the three conditions of 38/39.3.4.1 exists, a fire alarm system must be provided.

A required fire alarm system must have initiation means per 38/39.3.4.2, but the requirement for manual fire alarm boxes is waived if the system is initiated by either an automatic fire detection system providing protection throughout the building or an automatic sprinkler system providing protection throughout the building. This waiver does not exempt the fire alarm system but only the manual fire alarm boxes. Note that 9.6.2.6 requires at least one manual fire alarm box to be provided at a location acceptable to the authority having jurisdiction.

When the required fire alarm system is initiated by one of the means specified in 38/39.3.4.2, the system must automatically sound a general alarm throughout the building. In existing business occupancies, if a continuously attended location is provided (as is often the case in high-rise or other large office buildings), the alarm is permitted to sound at that location only, with

## CHAPTER 39 • Existing

**39.3.4.2 Initiation.** Initiation of the required fire alarm system shall be by one of the following means:

- (1) Manual means in accordance with 9.6.2.1(1)
- (2) Approved automatic fire detection system in accordance with 9.6.2.1(2) that provides protection throughout the building and the provision of 9.6.2.6 shall apply.
- (3) Approved automatic sprinkler system in accordance with 9.6.2.1(3) that provides protection throughout the building and the provision of 9.6.2.6 shall apply.

**39.3.4.3 Occupant Notification.** During all times that the building is occupied (see 7.2.1.1.3), the required fire alarm system, once initiated, shall perform one of the following functions:

- (1) It shall activate a general alarm in accordance with 9.6.3 and both of the following also shall apply:
  - (a) Positive alarm sequence in accordance with 9.6.3.4 shall be permitted.
  - (b) A presignal system in accordance with 9.6.3.3 shall be permitted.
- (2) Occupant notification shall be permitted to be made via a voice communication or public address system in accordance with 9.6.3.9.2.

**39.3.4.4 Emergency Forces Notification.** Emergency forces notification shall be accomplished in accordance with 9.6.4 when the existing fire alarm system is replaced.

the appropriate emergency action initiated at that location by using a voice communication or public address system (see 9.6.3.9.2). See 38/39.3.4.3 for details on occupant notification requirements.

Presignal systems are permitted in existing business occupancies only where such systems already exist [see 39.3.4.3(1)(b)]; where presignal systems are used, the fire department must be notified automatically, without delay, in case of a delay in notifying, or failure to notify, the building occupants. The superior fail-safe system — positive alarm sequence — is permitted for both new and existing business occupancies. See 9.6.3.3, 9.6.3.4, and *NFPA 72, National Fire Alarm and Signaling Code*, for details on presignal and positive alarm sequence systems.

The provision of 38.3.4.4 requires automatic emergency forces notification in accordance with 9.6.4 for all new business occupancies that are required to be provided with a fire alarm system, and all existing business occupancies when an existing, required fire alarm system is replaced.

## CHAPTER 38 • New

**38.3.5 Extinguishment Requirements.** Portable fire extinguishers shall be provided in every business occupancy in accordance with [Section 9.9](#).

Although no requirements for automatic sprinkler systems are provided in [38/39.3.5](#), [38.4.2](#) has the effect of requiring new high-rise office buildings to be protected by automatic sprinklers, because [Section 11.8](#) requires sprinklers. Also, if the atrium provisions of [8.6.7](#) are used, a sprinkler system is required throughout the building. The following features provide additional incentives to encourage the installation of automatic sprinkler systems:

1. Nonrated openings to attached parking structures ([38/39.1.3.2.2](#))
2. Elevator lobby exit access door locking ([38/39.2.2.2.3](#))
3. Delayed-egress locks ([38/39.2.2.2.5](#))

### 38.3.6 Corridors.

**38.3.6.1\*** Where access to exits is provided by corridors, such corridors shall be separated from use areas by fire barriers in accordance with [Section 8.3](#) having a minimum 1-hour fire resistance rating, unless one of the following conditions exists:

- (1)\* Where exits are available from an open floor area
- (2)\* Within a space occupied by a single tenant
- (3) Within buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with [9.7.1.1\(1\)](#)

**A.38.3.6.1** The intent of [38.3.6\(1\)](#) through (3) is to permit spaces to be open to the exit access corridor without separation.

**A.38.3.6.1(1)** Where exits are available from an open floor area, such as open plan buildings, corridors are not required to be separated. An example of an open plan building is a building in which the work spaces and accesses to exits are delineated by the use of tables, desks, bookcases, or counters, or by partitions that are less than floor-to-ceiling height.

**A.38.3.6.1(2)** It is the intent of this provision that a single tenant be limited to an area occupied under a single management and work the same hours. The concept is that people under the same employ working the same hours would likely be familiar with their entire tenant space. It is not the intent to apply this provision simply because tenants are owned by the same organization. For example, in a government-owned office building, the offices of different federal agencies would be considered multiple tenants, because an employee normally works for one agency. The agencies might work various hours. Another example of multiple tenancy would be a classroom building of a university, because some classrooms might be in use at times when other classrooms are not being used.

## CHAPTER 39 • Existing

**39.3.5 Extinguishment Requirements.** Portable fire extinguishers shall be provided in every business occupancy in accordance with [Section 9.9](#).

4. Stories constituting areas of refuge ([38/39.2.2.12](#))
5. Number of means of egress ([38/39.2.4](#))
6. Dead-end corridors ([38/39.2.5.2](#))
7. Common path of travel ([38/39.2.5.3](#))
8. Travel distance to exits ([38/39.2.6](#))
9. Discharge of exits through interior building areas ([38/39.2.7](#) per [Section 7.7](#))
10. Protection from hazards ([38/39.3.2](#))
11. Interior finish ([38/39.3.3](#) per [Section 10.2](#))
12. Elimination of initiation by means of manual fire alarm boxes ([38/39.3.4.2](#))
13. Nonrated corridors ([38.3.6.1](#))

**39.3.6 Corridors.** (No requirements.)

## CHAPTER 38 • New

**38.3.6.2** Openings in corridor walls required by **38.3.6.1** to have a fire resistance rating shall be protected in accordance with **Section 8.3**.

Corridors in new business occupancies are addressed in **38.3.6**; no corridor requirements are specified for existing business occupancies.

The provision of **38.3.6.1(1)** provides for the popular “office landscape” or “open office” arrangement. If there is direct access to exits from the open area, it is not necessary to provide corridors. This provision recognizes that a fire in an open space is subject to more rapid observation and response than a fire in an enclosed room or office.

The provision of **38.3.6.1(2)** recognizes that, in areas occupied by a single tenant, there is a high level of familiarity with the area, and the same people occupy the partitioned offices or

**38.3.7 Subdivision of Building Spaces.** (No special requirements.)

---

## 38.4 Special Provisions

**38.4.1 Limited Access or Underground Buildings.** See **Section 11.7**.

**38.4.2 High-Rise Buildings.** High-rise buildings shall comply with **Section 11.8**.

## CHAPTER 39 • Existing

spaces on a regular basis. Such spaces are exempt from corridor separation requirements.

The provision of **38.3.6.1(3)** recognizes the value of automatic sprinklers as a life safety feature that helps to control fire growth and, thus, maintains the exit access usable for a longer time. Such sprinklered business occupancies are exempt from all corridor requirements.

If any of the exemptions for rated corridors in business occupancies are utilized, there is no need to provide a smoke-resistant barrier between the corridor and the adjoining rooms, as is required for some other occupancies (see, for example, health care, **18/19.3.6**).

**39.3.7 Subdivision of Building Spaces.** (No special requirements.)

---

## 39.4 Special Provisions

**39.4.1 Limited Access or Underground Buildings.** See **Section 11.7**.

**39.4.2 High-Rise Buildings.**

**39.4.2.1** All high-rise business occupancy buildings shall be provided with a reasonable degree of safety from fire, and such degree of safety shall be accomplished by one of the following means:

- (1) Installation of a complete, approved, supervised automatic sprinkler system in accordance with **9.7.1.1(1)**
- (2) Installation of an engineered life safety system complying with all of the following:
  - (a) The engineered life safety system shall be developed by a registered professional engineer experienced in fire and life safety systems design.
  - (b) The life safety system shall be approved by the authority having jurisdiction and shall be permitted to include any or all of the following systems:
    - i. Partial automatic sprinkler protection
    - ii. Smoke detection alarms
    - iii. Smoke control
    - iv. Compartmentation
    - v. Other approved systems

**39.4.2.2\*** A limited, but reasonable, time shall be permitted for compliance with any part of **39.4.2.1**, commensurate with the magnitude of expenditure and the disruption of services.

## CHAPTER 38 • New

**38.4.3 Air Traffic Control Towers.**

**38.4.3.1** Air traffic control towers shall comply with the requirements of this chapter and [Section 11.3](#).

**38.4.3.2** The requirements of [Section 11.8](#) shall not apply to air traffic control towers.

**38.4.4 Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers in accordance with [8.7.3.3](#) shall be permitted.

The provision of [38/39.4.4](#) is new to the 2015 edition of the *Code*. It recognizes the use of alcohol-based hand-rub (ABHR) dis-

---

**38.5 Building Services**

**38.5.1 Utilities.** Utilities shall comply with the provisions of [Section 9.1](#).

**38.5.2 Heating, Ventilating, and Air-Conditioning.** Heating, ventilating, and air-conditioning equipment shall comply with the provisions of [Section 9.2](#).

**38.5.3 Elevators, Escalators, and Conveyors.** Elevators, escalators, and conveyors shall comply with the provisions of [Section 9.4](#).

**38.5.4 Waste Chutes, Incinerators, and Laundry Chutes.** Waste chutes, incinerators, and laundry chutes shall comply with the provisions of [Section 9.5](#).

---

**38.6 Reserved**

---

**38.7 Operating Features**

**38.7.1 Emergency Action Plans.** Emergency action plans complying with [Section 4.8](#) shall be provided in high-rise buildings.

## CHAPTER 39 • Existing

**A.39.4.2.2** In some cases, appreciable cost might be involved in bringing an existing occupancy into compliance. Where this is true, it would be appropriate for the authority having jurisdiction to prescribe a schedule determined jointly with the facility, allowing suitable periods of time for the correction of the various deficiencies and giving due weight to the ability of the owner to secure the necessary funds.

**39.4.2.3** In addition to the requirements of [39.4.2.1](#) and [39.4.2.2](#), all buildings, regardless of height, shall comply with all other applicable provisions of this chapter.

**39.4.3 Air Traffic Control Towers.**

**39.4.3.1** Air traffic control towers shall comply with the requirements of this chapter and [Section 11.3](#).

**39.4.3.2** The requirements of [Section 11.8](#) shall not apply to air traffic control towers.

**39.4.4 Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers in accordance with [8.7.3.3](#) shall be permitted.

pensers in business occupancies, provided that the detailed criteria of [8.7.3.3](#) are met.

---

**39.5 Building Services**

**39.5.1 Utilities.** Utilities shall comply with the provisions of [Section 9.1](#).

**39.5.2 Heating, Ventilating, and Air-Conditioning.** Heating, ventilating, and air-conditioning equipment shall comply with the provisions of [Section 9.2](#).

**39.5.3 Elevators, Escalators, and Conveyors.** Elevators, escalators, and conveyors shall comply with the provisions of [Section 9.4](#).

**39.5.4 Waste Chutes, Incinerators, and Laundry Chutes.** Waste chutes, incinerators, and laundry chutes shall comply with the provisions of [Section 9.5](#).

---

**39.6 Reserved**

---

**39.7 Operating Features**

**39.7.1 Emergency Action Plans.** Emergency action plans complying with [Section 4.8](#) shall be provided in high-rise buildings.

## CHAPTER 38 • New

**38.7.2 Drills.** In all business occupancy buildings occupied by more than 500 persons, or by more than 100 persons above or below the street level, employees and supervisory personnel shall be periodically instructed in accordance with [Section 4.7](#) and shall hold drills periodically where practicable.

**38.7.3 Extinguisher Training.** Designated employees of business occupancies shall be periodically instructed in the use of portable fire extinguishers.

**38.7.4 Food Service Operations.** Food service operations shall comply with [12.7.2](#).

**38.7.5 Upholstered Furniture and Mattresses.** The provisions of [10.3.2](#) shall not apply to upholstered furniture and mattresses.

**38.7.6 Soiled Linen and Trash Receptacles.** The requirements of [10.3.9](#) for containers for waste, or linen with a capacity of 20 gal (75.7 L) or more shall not apply.

**38.7.7 Inspection of Door Openings.** Door openings shall be inspected in accordance with [7.2.1.15](#).

Emergency action plans must be provided for both new and existing high-rise business occupancies per [38/39.7.1](#). This requirement, and the companion requirements of [Section 4.8](#) and its associated text in Annex A, were developed and revised, respectively, in response to recommendations by the NFPA High Rise Building Safety Advisory Committee, which was appointed following the collapse of the World Trade Center towers on September 11, 2001. See [Section 4.8](#) and its associated commentary for details on the contents of the required emergency action plan.

The authority having jurisdiction determines the extent of the portable fire extinguisher training required by [38/39.7.3](#) (e.g., instruction only or instruction and hands-on use).

New to the 2015 edition of the *Code*, [38/39.7.7](#) mandates the annual inspection of egress doors equipped with panic hardware or fire exit hardware, doors in exit enclosures, electrically controlled egress doors, and doors with special locking arrangements, via the reference to [7.2.1.15](#). The intent is to ensure that such doors, which might not be used routinely, operate properly

## CHAPTER 39 • Existing

**39.7.2 Drills.** In all business occupancy buildings occupied by more than 500 persons, or by more than 100 persons above or below the street level, employees and supervisory personnel shall be periodically instructed in accordance with [Section 4.7](#) and shall hold drills periodically where practicable.

**39.7.3 Extinguisher Training.** Designated employees of business occupancies shall be periodically instructed in the use of portable fire extinguishers.

**39.7.4 Food Service Operations.** Food service operations shall comply with [13.7.2](#).

**39.7.5 Upholstered Furniture and Mattresses.** The provisions of [10.3.2](#) shall not apply to upholstered furniture and mattresses.

**39.7.6 Soiled Linen and Trash Receptacles.** The requirements of [10.3.9](#) for containers for waste, or linen with a capacity of 20 gal (75.7 L) or more shall not apply.

**39.7.7 Inspection of Door Openings.** Door openings shall be inspected in accordance with [7.2.1.15](#).

in an emergency. See [7.2.1.15](#) and its associated commentary for additional details on the required inspection.

# Industrial Occupancies

The industrial occupancy classification is broad in its scope and application. The following are examples of industrial occupancies:

1. Factories of all kinds
2. Pumping stations
3. Telephone exchanges
4. Gas plants
5. Laundries
6. Laboratories
7. Recycling plants
8. Refineries
9. Food processing plants
10. Drycleaning plants
11. Auto body and repair shops
12. Sawmills
13. Hangars (for servicing aircraft)
14. Power plants
15. Post office central sorting/maintenance facilities

The range of facilities that are classified as industrial occupancies is diverse. Industrial occupancies comprise a wide variety of building configurations, uses, and equipment types. Some industrial occupancies might be considered innocuous with respect to the threat of fire hazard, such as a factory that manufactures concrete blocks. An industrial occupancy subject to the threat of a serious fire hazard might be a petroleum processing and refining plant, where the threat of explosion is always present. The subclassification system used in 40.1.2.1 is intended to assist the user in establishing the level of hazard to the occupants of an industrial occupancy.

The requirements of Chapter 40 were written to provide adequate life safety without unduly restricting the functional operations of a facility. For example, 40.2.2.10 and 40.2.2.11 permit fire escape ladders and slide escapes as part of an occupant protection package that balances the need for rapid escape from platforms and other industrial structures with the ability of the occupants to use such egress devices. By permitting the use of fire escape ladders and slide escapes, Chapter 40 recognizes that functional requirements necessitate occupant access to unusual spaces within the industrial facility and that efficient egress from these spaces is important.

A unique life safety consideration addressed in Chapter 40 involves egress for occupants of ancillary facilities. Paragraph 40.2.5.2 recognizes that some types of industrial processes and equipment cannot be immediately abandoned if the building fire alarm sounds. If workers do not remain in the building long

enough to effect orderly equipment shutdown during a fire emergency, dangers greater than fire might result. The protection measures required by 40.2.5.2 provide for the safety of occupants who must remain while others leave the building.

Another unique feature that the Code addresses for industrial occupancies is the equipment access dimensional criteria of Table 40.2.5.3.1. These dimensional criteria, although more lenient than those of Chapter 7, provide adequate egress paths for the small number of occupants using any of those routes to reach major aisles that lead to exits.

The statistics provided by the national fire incident databases demonstrate that the potential loss of life from fire in an industrial occupancy is directly related to the hazard of the industrial operation or process. Most multiple-death industrial fires are the result of flash fires caused by highly combustible material or explosions involving combustible dusts, flammable liquids, or gases.

Until recently, industrial fire losses have constituted a high percentage of the annual property loss from fire; however, such fires have not, as a general rule, resulted in extensive loss of life. With most rules, however, there are exceptions. At least four major dust explosions have occurred in industrial occupancies in recent years, killing a total of 32 workers.

In the first incident, which occurred in May 2002, 5 workers were killed in an explosion at a rubber reclaiming plant located in Vicksburg, Mississippi. The fire, which originated in the rubber dryer system, ignited the building's roof and spread to the bagging room, where rubber dust ignited and exploded. In the second incident, which occurred in January 2003, 6 workers were killed in a dust explosion at a pharmaceutical plant in Kinston, North Carolina. The accumulation of dust above a suspended ceiling led to the blast, which could be felt 25 miles (40 kilometers) away. In the third incident, which occurred in February 2003, 7 workers were killed when insulation particles inside an oven ignited and exploded at an automobile insulation manufacturing plant in Corbin, Kentucky. In the fourth incident, which occurred in February 2008, 14 workers died in a huge explosion fueled by the accumulation of sugar dust throughout the packaging building at a sugar processing plant in Port Wentworth, Georgia. Although it is not mandatorially referenced by the Code, NFPA 654, *Standard for the Prevention of Fire and Dust Explosions from the Manufacturing, Processing, and Handling of Combustible Particulate Solids*,<sup>1</sup> should be applied where industrial processes involve combustible dusts to reduce the likelihood of such catastrophic fires and explosions.

In March 2005, an explosion at a Texas City, Texas, oil refinery — an example of a high hazard industrial occupancy — killed 15 workers and injured more than 170. The explosion occurred in the refinery's isomerization unit — the location of equipment used to boost the octane in gasoline — when the system was being restarted following maintenance a few days earlier. Although the *Code* does not directly address the hazards associated with handling flammable liquids, it does reference NFPA 30, *Flammable and Combustible Liquids Code*,<sup>2</sup> which provides requirements for such operations to minimize the probability of fires and explosions (see 8.7.3.1). Other industry standards, such as those published by the American Petroleum Institute (API), directly address the hazards associated with refineries.

Natural gas explosions resulted in the deaths of a total of 10 workers in two separate incidents in 2009 and 2010. In June 2009, an explosion occurred at a food processing plant in Garner, North Carolina, when newly installed natural gas lines were being purged. The explosion killed 4 workers and injured dozens of others. In February 2010, another natural gas explosion occurred at a power plant undergoing construction in Middletown, Connecticut, when workers were using natural gas under high pressure to remove debris from gas piping. This explosion resulted in the deaths of 6 workers.

On April 17, 2013, a catastrophic explosion at a fertilizer plant in West, Texas, killed 15 people (including 10 fire fighters), injured more than 200, and damaged or destroyed some 500 buildings. Losses from the explosion were initially estimated at \$100 million.<sup>3</sup> Although the industrial processes involved in these incidents are not directly regulated by the *Code*, they do reinforce the need to follow applicable codes (e.g., NFPA 54, *National Fuel Gas Code*,<sup>4</sup> and NFPA 400, *Hazardous Materials Code*,<sup>5</sup> among others) and accepted industry practices when working with special hazards.

One of the major features to be considered in the design of an industrial occupancy's life safety system is the use of automatic sprinkler protection. Originally developed for industrial property protection, automatic sprinkler systems have also been largely responsible for an excellent life safety record in industrial occupancies. Limiting the size of a fire by means of sprinklers provides sufficient time for the safe evacuation of occupants. This record has been recognized by the fire protection community, as evidenced by the widespread use of automatic sprinkler systems in buildings with significant hazards to life. The contribution of the automatic sprinkler to safety to life can be fully appreciated only when the wide range of fire risks associated with the many processes used in an industrial facility are recognized.

Employees and other occupants of industrial buildings are generally ambulatory and capable of quick response to fires. They are also able to exit rapidly once properly alerted. To capitalize on this employee capability, many industrial facilities include life safety measures in their emergency preplanning. A well-conceived plan provides a valuable tool in preventing loss

of life. Provisions that should be part of the emergency preplan include the following:

1. Measures for alerting employees
2. Identification and posting of exit access routes
3. Establishment of group assembly areas for occupants once they have evacuated the building
4. Procedures for determining that all employees have safely evacuated

Responsibilities are usually established and assigned in the preplan to ensure that the tasks necessary to facilitate safe evacuation of the building are performed. The preplan should routinely be evaluated through simulated fire exercises and drills. Only through the execution of such drills can flaws in the preplan be recognized and modified.

Although the life safety record in industrial occupancies has been good, the trend toward constructing large industrial plants that house hazardous operations might prove problematic. The introduction of combustible materials, such as extensive quantities of plastics, has increased the need for additional measures to help protect workers from fire. Compared with the industrial buildings of the early twentieth century, the modern industrial complex has placed a larger number of employees in a more complex and increasingly hazardous environment. This trend has increased the need for facility managers to concentrate on life safety principles not only during the design stage but also during day-to-day plant operations.

As part of their employee training programs, most industrial firms include education in the use of first aid fire-fighting equipment, such as in-plant standpipes, hose, and portable fire extinguishers. Although first aid fire-fighting measures are primarily a property protection measure, they also provide a significant life safety benefit when utilized correctly by trained individuals. Industrial training of this type, where fully utilized, has resulted in a major reduction in loss of property and life.

---

## 40.1 General Requirements

### 40.1.1 Application.

**40.1.1.1** The requirements of this chapter shall apply to both new and existing industrial occupancies.

**40.1.1.2 Administration.** The provisions of [Chapter 1](#), Administration, shall apply.

**40.1.1.3 General.** The provisions of [Chapter 4](#), General, shall apply.

**40.1.1.4** Industrial occupancies shall include factories making products of all kinds and properties used for operations such as processing, assembling, mixing, packaging, finishing or decorating, repairing, and similar operations.

**40.1.1.5** Incidental high hazard operations protected in accordance with [Section 8.7](#) and [40.3.2](#) in occupancies containing low or ordinary hazard contents shall not be the basis for high hazard industrial occupancy classification.

Unlike most occupancies addressed by the *Code*, both new and existing industrial occupancies are covered in one chapter. Where requirements vary, exemptions that apply to existing industrial occupancies are often provided, or additional requirements that are limited to new industrial occupancies are specified.

**40.1.2 Classification of Occupancy.** Classification of occupancy shall be in accordance with [6.1.12](#).

**40.1.2.1 Subclassification of Occupancy.** Each industrial occupancy shall be subclassified according to its use as described in [40.1.2.1.1](#), [40.1.2.1.2](#), and [40.1.2.1.3](#).

**40.1.2.1.1 General Industrial Occupancy.** General industrial occupancies shall include all of the following:

- (1) Industrial occupancies that conduct ordinary and low hazard industrial operations in buildings of conventional design that are usable for various types of industrial processes
- (2) Industrial occupancies that include multistory buildings where floors are occupied by different tenants, or buildings that are usable for such occupancy and, therefore, are subject to possible use for types of industrial processes with a high density of employee population

**40.1.2.1.2 Special-Purpose Industrial Occupancy.** Special-purpose industrial occupancies shall include all of the following:

- (1) Industrial occupancies that conduct ordinary and low hazard industrial operations in buildings designed for, and that are usable only for, particular types of operations
- (2) Industrial occupancies that are characterized by a relatively low density of employee population, with much of the area occupied by machinery or equipment

It can be difficult to determine if a building qualifies as a special-purpose industrial occupancy. For example, a structure is often erected to protect a large machine or equipment from weather. Once constructed, authorities might try to impose means of egress requirements applicable to a general industrial occupancy, despite the fact that only a handful of personnel are expected to occupy the building. Steel mills, paper plants, power-generating plants, and other operations with large machines are examples of the types of industrial occupancies requiring massive structures for process control and weather protection. These structures often represent minimum hazards to life safety and are typically classified as special-purpose industrial occupancies. In many of the more modern operations, all process control is conducted from a control room by remote means, which further reduces the number of occupants likely to be exposed to a fire in the equipment areas.

The special-purpose industrial occupancy classification must not be applied to a building simply to reduce egress requirements. Economic considerations, or staffing limitations that result in occupancy by fewer employees than usual, should not be used as justification for reducing life safety features; the full number and arrangement of exits required for a general industrial occupancy must be maintained.

**40.1.2.1.3\* High-Hazard Industrial Occupancy.** High-hazard industrial occupancies shall include all of the following:

- (1) Industrial occupancies that conduct industrial operations that use high-hazard materials or processes or house high-hazard contents in excess of the maximum allowable quantities (MAQ) as permitted by the fire code.
- (2) Industrial occupancies in which incidental high-hazard operations in low- or ordinary-hazard occupancies that are protected in accordance with [Section 8.7](#) and [40.3.2](#) are not required to be the basis for overall occupancy classification.

**A.40.1.2.1.3** Additional information on the definition of high hazard industrial occupancy can be found in [A.3.3.190.8.2](#).

A high hazard industrial occupancy classification is limited to those industrial buildings housing extremely hazardous operations with regard to potential for rapid fire development or explosion. Incidental use of restricted quantities of flammable liquids in a building does not necessarily constitute a high hazard, although some additional life safety precautions might be required during the limited period of use. NFPA 30, *Flammable and Combustible Liquids Code*, specifies requirements for safe handling of flammable liquids. Storage of flammable liquids, such as paint, in sealed containers also does not necessarily require a high hazard occupancy classification, unless the operation includes mixing or blending operations that require the containers to be opened. Mixing and blending of flammable liquids is permitted to be conducted in a separate room with a fire barrier between the storage and mixing areas. The mixing and blending room would be considered a high hazard industrial occupancy, while the adjacent, fire-separated storage area would be considered a general industrial occupancy or possibly a storage occupancy subject to the requirements of [Chapter 42](#).

Combustible dusts released from an industrial or manufacturing process constitute a significant threat to life safety, as demonstrated by the incidents described in the commentary following the title of this chapter, and might justify a high hazard classification. Major loss of life has occurred in industrial occupancies that release extensive quantities of combustible dusts. Opportunity for the rapid escape of employees who work in operations that release combustible dust should be provided to prevent injury or loss of life if a dust explosion occurs. In high hazard occupancies that are subject to explosions, the provisions of [40.3.2](#) require special consideration of the techniques for explosion suppression or venting to ensure the life safety of occupants. Full use of fire protection engineering techniques

should be employed in these occupancies to minimize the risk to life safety.

The industrial occupancies that clearly require classification as high hazard are those associated with the production of explosives or highly reactive chemicals. In some especially hazardous operations, additional exits will be necessary to ensure rapid egress to prevent loss of life in the event of an explosion or fire. Where the installation of the preventive or protective measures specified in 40.3.2 is not possible due to the nature of the industrial operation, consideration should be given to operating procedures that restrict access to a limited number of people during the hazardous portion of the operation. The operating procedures would limit the potential threat to those trained personnel who are fully aware of the extent of the hazard. Procedures should also include a record of personnel who have signed in or out. This procedure ensures prompt determination of the number of personnel exposed to a hazardous operation and, thus, the number who might require rescue.

**40.1.2.2 Change of Industrial Occupancy Subclassification.** A change from one subclassification of industrial occupancy to another shall comply with Chapter 43.

Prior to the 2012 edition of the *Code*, changes in industrial occupancy subclassification were permitted only where the building complied with new construction requirements for the new subclassification. Changes in industrial occupancy subclassification must now comply with Chapter 43, Building Rehabilitation, which makes provisions for changes in occupancy classification based on the relative change in hazard category (see Section 43.7). In some cases, Chapter 43 permits a building to meet less restrictive requirements where there is a change in use or occupancy classification to promote the adaptive reuse of existing buildings. In cases where the relative hazard category increases, such as where a general industrial occupancy changes to a high hazard industrial occupancy, the building must meet the more restrictive new construction requirements. See Chapter 43 and associated commentary for additional details on building rehabilitation.

**40.1.3 Multiple Occupancies.** All multiple occupancies shall be in accordance with 6.1.14.

Subsection 40.1.3 directs the user to the multiple occupancy provisions of 6.1.14, which permit protecting multiple occupancy buildings either as mixed or as separated. If a multiple occupancy building is protected via the provisions of 6.1.14.4 for separated uses, the required separation, in terms of fire resistance rating, is specified by Table 6.1.14.4.1(a) and Table 6.1.14.4.1(b).

#### 40.1.4 Definitions.

Although no definitions are listed in 40.1.4, industrial occupancies are subclassified and defined in 40.1.2.1 under the labels *general industrial occupancy*, *special-purpose industrial occupancy*, and *high hazard industrial occupancy*. See also 3.3.190.8, 3.3.190.8.1, 3.3.190.8.2, and 3.3.190.8.3.

**40.1.4.1 General.** For definitions, see Chapter 3, Definitions.

**40.1.4.2 Special Definitions.** Special terms applicable to this chapter are defined in Chapter 3.

**40.1.5 Classification of Hazard of Contents.** Classification of hazard of contents shall be in accordance with Section 6.2.

The method for determining the degree of hazard to life safety posed by an industrial occupancy is often a matter of personal judgment and not science. The authority having jurisdiction (AHJ) must use judgment based on past experience, review of reference materials and engineering analyses, and full discussion with third parties to evaluate the life safety measures in an industrial occupancy. The *Code* establishes broad categories of occupancy classification so that the relative risks to life safety posed by various types of buildings can be assessed.

A common error made when classifying industrial occupancies is the use of hazard categories for automatic sprinklers contained in NFPA 13, *Standard for the Installation of Sprinkler Systems*,<sup>6</sup> to determine the hazard to life safety. While the guidelines in NFPA 13 might not differ greatly from those of the *Life Safety Code* where classifying occupancies with high hazards, the remaining categories specified in NFPA 13 are usually not suitable for the general industrial occupancy classification of the *Code*. (The use of NFPA 13 is particularly inappropriate where classifying low hazard occupancies, which are classified as light hazard by NFPA 13.) The distinction is that the life safety industrial occupancy classification is concerned with determining the overall hazard to occupants in a manufacturing building for purposes of implementing an adequate means of egress system, while the NFPA 13 classification system is concerned with defining the hazard so that a sprinkler system can be designed to meet the challenge of the hazard.

To examine the conflicts between life safety occupancy classification and classifications in other fire codes, consider a metalworking plant using a flammable solvent in a dip tank coating operation. From a life safety standpoint, the normally ordinary hazard classification of the metalworking plant should not be changed to high hazard solely because of the presence of a dip tank coater. An adequate means of safe egress leading away from the coater is required to ensure the safety of the occupants. However, additional exits and a reduction in travel distance to an exit, as specified for a high hazard contents area, are not required. Nevertheless, if the coater is the principal piece of equipment in a separately enclosed area, that area might be considered as a high hazard industrial occupancy.

When determining the life safety hazard classification for an industrial occupancy, the AHJ should carefully analyze the nature of that industrial operation to ensure an accurate evaluation of the hazard to occupants. A number of resources are available for properly determining the degree of risk to life safety. One resource that should not be overlooked is the expertise of the industrial plant operator, who can provide a wealth of hazard

information, although some such information might be treated as confidential to prevent competitors from learning the details of an industrial process. In such a case, the enforcing authority must handle that information with discretion; once an enforcing authority is known to be an outside source of data on industrial secrets, further cooperation will be difficult to obtain. Likewise, facility operators should be forthcoming with process information having an effect on emergency response operations.

Another resource is the engineering department of the company responsible for a facility's insurance coverage. In addition, discussions with officials who oversee jurisdictions where similar facilities exist and a review of available literature, such as the NFPA *Fire Protection Handbook*<sup>7</sup>, the *Industrial Fire Protection Handbook*<sup>8</sup>, and *Industrial Fire Protection Engineering*,<sup>9</sup> will provide further information on a particular process and its associated hazards.

To assess the risk to life safety in an industrial occupancy, a number of factors should be considered. It should be determined if the manufacturing process includes the handling of flammable, reactive, or explosive materials in quantities that could directly expose occupants to a fire or explosion. If so, the occupancy is a strong candidate for a high hazard classification. See 40.1.2.1.3.

It should also be determined whether the manufacturing process requires a large number of people or whether it is basically a large collection of machines or equipment occasionally attended by operators. In some instances, operators might be clustered in one location, such as a control room. If a building predominantly houses machinery or equipment and is occupied by few employees, the building can be classified as a special-purpose industrial occupancy. See 40.1.2.1.2.

If an industrial building is used mostly for storage of materials (such as preparatory stock for assembly or finished goods), it might meet the requirements for classification as a storage occupancy. See Chapter 42.

Hazard classification is based on the burning and explosive characteristics of the materials contained in a building, not on the quantity of combustibles. For example, there is no reason to classify a building as high hazard simply because it is associated with a manufacturing process that requires extensive quantities of ordinary combustible materials to be distributed in such a manner that the process involves a high combustible fuel load.

The classification of an industrial occupancy, for life safety purposes, is not based on the type of structure housing the industrial process. The basic purpose of the hazard classification in Section 6.2 is to evaluate the risk posed to occupants by the burning characteristics of the building's contents. The classification is determined by an evaluation of the contents and other factors in a fire's development that affect the time available for safe evacuation of the occupants. Once employees are evacuated to a safe location, the extent of fire spread in the structure becomes a threat to property. As long as life safety measures are met, the threat of heavy fire damage to a building is beyond the scope of the *Life Safety Code*.

## 40.1.6 Minimum Construction Requirements. (Reserved)

Some occupancy chapters, such as Chapters 18 and 19, which address the life safety needs of nonambulatory health care occupants, specify minimum building construction type requirements to ensure structural integrity for the time needed for a lengthy evacuation or for safe refuge within the building. No minimum construction requirements are imposed by Chapter 40, because industrial occupancies characteristically have ambulatory occupants and do not provide sleeping accommodations. Occupants will likely have the ability to egress the building relatively quickly before the fire-resisting qualities of the building's structural components become an issue.

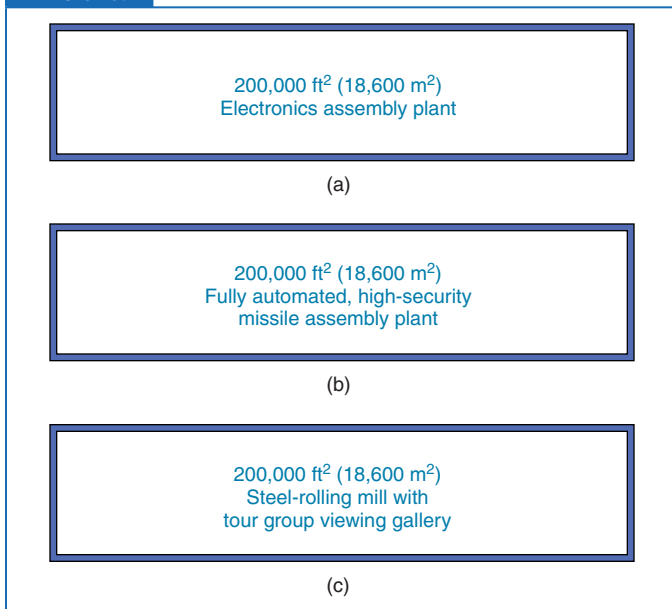

**40.1.7\* Occupant Load.** The occupant load, in number of persons for whom means of egress and other provisions are required, shall be determined on the basis of the occupant load factors of Table 7.3.1.2 that are characteristic of the use of the space, or shall be determined as the maximum probable population of the space under consideration, whichever is greater.

**A.40.1.7** In most cases, the requirements for maximum travel distance to exits will be the determining factor, rather than number of occupants, because exits provided to satisfy travel distance requirements will be sufficient to provide egress capacity for all occupants, except in cases of an unusual arrangement of buildings or the high occupant load of a general manufacturing occupancy.

The occupant load of an industrial occupancy is based on an average of 100 ft<sup>2</sup> (9.3 m<sup>2</sup>) of gross floor area per occupant in accordance with Table 7.3.1.2. Some users of the *Code* confuse this concept with the actual number of employees who occupy the facility. The usual complaint is that the number of potential employees calculated for egress purposes in accordance with the 100 ft<sup>2</sup> (9.3 m<sup>2</sup>) criterion far exceeds the anticipated or actual number of employees. Some industrial managers argue that using the larger number as a basis for egress design requires more exits, wider doors, and more passageways than are needed for emergency egress purposes, reducing productive work space and resulting in increased cost.

The concept of calculating occupant load by using an occupant load factor is useful, although it does not necessarily relate directly to the actual number of building occupants. The occupant load factor is used as a means of calculating the minimum egress requirements, based on the needs of an average industrial occupancy. Although actual conditions might vary in an individual location, the egress width determined by the occupant load calculation will normally provide the necessary, adequate, and required means of egress for a typical industrial building with little or no penalty to the building's owner/operator.

See Exhibit 40.1 for examples of occupant load determination using the occupant load factor for a general industrial occupancy and using the probable number of occupants for a special-purpose industrial occupancy.

**Exhibit 40.1***Determination of occupant load of industrial occupancies.*

In **Exhibit 40.1**, Part (a), the general industrial occupancy must provide a means of egress for at least 2000 persons, based on an occupant load factor of 100 ft<sup>2</sup> (9.3 m<sup>2</sup>) per person.

In **Exhibit 40.1**, Part (b), a special-purpose industrial occupancy can size its means of egress for the maximum 20 persons (actual anticipated employee population) who are expected to occupy the facility under any probable condition.

In **Exhibit 40.1**, Part (c), the 200-person tour groups that visit this special-purpose industrial occupancy on the first Monday of each month must be added to the 45 employees (actual employee population) who are normally present, for a total occupant load of 245 persons.

## 40.2 Means of Egress Requirements

### 40.2.1 General.

**40.2.1.1** Each required means of egress shall be in accordance with the applicable portions of **Chapter 7**.

**40.2.1.2\*** Normally unoccupied utility chases that are secured from unauthorized access and are used exclusively for routing of electrical, mechanical, or plumbing equipment shall not be required to comply with the provisions of **Chapter 7**.

**A.40.2.1.2** Horizontal and vertical utility chases in large industrial buildings used for routing of piping, ducts, and wiring must provide a reasonable level of access for occasional maintenance workers but do not warrant compliance with the comprehensive egress requirements of **Chapter 7**. Minimum access in these cases is governed by electrical and mechanical codes; **40.2.5.2**,

Industrial Equipment Access; and the Occupational Safety and Health Administration (OSHA) for facilities in the United States. Utility chases governed by **40.2.1.2** might involve tunnels or large open spaces located above or below occupied floors; however, such spaces differ from mechanical equipment rooms, boiler rooms, and furnace rooms, based on the anticipated frequency of use by maintenance workers. Portions of utility chases where the anticipated presence of maintenance workers is routine are not intended to be included by this paragraph.

### 40.2.2 Means of Egress Components.

**40.2.2.1 General.** Components of means of egress shall be limited to the types described in **40.2.2.2** through **40.2.2.13**.

#### 40.2.2.2 Doors.

**40.2.2.2.1** Doors complying with **7.2.1** shall be permitted.

**40.2.2.2.2** Delayed-egress locks complying with **7.2.1.6.1** shall be permitted.

Use of the delayed-egress locking device covered by **7.2.1.6.1** is permitted on any door in recognition of the security needs of some industrial occupancies. In effect, the allowable 15-second or 30-second delay will be experienced only under non-fire conditions or very early in a fire's growth, because the door must be usable immediately upon sprinkler operation, smoke or heat detection, or loss of power that controls the locking mechanism. The building must be protected throughout by an approved, supervised automatic sprinkler system or an approved, supervised automatic fire detection system to permit the use of delayed-egress locks per **7.2.1.6.1**.

**40.2.2.2.3** Access-controlled egress doors complying with **7.2.1.6.2** shall be permitted.

**Paragraph 40.2.2.2.3** permits the installation of access-controlled egress doors in industrial occupancies, provided that they meet the provisions of **7.2.1.6.2**. Access-controlled egress doors are frequently confused with so-called "mag-lock" doors, whereby an occupant must swipe a card or enter a code on a keypad, for example, to unlock the door in the direction of egress travel. The *Code* prohibits such locking arrangements on required means of egress doors, even if they are provided with an emergency release button and are arranged to unlock upon activation of the fire alarm system. To comply with the *Code*, access-controlled egress doors must be provided with all of the features described in **7.2.1.6.2(1)** through (7). The motion sensor arranged to detect approaching occupants and unlock the door described in **7.2.1.6.2(1)** is perhaps the most frequently overlooked requirement.

**40.2.2.2.4** Locks in accordance with **7.2.1.6.3** shall be permitted.

**40.2.2.2.5** Approved existing horizontal-sliding fire doors shall be permitted in the means of egress where they comply with all of the following conditions:

- (1) They are held open by fusible links.
- (2) The fusible links are rated at not less than 165°F (74°C).
- (3) The fusible links are located not more than 10 ft (3050 mm) above the floor.
- (4) The fusible links are in immediate proximity to the door opening.
- (5) The fusible links are not located above a ceiling.
- (6) The door is not credited with providing any protection under this *Code*.

Horizontal-sliding fire doors exist in many industrial occupancies for property protection purposes. Although the *Code* normally does not recognize these doors within the required means of egress, 40.2.2.2.5 makes a special exemption for existing horizontal-sliding fire doors. By requiring the fusible link to be positioned in immediate proximity to the door opening, rated 165°F (74°C) or higher, and located not more than 10 ft (3050 mm) above the floor, the *Code* helps to ensure that the door will remain open until rising temperatures make it unsafe to pass through the door opening. Because the door will not close early in the fire development, the door cannot be credited as a fire door for life safety purposes. However, the door might serve as a means of property protection. See Exhibit 40.2.

Existing horizontal-sliding fire door in accordance with 40.2.2.2.5.

### 40.2.2.3 Stairs.

40.2.2.3.1 Stairs shall comply with 7.2.2 and shall be permitted to be modified by any of the following:

- (1) Noncombustible grated stair treads and noncombustible grated landing floors shall be permitted.
- (2) Industrial equipment access stairs in accordance with 40.2.5.2 shall be permitted.

40.2.2.3.2 Spiral stairs complying with 7.2.2.2.3 shall be permitted.

40.2.2.3.3 Existing winders complying with 7.2.2.2.4 shall be permitted.

Paragraph 40.2.2.3.1(1) exempts stair treads and landings in industrial occupancies from the provisions of 7.2.2.3.3.1, which would otherwise require that all stair treads and stair landing floors be solid. Although the requirement for solid treads and landing floors is intended to prevent occupants from avoiding the use of the stairs because they become afraid when they are able to see through the openings to the floor or ground below, occupants of industrial occupancies are usually more familiar, and thus more comfortable, with grated or expanded metal treads and landings. There is also a high degree of certainty that occupants will be wearing shoes appropriate for the environment, and not high heels that could get stuck in the grate openings. The grated walking surfaces provide slip resistance in what are sometimes greasy and slippery surroundings. For consistency, 7.2.2.3.3.5(3) alerts the user that industrial occupancies, in accordance with Chapter 40, are exempt from the solid tread and landing provisions.

Paragraph 40.2.2.3.1(2) directs the user to 40.2.5.2, which has special provisions for industrial equipment access stairs that differ from the requirements of Chapter 7. See the commentary following 40.2.5.2.2.

40.2.2.4 Smokeproof Enclosures. Smokeproof enclosures complying with 7.2.3 shall be permitted.

Paragraph 40.2.2.4 does not mandate the use of smokeproof enclosures. It does, however, recognize such an enclosure as part of the means of egress system in an industrial occupancy only if that enclosure meets the requirements of 7.2.3. For an example of an occupancy requiring a smokeproof enclosure, see 31.2.11.1, which specifies that existing nonsprinklered or partially sprinklered high-rise apartment buildings are required to be provided with smokeproof enclosures in accordance with 7.2.3.

### 40.2.2.5 Horizontal Exits.

40.2.2.5.1 Horizontal exits complying with 7.2.4 shall be permitted.

40.2.2.5.2\* In horizontal exits where the opening is protected by a fire door assembly on each side of the wall in which it is located, one fire door shall be of the swinging type, as provided in 7.2.4.3.8, and the other shall be permitted to be an automatic-sliding fire door that shall be kept open whenever the building is occupied.

A.40.2.2.5.2 The customary building code requirement for fire doors on both sides of an opening in a fire wall is permitted to be met by having an automatic-sliding fire door on one side and a self-closing fire door swinging out from the other side of the wall. This arrangement qualifies only as a horizontal exit from the sliding door side. For further information, see A.7.2.4.3.10.

Paragraph 40.2.2.5.1 does not mandate the use of horizontal exits. It does, however, recognize a horizontal exit as part of the means of egress system in an industrial occupancy if that exit meets the requirements of 7.2.4, as modified by 40.2.2.5.2.

Paragraphs 40.2.2.5.2 and A.40.2.2.5.2 recognize the common practice of combining a horizontal exit that is used for life safety with a fire barrier having a significant fire resistance rating that is used for property protection. Opening protectives for such a fire barrier can require the use of a set of doors to achieve the required fire protection rating. It is impractical for both doors to swing in the same direction without interfering with each other; yet, operation of two doors that swing in opposite directions is cumbersome for daily or frequent use. The use of a combination of swinging and sliding doors, as shown in Exhibit 40.3, provides an acceptable arrangement for day-to-day functioning of the building. The normally open sliding door does not compromise life safety, because, by the time its fusible link mechanism releases the door and allows it to close, temperatures in the vicinity of the door opening render use of the door impractical. See also the commentary following 40.2.2.5(6). The provisions of 40.2.2.5 also permit an existing horizontal-sliding door (as depicted in Exhibit 40.2) to serve within the means of egress.

Exhibit 40.3

Combination swinging and sliding doors permitted by 40.2.2.5.2.

**40.2.2.6 Ramps.** Ramps complying with any of the following shall be permitted:

- (1) Ramps in accordance with 7.2.5
- (2) Industrial equipment access in accordance with 40.2.5.2

Paragraph 40.2.2.6 does not mandate the use of ramps in industrial occupancies. It does, however, recognize a ramp as part of the means of egress system if that ramp meets the requirements of 7.2.5. Paragraph 40.2.2.6 also serves to remind the user that

40.2.5.2 has special provisions for industrial equipment access ramps that differ from the requirements of Chapter 7. See the commentary following 40.2.5.2.2.

**40.2.2.7 Exit Passageways.** Exit passageways complying with 7.2.6 shall be permitted.

**40.2.2.8 Escalators and Moving Walks.** Existing previously approved escalators and moving walks complying with 7.2.7 and located within the required means of egress shall be permitted.

Note that 7.2.7 permits existing escalators and moving walks to continue to be recognized as required means of egress components if permitted by the applicable occupancy chapter. In earlier editions of the Code, escalators and moving walks were recognized as providing egress capacity for 75 persons. To qualify as exits (as opposed to exit access), escalators and moving walks must also meet the requirements of 7.1.3.2, which address exit enclosures.

Note that escalators protected in accordance with the sprinkler-vent, spray nozzle, rolling shutter, or partial enclosure method do not constitute acceptable exits but can continue to serve as exit access if previously approved as such.

**40.2.2.9 Fire Escape Stairs.** Existing fire escape stairs complying with 7.2.8 shall be permitted.

**40.2.2.10 Fire Escape Ladders.**

**40.2.2.10.1** Fire escape ladders complying with 7.2.9 shall be permitted.

**40.2.2.10.2** Fixed industrial stairs in accordance with the minimum requirements for fixed stairs and stair railing systems in ANSI/ASSE A1264.1, *Safety Requirements for Workplace Walking/Working Surfaces and Their Access; Workplace Floor, Wall and Roof Openings; Stairs and Guardrails Systems*, shall be permitted where fire escape ladders are permitted in accordance with 7.2.9.1.

The geometry associated with the incline angle and the size and shape of surfaces intended for foot placement on fire escape ladders falls within the range permitted for fixed industrial stairs. However, most fixed industrial stairs meet criteria that result in a safer arrangement than that provided by the fire escape ladder detailed in 7.2.9. Therefore, 40.2.2.10.2 recognizes fixed industrial stairs as a substitute for fire escape ladders.

**40.2.2.11 Slide Escapes.**

**40.2.2.11.1** Approved slide escapes complying with 7.2.10 shall be permitted as components in 100 percent of the required means of egress for both new and existing high hazard industrial occupancies.

**40.2.2.11.2** Slide escapes permitted by 40.2.2.11.1 shall be counted as means of egress only where regularly used in emergency egress drills to ensure that occupants are familiar with their use through practice.

The intent of [40.2.2.11](#) is to permit the use of slide escapes, which are commonly used components for means of egress from areas that house explosives or other highly hazardous materials in chemical industry buildings. This provision allows consideration of slide escapes as part of the required means of egress from both new and existing high hazard industrial occupancies. In many high hazard industrial occupancies, slide escapes are the only practical means of ensuring safe egress prior to an explosion or flash fire. As required by [40.2.2.11.2](#), occupants must be drilled in the use of the slide escapes to help ensure sufficient familiarity for quick egress under emergency conditions.

**40.2.2.12 Alternating Tread Devices.** Alternating tread devices complying with [7.2.11](#) shall be permitted.

The provisions of [7.2.11](#), in effect, limit the use of alternating tread devices to those locations where the *Code* recognizes the use of fire escape ladders (and fixed industrial stairs). See [40.2.2.10.1](#), [40.2.2.10.2](#), [7.2.9](#), and [7.2.11](#).

**40.2.2.13 Areas of Refuge.** Areas of refuge complying with [7.2.12](#) shall be permitted.

**40.2.3 Capacity of Means of Egress.** Capacity of means of egress shall comply with either [40.2.3.1](#) or [40.2.3.2](#).

**40.2.3.1** The capacity of means of egress shall be in accordance with [Section 7.3](#).

**40.2.3.2** In industrial occupancies, means of egress shall be sized to accommodate the occupant load as determined in accordance with [40.1.7](#); spaces not subject to human occupancy because of the presence of machinery or equipment shall not be included in the computation.

**Paragraph 40.2.3.2** imposes practical limits on the number of required means of egress and on the arrangement of the means of egress in industrial occupancies. No life safety purpose is served by providing exits from the center of a large machine or equipment installation that is unoccupied under normal operating conditions. A number of industries provide weather shelter for large processes and equipment. Typical examples include steel-rolling mills, paper extruders, and metalworking machines, all of which occupy a majority of the floor space in the sheltered building. In many of the more sophisticated operations, full process control is conducted from a remotely located control room. Personnel normally occupy the building only for maintenance and adjustment purposes, and then only on a limited basis. The provision of exits from these special-purpose industrial occupancies serves no useful purpose and could unjustly impose an economic penalty in the name of safety.

The large areas normally enclosed by special-purpose structures would require excessive egress width if the occupant load were calculated on the basis of the 100 ft<sup>2</sup> (9.3 m<sup>2</sup>) per person specified for general industrial occupancies. Such arrangements might actually require exits from the interior of machinery and equipment installations, which would be incompatible with the

equipment's design. In many cases, these exits would originate from locations that, even under normal operating conditions, would be considered dangerous for humans. Poorly conceived exit facilities serve no life safety purpose and detract from an otherwise well-designed egress system.

**40.2.4 Number of Means of Egress.** See also [Section 7.4](#).

**40.2.4.1** The number of means of egress shall comply with either [40.2.4.1.1](#) or [40.2.4.1.2](#).

**40.2.4.1.1** Not less than two means of egress shall be provided from every story or section, and not less than one exit shall be reached without traversing another story.

**40.2.4.1.2** A single means of egress shall be permitted from any story or section in low and ordinary hazard industrial occupancies, provided that the exit can be reached within the distance permitted as a common path of travel.

**40.2.4.2** In new buildings, floors or portions thereof with an occupant load of more than 500 shall have the minimum number of separate and remote means of egress specified by [7.4.1.2](#).

**40.2.4.3** Areas with high hazard contents shall comply with [Section 7.11](#).

The provisions of [40.2.4.1.1](#), which apply to the minimum required number of means of egress for industrial occupancies, clarify that, in addition to providing every story or section with access to at least two means of egress, one of the exits must be located on each floor, so that the entrance to that exit (e.g., a door that opens into an enclosed exit stair) can be reached without traveling to another floor.

**Paragraph 40.2.4.1.2** recognizes that there are small floors or areas in low and ordinary hazard industrial occupancies that, if provided with access to only a single exit, are no less safe than larger areas of a building that have access to two exits where an occupant must first travel through the maximum allowable common path. Where a single exit is provided, the occupant travels the 50 ft (15 m) [or 100 ft (30 m) in sprinklered buildings] of common path allowed by [Table 40.2.5.1](#), enters the exit, and is judged to have reached a point of safety (see [Exhibit 40.4](#)). In larger buildings and larger building areas that do not meet the limited travel distance for a single exit, a minimum of two exits must be provided. By traveling to the nearer of the two exits, the occupant is permitted to travel the same 50 ft (15 m) [or 100 ft (30 m) in sprinklered buildings] of common path that the occupant of the single-exit building traveled to reach the one exit before reaching the point where travel to the two exits in different directions is possible. Although the occupant of the single-exit building has reached an exit by this point, the occupant of the multiple-exit building is then allowed an additional 150 ft (46 m) [200 ft (61 m) if the building is sprinklered] of exit access travel before the safety of an exit must be reached. Therefore, the single-exit exemption provides a level of life safety that is at least equivalent to that of the multiple-exit building.

Exhibit 40.4

Single means of egress from story of low or ordinary hazard industrial occupancy.

In older editions, the Code required more than two exits based on occupant load for assembly occupancies only. Third, fourth, and subsequent exits were provided in industrial occupancies to meet travel distance requirements or as a convenience for day-to-day use. Paragraph 7.4.1.2 expands the concept

of requiring three or four exits based on occupant load to apply to all occupancies. Paragraph 40.2.4.2, in compliance with the option offered by 7.4.1.2, exempts existing buildings from the requirement for third and fourth exits to avoid unnecessarily forcing existing, previously approved means of egress systems into noncompliance.

Section 7.11 includes an adequate set of means of egress provisions for high hazard areas and is referenced by 40.2.4.3 to provide commensurate protection to industrial occupancies that contain high hazard areas. The provisions of Section 7.11 are vital to life safety in high hazard occupancies. The requirement for two means of egress for all high hazard occupancies recognizes the possibility that a fire or explosion might block or destroy one of the two exits. Two separate and equal means of egress from high hazard areas provide a necessary redundancy to ensure the evacuation of occupants under fire or explosion conditions and to minimize the potential for injury or loss of life. Subsection 7.11.4 recognizes that it is not necessary to require two means of egress from very small high hazard areas [maximum 200 ft<sup>2</sup> (18.6 m<sup>2</sup>)] with limited occupant load (maximum three persons) if the room door can be reached within 25 ft (7620 mm) of travel.

**40.2.5 Arrangement of Means of Egress.**

See the discussion of dead-end corridor pockets and common path of travel in A.7.5.1.5 and its associated commentary.

**40.2.5.1 General.** Means of egress, arranged in accordance with Section 7.5, shall not exceed that provided by Table 40.2.5.1.

**40.2.5.2 Ancillary Facilities.**

Table 40.2.5.1 Arrangement of Means of Egress

Level of Protection	General Industrial Occupancy		Special-Purpose Industrial Occupancy		High Hazard Industrial Occupancy
	ft	m	ft	m	
<b>Dead-End Corridor</b>					
Protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1)	50	15	50	15	Prohibited, except as permitted by 7.11.4
Not protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1)	50	15	50	15	Prohibited, except as permitted by 7.11.4
<b>Common Path of Travel</b>					
Protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1)	100	30	100	30	Prohibited, except as permitted by 7.11.4
Not protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1)	50	15	50	15	Prohibited, except as permitted by 7.11.4

**40.2.5.2.1\*** New ancillary facilities shall be arranged to allow travel in independent directions after leaving the ancillary facility so that both means of egress paths do not become compromised by the same fire or similar emergency.

**A.40.2.5.2.1** Ancillary facilities located within industrial occupancies might include administrative office, laboratory, control, and employee service facilities that are incidental to the predominant industrial function and are of such size that separate occupancy classification is not warranted.

**40.2.5.2.2\*** New ancillary facilities in special-purpose industrial occupancies where delayed evacuation is anticipated shall have not less than a 2-hour fire resistance–rated separation from the predominant industrial occupancy, and shall have one means of egress that is separated from the predominant industrial occupancy by 2-hour fire resistance–rated construction.

**A.40.2.5.2.2** Occupants of ancillary facilities located within special-purpose industrial occupancies might be required by administrative controls to remain in the facility when a fire occurs in the predominant industrial area, so that they can perform an orderly shutdown of process equipment to control the spread of the fire and minimize damage to important equipment or perform other safety or security functions.

The presence of ancillary facilities within an industrial occupancy can create challenges to life safety. For example, the means of egress for factory office workers, who might have little knowledge of the industrial processes and operations and their respective hazards, might require leaving the safety of an office area and traveling across the factory production floor.

In other cases, safe egress is not ensured for employees assigned to a control room who might have to perform orderly shutdown of certain processes to control the spread of fire before evacuating a building. The requirements of 40.2.5.2.1 and 40.2.5.2.2 are illustrated in Exhibit 40.5.

Ancillary facilities.

In Exhibit 40.5, an occupant of control room 1, which is elevated and has a single means of egress via a stair leading down to the main production floor, is forced to travel in one direction only into the open manufacturing area. This arrangement does not meet the requirement of 40.2.5.2.1, which mandates that egress be arranged to allow travel in independent directions after leaving the ancillary facility, so that both means of egress paths are not compromised by the same fire or similar emergency. Control room 1 requires a second exit access door and stair remotely located from the first.

Control room 2 in Exhibit 40.5 meets the requirements of both 40.2.5.2.1 and 40.2.5.2.2. Control room 2 permits egress travel in independent directions, so that both means of egress paths are not compromised by the same fire or similar emergency. Further, it provides one of the two means of egress via an exit passageway–like arrangement separated from the predominant industrial occupancy by 2-hour fire resistance–rated construction. Also, control room 2 is surrounded by 2-hour fire resistance–rated construction. This protection allows occupants charged with special emergency duties to delay their egress and still be afforded adequate life safety.

The requirements of 40.2.5.1, which first appeared in the 1997 edition of the Code, apply only to new ancillary facilities and are not required to be applied retroactively to existing facilities.

### 40.2.5.3 Industrial Equipment Access.

**40.2.5.3.1** Industrial equipment access doors, walkways, platforms, ramps, and stairs that serve as a component of the means of egress from the involved equipment shall be permitted in accordance with the applicable provisions of Chapter 7, as modified by Table 40.2.5.3.1.

**40.2.5.3.2** Any means of egress component permitted by 40.2.5.3.1 shall serve not more than 20 people.

**Table 40.2.5.3.1 Industrial Equipment Access Dimensional Criteria**

Feature	Dimensional Criteria
Minimum horizontal dimension of any walkway, landing, or platform	22 in. (560 mm) clear
Minimum stair or ramp width	22 in. (560 mm) clear between rails
Minimum tread width	22 in. (560 mm) clear
Minimum tread depth	10 in. (255 mm)
Maximum riser height	9 in. (230 mm)
Handrails are permitted to terminate, at the required height, at a point directly above the top and bottom risers.	
Maximum height between landings	12 ft (3660 mm)
Minimum headroom	6 ft 8 in. (2030 mm)
Minimum width of door openings	22 in. (560 mm) clear

Exhibit 40.6

Industrial equipment access dimensional criteria.

Paragraph 40.2.5.3 permits industrial equipment access walkways, platforms, ramps, stairs, and doors serving not more than 20 persons to deviate from some of the usual dimensional criteria specified by Chapter 7. The dimensional criteria detailed in Table 40.2.5.3.1 are illustrated in Exhibit 40.6.

### 40.2.6 Travel Distance to Exits.

40.2.6.1 Travel distance, measured in accordance with Section 7.6, shall not exceed that provided by Table 40.2.6.1 except as otherwise permitted by 40.2.6.2.

40.2.6.2\* **Power-Generation Buildings.** Buildings of noncombustible construction used exclusively for the enclosure of steam

generators, steam turbines, gas turbines, heat recovery generators, and flue gas treatment equipment shall be permitted to have a maximum travel distance of 400 ft (122 m), where all special hazards are protected by approved automatic suppression systems in accordance with one or more of the following standards, as applicable:

- (1) NFPA 11, *Standard for Low-, Medium-, and High-Expansion Foam*
- (2) NFPA 12, *Standard on Carbon Dioxide Extinguishing Systems*
- (3) NFPA 13, *Standard for the Installation of Sprinkler Systems*
- (4) NFPA 15, *Standard for Water Spray Fixed Systems for Fire Protection*
- (5) NFPA 16, *Standard for the Installation of Foam-Water Sprinkler and Foam-Water Spray Systems*
- (6) NFPA 17, *Standard for Dry Chemical Extinguishing Systems*
- (7) NFPA 750, *Standard on Water Mist Fire Protection Systems*
- (8) NFPA 2001, *Standard on Clean Agent Fire Extinguishing Systems*

A.40.2.6.2 See NFPA 850, *Recommended Practice for Fire Protection for Electric Generating Plants and High Voltage Direct Current Converter Stations*, for protection recommendations.

The travel distance exemption permitted by the footnote to Table 40.2.6.1 is meant to provide flexibility in determining the layout of the means of egress system in a single-story industrial building with a large floor area that houses a low- or ordinary-hazard general industrial occupancy. The exemption is limited to use in one-story buildings. Any stairs or other impediments to the rapid movement of occupants would result in slower evacuation of the building and increase the probability of exposure to smoke or fire. The exemption requires a performance-based

Table 40.2.6.1 Maximum Travel Distance to Exits

Level of Protection	General Industrial Occupancy		Special-Purpose Industrial Occupancy		High Hazardz Industrial Occupancy	
	ft	m	ft	m	ft	m
Protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1)	250 <sup>†</sup>	76 <sup>†</sup>	400	122	75	23
Not protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1)	200	61	300	91	NP	NP

NP: Not permitted.

<sup>†</sup>In one-story buildings, a travel distance of 400 ft (122 m) is permitted, provided that a performance-based analysis demonstrates that safe egress can be accomplished.

analysis to demonstrate that safe egress can be accomplished. NFPA 204, *Standard for Smoke and Heat Venting*,<sup>10</sup> might be of assistance. In addition, NFPA 92, *Standard for Smoke Control Systems*,<sup>11</sup> can be consulted. Also see [Chapter 5](#) for details on performance-based designs.

The construction of tunnels and elevated means of egress that originate from the center of an industrial building with an extensive floor area is rarely attempted. Only a handful of buildings have ever been provided with such egress facilities, and most were World War II era airframe manufacturing buildings of massive size. In most industrial buildings, it is not practicable or economical to construct exit tunnels or overhead passageways. These special types of means of egress are not easily altered if modifications are necessary to adjust to changes in the layout of the facility. In addition, the construction costs for tunnels and elevated passageways are high due to the special design features required to ensure their safety, including fire resistance-rated supports for the elevated passageways, waterproofing, and other features necessary to maintain the integrity of underground tunnels. Another negative factor in such construction is the confining nature of a tunnel or an elevated passage, which tends to discourage the use of these means of egress.

The use of horizontal exits that pass through fire walls is common in many industrial occupancies. The provisions in [Chapter 7](#) are required to be fully considered to ensure the safe use of horizontal exits. A common violation of the provisions of [Chapter 7](#) is the failure to provide the proper type of fire door in a horizontal exit fire barrier. A horizontal-sliding fire door is not an acceptable life safety feature. Such a door is permitted in existing installations in accordance with [40.2.2.2.5](#), but, even then, the door is not credited with protecting the opening for the purposes of this *Code*. If the horizontal exit is to be used from both sides of a fire wall, careful consideration of the direction of door swing is necessary to ensure that the *Code* will recognize such use. In many instances, two doors swinging in opposite directions will be required, so that the exit is permitted to be used as a means of egress from both sides of the fire wall. See [7.2.1.4](#), [7.2.4.3.8](#), and [40.2.2.5](#).

Low hazard and ordinary hazard special-purpose industrial occupancies, which are characterized by large, specialized equipment and low occupant load, are permitted an increase in travel distance beyond that allowed for low hazard and ordinary hazard general industrial occupancies. [Table 40.2.6.1](#) permits an increase to 300 ft (91 m) if the building is not sprinklered, and an increase to 400 ft (122 m) if the building is protected throughout by an approved, supervised automatic sprinkler system.

The provision of [40.2.6.2](#), which is new to the 2015 edition of the *Code*, allows a maximum travel distance of 400 ft (122 m) in power-generation buildings, provided that the building is sprinklered and all special hazards associated with the facility are protected in accordance with the noted, applicable standards. Determination of what constitutes a special hazard and

the appropriate protection will likely require a comprehensive engineering analysis of the facility and its processes for review and approval by the authority having jurisdiction.

**40.2.7 Discharge from Exits.** Discharge from exits shall be in accordance with [Section 7.7](#).

**40.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with [Section 7.8](#) or with natural lighting that provides the required level of illumination in structures occupied only during daylight hours.

#### 40.2.9\* Emergency Lighting.

**A.40.2.9** The authority having jurisdiction should review the facility and designate the stairs, aisles, corridors, ramps, and passageways that should be required to be provided with emergency lighting. In large locker rooms or laboratories using hazardous chemicals, for example, the authority having jurisdiction should determine that emergency lighting is needed in the major aisles leading through those spaces.

**40.2.9.1** Emergency lighting shall be provided in accordance with [Section 7.9](#).

**40.2.9.2** Emergency lighting shall not be required for any of the following:

- (1) Special-purpose industrial occupancies without routine human habitation
- (2) Structures occupied only during daylight hours, with skylights or windows arranged to provide the required level of illumination on all portions of the means of egress during such hours

The intent of [40.2.8](#) is not to require the installation of extensive and unneeded illumination systems in industrial occupancies. Illumination is required for the exit access, which is limited to designated aisles, corridors, and passageways that lead to an exit. No requirement is specified for the provision of illumination throughout the building, which in many industrial occupancies would involve lighting an extensive floor area. The purpose of the lighting system is to ensure that occupants are able to see the means of egress, not to illuminate the operation of production facilities.

In addition, the *Code* does not require illumination of the means of egress if the building is occupied during daylight hours only and the building, including stairways, has sufficient windows and skylights to ensure natural illumination. The authority having jurisdiction should make certain that the building is not occupied after daylight hours.

The exemptions of [40.2.9.2](#) for emergency lighting are included for the same reasons that illumination of the means of egress is not required (see [40.2.8](#)). [Paragraph 40.2.9.2\(1\)](#) addresses special-purpose industrial occupancies that are not routinely occupied. There is no need to install an extensive and costly emergency lighting system in a normally unoccupied building.

**40.2.10 Marking of Means of Egress.** Means of egress shall have signs in accordance with [Section 7.10](#).

#### 40.2.11 Special Means of Egress Features.

**40.2.11.1 Reserved.**

**40.2.11.2 Lockups.**

**40.2.11.2.1** Lockups in new industrial occupancies shall comply with the requirements of [22.4.5](#).

**40.2.11.2.2** Lockups in existing industrial occupancies, other than approved existing lockups, shall comply with the requirements of [23.4.5](#).

Where an industrial occupancy is provided with a lockup for security purposes, it must meet the provisions of [22/23.4.5](#), as specified in [40.2.11.2](#). The lockup criteria require the application of some of the concepts of detention and correctional occupancies to other occupancies where persons might be detained for security purposes, without classifying the lockup as a detention and correctional occupancy. See [22/23.4.5](#) and related commentary for details on the lockup provisions.

## 40.3 Protection

**40.3.1 Protection of Vertical Openings.** Any vertical opening shall be protected in accordance with [Section 8.6](#), unless otherwise permitted by one of the following:

- (1) In special-purpose industrial and high-hazard industrial occupancies where unprotected vertical openings exist and are necessary to manufacturing operations, such openings shall be permitted beyond the specified limits, provided that every floor level has direct access to one or more enclosed stairs or other exits protected against obstruction by any fire or smoke in the open areas connected by the unprotected vertical openings.
- (2) Approved existing open stairs, existing open ramps, and existing escalators shall be permitted where connecting only two floor levels.
- (3) Approved, existing, unprotected vertical openings in buildings with low- or ordinary-hazard contents that are protected throughout by an approved automatic sprinkler system in accordance with [9.7.1.1\(1\)](#) shall be permitted, provided that the following conditions exist:
  - (a) The vertical opening does not serve as a required exit.
  - (b) All required exits consist of outside stairs in accordance with [7.2.2](#), smokeproof enclosures in accordance with [7.2.3](#), or horizontal exits in accordance with [7.2.4](#).
- (4) Vertical openings in accordance with [8.6.9.1](#) shall be permitted.
- (5) Vertical openings in accordance with [8.6.9.2](#) shall be permitted.

[Paragraph 40.3.1\(1\)](#) strictly limits the use of unprotected vertical openings in high hazard and special-purpose industrial occupancies. Direct access to one or more enclosed stairways or to other exits is required from any areas connected by unprotected vertical openings. This provision recognizes that many high hazard and special-purpose industrial occupancies require openings between floor levels to accommodate piping, conveyors, and other devices and equipment essential to the orderly operation of the facility. In most of these situations, full enclosure is not practical or feasible. In high hazard occupancies, the provision of two means of egress will, in most situations, be sufficient to comply with this exemption. In special-purpose industrial occupancies, additional exits or other special arrangements will normally be required for compliance with the provision that stairways and exits be protected against obstruction from fire and smoke in open areas connected by unprotected vertical openings.

[Paragraph 40.3.1\(2\)](#) limits the use of existing open stairways, existing open ramps, and existing escalators that are unenclosed or unprotected by permitting them to connect only two floors. An existing open stairway connecting three floors would have to be enclosed, protected, or permitted by another of the exemptions to [40.3.1](#).

[Paragraph 40.3.1\(3\)](#) recognizes that an existing industrial occupancy might contain unprotected vertical openings and still provide a reasonable level of safety to life if the building houses only low or ordinary hazard contents and is protected by a complete automatic sprinkler system. Smokeproof enclosures and outside stairways (the only types of vertical exits permitted by this exemption) must be fully enclosed or protected against vertical fire spread and must meet the requirements of [Chapter 7](#). The unenclosed vertical openings are not permitted to serve as part of the means of egress, although they can remain as convenience openings and stairways to be used for normal operations.

[Paragraphs 40.3.1\(4\)](#) and [40.3.1\(5\)](#) permit convenience openings subject to the provisions of [8.6.9.1](#) and [8.6.9.2](#), respectively. Recognition of the [8.6.9.2](#) convenience stair opening permits an open stair connecting an unlimited number of stories, provided that the openings are protected by the draftstop and closely spaced sprinkler method detailed in NFPA 13, *Standard for the Installation of Sprinkler Systems*. See [8.6.9.2](#) and the related commentary for additional details.

#### 40.3.2\* Protection from Hazards.

**A.40.3.2** Emergency lighting should be considered where operations require lighting to perform orderly manual emergency operation or shutdown, maintain critical services, or provide safe start-up after a power failure.

**40.3.2.1** All high hazard industrial occupancies, operations, or processes shall have approved, supervised automatic extinguishing systems in accordance with [Section 9.7](#) or other protection

appropriate to the particular hazard, such as explosion venting or suppression.

**40.3.2.2** Protection in accordance with **40.3.2.1** shall be provided for any area subject to an explosion hazard in order to minimize danger to occupants in case of fire or other emergency before they have time to use exits to escape.

**40.3.2.3** Activation of the fire-extinguishing or suppression system required by **40.3.2.1** shall initiate the required building fire alarm system in accordance with **40.3.4.3.4**.

**40.3.2.4** Hazardous areas in industrial occupancies protected by approved automatic extinguishing systems in accordance with **Section 9.7** shall be exempt from the smoke-resisting enclosure requirement of **8.7.1.2**.

**40.3.2.5** Commercial cooking equipment shall be protected in accordance with NFPA 96, *Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations*. (See *Section 9.2.3*.)

The intent of **40.3.2** is to provide for the life safety of the occupants of industrial buildings by controlling the risk associated with hazardous operations. The alternatives offered in **40.3.2** are not all-inclusive, and a proper fire protection engineering solution might not incorporate the listed provisions. The *Code* intends to allow for engineering judgment in a wide range of potentially hazardous situations, including some where protection might be limited. The intent of **40.3.2** is also broad in application, because, in many highly hazardous operations, an explosion might be immediately preceded by a fire or other emergency, such as an overheated reactor vessel, an exothermic reaction, or increased pressure. Because such conditions might initiate an explosion, depending on the process and arrangement of the equipment, immediate egress from the facility might be necessary. If fire or other emergencies are likely to develop rapidly into an explosion, adequate precautions are necessary for life safety. Where a sprinkler system is used to provide the protection required by **40.3.2.1**, it must be electrically supervised.

In many modern facilities, provisions that prove adequate for the life safety of occupants might already be included for process control and property protection, and any additional measures will not increase the life safety of operators to an appreciable degree.

The NFPA *Fire Protection Handbook* discusses the basic principles of explosion prevention, venting, and suppression. The applicable chapters also contain an extensive bibliography on the subject. Requirements for the design and use of vents to limit pressures developed by explosions are specified in NFPA 68, *Standard on Explosion Protection by Deflagration Venting*.<sup>12</sup> Standards for explosion prevention systems are found in NFPA 69, *Standard on Explosion Prevention Systems*.<sup>13</sup>

**Paragraph 8.7.1.2** requires that, where a new hazardous area is protected by automatic sprinklers, the hazardous area must be

enclosed by smoke partitions rather than with fire barriers with a 1-hour fire resistance rating and doors with a 45-minute fire protection rating. **Paragraph 40.3.2.4** exempts hazardous areas in industrial occupancies from the requirement for smoke partitions if those areas are protected by automatic sprinklers. For consistency, similar wording appears in **8.7.1.2(2)**.

### 40.3.3 Interior Finish.

**40.3.3.1 General.** Interior finish shall be in accordance with **Section 10.2**.

**40.3.3.2 Interior Wall and Ceiling Finish.** Interior wall and ceiling finish materials complying with **Section 10.2** shall be Class A, Class B, or Class C in operating areas and shall be as required by **7.1.4** in exit enclosures.

### 40.3.3.3 Interior Floor Finish.

**40.3.3.3.1** Interior floor finish in exit enclosures and in exit access corridors shall be Class I or Class II in accordance with **10.2.7.4**.

**40.3.3.3.2** Interior floor finish in areas other than those specified in **40.3.3.3.1** shall not be required to comply with **Section 10.2.7**.

### 40.3.4 Detection, Alarm, and Communications Systems.

**40.3.4.1 General.** A fire alarm system shall be required in accordance with **Section 9.6** for industrial occupancies, unless the total occupant load of the building is under 100 persons and unless, of these, fewer than 25 persons are above or below the level of exit discharge.

**40.3.4.2 Initiation.** Initiation of the required fire alarm system shall be by any of the following means:

- (1) Manual means in accordance with **9.6.2.1(1)**
- (2) Approved automatic fire detection system in accordance with **9.6.2.1(2)** throughout the building, plus a minimum of one manual fire alarm box in accordance with **9.6.2.6**
- (3) Approved, supervised automatic sprinkler system in accordance with **9.6.2.1(3)** throughout the building, plus a minimum of one manual fire alarm box in accordance with **9.6.2.6**

### 40.3.4.3 Notification.

**40.3.4.3.1** The required fire alarm system shall meet one of the following criteria:

- (1) It shall provide occupant notification in accordance with **9.6.3**.
- (2) It shall sound an audible and visible signal in a constantly attended location for the purposes of initiating emergency action.

**40.3.4.3.2** Positive alarm sequence in accordance with **9.6.3.4** shall be permitted.

**40.3.4.3.3** Existing presignal systems in accordance with **9.6.3.3** shall be permitted.

**40.3.4.3.4** In high hazard industrial occupancies, as described in **40.1.2.1.3**, the required fire alarm system shall automatically initiate an occupant evacuation alarm signal in accordance with **9.6.3**.

The requirements of **40.3.4.3.1** and **40.3.4.3.4** specify two separate and distinct provisions for audible alarms activated by the fire alarm system required by **40.3.4.1**. In low and ordinary hazard industrial occupancies, the system is permitted to activate an evacuation alarm or to sound an alarm at a constantly attended location for the purpose of initiating emergency action (see **40.3.4.3.1**). This provision permits an interface between the alarm system and the plant's emergency organization. The alarm system is permitted to be controlled from a central security console or a similar location. The key feature is that the location from which the alarm sounds must be constantly staffed. This requirement is not intended to mandate the installation of supervisory service, such as that connected to a central station, but the location must be fully attended at all times when the building is occupied.

In high hazard occupancies, the alarm must be arranged to automatically provide evacuation signals (see **40.3.4.3.4**), because the safety of the occupants of these areas depends on their immediate notification of a fire.

Note that **40.3.4.3.3** recognizes existing presignal systems but not new presignal systems. If an automatic form of delay is desired for an existing alarm system that does not already have a presignal feature, or for a new alarm system, the more reliable system feature known as *positive alarm sequence* is permitted by **40.3.4.3.2**. The positive alarm sequence option might be applied to the high hazard industrial occupancies addressed in **40.3.4.3.4** for which an automatic form of occupant notification is needed. Also, positive alarm sequence might be used in industrial occupancies, other than those that are high hazard, where the provisions of **40.3.4.3.1(1)** are used instead of those of **40.3.4.3.1(2)**.

#### **40.3.5 Extinguishment Requirements. (Reserved)**

**40.3.6 Corridors.** The provisions of **7.1.3.1** shall not apply.

Without the exemption to the requirements of **7.1.3.1** provided by **40.3.6**, all new industrial occupancy corridors serving more than 30 persons would be required to have a 1-hour fire resistance rating, with openings protected by 20-minute fire protection-rated door assemblies. The exemption to **7.1.3.1** is provided because of the ambulatory nature of occupants of industrial occupancies and the operational need for openings, even where corridors are provided.

---

## **40.4 Special Provisions**

**40.4.1 Limited-Access or Underground Structures.** Limited-access or underground structures shall comply with **Section 11.7**.

### **40.4.2 High-Rise Buildings.**

**40.4.2.1** New high-rise industrial occupancies shall comply with **Section 11.8**.

**40.4.2.2** The provisions of **11.8.5.2.4(2)** for jockey pumps and **11.8.5.2.4(3)** for air compressors serving dry-pipe and pre-action systems shall not apply to special-purpose industrial occupancies.

New high-rise industrial occupancy buildings are required to comply with **Section 11.8**. This reference to the entire **Section 11.8** "high-rise package" was new to the 2012 edition of the *Code*. In prior editions, new high-rise industrial occupancy buildings were required to comply only with the sprinkler system requirements of **Section 11.8** (all new high-rise buildings are now required to comply with **Section 11.8** in its entirety). Note that **40.4.2.2** exempts special-purpose industrial occupancies from the standby power requirement for automatic sprinkler system pressure maintenance (jockey) pumps and air compressors.

**40.4.3 Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers in accordance with **8.7.3.3** shall be permitted.

The provision of **40.4.3** is new to the 2015 edition of the *Code*. It recognizes the use of alcohol-based hand-rub (ABHR) dispensers in business occupancies, provided that the detailed criteria of **8.7.3.3** are met.

---

## **40.5 Building Services**

**40.5.1 Utilities.** Utilities shall comply with the provisions of **Section 9.1**.

**40.5.2 Heating, Ventilating, and Air-Conditioning.** Heating, ventilating, and air-conditioning equipment shall comply with the provisions of **Section 9.2**.

**40.5.3 Elevators, Escalators, and Conveyors.** Elevators, escalators, and conveyors shall comply with the provisions of **Section 9.4**.

**40.5.4 Waste Chutes, Incinerators, and Laundry Chutes.** Waste chutes, incinerators, and laundry chutes shall comply with the provisions of **Section 9.5**.

---

## **40.6\* Special Provisions for Aircraft Servicing Hangars**

**A.40.6** For further information on aircraft hangars, see NFPA 409, *Standard on Aircraft Hangars*.

**40.6.1** The requirements of **Sections 40.1** through **40.5** shall be met, except as modified by **40.6.2** through **40.6.4**.

**40.6.2** The requirements for exits from aircraft servicing areas shall comply with 40.6.2.1 through 40.6.2.4.

**40.6.2.1** There shall be not less than two means of egress from each aircraft servicing area.

**40.6.2.2** Exits from aircraft servicing areas shall be provided at intervals not exceeding 150 ft (46 m) on all exterior walls.

**40.6.2.3** Where horizontal exits are provided, doors shall be provided in the horizontal exit fire barrier at intervals not exceeding 100 ft (30 m).

**40.6.2.4** Where dwarf, or “smash,” doors are provided in doors that accommodate aircraft, such doors shall be permitted for compliance with 40.6.2.1 through 40.6.2.3.

**40.6.3** Means of egress from mezzanine floors in aircraft servicing areas shall be arranged so that the travel distance to the nearest exit from any point on the mezzanine does not exceed 75 ft (23 m), and such means of egress shall lead directly to a properly enclosed stair discharging directly to the exterior, to a suitable cutoff area, or to outside stairs.

**40.6.4** Dead ends shall not exceed 50 ft (15 m) for other than high-hazard contents areas and shall not be permitted for high-hazard contents areas.

Section 40.6, which addresses aircraft servicing hangars, is nearly identical to Section 42.6, which addresses aircraft storage hangars. Because aircraft hangars are used for both storage and repair, corresponding requirements can be found in both Chapters 40 and 42.

---

## 40.7 Operating Features

**40.7.1 Upholstered Furniture and Mattresses.** The provisions of 10.3.2 shall not apply to upholstered furniture and mattresses.

**40.7.2 Soiled Linen and Trash Receptacles.** The requirements of 10.3.9 for containers for waste, or linen with a capacity of 20 gal (75.7 L) or more shall not apply.

**40.7.3 Inspection of Door Openings.** Door openings shall be inspected in accordance with 7.2.1.15.

New to the 2015 edition of the Code, 40.7.3 mandates the annual inspection of egress doors equipped with panic hardware or fire exit hardware, doors in exit enclosures, electrically controlled egress doors, and doors with special locking arrangements, via the reference to 7.2.1.15. The intent is to ensure that such doors, which might not be used routinely, operate properly in an emergency. See 7.2.1.15 and its associated commentary for additional details on the required inspection.

# Reserved

Typically, the occupancy chapters are paired so that the even-numbered chapter in the pair addresses new facilities of the occupancy type and the odd-numbered chapter addresses existing facilities of the occupancy type. [Chapter 40](#), which precedes this chapter, addresses both new and existing industrial occupancies in a single chapter. [Chapter 41](#) has been reserved to permit the chapter on new storage occupancies to be assigned an even number (i.e., [Chapter 42](#)). The reserved chapter number might be used at a future date if the requirements for industrial occupancies are split into a pair of chapters — one for new construction and one for existing buildings.

# Storage Occupancies

Storage occupancies include all buildings or structures used primarily for the storage or sheltering of goods, merchandise, products, or vehicles. The following are examples of storage occupancies:

1. Barns
2. Hangars (for aircraft storage only)
3. Freight terminals
4. Bulk oil storage
5. Truck and marine terminals
6. Parking garages
7. Cold storage
8. Grain elevators
9. Warehouses

Chapter 42 covers a range of facilities used for storage of a wide variety of commodities. While the same life safety philosophy that prevails in the other occupancy chapters applies to storage occupancies, the protection scheme is less complicated, given the relatively small number of people who characteristically occupy a storage occupancy. Although some warehouse facilities are substantially larger than buildings housing other occupancies, few people typically occupy them.

Once the basic characteristics of a given storage occupancy are determined, the general protection measures of Sections 42.2 and 42.3 can be applied. In addition to these measures, the supplementary provisions that are specific to a particular type of storage occupancy can be applied. These provisions include those for aircraft storage hangars (Section 42.6), grain and other bulk storage elevators (Section 42.7), and parking structures (Section 42.8).

## 42.1 General Requirements

### 42.1.1 Application.

42.1.1.1 The requirements of this chapter shall apply to both new and existing storage occupancies.

Note that Chapter 42 applies to both new and existing storage occupancies. Where the requirements vary, exemptions that apply to existing storage occupancies are often provided, or additional requirements that are limited to new storage occupancies are specified.

Minor storage that is incidental to another occupancy is treated as part of the other occupancy. See 6.1.14.1.3.

42.1.1.2 **Administration.** The provisions of Chapter 1, Administration, shall apply.

42.1.1.3 **General.** The provisions of Chapter 4, General, shall apply.

42.1.1.4 Storage occupancies shall include all buildings or structures used primarily for the storage or sheltering of goods, merchandise, products, or vehicles.

Life safety provisions for storage occupancies are not extensive, because the number of occupants is generally low, and many of those who occupy such a structure are present for only short periods of time. Furthermore, employees of storage occupancies normally do not remain in one location; instead, their assignments require that they move about and perform activities of a short-term nature.

Due to the special characteristics of storage occupancies, a number of provisions are included in the Code to modify, as required, those provisions that normally apply to occupancies with larger populations.

### 42.1.2 Classification of Occupancy.

42.1.2.1 Storage occupancies shall include all buildings and structures or parts thereof with occupancy as defined in 6.1.13.

42.1.2.2 Incidental storage in another occupancy shall not be the basis for overall occupancy classification.

42.1.2.3 Storage occupancies or areas of storage occupancies that are used for the purpose of packaging, labeling, sorting, special handling, or other operations requiring an occupant load greater than that normally contemplated for storage shall be classified as industrial occupancies. (See Chapter 40.)

The purpose of 42.1.2.3 is to provide suitable egress facilities for storage occupancies, or portions of storage occupancies, with a population greater than normally expected. It is common practice to employ large numbers of people in a storage building for industrial types of operations, such as labeling, sorting, or packaging. Such operations require enhanced life safety features in accordance with the provisions of Chapter 40 for industrial occupancies.

42.1.3 **Multiple Occupancies.** All multiple occupancies shall be in accordance with 6.1.14.

Subsection 42.1.3 directs the user to the multiple occupancy provisions of 6.1.14, which permit protecting the multiple

occupancies either as mixed or as separated. If the multiple occupancy building is protected via the provisions of 6.1.14.4 for separated uses, the required separation, in terms of fire barrier rating, is specified by Table 6.1.14.4.1(a) and Table 6.1.14.4.1(b).

#### 42.1.4 Definitions.

**42.1.4.1 General.** For definitions, see Chapter 3, Definitions.

**42.1.4.2 Special Definitions.** Special terms applicable to this chapter are defined in Chapter 3.

#### 42.1.5 Classification of Hazard of Contents.

**42.1.5.1** Contents of storage occupancies shall be classified as low hazard, ordinary hazard, or high hazard in accordance with Section 6.2, depending on the quantity and character of the materials stored, their packaging, and other factors.

**42.1.5.2** Hazardous materials that exceed the maximum allowable quantities (MAQ) as permitted in the fire code shall be classified as high-hazard contents.

No basis for comparison exists between the hazard categories for storage facilities in NFPA 13, *Standard for the Installation of Sprinkler Systems*,<sup>1</sup> and those of the *Life Safety Code*. The hazard categories for storage facilities contained in NFPA 13 are established for the design of automatic sprinkler systems.

There is a strong inclination to use the potential for rapid fire growth associated with high-piled or racked storage as justification for establishing strict life safety provisions. However, the arrangement of buildings typical for this type of storage is adequate to allow safe and rapid egress at the first notification or discovery of fire. If a building is not protected by automatic sprinklers, the *Code* provides adequate provisions — such as those for travel distance to an exit — to help ensure the safety of the occupants.

The provision of 42.1.5.2, which is new to the 2015 edition of *Code*, specifies that, where hazardous materials are stored in quantities exceeding the maximum allowable quantities (MAQs) established by the applicable fire code, they are to be treated as high hazard. As an example, Chapter 60 of NFPA 1, *Fire Code*,<sup>2</sup> establishes MAQs for numerous types of hazardous materials. It is noted, however, that the specified MAQs are not absolute maximums; rather, they represent the maximum quantity of a material permitted in a single control area without requiring additional protection features. Where the MAQ is exceeded in a control area, additional protection requirements are specified by NFPA 1, depending on the characteristics of the hazard.

#### 42.1.6 Minimum Construction Requirements. (Reserved)

Some occupancy chapters, such as Chapters 18 and 19, which address the life safety needs of nonambulatory health care occupants, specify minimum building construction type requirements to ensure structural integrity for the time needed for a lengthy evacuation or for safe refuge within the building. No

minimum construction requirements are imposed by Chapter 42, because, characteristically, storage occupancies have few occupants, and those few occupants are ambulatory.

**42.1.7\* Occupant Load.** The occupant load, in number of persons for whom means of egress and other provisions are required, shall be determined on the basis of the maximum probable population of the space under consideration.

**A.42.1.7** There is no occupant load factor specified for storage occupancies. Rather, the probable maximum number of persons present needs to be considered in determining the occupant load.

Although 42.1.7 and Table 7.3.1.2 do not provide an occupant load factor for calculating a minimum occupant load to size means of egress systems in a storage occupancy, it is necessary to establish an occupant load. The occupant load is determined on the basis of the maximum number of persons expected to occupy the storage occupancy under any anticipated facility operation. Due to the low occupant load characteristic of storage occupancies, compliance with other *Code* provisions — such as minimum widths for doors, corridors, or passageways; minimum number of exits; and travel distance allowances — generally yields means of egress systems capable of handling the actual occupant load, without specifically considering the occupant load when the means of egress is designed. Considering a door with a clear width of 32 in. (810 mm) has an egress capacity of 160 persons [based on 0.2 in. (5 mm) per person], egress capacity for nearly all storage occupancies is moot due to the anticipated low occupant load.

---

## 42.2 Means of Egress Requirements

### 42.2.1 General.

**42.2.1.1** Each required means of egress shall be in accordance with the applicable portions of Chapter 7.

**42.2.1.2\*** Normally unoccupied utility chases that are secured from unauthorized access and are used exclusively for routing of electrical, mechanical, or plumbing equipment shall not be required to comply with the provisions of Chapter 7.

**A.42.2.1.2** Horizontal and vertical utility chases in large industrial buildings used for routing of piping, ducts, and wiring must provide a reasonable level of access for occasional maintenance workers but do not warrant compliance with the comprehensive egress requirements of Chapter 7. Minimum access in these cases is governed by the electrical and mechanical code; 40.2.5.2, Industrial Equipment Access; and the Occupational Safety and Health Administration (OSHA) for facilities in the United States. Utility chases governed by 42.2.1.2 might involve tunnels or large open spaces located above or below occupied floors; however, such spaces differ from mechanical equipment rooms, boiler rooms, and furnace rooms, based on the anticipated frequency

of use by maintenance workers. Portions of utility chases where the anticipated presence of maintenance workers is routine are not intended to be included by this paragraph.

## 42.2.2 Means of Egress Components.

**42.2.2.1 Components Permitted.** Components of means of egress shall be limited to the types described in 42.2.2.2 through 42.2.2.12.

### 42.2.2.2 Doors.

**42.2.2.2.1** Doors complying with 7.2.1 shall be permitted.

**42.2.2.2.2** Delayed-egress locks complying with 7.2.1.6.1 shall be permitted.

**42.2.2.2.3** Access-controlled egress doors complying with 7.2.1.6.2 shall be permitted.

**42.2.2.2.4** Locks in accordance with 7.2.1.6.3 shall be permitted.

**42.2.2.2.5** Approved existing horizontal-sliding fire doors shall be permitted in the means of egress where they comply with all of the following conditions:

- (1) They are held open by fusible links.
- (2) The fusible links are rated at not less than 165°F (74°C).
- (3) The fusible links are located not more than 10 ft (3050 mm) above the floor.
- (4) The fusible links are in immediate proximity to the door opening.
- (5) The fusible links are not located above a ceiling.
- (6) The door is not credited with providing any protection under this Code.

Use of delayed-egress locking systems in accordance with the requirements of 7.2.1.6.1 is permitted on any door in recognition of the security needs of some storage occupancies. In effect, the allowable 15-second or 30-second delay will be experienced only under non-fire conditions or very early in a fire's growth, because the door must be usable immediately upon sprinkler operation, smoke or heat detection, and loss of power that controls the locking mechanism. The building must be protected throughout by an approved, supervised automatic sprinkler system or an approved, supervised automatic fire detection system.

Paragraph 42.2.2.2.3 recognizes the use of access-controlled egress doors in storage occupancies as a security measure that does not compromise the use of the means of egress.

New to the 2015 edition of the Code, the provision of 42.2.2.2.4 recognizes electrically locking door assemblies that separate the elevator lobby from the exit access in storage occupancies in accordance with 7.2.1.6.3. This provision permits an arrangement such that no exit is directly accessible from an elevator lobby without traversing an area accessed by doors that might be locked. Note that the use of the elevator lobby special locking arrangement requires the building to be protected by an

**Exhibit 42.1**

Existing horizontal-sliding fire door in accordance with 42.2.2.2.5.

approved, supervised automatic sprinkler system per 7.2.1.6.3(3). See 7.2.1.6.3 and its associated commentary for additional details.

Horizontal-sliding doors exist in many storage occupancies for property protection purposes. Although the Code normally does not recognize these doors within the required means of egress, 42.2.2.2.5 makes an exemption for existing horizontal-sliding fire doors. See Exhibit 42.1. By requiring the fusible link to be positioned in immediate proximity to the door opening, rated 165°F (74°C) or higher, and located not more than 10 ft (3050 mm) above the floor, the Code helps to ensure that the door will remain open until rising temperatures make it unsafe to pass through the door opening. Because the door will not close early in the fire development, the door gets no credit as a fire door for life safety purposes. However, the door might serve as a means of property protection; for example, to create separate fire areas to limit the maximum foreseeable loss for insurance purposes.

### 42.2.2.3 Stairs.

**42.2.2.3.1** Stairs shall comply with 7.2.2 and shall be permitted to be modified by any of the following:

- (1) Noncombustible grated stair treads and noncombustible grated landing floors shall be permitted.
- (2) Industrial equipment access stairs in accordance with 40.2.5.3 shall be permitted.

**42.2.2.3.2** Spiral stairs complying with 7.2.2.2.3 shall be permitted.

**42.2.2.3.3** Existing winders complying with 7.2.2.2.4 shall be permitted.

Paragraph 42.2.2.3.1(1) exempts stair treads and landings in storage occupancies from the provisions of 7.2.2.3.3.1, which would

otherwise require that all stair treads and stair landings be solid. Although the requirement for solid treads and landings is intended to prevent occupants from avoiding the use of the stairs because they become afraid when they are able to see through the openings to the floor or ground below, occupants of storage occupancies are usually more familiar, and thus more comfortable, with grated or expanded metal treads and landings. There is also a high degree of certainty that occupants will be wearing shoes appropriate for the environment, and not high heels that could get stuck in the grate openings. The grated walking surfaces provide slip resistance in what are sometimes greasy and slippery surroundings.

Paragraph 42.2.2.3.1(2) directs the user to the special provisions for industrial equipment access stairs in 40.2.5.3, which are permitted to be used in storage occupancies. The provisions of 40.2.5.3 differ from the requirements of Chapter 7. See the commentary following 40.2.5.3.2.

**42.2.2.4 Smokeproof Enclosures.** Smokeproof enclosures complying with 7.2.3 shall be permitted.

Paragraph 42.2.2.4 does not mandate the use of smokeproof enclosures. However, it does recognize a smokeproof enclosure as part of the means of egress system in a storage occupancy if that smokeproof enclosure meets the requirements of 7.2.3. For an example of an occupancy requiring a smokeproof enclosure, see 31.2.11.1, which specifies that existing nonsprinklered and partially sprinklered high-rise apartment buildings are required to be provided with smokeproof enclosures in accordance with 7.2.3.

#### 42.2.2.5 Horizontal Exits.

**42.2.2.5.1** Horizontal exits complying with 7.2.4 shall be permitted.

**42.2.2.5.2\*** In horizontal exits where the opening is protected by a fire door assembly on each side of the wall in which it is located, one fire door shall be of the swinging type, as provided in 7.2.4.3.8, and the other shall be permitted to be an automatic-sliding fire door that shall be kept open whenever the building is occupied.

**A.42.2.2.5.2** The customary building code requirement for fire doors on both sides of an opening in a fire wall is permitted to be met by having an automatic-sliding fire door on one side and a self-closing fire door swinging out from the other side of the wall. This arrangement qualifies only as a horizontal exit from the sliding door side. For further information, see A.7.2.4.3.10.

Paragraph 42.2.2.5.1 does not mandate the use of horizontal exits. However, it does recognize a horizontal exit as part of the means of egress system in a storage occupancy if that horizontal exit meets the requirements of 7.2.4, as modified by 42.2.2.5.2.

Paragraphs 42.2.2.5.2 and A.42.2.2.5.2 recognize the common practice of combining a horizontal exit that is used for life safety with a fire barrier of a significant fire resistance rating that

**Exhibit 42.2**

*Combination swinging and sliding doors permitted by 42.2.2.5.2.*

is used for property protection. Opening protectives for such a fire barrier can require the use of a set of two doors to achieve the required fire protection rating. It is impractical for both doors to swing in the same direction without interfering with each other; yet, operation of two doors that swing in opposite directions is cumbersome for daily or frequent use. One swinging and one sliding door, as shown in Exhibit 42.2, provide an acceptable arrangement for day-to-day functioning of the building. The open sliding door does not compromise life safety, because by the time its fusible link mechanism releases the door and allows it to close, temperatures in the vicinity of the door opening render use of the door impractical.

#### 42.2.2.6 Ramps.

**42.2.2.6.1** Ramps complying with 7.2.5 shall be permitted.

**42.2.2.6.2** Industrial equipment access ramps in accordance with 40.2.5.3 shall be permitted.

Paragraph 42.2.2.6.1 does not mandate the use of ramps in storage occupancies. However, it does recognize a ramp as part of the means of egress system if that ramp meets the requirements of 7.2.5.

Paragraph 42.2.2.6.2 recognizes the industrial access ramp provisions of 40.2.5.3, which are a relaxation of the ramp provisions of 7.2.5. For example, Table 40.2.5.3.1 permits a minimum ramp width of 22 in. (560 mm) instead of the 44 in. (1120 mm) minimum of Table 7.2.5.3(a). However, the industrial equipment access provisions of 40.2.5.3 include the restriction that the egress component, in this case a ramp, is to serve not more than 20 persons.

**42.2.2.7 Exit Passageways.** Exit passageways complying with 7.2.6 shall be permitted.

Paragraph 42.2.2.7 does not mandate the use of exit passageways in storage occupancies. However, it does recognize an exit passageway as part of the means of egress system if that exit passageway meets the requirements of 7.2.6.

**42.2.2.8 Fire Escape Stairs.** Existing fire escape stairs complying with 7.2.8 shall be permitted.

**42.2.2.9 Fire Escape Ladders.**

**42.2.2.9.1** Fire escape ladders complying with 7.2.9 shall be permitted.

**42.2.2.9.2** Fixed industrial stairs in accordance with the minimum requirements for fixed stairs in ANSI A1264.1, *Safety Requirements for Workplace Walking/Working Surfaces and Their Access; Workplace Floor, Wall and Roof Openings; Stairs and Guardrail Systems*, shall be permitted where fire escape ladders are permitted in accordance with 7.2.9.1.

The geometry associated with the incline angle and the size and shape of surfaces intended for foot placement on fire escape ladders falls within the range permitted for fixed industrial stairs. However, most fixed industrial stairs meet criteria that result in a safer arrangement than that provided by the fire escape ladder detailed in 7.2.9. Therefore, 42.2.2.9.2 recognizes fixed industrial stairs as a substitute for fire escape ladders.

**42.2.2.10 Slide Escapes.** Existing slide escapes complying with 7.2.10 shall be permitted.

The intent of 42.2.2.10 is to permit the continued use of existing slide escapes, which are a common means of egress from areas that house explosives or other highly hazardous materials in warehouses associated with the chemical industry. The provision permits slide escapes to be considered as part of the required means of egress from existing storage occupancies only if the slide escape meets the requirements of 7.2.10.

**42.2.2.11 Alternating Tread Devices.** Alternating tread devices complying with 7.2.11 shall be permitted.

The provisions of 7.2.11, in effect, limit the use of alternating tread devices to those locations where the Code recognizes the use of fire escape ladders. See 42.2.2.9.1, 7.2.9, and 7.2.11.

**42.2.2.12 Areas of Refuge.** Areas of refuge complying with 7.2.12 shall be permitted.

**42.2.3 Capacity of Means of Egress.** The capacity of means of egress shall be in accordance with Section 7.3.

Prior to the 1991 edition, the Code required a minimum 44 in. (1120 mm) width for corridors and passageways within the required means of egress of storage occupancies. A corridor or passageway of that minimum width would have provided egress capacity for 220 persons [i.e., 44 in./0.2 in. per person (approximately 1120 mm/5 mm per person) in accordance with Table 7.3.3.1 for level egress components]. That requirement resulted in excessively large egress systems, relative to the

occupant load, in many storage occupancies. The requirement was eliminated, and the minimum 36 in. (915 mm) width requirement of 7.3.4.1(2), which addresses the minimum width of any exit access, was made applicable to storage occupancies. Exit access is required to be wider than 36 in. (915 mm) only if a corridor or passageway in a storage occupancy is to provide capacity for more than 180 persons [i.e., 36 in./0.2 in. per person (approximately 915 mm/5 mm per person)].

See the commentary following A.42.1.7 for details on the determination of occupant load in a storage occupancy.

**42.2.4 Number of Means of Egress.** The number of means of egress shall comply with 42.2.4.1 through 42.2.4.3. (See also Section 7.4.)

**42.2.4.1** The number of means of egress shall comply with any of the following:

- (1) In low hazard storage occupancies, a single means of egress shall be permitted from any story or section.
- (2) In ordinary hazard storage occupancies, a single means of egress shall be permitted from any story or section, provided that the exit can be reached within the distance permitted as a common path of travel.
- (3) All buildings or structures not complying with 42.2.4.1(1) or 42.2.4.1(2) and used for storage, and every section thereof considered separately, shall have not less than two separate means of egress as remotely located from each other as practicable.

**42.2.4.2** In new buildings, floors or portions thereof with an occupant load of more than 500 persons shall have the minimum number of separate and remote means of egress specified by 7.4.1.2.

Paragraphs 42.2.4.1(1) and (2) modify the requirement for two, separate, remotely located means of egress, due, in part, to the small number of employees typically found in a storage occupancy and the exemplary life safety fire record of such facilities. Paragraph 42.2.4.1(1) recognizes that a low hazard storage occupancy is not subject to a self-propagating fire and, therefore, considers a single means of egress to be safe. Paragraph 42.2.4.1(2) permits a single means of egress in an ordinary hazard storage occupancy if the total travel distance to the single exit does not exceed the 50 ft (15 m) or 100 ft (30 m) common path of travel allowance for nonsprinklered and sprinklered buildings, respectively (see Table 42.2.5). This allowance is made because such a single-exit arrangement is equivalent or superior to a two-exit arrangement that applies the maximum common path of travel allowance and subsequently requires additional travel distance to reach an exit.

In Exhibit 42.3, a single exit is depicted in Part (a). It is located within the distance permitted for common path of travel (see Table 42.2.5), as addressed by 42.2.4.1(2) for ordinary hazard storage occupancies, and creates a situation no more dangerous

Exhibit 42.3

Common path of travel in single exit building compared to that in two-exit building.

than the common path of travel shown as X1 to C1 in the two-exit building depicted in Part (b) of Exhibit 42.3.

**42.2.4.3** Areas with high hazard contents shall comply with Section 7.11.

**42.2.5 Arrangement of Means of Egress.** Means of egress, arranged in accordance with Section 7.5, shall not exceed that provided by Table 42.2.5.

By definition, no self-propagating fire can occur in low hazard contents. If a fire will not spread or continue to burn, building occupants will not be subject to an emergent need to egress the building by means of paths that avoid the fire. Therefore, the Code establishes no maximum dead-end corridor and no maximum common path of travel for storage occupancies with low hazard contents. See Section 6.2.

An ordinary hazard storage occupancy, despite its characteristically low occupant load, is not permitted to provide a common path of travel that forces an occupant to travel in only one direction for more than 50 ft (15 m) [100 ft (30 m) in a sprinklered building] without providing a route to a second, remotely located exit.

By definition, the potential for an extremely rapid-developing fire or an explosion is a characteristic of high hazard contents. If a fire spreads with extreme rapidity, building occupants will have an emergent need to egress the building by means of paths that avoid the fire. Therefore, the Code permits no dead-end corridors and no common path of travel for storage occupancies with high hazard contents, except as permitted by 7.11.4. See Section 6.2 and 7.11.4.

Table 42.2.5 Arrangements of Means of Egress

Level of Protection	Low Hazard Storage Occupancy	Ordinary Hazard Storage Occupancy		High Hazard Storage Occupancy
		ft	m	
<b>Dead-End Corridor</b>				
Protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1)	NL	100	30	Prohibited, except as permitted by 7.11.4
Not protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1)	NL	50	15	Prohibited, except as permitted by 7.11.4
<b>Common Path of Travel</b>				
Protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1)	NL	100	30	Prohibited, except as permitted by 7.11.4
Not protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1)	NL	50	15	Prohibited, except as permitted by 7.11.4

NL: Not limited.

**42.2.6\* Travel Distance to Exits.** Travel distance, measured in accordance with [Section 7.6](#), shall not exceed that provided by [Table 42.2.6](#).

**A.42.2.6** The travel distance to exits specified recognizes a low population density. Consideration should be given to locating areas that have a relatively high population, such as lunchrooms, meeting rooms, packaging areas, and offices, near the outside wall of the building to keep the travel distance to a minimum.

[Subsection 42.2.6](#) establishes limitations on travel distance for storage occupancies. Note that the provisions create a direct relationship between the level of hazard of contents housed within a building and its life safety requirements. Therefore, in low hazard storage occupancies, no limitation is imposed on travel distance.

The absence of travel distance restrictions for low hazard storage occupancies is reasonable, because the small fire risk posed by low hazard materials, coupled with the low number of occupants, provides a minimal risk to life safety. The imposition of restrictive provisions would not be consistent with good fire protection and reasonable life safety requirements, because the probability of fire is relatively low, and occupants are not expected to experience difficulty in evacuating the building. See [Section 6.2](#) for guidelines on the classification of low hazard contents.

As the level of hazard of contents increases, travel distance limitations are imposed. Storage buildings housing ordinary hazards and lacking sprinkler protection are limited to 200 ft (61 m) of travel distance to the nearest exit. A distance of 400 ft (122 m) is permitted if complete automatic sprinkler protection is provided. In high hazard storage occupancies, travel distance is restricted to a maximum of 75 ft (23 m) in nonsprinklered

buildings and 100 ft (30 m) if the building is equipped with a complete automatic sprinkler system.

The last entry in [Table 42.2.6](#) addresses an increase in travel distance for storage occupancies where flammable and combustible liquid products are stored and protected in accordance with NFPA 30, *Flammable and Combustible Liquids Code*.<sup>3</sup> Since the 1996 edition, NFPA 30 has provided adequate safeguards to permit increasing the travel distance allowance from 75 ft (23 m) to 150 ft (46 m). Flammable and combustible liquids storage facilities not in compliance with the 1996, 2000, 2003, 2008, 2012, or 2015 edition of NFPA 30 should not make use of the travel distance increase.

**42.2.7 Discharge from Exits.** Discharge from exits shall be in accordance with [Section 7.7](#).

#### 42.2.8 Illumination of Means of Egress.

**42.2.8.1** Means of egress shall be illuminated in accordance with [Section 7.8](#).

**42.2.8.2** In structures occupied only during daylight hours, means of egress shall be permitted to be illuminated with windows arranged to provide the required level of illumination on all portions of the means of egress during such hours, when approved by the authority having jurisdiction.

The intent of [42.2.8](#) is not to require the installation of extensive and unneeded illumination systems in storage occupancies. Illumination is required for exits and exit access, which is limited to designated aisles, corridors, and passageways that lead to an exit. Limiting the extent of the lighting system to egress areas eliminates the necessity for installing specialized lighting systems

**Table 42.2.6 Maximum Travel Distance to Exits**

Level of Protection	Low Hazard Storage Occupancy	Ordinary Hazard Storage Occupancy		High Hazard Storage Occupancy	
		ft	m	ft	m
Protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1)	NL	400	122	100	30
Not protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1)	NL	200	61	75	23
Flammable and combustible liquid products stored and protected in accordance with NFPA 30, <i>Flammable and Combustible Liquids Code</i>	NA	NA	NA	150	46

NL: Not limited. NA: Not applicable.

throughout storage areas, a practice that might be extremely costly while providing little or no return in safety to life.

**Paragraph 42.2.8.2** exempts the requirement for illumination systems if a building, including the stairways, is sufficiently lit during periods of occupancy by means of natural lighting. The term *windows*, as used in the text of the exemption, should not be interpreted literally. The term is meant to include skylights, open wall sections, and similar means of illumination by natural sources. The provisions are based on the fact that there is no need for a lighting system if the building is unoccupied during nondaylight hours.

**42.2.9 Emergency Lighting.** Emergency lighting shall be provided in normally occupied storage occupancies in accordance with **Section 7.9**, except for spaces occupied only during daylight hours with natural illumination in accordance with **42.2.8.2**.

The requirement for emergency lighting is exempted in storage occupancies that are naturally illuminated when occupied for the reasons stated in the commentary following **42.2.8.2**. The exemption permits circuit arrangements that disconnect power from emergency lighting systems when the building is unoccupied. In many warehouses, power is turned off during periods when the building is unoccupied. This power disconnection serves fire prevention, energy conservation, and security purposes.

**42.2.10 Marking of Means of Egress.** Means of egress shall have signs in accordance with **Section 7.10**.

**42.2.11 Special Means of Egress Features.**

**42.2.11.1 Reserved.**

**42.2.11.2 Lockups.**

**42.2.11.2.1** Lockups in new storage occupancies shall comply with the requirements of **22.4.5**.

**42.2.11.2.2** Lockups in existing storage occupancies, other than approved existing lockups, shall comply with the requirements of **23.4.5**.

If a storage occupancy is provided with a lockup for security purposes, it must meet the provisions of **22/23.4.5**, as specified in **42.2.11.2**. The lockup criteria require the application of some of the concepts of detention and correctional occupancies to other occupancies where persons might be detained for security purposes, without classifying the lockup as a detention and correctional occupancy. See **22/23.4.5** and related commentary for details on the lockup provisions.

## 42.3 Protection

**42.3.1 Protection of Vertical Openings.** Any vertical opening shall be protected in accordance with **Section 8.6**, unless otherwise permitted by one of the following:

- (1) Vertical openings in accordance with **8.6.9.1** or **8.6.9.2** shall be permitted.
- (2) Existing open stairs, existing open ramps, and existing open escalators shall be permitted where connecting only two floor levels.
- (3) Existing unprotected vertical openings in buildings with low- or ordinary-hazard contents, and protected throughout by an approved automatic sprinkler system in accordance with **9.7.1.1(1)**, shall be permitted where they do not serve as required exits, and where all required exits consist of outside stairs in accordance with **7.2.2**, smokeproof enclosures in accordance with **7.2.3**, or horizontal exits in accordance with **7.2.4**.

**Paragraph 42.3.1(3)** recognizes that an existing storage occupancy might contain unprotected vertical openings and still provide a reasonable level of safety to life if the building houses only low or ordinary hazard contents and is protected by a complete automatic sprinkler system. Smokeproof enclosures and outside stairs (the only types of vertical exits permitted by this exemption) must be fully enclosed or protected against vertical fire spread and must meet the requirements of **Chapter 7**. The unenclosed vertical openings are not permitted to serve as part of the means of egress, although they can remain as convenience openings and stairways to be used for normal operations.

**42.3.2 Protection from Hazards.** See also **Section 8.7**.

**42.3.3 Interior Finish.**

**42.3.3.1 General.** Interior finish shall be in accordance with **Section 10.2**.

**42.3.3.2 Interior Wall and Ceiling Finish.** Interior wall and ceiling finish materials shall be Class A, Class B, or Class C in accordance with **Section 10.2** in storage areas and shall be as required by **7.1.4** in exit enclosures.

**42.3.3.3 Interior Floor Finish.**

**42.3.3.3.1** Interior floor finish in exit enclosures and in exit access corridors shall be Class I or Class II.

**42.3.3.3.2** Interior floor finish in areas other than those specified in **42.3.3.3.1** shall not be required to comply with **Section 10.2.7**.

**42.3.4 Detection, Alarm, and Communications Systems.**

**42.3.4.1 General.** A fire alarm system shall be required in accordance with **Section 9.6** for storage occupancies, except as modified by **42.3.4.1.1**, **42.3.4.1.2**, and **42.3.4.1.3**.

**42.3.4.1.1** Storage occupancies limited to low hazard contents shall not be required to have a fire alarm system.

**42.3.4.1.2** Storage occupancies with ordinary or high hazard contents not exceeding an aggregate floor area of 100,000 ft<sup>2</sup> (9300 m<sup>2</sup>) shall not be required to have a fire alarm system.

**42.3.4.1.3** Storage occupancies protected throughout by an approved automatic sprinkler system in accordance with [Section 9.7](#) shall not be required to have a fire alarm system.

**42.3.4.2 Initiation.** Initiation of the required fire alarm system shall be by any of the following means:

- (1) Manual means in accordance with [9.6.2.1\(1\)](#)
- (2) Approved automatic fire detection system in accordance with [9.6.2.1\(2\)](#) throughout the building, plus a minimum of one manual fire alarm box in accordance with [9.6.2.6](#)
- (3) Approved, supervised automatic sprinkler system in accordance with [9.6.2.1\(3\)](#) throughout the building, plus a minimum of one manual fire alarm box in accordance with [9.6.2.6](#)

**42.3.4.3 Notification.**

**42.3.4.3.1** The required fire alarm system shall meet one of the following criteria:

- (1) It shall provide occupant notification in accordance with [9.6.3](#).
- (2) It shall sound an audible and visible signal in a constantly attended location for the purposes of initiating emergency action.

**42.3.4.3.2** Positive alarm sequence in accordance with [9.6.3.4](#) shall be permitted.

**42.3.4.3.3** Existing presignal systems in accordance with [9.6.3.3](#) shall be permitted.

**42.3.4.3.4** In high hazard storage occupancies, the required fire alarm system shall automatically initiate an occupant evacuation alarm signal in accordance with [9.6.3](#).

**Subsection 42.3.4** requires the installation of a fire alarm system in nonsprinklered storage occupancies with an aggregate floor area of over 100,000 ft<sup>2</sup> (9300 m<sup>2</sup>). An alarm system is also not required in storage occupancies limited to housing low hazard contents, regardless of size, nor is one required in sprinklered storage occupancies, regardless of size. Storage placement limits visibility in buildings with large floor areas. As a result, personnel who work in storage areas might be unaware of the occurrence of fire for a long period. If fire spreads, which is highly possible in an unprotected storage building, means of egress could be blocked. An alarm system provides a means of alerting all occupants to the presence of fire and allows for timely egress.

The requirements of [42.3.4.3.1](#) and [42.3.4.3.4](#) specify two separate and distinct provisions for audible alarms activated by the fire alarm system required by [42.3.4.1](#). In low and ordinary hazard storage occupancies (see [42.3.4.3.1](#)), the system is permitted to activate an evacuation alarm or sound an alarm at a constantly attended location for the purpose of initiating emergency action. This provision permits an interface between the alarm system and the building's emergency organization. The alarm system is permitted to be controlled from a central security console or a similar location. The key feature is that the

location from which the alarm sounds must be constantly staffed. This requirement is not intended to mandate the installation of supervisory service, such as connection to a central station, but the location must be fully attended at all times when the building is occupied.

In high hazard storage occupancies (see [42.3.4.3.4](#)), the alarm must be arranged to automatically provide evacuation signals, because the safety of the occupants of these areas depends on their immediate notification of a fire.

Note that [42.3.4.3.3](#) permits existing presignal systems but not new presignal systems. If an automatic form of delay is desired for an existing alarm system that is not already equipped with a presignal feature, or for a new alarm system, the more reliable system feature known as positive alarm sequence is permitted. The positive alarm sequence option permitted by [42.3.4.3.2](#) might be applied to the high hazard storage occupancies addressed in [42.3.4.3.4](#) for which an automatic form of occupant notification is needed. Also, positive alarm sequence might be used in storage occupancies, other than those that are high hazard, where the provisions of [42.3.4.3.1\(1\)](#) are used instead of those of [42.3.4.3.1\(2\)](#).

The *Code* does not mandate an alarm system as a property protection requirement, although the probability of property loss is reduced in any occupancy where an alarm system is installed.

**42.3.5 Extinguishment Requirements. (Reserved)**

**42.3.6 Corridors.** The provisions of [7.1.3.1](#) shall not apply.

Without the exemption to the requirements of [7.1.3.1](#) provided by [42.3.6](#), all new storage occupancy corridors serving more than 30 persons would be required to have a 1-hour fire resistance rating, with openings protected by 20-minute fire protection-rated door assemblies. The exemption to [7.1.3.1](#) is provided because of the ambulatory nature of occupants of storage occupancies, the operational need for openings (even where corridors are provided), and the functional need served by open floor areas.

---

## 42.4 Special Provisions

**42.4.1 Limited-Access or Underground Structures.** Limited-access or underground structures shall comply with [Section 11.7](#).

**42.4.2 High-Rise Buildings.** New high-rise storage occupancies shall comply with [Section 11.8](#).

New high-rise, storage occupancy buildings are required to comply with [Section 11.8](#). This reference to the entire [Section 11.8](#) "high-rise package" was new to the 2012 edition of the *Code*. In prior editions, new high-rise industrial occupancy buildings were required to comply only with the sprinkler system requirements of [Section 11.8](#).

**42.4.3 Alcohol-Based Hand-Rub Dispensers.** Alcohol-based hand-rub dispensers in accordance with 8.7.3.3 shall be permitted.

The provision of 42.4.3 is new to the 2015 edition of the *Code*. It recognizes the use of alcohol-based hand-rub (ABHR) dispensers in business occupancies, provided that the detailed criteria of 8.7.3.3 are met.

## 42.5 Building Services

**42.5.1 Utilities.** Utilities shall comply with the provisions of Section 9.1.

**42.5.2 Heating, Ventilating, and Air-Conditioning.** Heating, ventilating, and air-conditioning equipment shall comply with the provisions of Section 9.2.

**42.5.3 Elevators, Escalators, and Conveyors.** Elevators, escalators, and conveyors shall comply with the provisions of Section 9.4.

**42.5.4 Waste Chutes, Incinerators, and Laundry Chutes.** Waste chutes, incinerators, and laundry chutes shall comply with the provisions of Section 9.5.

## 42.6\* Special Provisions for Aircraft Storage Hangars

**A.42.6** For further information on aircraft hangars, see NFPA 409, *Standard on Aircraft Hangars*.

**42.6.1** The requirements of Sections 42.1 through 42.5 shall be met, except as modified by 42.6.1.1 through 42.6.3.

**42.6.1.1** There shall be not less than two means of egress from each aircraft storage area.

**42.6.1.2** Exits from aircraft storage areas shall be provided at intervals not exceeding 150 ft (46 m) on all exterior walls.

**42.6.1.3** Where horizontal exits are provided, doors shall be provided in the horizontal exit fire barrier at intervals not exceeding 100 ft (30 m).

**42.6.1.4** Where dwarf, or “smash,” doors are provided in doors that accommodate aircraft, such doors shall be permitted for compliance with 42.6.1.1, 42.6.1.2, and 42.6.1.3.

**42.6.2** Means of egress from mezzanine floors in aircraft storage areas shall be arranged so that the travel distance to the nearest exit from any point on the mezzanine does not exceed 75 ft (23 m), and such means of egress shall lead directly to a properly enclosed stair discharging directly to the exterior, to a suitable cutoff area, or to outside stairs.

**42.6.3** Dead ends shall not exceed 50 ft (15 m) for other than high hazard contents areas and shall not be permitted for high hazard contents areas.

For provisions that apply to aircraft servicing hangars, see Section 40.6.

Section 42.6 specifies two alternate methods of providing egress from aircraft storage hangars. Where egress is possible through the outside wall, a distance of 150 ft (46 m) between exit doors is adequate. In larger hangars, the storage bay might have offices and other rooms located along one or more sides with walls constructed of fire resistance-rated materials. In those cases where the wall has a fire resistance rating so as to qualify as a horizontal exit, exit spacing of up to 100 ft (30 m) is specified. If the wall is nonrated, access to the outside is required. During inclement weather, large hangar doors are typically closed, so it is common procedure to provide small access doors for personnel in the larger aircraft hangar door. The small door can be considered a normal means of egress from an aircraft hangar. If possible, the door should swing in the direction of egress; however, this might not be possible due to the design of the aircraft door. For further information on aircraft hangars, see NFPA 409, *Standard on Aircraft Hangars*.<sup>4</sup> A typical aircraft storage hangar is depicted in Exhibit 42.4.

Exhibit 42.4

Typical aircraft storage hangar.

## 42.7\* Special Provisions for Grain Handling, Processing, Milling, or Other Bulk Storage Facilities

**A.42.7** For further information, see NFPA 61, *Standard for the Prevention of Fires and Dust Explosions in Agricultural and Food Processing Facilities*. The egress requirements for storage elevators are based on the possibility of fire and are not based on the possibility of grain dust explosions.

**42.7.1 General.** The requirements of Sections 42.1 through 42.5 shall be met, except as modified by 42.7.2 through 42.7.4.2.

**42.7.2 Number of Means of Egress.** There shall be not less than two means of egress from all working levels of the head house, as modified by 42.7.2.1, 42.7.2.2, and 42.7.2.3.

**42.7.2.1** One of the two means of egress shall be a stair to the level of exit discharge, and, if this means of egress is interior to the structure, it shall be enclosed by a dust-resistant, 1-hour fire resistance-rated enclosure in accordance with 7.1.3.2. Exterior stair means of egress shall be protected from the structure by a 1-hour fire resistance-rated wall that extends at least 10 ft (3050 mm) beyond the stair.

**42.7.2.2** The second means of egress shall be one of the following:

- (1) Exterior stair or basket ladder-type fire escape that is accessible from all working levels of the structure and provides a passage to the finished ground level
- (2) Exterior stair or basket ladder-type fire escape that is accessible from all working levels of the structure, provides access to adjoining structures, and provides a continuous path to the means of egress described in 42.7.3

**42.7.2.3** Stair enclosures in existing structures shall be permitted to have non-fire-rated dust-resistant enclosures.

**42.7.3 Means of Egress to Finished Ground Level.** An exterior stair or basket ladder-type fire escape shall provide passage to the finished ground level from the top of the end of an adjoining structure, such as a silo, conveyor, gallery, or gantry.

It is not the intent of 42.7.2.1 to require a fully dust-tight shaft, because the door will allow passage of limited amounts of dust during the normal course of daily operations. However, the shaft should be separated from the operating areas by fire resistance-rated construction and should be as free of dust as possible. Stairs that are exterior to the structure are not required to be enclosed; however, they must be separated from the structure by a 1-hour fire barrier that extends 10 ft (3050 mm) beyond the stair in all directions.

Subsection 42.7.2 requires that one means of egress from the head house must be an enclosed stair if it is interior to the structure. The alternate means of egress can be either an outside stair or a basket ladder-type fire escape connecting all working levels and leading to either the ground or the top of an adjoining structure that complies with 42.7.3.

The principal hazard of elevator storage structures that handle combustible materials is the potential for a dust explosion. A dust explosion can be violent enough to damage or destroy the primary means of egress required in 42.7.2. Exhibit 42.5 depicts an explosion-damaged bulk storage facility.

**Exhibit 42.5**

*Explosion-damaged bulk storage facility.*

**42.7.4 Extinguishment Requirements. (Reserved)**

**42.7.5 Underground Spaces.**

**42.7.5.1 Number of Means of Egress.**

**42.7.5.1.1** Underground spaces shall have not less than two means of egress, one of which shall be permitted to be a means of escape, except as permitted in 42.7.5.1.2.

**42.7.5.1.2** Where the horizontal travel distance to the means of egress is less than 50 ft (15 m) in normally unoccupied spaces, a single means of egress shall be permitted.

**42.7.5.2 Travel Distance to Exits.** Travel distance, measured in accordance with Section 7.6, shall not exceed that provided by Table 42.7.5.2.

**Table 42.7.5.2 Maximum Travel Distance to Means of Escape or Exits**

Level of Protection	Travel Distance	
	ft	m
Protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1)	400	122
Not protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1)	200	61
Existing structures	Unlimited	

## 42.8 Special Provisions for Parking Structures

### 42.8.1 General Requirements.

**42.8.1.1\* Application.** The provisions of 42.8.1 through 42.8.5.4 shall apply to parking structures of the closed or open type, above or below grade plane, but shall not apply to assisted mechanical-type or automated-type parking facilities that are not occupied by customers. The requirements of Sections 42.1 through 42.7 shall not apply.

**A.42.8.1.1** For further information on garages, including a definition of the term *open garage*, see NFPA 88A, *Standard for Parking Structures*.

The intent of the special provisions for parking structures is to provide adequate life safety for the patrons, who probably will be unfamiliar with the parking structure and its arrangement. Where parking attendants are the only occupants who enter the parking area, the Code's intent is to provide exits in accordance with the previous sections of Chapter 42. In such instances, the provisions for ordinary hazard contents storage occupancies apply.

Section 42.8 is self-contained and, therefore, independent of Sections 42.1 through 42.7, which apply to other storage occupancies. However, Section 42.8 does reference other portions of the Code, mainly the core Chapters 1 through 7.

For further information on parking structures, see NFPA 88A, *Standard for Parking Structures*.<sup>5</sup>

### 42.8.1.2 Multiple Occupancies.

**42.8.1.2.1** Where both parking and repair operations are conducted in the same building, the entire building shall comply with Chapter 40, except as modified by 42.8.1.2.2.

**42.8.1.2.2** Where the parking and repair sections are separated by not less than 1-hour fire-rated construction, the parking and repair sections shall be permitted to be treated separately.

**42.8.1.2.3** In areas where repair operations are conducted, the means of egress shall comply with Chapter 40.

Paragraph 42.8.1.2.2 permits a building to house parking and repair operations simultaneously and permits such operations to be treated independently if they are separated by 1-hour fire resistance-rated construction. The provisions of Chapter 40 would govern the repair operations, and Section 42.8 would cover the parking facilities.

**42.8.1.3 Open Parking Structures.** Open parking structures shall comply with 42.8.1.3.1 through 42.8.1.3.3.

**42.8.1.3.1** Each parking level shall have wall openings open to the atmosphere for an area of not less than 1.4 ft<sup>2</sup> for each linear foot (0.4 m<sup>2</sup> for each linear meter) of its exterior perimeter. [88A: 5.5.1]

**42.8.1.3.2** The openings addressed in 42.8.1.3.1 shall be distributed over 40 percent of the building perimeter or uniformly over two opposing sides. [88A: 5.5.2]

**42.8.1.3.3** Interior wall lines and column lines shall be at least 20 percent open, with openings distributed to provide ventilation. [88A: 5.5.3]

The requirements of 42.8.1.3 specify the degree to which an open parking structure's exterior walls must have openings. Parking structures that meet these criteria provide sufficient area in exterior walls to vent the products of combustion to a greater degree than an enclosed parking structure. Open parking structures — as contrasted with enclosed parking structures — are permitted to use vehicle ramps as a second means of egress [42.8.2.2.6.1(2)], are permitted to have longer travel distance allowances (Table 42.8.2.6.1), and are exempt from the requirement for a fire alarm system (42.8.3.4.1.2).

**42.8.1.4 Classification of Occupancy.** Incidental vehicle parking in another occupancy shall not be the basis for overall occupancy classification.

**42.8.1.5 Classification of Hazard of Contents.** Parking structures used only for the storage of vehicles shall be classified as ordinary hazard in accordance with Section 6.2.

Paragraph 42.8.1.5 appropriately classifies the hazard of contents as ordinary hazard for garages used only for the storage of vehicles. With the increased use of combustible materials in vehicle bodies and interiors, a garage presents a hazard greater than that of low hazard contents, as defined by the hazard of contents classifications specified in Section 6.2. The presence of gasoline, diesel fuel, and alternative fuels such as compressed natural gas in closed automobile fuel tanks or gas cylinders does not warrant a high hazard classification.

**42.8.1.6 Minimum Construction Requirements.** (No requirements.)

**42.8.1.7 Occupant Load.** (No requirements.)

### 42.8.2 Means of Egress Requirements.

**42.8.2.1 General.** Means of egress shall be in accordance with Chapter 7 and 42.8.2.

#### 42.8.2.2 Means of Egress Components.

**42.8.2.2.1 Components Permitted.** Components of means of egress shall be limited to the types described in 42.8.2.2.2 through 42.8.2.2.9.

##### 42.8.2.2.2 Doors.

**42.8.2.2.2.1** Doors complying with 7.2.1 shall be permitted.

**42.8.2.2.2.2** Special locking arrangements complying with 7.2.1.6 shall be permitted.

**42.8.2.2.2.3** An opening for the passage of automobiles shall be permitted to serve as an exit from a street floor, provided that no door or shutter is installed therein.

#### **42.8.2.2.3 Stairs.**

**42.8.2.2.3.1** Stairs complying with 7.2.2 shall be permitted, unless otherwise permitted by 42.8.2.2.3.2.

**42.8.2.2.3.2** In open parking structures, stairs complying with 7.2.2.5.1 shall not be required.

Stairs in open parking structures are not required to be enclosed to be considered as pseudo-exits. Companion travel distance provisions in 42.8.2.6 indicate that travel distance in open parking structures is measured to either an exit, as is typically required, or to an open stair, and the travel distance along the open stair is unlimited. This provision recognizes the low incidence of loss of life from fire in open parking structures and the personal crime issues associated with stair enclosures.

**42.8.2.2.3.3** Existing winders complying with 7.2.2.2.4 shall be permitted.

**42.8.2.2.3.4** Paragraph 7.2.2.4.5.3(2) shall not apply to guards for parking garages that are accessible to the general public.

**42.8.2.2.4 Smokeproof Enclosures.** Smokeproof enclosures complying with 7.2.3 shall be permitted.

**42.8.2.2.5 Horizontal Exits.** Horizontal exits complying with 7.2.4 shall be permitted.

#### **42.8.2.2.6 Ramps.**

**42.8.2.2.6.1** Ramps shall be permitted in accordance with any of the following conditions:

- (1) Ramps complying with 7.2.5 shall be permitted and shall not be subject to normal vehicular traffic where used as an exit.
- (2) In a ramp-type open parking structure with open vehicle ramps not subject to closure, the ramp shall be permitted to serve in lieu of the second means of egress from floors above the level of exit discharge, provided that the ramp discharges directly outside at the street level.
- (3) For parking structures extending only one floor level below the level of exit discharge, a vehicle ramp leading directly to the outside shall be permitted to serve in lieu of the second means of egress, provided that no door or shutter is installed therein.

**42.8.2.2.6.2** Paragraph 7.2.2.4.5.3(2) shall not apply to guards for parking structures that are accessible to the general public.

Paragraphs 42.8.2.2.6.1(2) and (3) permit the use of vehicle ramps as part of the means of egress. Properly arranged ramps can facilitate safe egress to a degree well in excess of that required for the given number of occupants.

Paragraph 42.8.2.2.6.1(2) allows consideration of ramps in open-air parking structures as a secondary means of egress from floors located above the street level where they are arranged to provide clear and unobstructed discharge to the street level. Ramps from floors located above the street level are required to be open and must not be enclosed by walls or other means that will confine smoke and heat in the ramp structure. Ramps located in enclosed garages — except those addressed by 42.8.2.2.6.1(3) — cannot be considered as part of the egress system, and normal means of egress (specified in 42.8.2.2) needs to be provided.

Paragraph 42.8.2.2.6.1(3) permits a ramp to be used as a second means of egress in a garage that extends not more than one floor level below the level of exit discharge. The ramp must not have a door or a shutter and must lead directly outside.

**42.8.2.2.7 Exit Passageways.** Exit passageways complying with 7.2.6 shall be permitted.

**42.8.2.2.8 Fire Escape Stairs.** Fire escape stairs complying with 7.2.8 shall be permitted for existing parking structures only.

#### **42.8.2.2.9 Areas of Refuge.**

**42.8.2.2.9.1** Areas of refuge complying with 7.2.12 shall be permitted, as modified by 42.8.2.2.9.2.

**42.8.2.2.9.2** In open-air parking structures, the area of refuge requirements of 7.2.12.1.2(2) shall not apply.

**42.8.2.3 Capacity of Means of Egress.** See also 42.8.2.4 and 42.8.2.5.

**42.8.2.4 Number of Means of Egress.** The number of means of egress shall comply with 42.8.2.4.1 and 42.8.2.4.2. (See also Section 7.4.)

**42.8.2.4.1** Not less than two means of egress shall be provided from every floor or section of every parking structure.

**42.8.2.4.2** In new buildings, floors or portions thereof with an occupant load of more than 500 persons shall have the minimum number of separate and remote means of egress specified by 7.4.1.2.

Note that there is no exemption to the requirement of 42.8.2.4.1 for two means of egress from all stories of parking structures.

**42.8.2.5 Arrangement of Means of Egress.** See also Section 7.5.

**42.8.2.5.1** A common path of travel shall be permitted for the first 50 ft (15 m) from any point in the parking structure.

**42.8.2.5.2** Dead ends shall not exceed 50 ft (15 m).

**42.8.2.5.3** Where fuel-dispensing devices are located within a parking structure, 42.8.2.5.3.1 and 42.8.2.5.3.2 shall apply.

**42.8.2.5.3.1** Travel away from the fuel-dispensing device in any direction shall lead to an exit with no dead end in which occupants might be trapped by fire.

**42.8.2.5.3.2** Within closed parking structures containing fuel-dispensing devices, exits shall be arranged and located to meet all of the following additional requirements:

- (1) Exits shall lead to the outside of the building on the same level or to stairs, with no upward travel permitted, unless direct outside exits are available from that floor.
- (2) Any story below the story at which fuel is being dispensed shall have exits leading directly to the outside via outside stairs or doors at the finished ground level.

**Paragraph 42.8.2.5.3** specifies the conditions required for protection of the occupants of parking garages from fires that might be caused by fuel-dispensing operations located inside the building. Additional provisions apply where fuel dispensing takes place in enclosed parking structures. **Paragraph 42.8.2.5.3.2(2)** requires that direct access to the outside be provided from floors located below those on which gasoline is dispensed. This requirement prevents gasoline vapors, which are heavier than air, from accumulating in enclosed portions of a means of egress, such as interior exit stairs.

The hazards associated with dispensing gasoline inside buildings are avoided by dispensing fuel outdoors, as in the case of ordinary gas stations. See NFPA 30A, *Code for Motor Fuel Dispensing Facilities and Repair Garages*,<sup>6</sup> for requirements on dispensing fuel indoors.

**42.8.2.6 Travel Distance to Exits.**

**42.8.2.6.1** Travel distance, measured in accordance with **Section 7.6**, shall not exceed that provided by **Table 42.8.2.6.1**, except as otherwise permitted in **42.8.2.6.2**.

**42.8.2.6.2** In open parking structures, travel distance shall comply with one of the following:

- (1) The travel distance to an exit shall not exceed the travel distance specified in **Table 42.8.2.6.1**.

- (2) The travel distance to a stair that does not meet the provisions for an exit enclosure shall not exceed the travel distance specified in **Table 42.8.2.6.1**, and travel along the stair shall not be limited.

The provisions of **42.8.2.6.2(2)** permit open stairs in open parking structures to be equivalent to enclosed exits for the purpose of measuring travel distance to an exit. These criteria were added to the *Code* for consistency with NFPA 88A, *Standard for Parking Structures*, and recognize the good life safety record associated with open parking structures. Further, these criteria are intended to improve crime safety in open parking structures by eliminating hiding locations for would-be assailants. See the companion provision of **42.8.2.2.3.2**, which exempts the requirement for enclosure of exit stairs in open parking structures.

**42.8.2.7 Discharge from Exits.** Exit discharge shall comply with **Section 7.7**.

**42.8.2.8 Illumination of Means of Egress.** Means of egress shall be illuminated in accordance with **Section 7.8** or with natural lighting that provides the required level of illumination in structures occupied only during daylight hours.

**42.8.2.9 Emergency Lighting.** Parking structures shall be provided with emergency lighting in accordance with **Section 7.9**, except for structures occupied only during daylight hours and arranged to provide the required level of illumination of all portions of the means of egress by natural means.

**42.8.2.10 Marking of Means of Egress.** Means of egress shall have signs in accordance with **Section 7.10**.

**42.8.2.11 Special Means of Egress Features.** (Reserved)

**42.8.3 Protection.**

**42.8.3.1 Protection of Vertical Openings.**

**42.8.3.1.1 Vertical Openings in Enclosed Parking Structures.**

**Table 42.8.2.6.1 Maximum Travel Distance to Exits**

Level of Protection	Enclosed Parking Structure		Open Parking Structure		Parking Structure Open Not Less than 50% on All Sides	
	ft	m	ft	m	ft	m
Protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1)	200	61	400	122	400	122
Not protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1)	150	46	300	91	400	122

**42.8.3.1.1.1** Unless otherwise provided in 42.8.3.1.1.3, 42.8.3.1.1.4, or 42.8.3.1.1.5, vertical openings through floors in enclosed parking structures four stories or more in height shall be enclosed with walls or partitions having a fire resistance rating of not less than 2 hours. [88A:5.4.3]

**42.8.3.1.1.2** Unless otherwise provided in 42.8.3.1.1.3, 42.8.3.1.1.4, or 42.8.3.1.1.5, vertical openings through floors in enclosed parking structures less than four stories in height shall be enclosed with walls or partitions having a fire resistance rating of not less than 1 hour. [88A:5.4.4]

**42.8.3.1.1.3** Ramps in enclosed parking structures shall not be required to be enclosed in accordance with 42.8.3.1.1.1 or 42.8.3.1.1.2 where the parking structure is protected throughout by an approved, automatic sprinkler system. [88A:5.4.5]

**42.8.3.1.1.4** Ramps in enclosed parking structures shall not be required to be enclosed in accordance with 42.8.3.1.1.1 or 42.8.3.1.1.2 where the parking structure is protected throughout by an approved, supervised, automatic fire detection system and a mechanical ventilation system in accordance with 6.3.1 of NFPA 88A, *Standard for Parking Structures*. [88A:5.4.6]

**42.8.3.1.1.5** Openings in the floor assembly between an enclosed parking structure and an open parking structure, except exit openings, shall not be required to be enclosed where the enclosed parking structure is protected in accordance with 42.8.3.1.1.1 or 42.8.3.1.1.2. [88A:5.4.7]

**42.8.3.1.1.6** Sprinkler systems provided in accordance with 42.8.3.1.1.3 or 42.8.3.1.1.5 shall be supervised in accordance with 9.7.2.

**42.8.3.1.2** Unprotected vertical openings through floors in open parking structures shall be permitted. [88A:5.4.8]

Requirements for the protection of vertical openings in parking structures, which are largely extracted from NFPA 88A, *Standard for Parking Structures*, are provided in 42.8.3.1. These provisions permit ramps to be unenclosed under any of the following conditions:

1. The parking garage is enclosed and is protected by an approved, electrically supervised automatic sprinkler system.
2. The parking garage is enclosed and is protected by a fire detection system and mechanical ventilation.
3. The parking structure meets the exterior wall openness criteria of 42.8.1.3 for open parking structures.

**42.8.3.2 Protection from Hazards.** (No requirements.)

### 42.8.3.3 Interior Finish.

**42.8.3.3.1 General.** Interior finish shall be in accordance with Section 10.2.

**42.8.3.3.2 Interior Wall and Ceiling Finish.** Interior wall and ceiling finish materials complying with Section 10.2 shall be Class A, Class B, or Class C in parking structures and shall be as required by 7.1.4 in exit enclosures.

### 42.8.3.3.3 Interior Floor Finish.

**42.8.3.3.3.1** Interior floor finish in exit enclosures and exit access corridors shall be Class I or Class II.

**42.8.3.3.3.2** Interior floor finish in areas other than those specified in 42.8.3.3.3.1 shall not be required to comply with 10.2.6.

### 42.8.3.4 Detection, Alarm, and Communications Systems.

**42.8.3.4.1 General.** A fire alarm system shall be required in accordance with Section 9.6 for parking structures, except as modified by 42.3.4.1.1, 42.3.4.1.2, and 42.3.4.1.3.

**42.8.3.4.1.1** Parking structures not exceeding an aggregate floor area of 100,000 ft<sup>2</sup> (9300 m<sup>2</sup>) shall not be required to have a fire alarm system.

**42.8.3.4.1.2** Open parking structures shall not be required to have a fire alarm system.

**42.8.3.4.1.3** Parking structures protected throughout by an approved automatic sprinkler system in accordance with Section 9.7 shall not be required to have a fire alarm system.

**42.8.3.4.2 Initiation.** Initiation of the required fire alarm system shall be by one of the following means:

- (1) Manual means in accordance with 9.6.2.1(1)
- (2) Approved automatic fire detection system in accordance with 9.6.2.1(2) throughout the building, plus a minimum of one manual fire alarm box in accordance with 9.6.2.6
- (3) Approved, supervised automatic sprinkler system in accordance with 9.6.2.1(3) throughout the building, plus a minimum of one manual fire alarm box in accordance with 9.6.2.6

### 42.8.3.4.3 Notification.

**42.8.3.4.3.1** The required fire alarm system shall sound an audible alarm in a continuously attended location for purposes of initiating emergency action.

**42.8.3.4.3.2** Positive alarm sequence in accordance with 9.6.3.4 shall be permitted.

**42.8.3.4.3.3** Existing presignal systems in accordance with 9.6.3.3 shall be permitted.

### 42.8.3.5 Extinguishing Requirements. (Reserved)

**42.8.3.6 Corridors.** The provisions of 7.1.3.1 shall not apply.

## 42.8.4 Special Provisions — High-Rise Buildings.

**42.8.4.1** The provisions of Section 11.8 shall not apply to new high-rise, open parking structures, except as otherwise required by 42.8.4.2.

**42.8.4.2** The provisions of 11.8.3 shall apply to new high-rise, open parking structures.

## 42.8.5 Building Services.

**42.8.5.1 Utilities.** Utilities shall comply with the provisions of [Section 9.1](#).

**42.8.5.2 Heating, Ventilating, and Air-Conditioning.** Heating, ventilating, and air-conditioning equipment shall comply with the provisions of [Section 9.2](#).

**42.8.5.3 Elevators, Escalators, and Conveyors.** Elevators, escalators, and conveyors shall comply with the provisions of [Section 9.4](#).

**42.8.5.4 Waste Chutes, Incinerators, and Laundry Chutes.** Waste chutes, incinerators, and laundry chutes shall comply with the provisions of [Section 9.5](#).

---

## 42.9 Operating Features

**42.9.1 Upholstered Furniture and Mattresses.** The provisions of [10.3.2](#) shall not apply to upholstered furniture and mattresses.

**42.9.2 Soiled Linen and Trash Receptacles.** The requirements of [10.3.9](#) for containers for waste, or linen with a capacity of 20 gal (75.7 L) or more shall not apply.

**42.9.3 Inspection of Door Openings.** Door openings shall be inspected in accordance with [7.2.1.15](#).

New to the 2015 edition of the Code, [42.9.3](#) mandates the annual inspection of egress doors equipped with panic hardware or fire exit hardware, doors in exit enclosures, electrically controlled egress doors, and doors with special locking arrangements, via the reference to [7.2.1.15](#). The intent is to ensure that such doors, which might not be used routinely, operate properly in an emergency. See [7.2.1.15](#) and its associated commentary for additional details on the required inspection.

# Building Rehabilitation

**Chapter 43** first appeared in the 2006 edition of the *Code*. In editions prior to 2006, any alteration or any installation of new equipment was required to meet, as nearly as practicable, the requirements for new construction. **Paragraph 4.6.7.2** on building rehabilitation directs the user to **Chapter 43**. **Chapter 43** presents provisions based on a set of concepts that differ from those of the 2003 and earlier editions, including those specified in paragraphs 1 through 4, which follow.

1. During a rehabilitation project, a building must meet the base level of life safety required by the *Code* chapter applicable to the existing occupancy. For example, an assembly occupancy undergoing rehabilitation must meet the requirements of **Chapter 13** for existing assembly occupancies. See **4.6.7.3**, **43.1.2.1(1)**, and **43.7.1.1**.

2. The rehabilitation work must maintain or increase the level of *Code* compliance.

3. Rehabilitation work in existing construction elements or building features is held to a lower standard than rehabilitation work in new elements or features.

4. Upgrades (other than those required for compliance with the existing occupancy chapter) are typically required only in the rehabilitation work areas, not throughout the occupancy or building.

The requirements of this chapter strive to maintain or improve the existing level of life safety without requiring all rehabilitation work to comply with the provisions applicable to new construction. The goal of this approach is to encourage the continued use or adaptive reuse of existing buildings. Often building rehabilitation is not undertaken because of the perception that unwanted or unwarranted upgrades will be forced on the building owner. This chapter establishes the level of acceptable *Code* compliance.

The level of *Code* compliance established by this chapter uses a stepped approach to mandate requirements. Minor levels of rehabilitation must meet minimal requirements; major rehabilitation projects must meet more significant requirements.

NFPA did not originate the concept of a building rehabilitation code or a code chapter on rehabilitation. In 1997, the U.S. Department of Housing and Urban Development (HUD) published *Nationally Applicable Recommended Rehabilitation Provisions (NARRP)*.<sup>1</sup> NARRP was devised to provide a basis for developing local and model codes that promote the continued use of existing building stock. NFPA first addressed the subject in 2001 to 2002, when its building code committees developed Chapter 15, Building Rehabilitation, for *NFPA 5000*<sup>®</sup>, *Building*

*Construction and Safety Code*<sup>®.2</sup> **Chapter 43** of *NFPA 101* addresses only the life safety subset of the building rehabilitation provisions from *NFPA 5000*.

The organization of this chapter differs from that of the other chapters of this *Code*. **Section 43.1** contains general or administrative provisions, while **Section 43.2** contains definitions. The provisions of the two sections lead the user to classifying the rehabilitation work category as repair, renovation, modification, reconstruction, change of use, change of occupancy classification, or addition. The user then moves directly to the applicable provisions — **Sections 43.3** through **43.6**, respectively, for repair, renovation, modification, and reconstruction; **Section 43.7** for change of use or change of occupancy classification; or **Section 43.8** for additions. **Sections 43.3** through **43.8** provide options for treating historic building rehabilitation via the special provisions contained in **Section 43.10**, Historic Buildings.

---

## 43.1 General

### 43.1.1 Classification of Rehabilitation Work Categories.

Rehabilitation work on existing buildings shall be classified as one of the following work categories:

- (1) Repair
- (2) Renovation
- (3) Modification
- (4) Reconstruction
- (5) Change of use or occupancy classification
- (6) Addition

See **43.2.2.1.1** through **43.2.2.1.7** for definitions of the seven categories of rehabilitation work — repair, renovation, modification, reconstruction, change of use, change of occupancy classification, and addition. The seven categories are a key concept of this chapter for achieving the objective of proportionality of work. That is, the more work that is proposed for the rehabilitation project, the more work that might be required by the *Code* in terms of upgrading existing conditions.

For example, the provisions of **Section 43.6** for reconstruction require more work than is required by **Section 43.5** for modification, which, in turn, requires more work than is required by **Section 43.4** for renovation. **Section 43.5** does not repeat the provisions of **Section 43.4** but mandatorily references their use and provides only the incremental features not contained in **Section 43.4**. See **43.5.1.1**, which requires modification to meet the provisions of **Section 43.5**, as well as the provisions of

**Section 43.4**, applicable to renovation. Similarly, **43.6.1.1** requires that reconstruction meet the provisions of **Section 43.6**, as well as those of **Section 43.5**, applicable to modification, and **Section 43.4**, applicable to renovation.

### 43.1.2 Applicable Requirements.

**43.1.2.1** Any building undergoing repair, renovation, modification, or reconstruction (*see 43.2.2.1.1 through 43.2.2.1.4*) shall comply with both of the following:

- (1) Requirements of the applicable existing occupancy chapters (*see Chapters 13, 15, 17, 19, 21, 23, 24, 26, 29, 31, 33, 37, 39, 40, and 42*)
- (2) Requirements of the applicable section of this chapter (*see Sections 43.3, 43.4, 43.5, and 43.6*)

**Chapter 43**, with the exception of the provisions for reconstruction, does not mandate improvements or set minimum acceptable standards for spaces that are not undergoing rehabilitation. Such improvements or standards are left to other chapters to require, as the *Code* applies both to new construction and to existing situations. It is the intent of **1.3.1**, **4.4.2.1**, and **4.6.9.1** that an existing situation, even if not undergoing rehabilitation, needs to comply with the *Code* provisions detailed in the applicable existing occupancy chapter. For example, an existing theater must meet the provisions of **Chapter 13** for existing assembly occupancies, even where no rehabilitation is taking place. Yet, due to inadequate enforcement or waivers, not all existing buildings (i.e., existing situations) are *Code* compliant. Therefore, **43.1.2.1** establishes that any building undergoing repair, renovation, modification, or reconstruction be in compliance with the applicable existing occupancy chapter — even for features and systems not related to the rehabilitation project — before the user proceeds to implement the criteria of **Sections 43.3 through 43.6**. A similar provision, generalized to have applicability to all rehabilitation work categories, appears in **4.6.7.3**.

Two examples of the effect of the requirements of **43.1.2.1** follow.

#### Example 1

An existing two-story business occupancy building will undergo a modification involving the reconfiguration of the second-floor tenant space. The second floor is served by only a single exit. If **39.2.4** requires the second floor to have a minimum of two exits, a second exit needs to be added as a condition for proceeding with the rehabilitation project. The reconfiguration of the second-floor space (but not the addition of the second exit) must meet the modification provisions of **Section 43.5**. See **43.1.4.5** and its commentary.

#### Example 2

An existing two-story business occupancy building will undergo a reconstruction involving the reconfiguration of the second-floor corridor shared by multiple occupant spaces. The second floor has

an occupant load of 400 (which will not be changed by the rehabilitation project) and is served by two exits with a combined capacity of 300 persons. **Subsection 39.2.3** requires egress capacity for the existing business occupancy to be in compliance with **Section 7.3**. It would appear that **43.1.2.1(1)** requires that egress capacity for an additional 100 persons be added as a condition for proceeding with the rehabilitation project. However, **43.4.2** (which is positioned within **Section 43.4** for renovations but has applicability to reconstruction because **43.6.1.1** requires compliance with **Sections 43.4, 43.5, and 43.6**) offers the two possible exemptions specified in paragraphs 1 and 2, which follow.

**1.** The authority having jurisdiction (AHJ) is permitted to establish the occupant load as the 300 persons for whom the existing means of egress is adequate, provided that measures are established to prevent occupancy by more than 300 persons. Such measures would have the effect of making the egress capacity sufficient for the occupant load, so as to preclude having to add additional egress capacity.

**2.** If the existing 300-person egress capacity was previously approved as being adequate for the 400-person occupant load, the egress system need not be upgraded. See **3.3.214** for a definition of the term *previously approved*. Also see **A.43.4.2(2)**.

In Example 2, where the existing 300-person egress capacity was not previously approved and the current AHJ does not permit its continued use, elements must be added to the egress system to increase the egress capacity to 400 persons. The reconstruction of the second-floor corridor (but not the addition of egress elements to increase the egress capacity) must meet the reconstruction provisions of **Section 43.6**. See the commentary following **43.1.4.5**.

The point of Example 2 is that, although **43.1.2.1** requires buildings undergoing repair, renovation, modification, or reconstruction to meet the provisions of the applicable existing occupancy chapter, the user needs to check for any applicable exemptions within other sections of **Chapter 43**.

**43.1.2.2** Any building undergoing change of use or change of occupancy classification (*see 43.2.2.1.5 and 43.2.2.1.6*) shall comply with the requirements of **Section 43.7**.

**43.1.2.3** Any building undergoing addition (*see 43.2.2.1.7*) shall comply with the requirements of **Section 43.8**.

**43.1.2.4** Historic buildings undergoing rehabilitation shall comply with the requirements of **Section 43.10**.

The provisions of **43.1.2.2 through 43.1.2.4** supplement those of **43.1.2.1** to complete the road map directing the user to the appropriate section of **Chapter 43**, based on the rehabilitation work category assigned to the project. See **43.2.2.1.1 through 43.2.2.1.7** for definitions of the seven categories of rehabilitation work — repair, renovation, modification, reconstruction, change of use, change of occupancy classification, and addition.

**43.1.2.5** Nothing in this chapter shall be interpreted as excluding the use of the performance-based option of [Chapter 5](#).

The performance-based option of [Chapter 5](#) is a rigorous and formalized method of providing a level of life safety equivalent to that required by the prescriptive provisions of the *Code*. See [43.1.4.2](#) and the commentary that follows [43.1.4.2](#) for more information.

### 43.1.3 Multiple Rehabilitation Work Categories.

**43.1.3.1** Work of more than one rehabilitation work category shall be permitted to be part of a single work project.

**43.1.3.2** Where a project includes one category of rehabilitation work in one building area and another category of rehabilitation work in a separate area of the building, each project area shall comply with the requirements of the respective category of rehabilitation work.

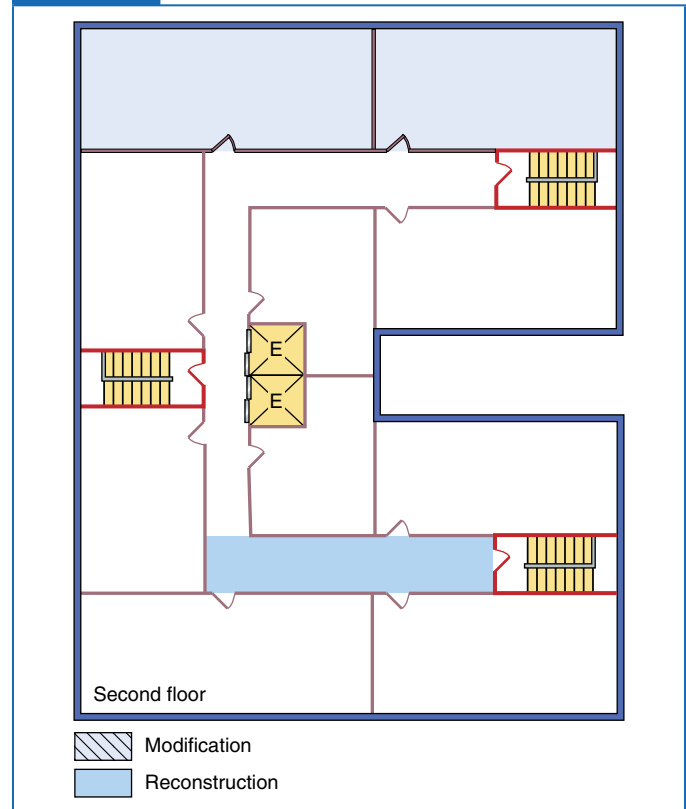

**43.1.3.3** Where a project consisting of modification and reconstruction is performed in the same work area, or in contiguous work areas, the project shall comply with the requirements applicable to reconstruction, unless otherwise specified in [43.1.3.4](#).

**43.1.3.4** Where the reconstruction work area is less than 10 percent of the modification work area, the two shall be considered as independent work areas, and the respective requirements shall apply.

It is the intent of [43.1.3](#) to permit multiple categories of work on a single rehabilitation project. For example, a bathroom is being rehabilitated by relocating the water closet and wallpapering the walls. These two projects, whether performed separately or at the same time, would be treated in the same manner (i.e., the water closet relocation is treated as a modification and the wallpapering is treated as a renovation). Each project must comply with the requirements for its level of work.

[Paragraph 43.1.3.2](#) addresses the situation where a rehabilitation project includes one category of rehabilitation work in one building area and another category of rehabilitation work in a separate area of the building. The provision permits each project to comply with its respective category of rehabilitation work. [Exhibit 43.1](#) depicts such a situation. The floor plan shown is that of the second floor of a multistory building. The second floor is a business occupancy with multiple occupant spaces. The two rooms at the top of the exhibit are undergoing a rehabilitation that will involve reconfiguration of the space so as to be classified as a modification. The corridor in the lower portion of the exhibit serves more than a single occupant space, and its reconfiguration is classified as a reconstruction. Provided that the authority having jurisdiction judges that the areas are separate areas (note that [43.1.3.2](#) uses the term *separate area*, and not the term *separated area*, so as to suggest that separation distance might be used to establish separate areas), the modification shown at the top of the exhibit is permitted to comply independently with the provisions for modification, and the reconstruction shown at the bottom of the exhibit is permitted to comply

**Exhibit 43.1**

*Modification area treated independently of reconstruction area.*

independently with the provisions for reconstruction. If the modification area were on a different floor than the reconstruction area, the requirement for a separate area would also be met.

Per [43.1.3.3](#) and [43.1.3.4](#), for projects that involve modification and reconstruction in the same work area, or in contiguous work areas, and where the reconstruction area is at least 10 percent of the modification area, the entire project must comply with reconstruction requirements. This requirement prevents a major rehabilitation project from being classified as a combination of a modification project (e.g., an occupant space reconfiguration) and a reconstruction project (e.g., rehabilitation work performed in a corridor shared by multiple occupant spaces, including the tenant occupying the space being reconfigured). Without the safeguard provided by [43.1.3.3](#), an entire floor could be rehabilitated without mandating some of the upgrades associated with reconstruction. An example of such an upgrade can be found in [43.6.4.2](#), which mandates compliance with the sprinkler provisions applicable to new construction for the occupancy on any story where the rehabilitation work area exceeds 50 percent of the area of that story.

[Exhibit 43.2](#) illustrates the provisions of [43.1.3.3](#) and [43.1.3.4](#). The floor plan shown is that of the second floor of a multistory building. The second floor is a business occupancy with multiple occupant spaces. The two rooms at the top of the exhibit are undergoing a rehabilitation that involves reconfiguration of the

Exhibit 43.2

Reconstruction provisions required for modification area and reconstruction area.

space so as to be classified as a modification. The corridor in the vicinity of the two rooms undergoing rehabilitation serves more than a single occupant space, and its reconfiguration is classified as a reconstruction. The corridor reconstruction project exceeds 10 percent of the modification work area (i.e., the solid blue area exceeds 10 percent of the cross-hatched blue area). Per 43.1.3.3, the overall project must comply with the requirements applicable to reconstruction.

#### 43.1.4 Compliance.

**43.1.4.1** Repairs, renovations, modifications, reconstruction, changes of use or occupancy classification, and additions shall conform to the specific requirements for each category in other sections of this chapter.

**43.1.4.2** This chapter shall not prevent the use of any alternative material, alternative design, or alternative method of construction not specifically prescribed herein, provided that the alternative has been deemed to be equivalent and its use authorized by the authority having jurisdiction in accordance with Section 1.4.

Paragraph 43.1.4.2 provides an equivalency allowance for all projects. This provision might seem redundant with regard to those of Section 1.4 but is included in this chapter to emphasize

that the traditional methods of equivalent compliance are permitted to be used in addition to the special provision addressed in 43.1.4.3.

**43.1.4.3** Where compliance with this chapter, or with any provision required by this chapter, is technically infeasible or would impose undue hardship because of structural, construction, or dimensional difficulties, the authority having jurisdiction shall be authorized to accept alternative materials, design features, or operational features.

Paragraph 43.1.4.3 permits the authority having jurisdiction to accept alternatives that might not be fully equivalent to Code requirements where the applicant demonstrates that full compliance would be technically infeasible or would impose an undue hardship. The term *technically infeasible* is defined in 43.2.2.5.

One of the source documents for this chapter, *Nationally Applicable Recommended Rehabilitation Provisions (NARRP)*, addresses the concept of disproportionate cost.<sup>3</sup> While not specifically discussed in the Code, disproportionate cost might be a consideration for undue hardship. One jurisdiction that participated in the development of NARRP indicated that the following three tests are necessary to determine such an economic hardship:

1. Cost of compliance in an existing building versus the cost of new construction
2. Cost of compliance as a proportion of the cost of the proposed project
3. Cost of the proposed project versus the replacement cost of the building

It is important that the AHJ and the building owner maintain records of all approved compliance alternatives. These records might be needed in the future to document compliance with the wording of 43.4.1.4 ("The work shall not make the building less conforming with . . . any previous approved alternative arrangements . . ."). The AHJ might require peer review of the proposed alternatives to judge their acceptability under 43.1.4.3 and the general equivalency provision of 43.1.4.2.

**43.1.4.4** Elements, components, and systems of existing buildings with features that exceed the requirements of this Code for new construction, and not otherwise required as part of previously documented, approved, alternative arrangements, shall not be prevented by this chapter from being modified, provided that such elements, components, and systems remain in compliance with the applicable Code provisions for new construction.

As noted in the commentary following the title of this chapter, Chapter 43 was developed using the concept that rehabilitation work should not reduce the existing level of Code compliance. However, 43.1.4.4 establishes that, if the existing condition exceeds that required for new construction, the condition is permitted to be altered, provided that the resulting feature meets the requirements for new construction. For example, if a rehabilitation project in an existing hospital involves reconstruction, the

corridor width requirements for the reconstruction would be as specified in paragraphs 1 and 2, which follow.

1. Per 43.1.2.1(1), the hospital must meet the requirements of Chapter 19 for existing health care occupancies. Paragraph 19.2.3.4 requires the corridor to be not less than 48 in. (1220 mm) in width.

2. Per 43.6.1.1(2) and 43.5.1.3, any newly constructed corridors must meet the width requirement for new construction, typically an 8 ft (2440 mm) width in patient care areas per 18.2.3.4. If the existing corridor were 10 ft (3050 mm) wide, 43.1.4.4 permits the corridor width to be reduced to 8 ft (2440 mm) during the reconstruction project, provided that an 8 ft (2440 mm) width is sufficient to provide the required egress capacity. The provision of 43.1.4.4 is consistent with 4.6.7.4 and 4.6.12.2. See also A.4.6.7.5.

**43.1.4.5** Work mandated by any accessibility, property, housing, or fire code; mandated by the existing building requirements of this Code; or mandated by any licensing rule or ordinance, adopted pursuant to law, shall conform only to the requirements of that code, rule, or ordinance and shall not be required to conform to this chapter, unless the code requiring such work so provides.

Work of the type listed in 43.1.4.5 is not considered a rehabilitation project. Accordingly, such work need not comply with the provisions of Chapter 43. The work required by such retrospective regulation needs to comply only with the provisions of the Code requiring that the work be performed. For example, if an existing building undergoing repair, renovation, modification, or reconstruction is determined to have an inadequate egress system, based on the requirements of the applicable existing occupancy chapter of this Code, 4.6.7.3 requires that improvements to the egress system be made to bring the building into compliance with the existing occupancy chapter [see also 43.1.2.1(1)]. The fact that work is being done on the egress system to comply with 4.6.7.3 would not also impose the requirements of Sections 43.3 through 43.6.

Example 1, which appears in the commentary following 43.1.2.1(2), illustrates the provision of 43.1.4.5. An existing two-story business occupancy building will undergo a modification involving the reconfiguration of the second-floor tenant space. The second floor is served by only a single exit. If 39.2.4 requires the second floor to have a minimum of two exits, a second exit needs to be added as a condition for proceeding with the rehabilitation project. The work associated with adding the second exit is to be performed without classifying it as one of the rehabilitation work categories, and the work is not subject to the provisions of Chapter 43. The reconfiguration of the second-floor space (but not the addition of a second exit) must meet the modification provisions of Section 43.5.

As further explanation of the above example, the remedial exit that is to be added will be an enclosed exit stair. Walls at

each side of the stair obviate the need for guards (see 7.1.8), but handrails are required. The provision of 7.2.2.4.1.1 requires new stairs to have handrails at both sides; the provision of 7.2.2.4.1.6 permits existing stairs to have a handrail at one side only. The provision of 7.2.2.4.5.1 requires new handrails to be within the height range of 34 in. (865 mm) to 38 in. (965 mm); the provision of 7.2.2.4.5.2 requires existing handrails to be within the height range of 30 in. (760 mm) to 38 in. (965 mm). Given that 43.1.4.5 exempts the construction of the remedial stair from the rehabilitation work category provisions of Chapter 43, the stair — although being newly constructed — is permitted to comply with the requirements for existing stairs. The stair is permitted to be constructed with a handrail at one side only, and that handrail is permitted to be mounted at a 30 in. (760 mm) height. The stair will then meet the requirements applicable to existing stairs as required by 43.1.2.1(1), and modification of the second floor is permitted to be undertaken in accordance with 43.1.2.1(2). In other words, the new stair and the existing stair are held to the same criteria relative to permitting the second floor modification, for which Chapter 43 was consulted, to proceed.

## 43.2 Special Definitions

**43.2.1 General.** The words and terms used in Chapter 43 shall be defined as detailed in 43.2.2, unless the context clearly indicates otherwise.

### 43.2.2 Special Definitions.

**43.2.2.1 Categories of Rehabilitation Work.** The nature and extent of rehabilitation work undertaken in an existing building.

**43.2.2.1.1 Repair.** The patching, restoration, or painting of materials, elements, equipment, or fixtures for the purpose of maintaining such materials, elements, equipment, or fixtures in good or sound condition.

Repair is the first category of the repair/renovation/modification/reconstruction continuum that establishes the amount of rehabilitation work required to be performed when using a specific subset of the Chapter 43 requirements. Examples of rehabilitation work that might meet the definition of the term *repair* are provided in paragraphs 1 through 4, which follow.

1. A 24 in. (610 mm) wide by 24 in. (610 mm) high piece of wallpaper, vandalized with graffiti, is cut and peeled away from an existing corridor wall and replaced with a similarly sized piece of wallpaper in a theater. [The combustibility of the replacement patch of wallpaper is not germane to classifying the rehabilitation work category. Once the category is established as that of repair, the provisions of Section 43.3 apply, and 43.3.1.3 requires that the repair be done using like materials (such as wallpaper retained from the original installation, provided that the use of

such material is not prohibited by some other *Code* provision) or materials permitted by other sections of the *Code* — typically the interior finish provisions of the \_\_\_\_\_.3.3 subsection of the applicable existing occupancy chapter.]

2. Four 24 in. × 24 in. (610 mm × 610 mm) lay-in ceiling tiles, damaged by water from a roof leak, are replaced in an existing office.

3. A portion of an existing plaster-on-lath wall, where plaster has been disengaged from the lath after being impacted by a wheeled cart, is patched with gypsum wallboard compound, sanded, and painted to match the wall section in an existing hospital.

4. Chipped paint areas on doors and door frames in an existing detention and correctional occupancy building are touched up by brushing new paint over the chipped areas.

**43.2.2.1.2 Renovation.** The replacement in kind, strengthening, or upgrading of building elements, materials, equipment, or fixtures, that does not result in a reconfiguration of the building spaces within.

Renovation is the second category of the repair/renovation/modification/reconstruction continuum that establishes the amount of rehabilitation work required to be performed when using a specific subset of the **Chapter 43** requirements. Examples of rehabilitation work that might meet the definition of the term *renovation* are provided in paragraphs 1 through 4, which follow.

1. An existing corridor wall in an apartment building is wallpapered, regardless of whether it had been papered before.

2. A lay-in tile ceiling is removed and replaced to modernize the décor in an existing office.

3. The existing lavatories and water closets in a school building, which are badly stained with mineral deposits, are replaced (i.e., swapped out on a one-to-one basis without any relocation) for aesthetic reasons.

4. The existing shelving for the display of merchandise in a bulk merchandising retail building is replaced (i.e., swapped out on a one-to-one basis without any relocation) with heavy-duty shelving, to provide the support for heavy items that the existing shelving could not provide.

**43.2.2.1.3 Modification.** The reconfiguration of any space; the addition, relocation, or elimination of any door or window; the addition or elimination of load-bearing elements; the reconfiguration or extension of any system; or the installation of any additional equipment.

Modification is the third category of the repair/renovation/modification/reconstruction continuum that establishes the amount of rehabilitation work required to be performed when using a specific subset of the **Chapter 43** requirements. Examples of rehabilitation work that might meet the definition of the

term *modification* are provided in paragraphs 1 through 4, which follow.

1. A second door is installed — for the convenience of occupants — in the corridor wall that separates an existing tenanted office space from the common corridor serving multiple tenants. The work is done in one evening during a time that the building is not otherwise occupied so as not to affect the common corridor used for egress by other tenants. (If the door is added to correct a *Code* deficiency by shortening an excessive common path of travel to the length permitted by **39.2.5.3** for existing business occupancies, the work is not to be considered a rehabilitation project and is not subject to the provisions of **Chapter 43**. This is further explained in the commentary following **43.1.4.5**.)

2. Two existing hotel guest rooms are combined into one larger room by removing the wall between the two rooms. All work occurs exclusively within the envelope of the guest rooms and does not affect the common corridor serving the guest rooms on that floor.

3. Ten percent of the shelving for the display of merchandise in a grocery store is removed, and the remaining 90 percent of the shelving is relocated so as to create wider aisles for the convenience of patrons.

4. A sprinkler system is voluntarily (i.e., not statutorily) installed throughout a warehouse building so the owner can qualify for a savings on the building's property insurance premium. (For modification work involving the entire building, the extensive modifications provisions of **43.5.2.1** would normally have the effect of requiring the rehabilitation work category to be changed from modification to reconstruction, but **43.5.2.2** permits modification work that is exclusively fire protection system work to retain its original classification of modification.)

As introduced in the example in paragraph 4, extensive modifications, as addressed in **43.5.2**, might force a change in rehabilitation work category from modification to reconstruction. For example, per **43.5.2.1**, the modification of an entire building or an entire occupancy within a building is required (with exemptions) to be classified as reconstruction rather than modification. Similarly, per **43.5.2.3**, where the total area of all the rehabilitation work areas included in a modification exceeds 50 percent of the area of the building, the rehabilitation work category is required (with exemptions) to be classified as reconstruction rather than modification. See **43.5.2**.

**43.2.2.1.4\* Reconstruction.** The reconfiguration of a space that affects an exit or a corridor shared by more than one occupant space; or the reconfiguration of a space such that the rehabilitation work area is not permitted to be occupied because existing means of egress and fire protection systems, or their equivalent, are not in place or continuously maintained.

**A.43.2.2.1.4** It is not the intent that a corridor, aisle, or circulation space within a suite be considered as a corridor that is shared

by more than one occupant space. The suite should be considered as only one occupant space. The following situations should be considered to involve more than one occupant space:

- (1) Work affecting a corridor that is common to multiple guest rooms on a floor of a hotel occupancy
- (2) Work affecting a corridor that is common to multiple living units on a floor of an apartment building occupancy
- (3) Work affecting a corridor that is common to multiple tenants on a floor of a business occupancy

Reconstruction is the final category of the repair/renovation/modification/reconstruction continuum that establishes the amount of rehabilitation work required to be performed when using a specific subset of the Chapter 43 requirements. Examples of rehabilitation work that might meet the definition of reconstruction are provided in paragraphs 1 through 4, which follow.

1. The corridor serving the multiple occupant spaces on a floor of an existing jewelry retail sales building is relocated to unite two sales spaces occupied by one of the tenants (i.e., the tenant's space was formerly divided into two sales areas by the existing corridor so as to require travel across the common corridor to move between the two areas) while continuing to provide all occupant spaces on the floor with access to the two exits required by 37.2.4.1.

2. A floor in an existing hotel building is gutted to the columns and exterior walls, and hotel guest suites are constructed in the space formerly occupied as individual guest rooms.

3. A wing in an existing hospital is closed to occupancy and isolated from the remainder of the building by temporary fire resistance-rated barriers while the required smoke barriers and corridor walls are relocated, and a new elevator and associated hoistway are added to facilitate day-to-day operations; the other wing of the hospital building remains occupied during the rehabilitation, as it is served by an exit at its far end and another exit at the central core of the building where the two wings are joined.

4. An exit passageway, serving as the discharge for an enclosed exit stair located within the core of a multistory, multi-occupant space, existing office building, is extended so as to discharge to the outside at a new location along an exterior wall, because an addition will be constructed to abut the building at the location where the exit passageway formerly discharged through the exterior wall.

The definition of the term *reconstruction* addresses work that affects an exit or corridor shared by more than one occupant space. The following situations are considered to involve more than one occupant space:

1. Work affecting a corridor on a hotel guest room floor
2. Work affecting a corridor on a hospital patient floor
3. Work affecting a corridor on an elementary school floor

Extensive modifications, as addressed in 43.5.2, might force a change in rehabilitation work category from modification to reconstruction. For example, per 43.5.2.1, the modification of an entire building, or an entire occupancy within a building, is required (with exemptions) to be classified as reconstruction rather than modification. Similarly, per 43.5.2.3, where the total area of all the rehabilitation work areas included in a modification exceeds 50 percent of the area of the building, the rehabilitation work category is required (with exemptions) to be classified as reconstruction rather than modification. See 43.5.2.

**43.2.2.1.5 Change of Use.** A change in the purpose or level of activity within a structure that involves a change in application of the requirements of the Code.

The term *change of use* is meant to address any change in the purpose or level of activity that, although it does not create a change of occupancy, does result in one or more differences in Code provisions applicable to the uses before and after the change. Examples of rehabilitation work that might meet the definition of the term *change of use* include the following:

1. A family day-care home is changed to a day-care occupancy when the number of clients is increased from 12 to 15, resulting in having to comply with the requirements of Sections 17.1 through 17.5 rather than Section 17.6.
2. A small board and care occupancy is changed to a large board and care occupancy when a living room is converted to a bedroom, so that the number of sleeping accommodations for clients increases from 16 to 18, resulting in having to comply with the requirements of Section 33.3 rather than Section 33.2.
3. The contents and processes in an existing general industrial occupancy building are changed so as to become more hazardous, and, therefore, the occupancy requires reclassification as a high hazard industrial occupancy and compliance with the special requirements for such.
4. The furniture is removed from a patient sleeping room in a hospital, and medical supplies are stored in the room, creating a hazardous area subject to the requirements for the protection from hazards.
5. Dining tables are removed from an assembly occupancy restaurant with an occupant load of 280 persons, increasing the occupant load to 320 persons, resulting in the requirement for a fire alarm system.

Other examples of change of use are presented in the commentary following 43.7.1.

The applicable occupancy chapter might further supplement the definition of the term *change of use* for purposes of applying the provisions of 43.7.1 to that occupancy. For example, 18/19.1.1.4.2 exempts some changes from one health care occupancy subclassification to another from being considered a change of use. Users are cautioned to consult the applicable occupancy chapters in addition to the provisions of Chapter 43.

**43.2.2.1.6 Change of Occupancy Classification.** The change in the occupancy classification of a structure or portion of a structure.

See the commentary following 43.7.2.

**43.2.2.1.7 Addition.** An increase in the building area, aggregate floor area, building height, or number of stories of a structure.

See the commentary following the title of Section 43.8.

**43.2.2.2\* Equipment or Fixture.** Any plumbing, heating, electrical, ventilating, air-conditioning, refrigerating, and fire protection equipment; and elevators, dumbwaiters, escalators, boilers, pressure vessels, or other mechanical facilities or installations related to building services.

**A.43.2.2.2** Equipment or fixtures do not include manufacturing, production, or process equipment, but do include connections from building service to process equipment.

**43.2.2.3 Load-Bearing Element.** Any column, girder, beam, joist, truss, rafter, wall, floor, or roof sheathing that supports any vertical load in addition to its own weight, or any lateral load.

**43.2.2.4 Rehabilitation Work Area.** That portion of a building affected by any renovation, modification, or reconstruction work as initially intended by the owner, and indicated as such in the permit, but excluding other portions of the building where incidental work entailed by the intended work must be performed, and excluding portions of the building where work not initially intended by the owner is specifically required.

The definition of the term *rehabilitation work area* clarifies that, if a provision of this chapter requires work in an area of the building not initially intended by the rehabilitation plan, such additional work does not increase the size of the rehabilitation work area. This concept is illustrated in Exhibit 43.3, which depicts a two-story dormitory. Reconstruction on the second floor exceeds 50 percent of the floor area and mandates the requirement of 43.6.2.2.2 for illumination and emergency lighting to be provided throughout the second floor in accordance with the

requirements applicable to new construction for the applicable occupancy (in this case, Chapter 28 for new hotels and dormitories). The installation of illumination and emergency lighting throughout the second floor does not increase the size of the rehabilitation work area. If this exemption were not provided, the rehabilitation work area would have been increased to include the entire second floor, and, because the second floor exceeds 50 percent of the entire building area, 43.6.4.1 would have required that automatic sprinklers be installed on both floors (i.e., the floor undergoing the reconstruction and all floors below) as 28.3.5.1 requires sprinklers. Instead, per the requirement of 43.6.4.2, the initial rehabilitation work area exceeding 50 percent of the area of the second floor mandates a requirement for the sprinklering of that floor only.

As another example of the work area size concept, a sprinkler system is voluntarily installed as a modification involving the entire area of the third floor of an office building. Piping associated with the riser that supplies water to the sprinkler system is installed on the first and second floors. The work associated with the installation of the riser on the first and second floors is considered incidental. The rehabilitation work area is established as being the third floor only.

**43.2.2.5 Technically Infeasible.** A change to a building that has little likelihood of being accomplished because the existing structural conditions require the removal or alteration of a load-bearing member that is an essential part of the structural frame, or because other existing physical or site constraints prohibit modification or addition of elements, spaces, or features that are in full and strict compliance with applicable requirements.

The term *technically infeasible* is used in the compliance provisions of 43.1.4.3.

## 43.3 Repairs

The basic provisions of the repair requirements of Section 43.3 are as follows:

1. Perform the repair with like materials, unless the material is currently prohibited, or with materials permitted by other sections of the Code. See 43.3.1.3.
2. Do not reduce the level of Code compliance. See 43.3.1.4.
3. Ensure that the building undergoing repair meets the requirements of the applicable existing occupancy chapter. See 43.1.2.1(1) and 4.6.7.3.

The difference between the terms *repair* and *renovation*, as defined in 43.2.2.1.1 and 43.2.2.1.2, respectively, is mostly one of quantity. An extensive repair becomes a renovation, and a minor renovation becomes a repair. Some examples are as follows:

1. The replacement of a swatch of corridor carpeting that was stained when a bottle of liquid bleach was spilled is typically

Exhibit 43.3

Rehabilitation work area not increased by work required in other areas.

**Commentary Table 43.1 Rehabilitation Work Category of Repair**

Rehabilitation Work Category	Section	Applicable Occupancy Chapter		Additional (Unplanned) Work Required
		Features Retained / Not Changed	Features Added / Changed	
Reconstruction				
Modification				
Renovation				
Repair	43.3	Existing	Existing (features repaired)	No

a repair. The replacement of the corridor carpeting is typically a renovation.

- The replacement of a few ceiling tiles is typically a repair. The replacement of a ceiling is typically a renovation.
- The patching of a hole in a wall is typically a repair. The removal and replacement of a wall is typically a renovation. However, the removal, replacement, and relocation of a wall is a modification.
- The replacement of a door closer that is not functioning is typically a repair. The replacement of a door is typically a renovation.

See the examples of repair, renovation, and modification in the commentary following 43.2.2.1.1, 43.2.2.1.2, and 43.2.2.1.3.

### 43.3.1 General Requirements.

**43.3.1.1** A repair, as defined in 43.2.2.1.1, in other than historic buildings shall comply with the requirements of Section 43.3.

**43.3.1.2** Repairs in historic buildings shall comply with the requirements of one of the following:

- Section 43.3
- Section 43.3, as modified by Section 43.10

**43.3.1.3** The work shall be done using like materials or materials permitted by other sections of this Code.

The provision of 43.3.1.3 can be illustrated by an example. The existing interior wall finish in the corridor of a nonsprinklered office building is a previously approved (see definition in 3.3.214) Class A textile wall covering. A piece of the textile wall covering, which had been vandalized with graffiti, is cut and peeled away from the existing corridor wall and is replaced with Class A textile wall covering retained from the original installation. Although 10.2.4.1(1) would not permit new Class A textile wall covering to be installed in a nonsprinklered corridor, 10.2.4.1(4) permits previously approved existing Class A textile wall covering to be continued in use. The repair is permitted to be made using the original material.

**43.3.1.4** The work shall not make the building less conforming with the other sections of this Code, or with any previously

approved alternative arrangements, than it was before the repair was undertaken.

The requirement in 43.3.1.4 that repairs must not make a building less conforming with other Code requirements is a basic premise throughout this chapter. Additionally, per 43.1.2.1(1) and 4.6.7.3, the building that undergoes repair must meet the requirements of the applicable existing occupancy chapter. See the commentary following 43.1.2.1(2).

Commentary Table 43.1 presents a roadmap for using the Chapter 43 provisions for the rehabilitation work category of repair.

## 43.4 Renovations

The basic provisions of the renovation requirements of Section 43.4 are as follows:

- The renovation work, other than that involving new interior finish materials, is permitted to be performed in compliance with the Code provisions applicable to existing buildings. Thus, the provision of 43.4.1.3 permits a leniency not recognized prior to the development of Chapter 43 in 2006, as earlier editions of the Code required renovation work to comply with the requirements applicable to new construction.
- New interior finish materials must meet the requirements for new construction. See 43.4.3.
- The renovation work must not reduce the level of Code compliance. See 43.4.1.4.
- The building undergoing renovation must meet the requirements of the applicable existing occupancy chapter. See 43.1.2.1(1) and 4.6.7.3.

### 43.4.1 General Requirements.

**43.4.1.1** A renovation, as defined in 43.2.2.1.2, in other than historic buildings shall comply with the requirements of Section 43.4.

**43.4.1.2** Renovations in historic buildings shall comply with the requirements of one of the following:

- (1) **Section 43.4**
- (2) **Section 43.4**, as modified by **Section 43.10**

**43.4.1.3** All new work shall comply with the requirements of this *Code* applicable to existing buildings.

**43.4.1.4** The work shall not make the building less conforming with other sections of this *Code*, or with any previous approved alternative arrangements, than it was before the renovation was undertaken, unless otherwise specified in **43.4.1.5**.

**43.4.1.5** Minor reductions in the clear opening dimensions of replacement doors and windows that result from the use of different materials shall be permitted, unless such reductions are prohibited.

The exemption permitted by **43.4.1.5** for areas undergoing renovation is meant to permit minor or inconsequential reductions in the clear width of openings of doors or windows that are caused by using replacement materials. It is not uncommon for a door replacement project to result in a slightly narrower opening than had been provided before the renovation, due to the use of different materials or products manufactured in accordance with current product standards. The *Code* intentionally allows the authority having jurisdiction to determine how much deviation to permit. For example, a reduction of 2 in. (51 mm) in the 34 in. (865 mm) clear width provided by a 36 in. (915 mm) wide door leaf might be considered minor because the 32 in. (815 mm) width door opening provides the minimum clear width required by **7.2.1.2.3** for the purpose of accommodating a wheelchair user. A similar 2 in. (51 mm) reduction in the 32 in. (815 mm) clear width provided by a 34 in. (865 mm) wide door leaf should not be considered minor or inconsequential, because the door opening would no longer ensure passage by a wheelchair user.

**43.4.2 Capacity of Means of Egress.** The capacity of means of egress, determined in accordance with **Section 7.3**, shall be sufficient for the occupant load thereof, unless one of the following conditions exists:

- (1) The authority having jurisdiction shall be permitted to establish the occupant load as the number of persons for which existing means of egress is adequate, provided that measures are established to prevent occupancy by a greater number of persons.
- (2)\* The egress capacity shall have been previously approved as being adequate.

**A.43.4.2(2)** Some building codes have permitted an increase in egress capacity in buildings protected throughout by an approved automatic sprinkler system. The intent of **43.4.2(2)** is that, during a renovation project, egress capacity is permitted to continue to be evaluated using the previously approved method.

The provisions of **43.4.2** can be applied to rehabilitation projects involving renovation, modification, or reconstruction, as **Section 43.5** for modifications requires compliance with **Section 43.4**, as does **Section 43.6** for reconstruction. See the commentary following **43.1.1(6)**.

The provision of **43.4.2(1)** provides all occupancies with an exemption previously offered only to existing assembly occupancies by **13.1.7.1.3**. Where an existing means of egress has insufficient capacity for the occupant load (see the commentary following **A.7.3.1.2**), the AHJ is permitted to establish the occupant load as the number of persons that the existing means of egress can accommodate. Similarly, the provision of **43.4.2(2)** permits a previously approved occupant load to be continued to be recognized as addressed by the advisory text of **A.43.4.2(2)**. In both cases, the owner/operator is charged with assuring that occupancy does not exceed the approved occupant load.

**43.4.3 Interior Finish Requirements.** New interior finish materials shall meet the requirements for new construction.

**Paragraph 43.4.3** requires that the *Code* provisions applicable to new construction be applied to the installation of new interior finish materials. This provision is stricter than that of **43.4.1.3**, which permits other renovation work to be done per the *Code* requirements applicable to existing buildings.

An example of the application of **43.4.3** follows. The corridor walls in a nonsprinklered day-care occupancy building are being refinished by installing plastic laminate paneling over the existing painted gypsum board. The paneling is required to meet the *Code* provisions applicable to new construction. **Paragraph 16.3.3.2**, applicable to interior wall finish in new day-care occupancies, requires Class A material in corridors. Had the normal provision of **43.4.1.3** applied, so as to permit the material to comply with the *Code* provisions for existing buildings, **17.3.3.2** would have permitted the use of Class A or Class B interior finish materials.

**43.4.4 Other Requirements.** The reconfiguration or extension of any system, or the installation of any additional equipment, shall comply with **Section 43.5**.

**Paragraph 43.4.4** has the effect of expanding the definition of the term *modification* and limiting the definition of the term *renovation*. The reconfiguration or extension of any system, or the installation of any additional equipment, must be classified as a modification, not as a renovation. The effect of this requirement is that such reconfiguration, extension, or installation is required to comply with the requirements of other *Code* sections applicable to new construction. Had this provision not appeared, the reconfiguration, extension, or installation would have been permitted to be done per the *Code* requirements applicable to existing buildings, as **43.4.1.3** directs.

**Commentary Table 43.2** presents a roadmap for using the **Chapter 43** provisions for the rehabilitation work category of renovation.

**Commentary Table 43.2 Rehabilitation Work Category of Renovation**

Rehabilitation Work Category	Section	Applicable Occupancy Chapter		Additional (Unplanned) Work Required
		Features Retained / Not Changed	Features Added / Changed	
Reconstruction				
Modification				
Renovation	43.4	Existing	Existing New — interior finish	No
Repair	43.3	Existing	Existing (features repaired)	No

## 43.5 Modifications

The basic provisions of the modification requirements of [Section 43.5](#) are as follows:

1. Newly constructed elements, components, and systems are required to comply with the requirements of other *Code* sections applicable to new construction.
2. Work must also meet the renovation provisions of [Section 43.4](#).
3. The modification work must not reduce the level of *Code* compliance. See [43.4.1.4](#), applicable per [43.5.1.1\(2\)](#).
4. The building undergoing modification must meet the requirements of the applicable existing occupancy chapter. See [43.1.2.1\(1\)](#) and [4.6.7.3](#).

### 43.5.1 General Requirements.

**43.5.1.1** A modification, as defined in [43.2.2.1.3](#), in other than historic buildings shall comply with both of the following:

- (1) [Section 43.5](#)
- (2) [Section 43.4](#)

**43.5.1.2** Modifications in historic buildings shall comply with the requirements of one of the following:

- (1) [43.5.1.1\(1\)](#) and (2)
- (2) [43.5.1.1\(1\)](#) and (2), as modified by [Section 43.10](#)

**43.5.1.3** Newly constructed elements, components, and systems shall comply with the requirements of other sections of this *Code* applicable to new construction.

**Paragraph 43.5.1.3** requires that the *Code* provisions applicable to new construction be applied to newly constructed elements, components, and systems. This is the requirement that is mainly responsible for making the provisions for modification stricter than those for renovation. **Paragraph 43.4.1.3** permits rehabilitation work classified as renovation (other than that involving the installation of interior finish materials) to be done per the *Code* requirements applicable to existing buildings.

### 43.5.2 Extensive Modifications.

**Subsection 43.5.2** has the effect of expanding the definition of the term *reconstruction*, and limiting the definition of the term *modification*, via the introduction of criteria for judging a modification to be an extensive modification subject to the reconstruction provisions of [Section 43.6](#).

**43.5.2.1** The modification of an entire building or an entire occupancy within a building shall be considered as a reconstruction and shall comply with the requirements of [Section 43.6](#) for the applicable occupancy, unless otherwise specified in [43.5.2.2](#).

**43.5.2.2** Modification work that is exclusively electrical, plumbing, mechanical, fire protection system, or structural work shall not be considered a reconstruction, regardless of its extent.

**43.5.2.3** Where the total area of all the rehabilitation work areas included in a modification exceeds 50 percent of the area of the building, the work shall be considered as a reconstruction and shall comply with the requirements of [Section 43.6](#) for the applicable occupancy, unless otherwise specified in [43.5.2.4](#).

**43.5.2.4** Rehabilitation work areas in which the modification work is exclusively plumbing, mechanical, fire protection system, or electrical work shall not be included in the computation of total area of all rehabilitation work areas.

Two examples related to extensive modifications follow.

#### Example 1

**Exhibit 43.4** illustrates an existing two-story hotel undergoing modification throughout the second floor. The modification includes cutting through the roof to add skylight windows along the length of the interior corridor; installing skylight windows in each guest room; and reconfiguring the bathroom in each guest room by removing the bathtub and installing a glass-enclosed shower. **Paragraph 43.5.2.3** requires that the modification of more than 50 percent of the area of the building be reclassified as a reconstruction and meet the requirements of [Section 43.6](#). **Paragraph 43.6.4.1** requires that a rehabilitation work area

**Commentary Table 43.3 Rehabilitation Work Category of Modification**

Rehabilitation Work Category	Section	Applicable Occupancy Chapter		Additional (Unplanned) Work Required
		Features Retained / Not Changed	Features Added / Changed	
Reconstruction				
Modification	43.5	Existing	New	No
Renovation	43.4	Existing	Existing New — interior finish	No
Repair	43.3	Existing	Existing (features repaired)	No

**Exhibit 43.4**

*Extensive modification that might require reclassification to reconstruction per Example 1; limited modification that does not require reclassification to reconstruction per Example 2.*

involving reconstruction (see 43.6.1.3) of more than 50 percent of the aggregate building area be sprinklered (i.e., on the floor undergoing the reconstruction and all floors below, which in this case is the second floor and first floor) if sprinklers are required for new construction by the occupancy chapter. Paragraph 28.3.5.1, applicable to new hotels, requires sprinklers. Thus, as part of the rehabilitation, the second floor and the first floor must be sprinklered. The effect of having to reclassify the rehabilitation work from modification to reconstruction is significant in raising the required level of life safety above that which existed prior to the rehabilitation project.

### Example 2

Exhibit 43.4 illustrates an existing two-story hotel undergoing modification throughout the second floor. The modification is limited to the voluntary addition of a sprinkler system throughout the second floor, as automatic sprinkler systems are not required by this Code for existing hotels that are not in high-rise buildings. The system installation will make extensive use of sidewall sprinklers to preclude the need for removing the ceiling or requiring guests to vacate the area while the work is being done. The modification is not required to be reclassified

as reconstruction, because 43.5.2.4 exempts modification work that is exclusively plumbing, mechanical, fire protection system, or electrical work from having to be included in the computational area for purposes of applying the 50 percent criterion of 43.5.2.3. The installation of a sprinkler system is fire protection system work. The rehabilitation project remains a modification that must comply with the provisions of 43.5.1. In contrast to Example 1 above, the sprinkler system installation need not include the first floor.

Commentary Table 43.3 presents a roadmap for using the Chapter 43 provisions for the rehabilitation work category of modification.

## 43.6 Reconstruction

The basic provisions of the reconstruction requirements of Section 43.6 are as follows:

1. Newly constructed elements, components, and systems are required to comply with the requirements of other Code sections applicable to new construction.
2. Select building elements and systems that are not envisioned as part of the rehabilitation work plan must be provided under the conditions specified in 43.6.2.2 through 43.6.6.
3. Work must also meet the renovation provisions of Section 43.4 and the modification provisions of Section 43.5.
4. The reconstruction work must not reduce the level of Code compliance. See 43.4.1.4, applicable per 43.6.1.1(3).
5. The building undergoing modification must meet the requirements of the applicable existing occupancy chapter. See 43.1.2.1(1) and 4.6.7.3.

As explained in the commentary following the title of this chapter, NFPA first addressed the subject of special provisions for existing building rehabilitation when its building code committees developed Chapter 15, Building Rehabilitation, for NFPA 5000, *Building Construction and Safety Code*. In Chapter 15

of *NFPA 5000*, an existing building is required to meet progressively more stringent requirements as the rehabilitation work changes (from repair to renovation to modification to reconstruction), but the building itself is not required to meet a minimum prescribed level of performance as a condition for proceeding with the rehabilitation. The direction taken by *NFPA 5000* is consistent with that traditionally assumed by model building codes. Building codes typically do not require existing buildings that are simply being occupied, but for which there is no rehabilitation project, to be upgraded to the level of life safety required by the *Life Safety Code* for existing buildings. For example, the *Code* requires existing business occupancy buildings to be in compliance with the provisions of **Chapter 39**, Existing Business Occupancies.

The reconstruction section of Chapter 15 of *NFPA 5000* is where the rehabilitation project becomes sufficiently complex so as to mandate requirements for work in a variety of elements and systems that are not part of the original rehabilitation work plan. **Section 43.6** of this *Code* is modeled after the reconstruction section of Chapter 15 of *NFPA 5000*, but **Section 43.6** addresses only the life safety subset of the building rehabilitation provisions from *NFPA 5000*. **Section 43.6** has less effect than its counterpart in *NFPA 5000*, because **43.1.2.1(1)** and **4.6.7.3** require compliance with the applicable existing occupancy chapters as a condition for using **Chapter 43** for repair, renovation, modification, or reconstruction. The requirement of **43.1.2.1(1)** ensures that the building being rehabilitated has many of the incremental features required by **Section 43.6**, albeit such features will often be in compliance with the provisions for existing buildings and might not meet all the requirements for new construction exactly. For example, **43.1.2.1(1)** has the effect of requiring the building undergoing rehabilitation to meet the illumination requirements applicable to existing buildings, which means that stairs might not have the 10 ft-candle (108 lux) illumination level required of new stairs by **7.8.1.3(1)**. See **43.6.2.2.3**, which requires some reconstruction areas to be provided with illumination in accordance with the requirements applicable to new construction.

**Section 43.6** has its biggest effect in **43.6.4**, where sprinklers are required for the floor containing the rehabilitation work area (in some cases, sprinklers also are required on all floors below) if the work area is large, but only if sprinklers are required by the section of the *Code* applicable to new construction for the occupancy. For example, if the rehabilitation work area in an existing hotel building is large enough to mandate the sprinkler requirement of **43.6.4.1** or **43.6.4.2**, sprinklers are required, because **28.3.5.1**, applicable to new hotels, requires sprinklers. On the other hand, if the rehabilitation work area in an existing, non-high-rise business occupancy building is large enough to mandate the sprinkler requirement of **43.6.4.1** or **43.6.4.2**, sprinklers are not required, because the provisions of **38.3.5** combined with those of **38.4.2**, applicable to new business occupancies, do not require sprinklers if the building is not a high-rise building.

### 43.6.1 General Requirements.

**43.6.1.1** A reconstruction, as defined in **43.2.2.1.4**, in other than historic buildings shall comply with all of the following:

- (1) **Section 43.6**
- (2) **Section 43.5**, except that any stairway replacing an existing stairway shall be permitted to comply with **7.2.2.2.1.1(3)**
- (3) **Section 43.4**

**43.6.1.2** Reconstruction work in historic buildings shall comply with the requirements of one of the following:

- (1) **43.6.1.1(1)**, (2), and (3)
- (2) **43.6.1.1(1)**, (2), and (3), as modified by **Section 43.10**

**43.6.1.3** Wherever the term *rehabilitation work area* is used in **Section 43.6**, it shall include only the area affected by reconstruction work and areas covered by **43.5.2**.

**43.6.1.4** Other rehabilitation work areas affected exclusively by renovation or modification work shall not be included in the rehabilitation work area required to comply with **Section 43.6**.

### 43.6.2 Means of Egress.

**43.6.2.1 General.** The means of egress shall comply with the requirements applicable to the existing occupancy [*see 43.1.2.1(I)*], as modified by **43.6.2**.

**Paragraph 43.6.2.1** repeats the requirements of **43.1.2.1(1)** and **4.6.7.3** but makes the requirements specific to means of egress and adds the words “as modified by **43.6.2**.” The provisions of **43.6.2.2.1** through **43.6.2.2.3** mandate compliance with the illumination provisions applicable to new construction. They have limited additional effect over that resulting from compliance with **43.1.2.1(1)** and **4.6.7.3**, which require compliance with the provisions of the applicable existing occupancy chapter. For each occupancy classification, the chapter applicable to existing buildings applies the same illumination requirement as the chapter for new construction (i.e., compliance with **Section 7.8**). One effect of **43.6.2.2** that would not result from compliance with **43.1.2.1(1)** only is the requirement for a minimum 10 ft-candle (108 lux) illumination level on new stairs, as required by **7.8.1.3(1)**. For example, **43.6.2.2.3** establishes a rehabilitation threshold at which illumination of the exit stairs serving the rehabilitation area is required. Such illumination of new stairs must provide the 10 ft-candle (108 lux) illumination level detailed in **7.8.1.3(1)**. Compliance with only **43.1.2.1(1)** or **4.6.7.3** would provide a minimum illumination level of 1 ft-candle (10.8 lux) for other than new stairs.

#### 43.6.2.2\* Illumination, Emergency Lighting, and Marking of Means of Egress.

**A.43.6.2.2** The provisions for marking of means of egress are those addressed in **Section 7.10**.

The *Code* treats illumination of means of egress, emergency lighting of means of egress, and marking of means of egress as a trio whose elements work together to increase occupant awareness of the means of egress. All three elements are necessary. See Sections 7.8, 7.9, and 7.10.

**43.6.2.2.1** Means of egress in rehabilitation work areas shall be provided with illumination, emergency lighting, and marking of means of egress in accordance with the requirements of other sections of this *Code* applicable to new construction for the occupancy.

**43.6.2.2.2** Where the reconstruction rehabilitation work area on any floor exceeds 50 percent of that floor area, means of egress throughout the floor shall be provided with illumination, emergency lighting, and marking of means of egress in accordance with the requirements of other sections of this *Code* applicable to new construction for the occupancy, unless otherwise specified in 43.6.2.2.4.

**43.6.2.2.3** In a building with rehabilitation work areas involving more than 50 percent of the aggregate floor area within the building, the means of egress within the rehabilitation work area and the means of egress, including the exit and exit discharge paths, serving the rehabilitation work area shall be provided with illumination, emergency lighting, and marking of means of egress in accordance with the requirements of other sections of this *Code* applicable to new construction for the occupancy, unless otherwise specified in 43.6.2.2.4.

**43.6.2.2.4** Means of egress within a tenant space that is entirely outside the rehabilitation work area shall be permitted to comply with the requirements for illumination, emergency lighting, and marking of means of egress applicable to the existing occupancy in lieu of the requirements for illumination and emergency lighting applicable to new construction required by 43.6.2.2.2 and 43.6.2.2.3.

### 43.6.3 Fire Barriers and Smoke Barriers.

**43.6.3.1** In small residential board and care occupancies and one- and two-family dwellings where the rehabilitation work area is in any attached dwelling unit, walls separating the dwelling units, where such walls are not continuous from the foundation to the underside of the roof sheathing, shall be constructed to provide a continuous fire separation using construction materials that are consistent with the existing wall or that comply with the requirements for new buildings of the occupancy involved.

**43.6.3.2** The following shall apply to work required by 43.6.3.1:

- (1) It shall be performed on the side of the wall of the dwelling unit that is part of the rehabilitation work area.
- (2) It shall not be required to be continuous through concealed floor spaces.

The provisions of 43.6.3 have applicability only to small residential board and care occupancies and one- and two-family

dwellings. Paragraph 43.6.3.1 has the effect of requiring that there be fire separations between the dwelling unit undergoing reconstruction and any adjacent dwelling units. This provision will, in some cases, involve an upgrade that would not be required by 43.1.2.1(1) or 4.6.7.3.

Paragraph 43.6.3.2 approaches the fire separation installation required by 43.6.3.1 in a practical way. Paragraph 43.6.3.2(1) permits the work needed for compliance to be done on the side of the wall in the dwelling unit that is part of the rehabilitation work area. In many cases, access is not readily available to the other side of the wall, because it is in a dwelling unit that is not part of the rehabilitation work area. Paragraph 43.6.3.2(2) recognizes the difficulty and disruptive effects of performing work in the portion of the wall sandwiched between the ceiling and the floor or roof above.

### 43.6.4 Extinguishing Systems.

Section 43.6 on reconstruction has its most profound effect in 43.6.4, where some degree of sprinkling is required (if the applicable occupancy chapter for new construction requires sprinklers) if the rehabilitation work area exceeds a threshold expressed as a percentage of aggregate building area or a percentage of the area of the floor undergoing reconstruction.

**43.6.4.1** In a building with rehabilitation work areas involving over 50 percent of the aggregate building area, automatic sprinkler systems shall be provided on the highest floor containing a rehabilitation work area and on all floors below in accordance with the requirements of other sections of this *Code* applicable to new construction for the occupancy.

**43.6.4.2** On any story with rehabilitation work areas involving over 50 percent of the area of the story, a sprinkler system shall be provided throughout the story in accordance with the requirements of other sections of this *Code* applicable to new construction for the occupancy.

Paragraphs 43.6.4.1 and 43.6.4.2 are the two provisions of Section 43.6 that do the most to raise the level of life safety above that required for rehabilitation projects by earlier editions of the *Code*. In earlier editions, any alteration or any installation of new equipment was required to meet, as nearly as practicable, the requirements for new construction. However, only the altered, renovated, or modernized portion of an existing building, system, or individual component was required to meet the provisions of the *Code* that are applicable to new construction. An extensive rehabilitation project that did not include sprinkling was not required to be sprinklered (in other than health care occupancies, which have specialized requirements for installing sprinklers in the smoke compartment undergoing major rehabilitation — see, for example, 18.1.1.4.3.3 and 18.1.1.4.3.4). The provisions of 43.6.4.1 and 43.6.4.2 might require sprinklers for major reconstruction, even where the plan for the rehabilitation project does not involve sprinklers.

The application of 43.6.4.1 is illustrated in Exhibit 43.5. The existing, three-story, nonsprinklered hotel building is undergoing reconstruction. The rehabilitation work area is comprised of all of the second floor and portions of the first floor, so that the rehabilitation work area exceeds 50 percent of the aggregate building area. The threshold of 43.6.4.1 is exceeded; therefore, sprinklers are required to be provided on the highest floor containing a rehabilitation work area (i.e., the second floor) and on all floors below (i.e., the first floor) if sprinklers are required by other sections of the Code applicable to new construction for the occupancy. New hotels are addressed in Chapter 28, and 28.3.5.1 requires new hotels to be sprinklered. Thus, the major reconstruction mandates the sprinklering of the first and second floors, but sprinklers are not required on the third floor.

If the occupancy of the existing, three-story, nonsprinklered building shown in Exhibit 43.5 and addressed in the above

paragraph is changed from hotel to business, the provisions of 43.6.4.1 have no effect relative to requiring the installation of sprinklers. This is because 38.3.5 and 38.4.2, applicable to new business occupancies, do not require new, non-high-rise business occupancy buildings to be sprinklered.

The application of 43.6.4.2 is illustrated in Exhibit 43.6. The existing, three-story, nonsprinklered hotel building is undergoing reconstruction. The rehabilitation work area is comprised of two-thirds of the second floor, so that the rehabilitation work area exceeds 50 percent of the area of the story. The threshold of 43.6.4.2 is exceeded; therefore, sprinklers are required to be provided throughout the story containing the rehabilitation work area (i.e., the second floor) if sprinklers are required by other sections of the Code applicable to new construction for the occupancy. New hotels are addressed in Chapter 28, and 28.3.5.1 requires new hotels to be sprinklered. Thus, the major

Exhibit 43.5

Rehabilitation work area large enough to require sprinklering of the first and second floors of a hotel occupancy.

Exhibit 43.6

Rehabilitation work area large enough to require sprinklering of the second floor of a hotel occupancy.

reconstruction mandates the sprinkling of the second floor, but sprinklers are not required on the first and third floors.

If the occupancy of the existing, three-story, nonsprinklered building shown in Exhibit 43.6 and addressed in the above paragraph is changed from hotel to business, the provisions of 43.6.4.2 have no effect relative to requiring the installation of sprinklers. This is because 38.3.5 and 38.4.2, applicable to new business occupancies, do not require new, non-high-rise business occupancy buildings to be sprinklered.

**43.6.4.3** Where sprinklers are installed in an elevator hoistway or elevator machine room as part of the rehabilitation work, the elevators shall comply with the fire fighters' emergency operations requirements of ASME A17.1/CSA B44, *Safety Code for Elevators and Escalators*.

The intent of 43.6.4.3 is more easily understood by first understanding the effect of 9.4.3.2. Paragraph 9.4.3.2 mandates compliance with the fire fighters' emergency operations requirements of ASME A17.3, *Safety Code for Existing Elevators and Escalators*,<sup>4</sup> not with the requirements of ASME A17.1/CSA B44, *Safety Code for Elevators and Escalators*,<sup>5</sup> which has applicability to new elevator installations. ASME A17.3 requires existing elevators to meet the Phase I Emergency Operation (i.e., elevator recall) and Phase II Emergency Operation (i.e., fire fighters' service) provisions of the 1987 edition of ASME A17.1,<sup>6</sup> unless the elevator was required to comply with a later edition of ASME A17.1 at the time of installation or alteration. Therefore, the emergency operations features provided for existing elevators might not be as robust as the emergency operations features required for new elevators by the current edition of ASME A17.1/CSA B44.

In 43.6.4.3, the issue is that of installing sprinklers in elevator hoistways or elevator machine rooms. Water discharging from sprinklers in such areas has the potential to adversely affect the operation of the elevator. The more recent editions of ASME A17.1 and ASME A17.1/CSA B44 (i.e., ASME A17.1 became ASME A17.1/CSA B44 in 2007 without a title change) require a shunt-trip feature that calls the elevator out of service prior to sprinkler system waterflow. Paragraph 43.6.4.3 requires compliance with ASME A17.1/CSA B44, as an added provision to that required by 9.4.3.2, to ensure that the shunt-trip feature is provided where sprinklers are installed in existing elevator hoistways or elevator machine rooms.

**43.6.4.4** Any rehabilitation work areas in a building that is required to be provided with a standpipe system by other sections of this Code shall be provided with standpipes up to and including the highest rehabilitation work area floor.

Paragraph 43.6.4.4 has the potential to be misinterpreted.

First, the intent of 43.6.4.4 is to require the standpipe only if such standpipe is required by the provisions of the applicable existing occupancy chapter. In general, standpipes are not required for existing buildings that are not high-rise buildings. All new high-rise building construction is required by 11.8.1.1(1) to meet the provisions of Section 11.8 that require standpipes. If

the existing building is high-rise and the applicable occupancy chapter does not reference Section 11.8 (or otherwise require the building to have standpipes due to its high-rise nature), it is not the intent of 43.6.4.4 to require the existing building that is undergoing reconstruction to be provided with standpipes. For example, 29.4.1.1 and 29.3.5.1, which apply to existing high-rise hotels, require sprinklers but not standpipes, as the standpipe provisions of Section 11.8 are not referenced. If an existing high-rise hotel building is undergoing reconstruction, standpipes are not required to be added as part of the rehabilitation project. As an example of the corollary condition, 17.4.2, which applies to existing day-care occupancies located in the high-rise portion of a building, requires compliance with Section 11.8, which, in turn, requires standpipes. If a floor housing an existing day-care occupancy is located in the high-rise portion of a building, and that floor is undergoing reconstruction, standpipes are required to be added as part of the rehabilitation project for compliance with 43.6.4.4. The provision of 43.6.4.4 has the effect of modifying the requirement of 43.1.2.1(1), which would require standpipes throughout the entire height of the building for compliance with 17.4.2 as a condition for allowing the rehabilitation project.

Second, it is not the intent of 43.6.4.4 to require standpipes to be installed in portions of the building not required by the applicable occupancy chapter to be provided with standpipes. For example, 13.4.6.12, which applies to existing assembly occupancy stages, requires standpipes on the stage. The requirement for standpipes on the stage is not meant to mandate a requirement for standpipes to be installed "up to and including the highest rehabilitation work area floor," as specified in 43.6.4.4. Note that the stage standpipes are required for compliance with 43.1.2.1(1) and 4.6.7.3, which has the effect of mandating the provisions of 13.4.6.12 and is unrelated to the provision of 43.6.4.4.

**43.6.4.5** The standpipes required by 43.6.4.4 shall be located and installed in accordance with NFPA 14, *Standard for the Installation of Standpipe and Hose Systems*, unless otherwise provided in 43.6.4.6 and 43.6.4.7.

**43.6.4.6** No pump shall be required, provided that the following criteria are met:

- (1) The standpipes are capable of accepting delivery by fire department apparatus of a minimum of 250 gpm at 65 psi (945 L/min at 4.5 bar) to the topmost floor in buildings equipped throughout with an automatic sprinkler system or a minimum of 500 gpm at 65 psi (1890 L/min at 4.5 bar) to the topmost floor in other buildings.
- (2) Where the standpipe terminates below the topmost floor, the standpipe is designed to meet the flow/pressure requirements of 43.6.4.6(1) for possible future extension of the standpipe.

**43.6.4.7** In other than high-rise buildings, the required interconnection of the standpipes for a wet system shall be permitted at the lowest level of the rehabilitation work area.

**Commentary Table 43.4 Rehabilitation Work Category of Reconstruction**

Rehabilitation Work Category	Section	Applicable Occupancy Chapter		Additional (Unplanned) Work Required
		Features Retained / Not Changed	Features Added / Changed	
Reconstruction	43.6	Existing	New	Yes
Modification	43.5	Existing	New	No
Renovation	43.4	Existing	Existing New — interior finish	No
Repair	43.3	Existing	Existing (features repaired)	No

Paragraphs 43.6.4.6 and 43.6.4.7 offer some relief from the criteria of NFPA 14, *Standard for the Installation of Standpipe and Hose Systems*.<sup>7</sup> These provisions are consistent with the intent of the NARRP document on which this chapter is based. See the commentary following the chapter title. A rehabilitation chapter should promote the continued use and adaptive reuse of existing structures without burdening the facility with unreasonable expense and while still ensuring adequate life safety.

Note that 43.6.4.6(2) might have the effect of requiring the standpipe being installed as part of a rehabilitation project to be designed for more than its immediate need, so that it can accommodate future rehabilitation work on floors above that undergoing reconstruction. It would be false economy to design the standpipe system to meet only its current need and then have to replace it, or otherwise supplement it, during future rehabilitation projects.

### 43.6.5 Fire Alarm Systems — Smoke Alarms.

**43.6.5.1** In lodging or rooming houses, hotels and dormitories, and apartment buildings, individual sleeping rooms, guest rooms, and dwelling units within any rehabilitation work area shall be provided with smoke alarms complying with the requirements of other sections of this *Code* applicable to new construction for the occupancy.

**43.6.5.2** Where the rehabilitation work area is located in residential board and care occupancies or one- and two-family dwelling units, smoke alarms complying with the requirements of other sections of this *Code* applicable to new construction for the occupancy shall be provided.

**43.6.6 Elevators.** In high-rise buildings, where the rehabilitation work area is one entire floor, or where the rehabilitation work area is 20 percent or more of the occupied floor area of the building, all floors shall be accessible by at least one elevator.

Paragraph 43.6.6 applies only in high-rise buildings, and only where the rehabilitation work area encompasses at least one entire floor or at least 20 percent of the occupied floor area of the building. Those thresholds are judged to have created a reconstruction project of sufficient size to justify requiring that all floors be accessible by at least one elevator. Paragraph 9.4.3.2

requires the elevator, if existing, to have emergency operations features in accordance with ASME A17.3, *Safety Code for Existing Elevators and Escalators*. Paragraphs 43.6.1.1(2), 43.5.1.3, and 9.4.3.1 require the elevator, if new, to have emergency operations features in accordance with ASME A17.1/CSA B44, *Safety Code for Elevators and Escalators*. The elevator recall provisions of Phase I Emergency Operation remove the elevator from service upon smoke detection in the elevator machine room or landing lobbies to prevent misuse that could injure building occupants. The fire fighters' service provisions of Phase II Emergency Operation permit the elevator to be placed back in service under the command of trained emergency forces personnel who might use the elevator to shuttle fire-fighting equipment to floors in the vicinity of the fire floor or to rescue persons unable to use the exit stairs.

Commentary Table 43.4 presents a roadmap for using the Chapter 43 provisions for the rehabilitation work category of reconstruction.

## 43.7 Change of Use or Occupancy Classification

Section 43.7 addresses, in individual subsections, change of use that does not involve a change of occupancy (hereafter referred to as *change of use*) and change of use that does involve a change of occupancy (hereafter referred to as *change of occupancy*).

### 43.7.1 Change of Use.

The term *change of use* is defined in 43.2.2.1.5 as "a change in the purpose or level of activity within a structure that involves a change in application of the requirements of the *Code*." Examples of change of use include the following:

1. An assembly occupancy restaurant that is not required to be sprinklered by the provisions of Chapter 13 is rehabilitated for use as an assembly occupancy nightclub with an occupant load exceeding 100. The resulting change in application of the requirements of the *Code* is that the building is required to be sprinklered in accordance with 13.3.5.1(3).

2. A 280-person assembly occupancy restaurant, with large dining tables, that is not required to have a fire alarm system by the provisions of Chapter 13 is rehabilitated by removing tables so as to increase the occupant load to 320 persons. The resulting change in application of the requirements of the Code is that the building is required to have a fire alarm system in accordance with 13.3.4.1.1.
3. An educational occupancy classroom is rehabilitated for use as an educational occupancy science laboratory using chemicals. The resulting change in application of the requirements of the Code is that the laboratory must be protected in accordance with 14.3.2.4 as a hazardous area.
4. A 300 ft<sup>2</sup> (27.9 m<sup>2</sup>) health care occupancy patient sleeping room is rehabilitated for use as a health care occupancy soiled linen storage room by removing the furniture. [Note that, per 6.1.14.1.3(1), storage use is permitted to be considered incidental to the predominant health care occupancy, rather than being classified as a storage occupancy. Thus, there is no change of occupancy.] The resulting change in application of the requirements of the Code is that the room is required to be protected as a hazardous area in accordance with 18.3.2.1.
5. A mercantile occupancy department store is rehabilitated for use as a mercantile occupancy bulk merchandising retail building. The resulting change in application of the requirements of the Code is that the building is required to meet the special criteria of 37.4.5 for bulk merchandising retail buildings.

**43.7.1.1** A change of use that does not involve a change of occupancy classification shall comply with the requirements applicable to the new use in accordance with the applicable existing occupancy chapter, unless the change of use creates a hazardous contents area as addressed in 43.7.1.2.

**43.7.1.2** A change of use that does not involve a change of occupancy classification but that creates a hazardous area shall comply with one of the following:

- (1) The change of use shall comply with the requirements applicable to the new use in accordance with the applicable occupancy chapter for new construction.
- (2) For existing health care occupancies protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1), where a change in use of a room or space not exceeding 250 ft<sup>2</sup> (23.2 m<sup>2</sup>) results in a room or space that is described by 19.3.2.1.5(7), the requirements for new construction shall not apply, provided that the enclosure meets the requirements of 19.3.2.1.2 and 19.3.2.1.3.

**43.7.1.3** Any repair, renovation, modification, or reconstruction work undertaken in connection with a change of use that does not involve a change of occupancy classification shall comply with the requirements of Sections 43.3, 43.4, 43.5, and 43.6, respectively.

A change of use might occur without any repair, renovation, modification, or reconstruction work. For example, consider the assembly occupancy change of use described in item 2 of the commentary following the title of 43.7.1. Tables are removed, permitting the occupant load to be increased from 280 to 320 persons. Provided that the new use does not create a hazardous contents area, 43.7.1.1 requires compliance with the requirements applicable to the new use in accordance with the applicable existing occupancy chapter. In this case, the requirements of Chapter 13 are applied, and, although the restaurant did not formerly require a fire alarm system, a fire alarm system is required in accordance with 13.3.4.1.1.

Another example of a change of use that might occur without any planned repair, renovation, modification, or reconstruction work is the health care occupancy change of use described in item 4 of the commentary following the title of 43.7.1. Furniture is moved out of a patient room and soiled linen is placed in storage in the room. The provision of 43.7.1.2 mandates that the newly created hazardous area be protected in accordance with the applicable occupancy chapter for new construction, as the exemption of 43.7.1.2(2) is prohibited from being applied to a room in excess of 250 ft<sup>2</sup> (23.2 m<sup>2</sup>). In this case, the requirements of 18.3.2.1 are applied, so that the room is sprinklered and separated from the remainder of the floor by 1-hour fire resistance-rated barriers. The required installation of sprinklers and the construction of the fire resistance-rated barriers cause a modification, or other rehabilitation work category project, to take place that was not planned when the introduction of soiled linen storage into a patient sleeping room was contemplated.

A change of use might occur in conjunction with repair, renovation, modification, or reconstruction work. For example, consider the educational occupancy change of use described in item 3 of the commentary following the title of 43.7.1. In creating the science laboratory that employs the use of chemicals, rehabilitation work is undertaken to install laboratory benches with related water piping, gas piping, fume hoods, and exhaust fans. The rehabilitation work is categorized as modification. The provision of 43.7.1.3 requires compliance with the provisions of Section 43.5 for modification. Additionally, the provision of 43.7.1.2 requires the laboratory to be protected in accordance with 14.3.2.4.

Commentary Table 43.5 presents a roadmap for using the Chapter 43 provisions for the rehabilitation work category of change of use.

**43.7.2 Change of Occupancy Classification.** Where the occupancy classification of an existing building or portion of an existing building is changed, in other than historic buildings, the building shall meet the requirements of 43.7.2.1 or 43.7.2.3.

The term *change of occupancy classification* is defined in 43.2.2.1.6 as “the change in the occupancy classification of a structure or portion of a structure.” The definition is simple, because the term itself is almost self-explanatory. The definition

**Commentary Table 43.5 Rehabilitation Work Category of Change of Use**

Rehabilitation Work Category	Section	Applicable Occupancy Chapter		Additional (Unplanned) Work Required
		Unrelated Existing Features	Affected Features	
Change of Use	43.7.1	Existing	Existing New — where change creates a hazardous area	That resulting from change of use

clarifies that the change might apply to a portion of a structure and not necessarily to a structure as a whole. Examples of change of occupancy classification include the following:

1. A restaurant with an occupant load of fewer than 50 is rehabilitated for use as a restaurant with an occupant load of 60. The occupancy is reclassified from a mercantile occupancy (see A.6.1.2.1) to an assembly occupancy.
2. A bed and breakfast with sleeping accommodations for 16 is rehabilitated for use as a bed and breakfast with sleeping accommodations for 20. The occupancy is reclassified from a lodging or rooming house to a hotel.
3. A doctor's office for patient examination is rehabilitated for use as a dialysis clinic for eight patients. The occupancy is reclassified from a business occupancy to an ambulatory health care occupancy.
4. A high school is rehabilitated for use as 10 condominium residential living units. The occupancy is reclassified from an educational occupancy to an apartment building.
5. A department store is rehabilitated for use as a telemarketing call center. The occupancy is reclassified from a mercantile occupancy to a business occupancy.

Compliance with the provisions of an occupancy chapter that applied to the occupancy prior to a change of occupancy classification does not ensure life safety in the newly created occupancy. As a minimum, the new occupancy is required to meet the provisions of the applicable existing occupancy chapter for the occupancy created by the change [see 43.7.2.1(1)] and the sprinkler, alarm system, and hazardous area requirements of the applicable new occupancy chapter for the occupancy created by the change [see 43.7.2.1(2)]. If the change of occupancy classification is such that the new occupancy has a higher hazard classification category (as addressed in Table 43.7.3) than that of the prior occupancy, the new occupancy is required to meet the provisions of the applicable new occupancy chapter (see 43.7.2.3). The process for handling change of occupancy is addressed in more detail in the commentary following A.43.7.2.1(2) and the commentary following 43.7.2.3.

**43.7.2.1** Where a change of occupancy classification creates other than an assembly occupancy, and the change occurs within

the same hazard classification category or to an occupancy classification of a lesser hazard classification category (i.e., a higher hazard category number), as addressed by Table 43.7.3, the building shall meet both of the following:

- (1) Requirements of the applicable existing occupancy chapters for the occupancy created by the change (see Chapters 15, 17, 19, 21, 23, 24, 26, 29, 31, 33, 37, 39, 40, and 42)
- (2)\* Requirements for automatic sprinkler and detection, alarm, and communications systems and requirements for hazardous areas applicable to new construction for the occupancy created by the change (see Chapters 14, 16, 18, 20, 22, 24, 26, 28, 30, 32, 36, 38, 40, and 42)

**A.43.7.2.1(2)** It is not the intent of 43.7.2.1(2) to supersede the provision of 32.2.3.5.2 that exempts automatic sprinklers from small board and care facility conversions serving eight or fewer residents when all occupants have the ability as a group to move reliably to a point of safety within 3 minutes.

**Paragraph 43.7.2.1** addresses change of occupancy classification where a new occupancy (other than assembly) has the same or lower hazard classification category (as addressed in Table 43.7.3) than that of the prior occupancy. Note that, for purposes of applying the hazard category classifications of Table 43.7.3, a higher hazard category number (e.g., 4) designates a lower hazard or challenge to life safety than does a lower hazard category number (e.g., 1). The term lower hazard means that the occupancy and occupant characteristics are such that adequate life safety can be provided using a less extensive mix of life safety features than would be required to protect an occupancy with a higher hazard category.

The process of establishing whether the new occupancy has the same or a lower hazard classification category than the prior occupancy is illustrated by the examples in paragraphs 1 through 3, which follow.

1. A business occupancy office building (hazard category 3 per Table 43.7.3) is rehabilitated to become a residential occupancy apartment building (hazard category 3). The hazard category after the change of occupancy is the same as before the change. The applicable provisions are those of 43.7.2.1(1) and (2).

2. A health care occupancy hospital (hazard category 2) is rehabilitated to become an ambulatory health care occupancy outpatient surgical center (hazard category 3). The hazard category after the change of occupancy is lower (i.e., it presents less hazard or challenge to life safety) than that which existed before the change. The applicable provisions are those of 43.7.2.1(1) and (2).

3. A residential occupancy apartment building for the elderly (hazard category 3) is rehabilitated to become a residential board and care occupancy (hazard category 2). The hazard category after the change of occupancy is not the same or lower than that before the change, and the provisions of 43.7.2.1 do not apply. Rather, the hazard category after the change of occupancy is higher than that before the change, and the provisions of 43.7.2.3 apply. See the commentary following 43.7.2.3.

Use of the provisions of 43.7.2.1 is illustrated by the examples in paragraphs 1 and 2, which follow.

1. A four-story business occupancy office building (hazard category 3) is rehabilitated to become a residential occupancy hotel (hazard category 3) where guest rooms are accessed from an interior corridor system. Per 43.7.2.1(1), the new hotel must meet the requirements of Chapter 29 for existing hotels and dormitories. Per 43.7.2.1(2), the new hotel must also meet the automatic sprinkler, detection, alarm, and communications systems and hazardous areas requirements of Chapter 28 for new hotels and dormitories, which have the effect of mandating some features not required by Chapter 29. For example, 28.3.5.1 requires that the hotel building be sprinklered. With respect to the detection, alarm, and communications systems, the following requirements are a result of having to comply with 28.3.4:

- a. The hotel is not permitted to have a presignal system (see 28/29.3.4.3 and 9.6.3.3).
- b. A visible notification appliance (i.e., a strobe) must be provided in guest rooms and guest suites specifically required and equipped to accommodate hearing-impaired individuals (see 28.3.4.3.3).
- c. Visible notification appliances must be provided in occupiable areas, other than guest rooms and guest suites (see 28.3.4.3.4).
- d. Alarm annunciation must be provided (see 28.3.4.3.5).
- e. Emergency forces (i.e., fire department) notification must be provided in accordance with 9.6.4 (see 28.3.4.3.6).
- f. The smoke alarms, which are required in every guest room and every living area and sleeping room within a guest suite, must be in compliance with 9.6.2.10, so as to be provided with secondary power and interconnected within each guest suite (see 28.3.4.5 and the exemptions, offered only for existing hotels, in 29.3.4.5.1 and 29.3.4.5.2).

Also, with respect to the protection of hazardous areas, Table 28.3.2.2.2 requires some new hazardous areas, such as guest laundries, to be protected by sprinklers and isolated from

the remainder of the floor by 1-hour fire resistance-rated barriers. Table 29.3.2.2.2 requires guest laundries to be protected by sprinklers or isolated from the remainder of the floor by 1-hour fire resistance-rated barriers.

2. A two-story residential occupancy hotel (hazard category 3) is rehabilitated to become a business occupancy office building (hazard category 3) with an occupant load on each floor of fewer than 50. Per 43.7.2.1(1), the newly created business occupancy must meet the requirements of Chapter 39 for existing business occupancies. Per 43.7.2.1(2), the newly created business occupancy must also meet the automatic sprinkler, detection, alarm, and communications systems and hazardous areas requirements of Chapter 38 for new business occupancies, which have no additional effect. Neither Chapter 38 nor Chapter 39 requires non-high-rise business occupancy buildings to be sprinklered. Although the threshold for requiring a fire alarm system differs for new and existing business occupancies (see 38/39.3.4.1), the new business occupancy does not exceed either threshold and is not required to be provided with a fire alarm system. The provisions for the protection of hazardous areas of 38.3.2 are identical to those of 39.3.2, so as not to require any protection in excess of that mandated for an existing hazardous area in a business occupancy.

**43.7.2.2** Where a change of occupancy classification creates an assembly occupancy, and the change occurs within the same hazard classification category or to an occupancy classification of a lesser hazard classification category (i.e., a higher number), as addressed by 43.7.3, the building shall meet both of the following:

- (1) Requirements of Chapter 13 for existing assembly occupancies
- (2) Requirements for automatic sprinkler and detection, alarm, and communications systems, requirements for hazardous areas, and requirements for main entrance/exit of Chapter 12 for new assembly occupancies

The provisions of 43.7.2.2, applicable to assembly occupancies, require everything that 43.7.2.1 does for all other occupancies. Additionally, the Chapter 12 new assembly occupancy requirements for the sizing of the main entrance/exit are made applicable.

**43.7.2.3** Where a change of occupancy classification occurs to an occupancy classification of a higher hazard classification category (i.e., a lower hazard category number), as addressed by Table 43.7.3, the building shall comply with the requirements of the occupancy chapters applicable to new construction for the occupancy created by the change. (See Chapters 12, 14, 16, 18, 20, 22, 24, 26, 28, 30, 32, 36, 38, 40, and 42.)

See the commentary following A.43.7.2.1(2) on the subject of comparing the hazard classification category of the new occupancy against that of the occupancy that existed prior to the change of occupancy classification.

Use of the provision of 43.7.2.3 is illustrated by the examples in paragraphs 1 and 2, which follow.

1. A residential occupancy apartment building for the elderly (hazard category 3) is rehabilitated to become a residential board and care occupancy (hazard category 2). The hazard category after the change of occupancy is not the same as or lower than that before the change, and the provisions of 43.7.2.1 do not apply. Rather, the hazard category after the change of occupancy is higher than that before the change, and the provisions of 43.7.2.3 apply. Per 43.7.2.3, the new board and care facility must meet the requirements of Chapter 32 for new residential board and care occupancies.

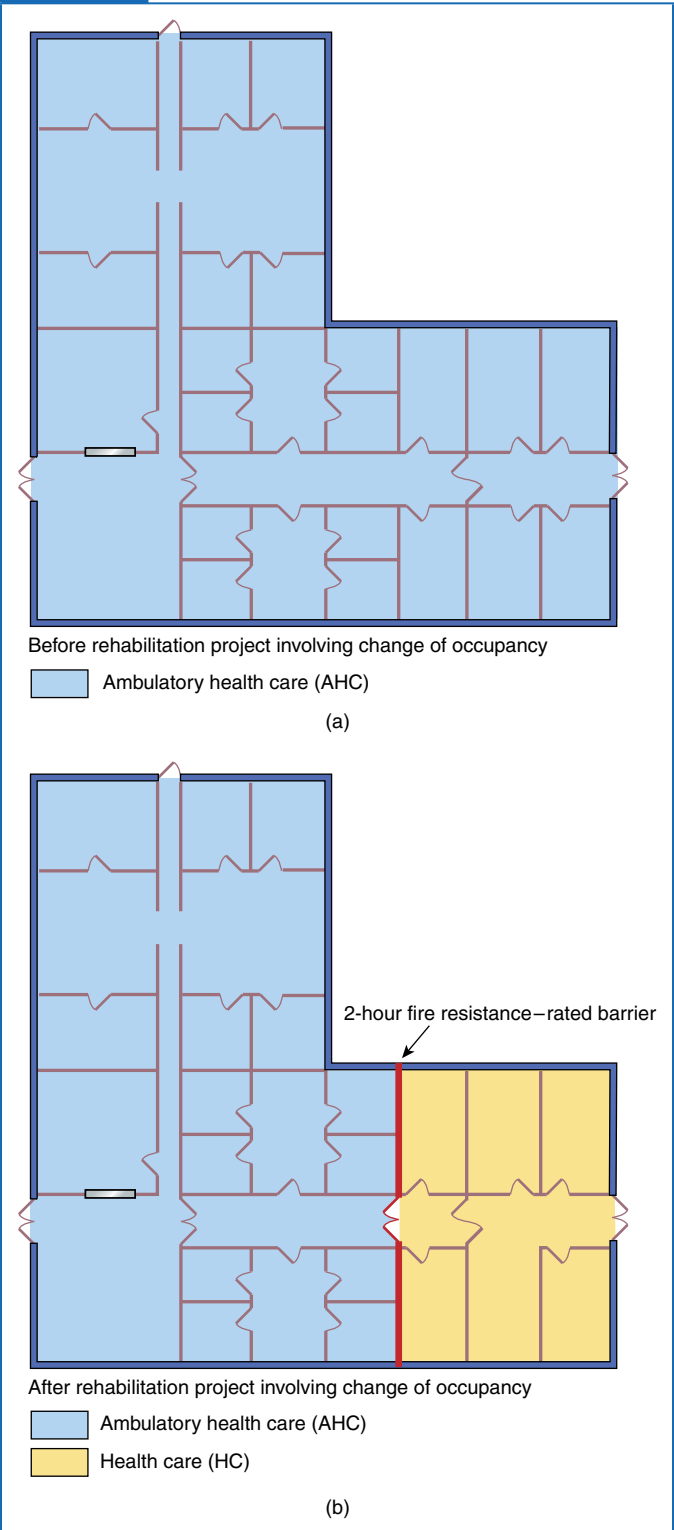

2. An ambulatory health care occupancy outpatient surgical center (hazard category 3) is rehabilitated to become a health care occupancy surgical and inpatient sleeping facility (hazard category 2) where four or more surgical patients can remain for more than 24 hours. The hazard category after the change of occupancy is not the same as or lower than that before the change, and the provisions of 43.7.2.1 do not apply. Rather, the hazard category after the change of occupancy is higher than that before the change, and the provisions of 43.7.2.3 apply. Per 43.7.2.3, the new inpatient surgical care facility must meet the hospital requirements of Chapter 18 for new health care occupancies.

The provisions of 43.7.2.3 are further illustrated by the example that follows. The illustration in Part (a) of Exhibit 43.7 depicts a one-story ambulatory health care occupancy outpatient surgical center (hazard category 3) before a rehabilitation project changes the occupancy of a portion of the building. The ambulatory health care occupancy complies with Chapter 21 for existing ambulatory health care occupancies, including the features that follow:

1. The building is of Type V(000) construction, as permitted by 21.1.6.1.
2. The portion of the corridor system running along the wing at the left of the exhibit is 44 in. (1120 mm) wide, as required by 21.2.3.2.
3. The portion of the corridor system along the wing at the right of the exhibit exceeds the minimum width required by 21.2.3.2 and is 8 ft (2440 mm) wide.
4. The interior wall and ceiling finish in rooms and spaces separated from the corridor is Class C, as permitted by 21.3.3.2.2.
5. The interior wall and ceiling finish in the corridor is Class B, as permitted by 21.3.3.2.1.
6. The building is nonsprinklered, as 21.3.5 does not require sprinklers.
7. The corridor walls have no fire resistance rating, the corridor doors have no fire protection rating, and some use areas are left open to the corridor, as 21.3.6 has no corridor separation requirements.

The illustration in Part (b) of Exhibit 43.7 depicts the one-story building in Part (a) of the exhibit following completion of

**Exhibit 43.7**

*Change of occupancy made to a portion of the building.*

the rehabilitation project. A portion of the wing at the right of the illustration has undergone a change of occupancy to a health care occupancy inpatient sleeping facility (hazard category 2) where four or more surgical patients from other portions of the building can remain for more than 24 hours. All other portions of the building were unaffected by the rehabilitation project and remain an ambulatory health care occupancy outpatient surgical center (hazard category 3). The rehabilitation project created a change of occupancy for the portion of the building that now houses the inpatient sleeping facility. The new health care occupancy has a hazard category (i.e., hazard category 2) that is higher than that of the ambulatory health care occupancy (i.e., hazard category 3) and must comply with the requirements of 43.7.2.3 rather than 43.7.2.1.

The provisions of 43.7.2.3 have the effect of requiring the building to comply with the requirements of Chapter 18 for new health care (HC) occupancies. The provisions of 18.1.3.4 permit the ambulatory health care (AHC) occupancy portion of the building to retain its classification as an AHC occupancy, without having to meet the requirements of Chapter 18 for HC occupancies, where the AHC occupancy is separated from the HC occupancy by minimum 2-hour fire resistance-rated barriers and the AHC occupancy does not provide services simultaneously for four or more inpatients for purposes of housing or treatment, or customary access for inpatients of the HC occupancy who are incapable of self-preservation. In this case, the health care occupancy inpatients are patients who received their surgical services as outpatients but were kept overnight in the adjacent health care occupancy inpatient area. The patients were not initially admitted as inpatients and were then moved to the ambulatory health care occupancy to receive their surgical procedures.

The separation between the existing AHC occupancy and the new HC occupancy, as depicted in Part (b) of Exhibit 43.7, is required to be a minimum 2-hour fire resistance-rated barrier in accordance with 18.1.3.4(2). Further, the barrier must be a horizontal exit in accordance with 18.2.2.5 and 7.2.4, because 18.1.3.7 requires all means of egress from the health care occupancy inpatient area that traverse the ambulatory health care space to meet the provisions of Chapter 18, unless otherwise permitted by 18.1.3.8. Paragraph 18.1.3.8 permits, as an exemption to the requirement of 18.1.3.7, a horizontal exit to serve as the necessary separation where the horizontal exit is in compliance with 18.2.2.5.

For compliance with all applicable provisions related to the required fire resistance rating of the separation between the new health care occupancy inpatient sleeping area and the existing ambulatory health care occupancy surgical center, a horizontal exit is provided. The horizontal exit is constructed to have a 2-hour fire resistance rating for compliance with 18.2.2.5 and 7.2.4.3.1.

The entire building depicted in Part (b) of Exhibit 43.7 must be sprinklered for compliance with 18.3.5.1, which requires that the building containing the health care occupancy (not just the

health care occupancy) be protected throughout by an approved, supervised automatic sprinkler system. Other than the sprinkler provision, the existing ambulatory health care occupancy surgical center — which is separated by a horizontal exit from the new health care occupancy inpatient sleeping area — must comply with the requirements for ambulatory health care occupancies. However, the requirement of 43.7.2.3 is not clear on whether the provisions of Chapter 21 for existing AHC occupancies or those of Chapter 20 for new AHC occupancies are to be followed. The choice of Chapter 20 or Chapter 21 must be decided by the AHJ. Luckily, the requirements of Chapter 20 are not very different from those of Chapter 21. For the purposes of this example, the AHJ has judged that continued compliance with Chapter 21 is adequate. Paragraph 43.7.2.3 requires the new health care occupancy inpatient sleeping area to comply with Chapter 18 for new health care occupancies. Some of the differences that result from applying the requirements of Chapter 18 to part of the building and those of Chapter 21 to the remaining areas are specified in paragraphs 1 through 4, which follow.

**1. Building construction type.** The existing Type V(000) construction must be upgraded to at least Type V(111) construction in the portion of the building housing the new health care occupancy inpatient sleeping area (i.e., the yellow-shaded portion of the building to the right of the horizontal exit depicted in Part (b) of Exhibit 43.7) for compliance with Table 18.1.6.1. Type V(111) construction might be achieved by sheathing the Type V(000) construction with gypsum board so as to provide the requisite 1-hour fire resistance rating.

The provision of 18.1.3.6(2) permits the existing Type V(000) construction to continue to be used in the portion of the building housing the ambulatory health care occupancy surgical center based on the presence of the 2-hour fire resistance-rated, vertically aligned barrier separating the two occupancies. In effect, the barrier allows each of the two portions of the building to be considered as a separate building, given that a building can have only one construction type. See 8.2.1.3.

**2. Corridor width.** The existing 8 ft (2440 mm) corridor width must be maintained in the new health care occupancy inpatient sleeping area, as that is the minimum width specified by 18.2.3.4.

The width of the ambulatory health care occupancy surgical center corridor located immediately to the left of the 2-hour fire resistance-rated horizontal exit barrier in Part (b) of Exhibit 43.7 is greater than the 44 in. (1120 mm) width required by 21.2.3.2. It is also wider than the 44 in. (1120 mm) width required by 20.2.3.2 for new ambulatory health care occupancies; therefore, per 4.6.7.4 and 18.1.3.8, the width could be decreased to 44 in. (1120 mm), and such change would create new rehabilitation work categorized as a modification. Any modification is subject to the provisions of Section 43.5. Per 43.5.1.3, the provisions of 20.2.3.2 are made applicable, and the result is the same as just described — the corridor width is permitted to be decreased to 44 in. (1120 mm).

Paragraph 21.2.3.2 permits the existing 44 in. (1120 mm) width corridor running along the wing at the left of Part (b) of Exhibit 43.7 to continue to be used, just as it was prior to the rehabilitation project.

**3. Interior wall and ceiling finish.** The existing Class C interior wall and ceiling finish in the rooms of the new health care occupancy inpatient sleeping area is permitted to continue to be used in each of those rooms that individually has a capacity not exceeding four persons via the combined effect of the exemption provided in 18.3.3.2.1 and that of 10.2.8.1, which applies because the building is sprinklered throughout for compliance with 18.3.5.1, as previously addressed.

Paragraph 21.3.3.2.2 permits the ambulatory health care occupancy surgical center Class C interior wall and ceiling finish in the rooms and spaces separated from the corridor to continue to be used, just as it was prior to the rehabilitation project.

The existing Class B interior wall and ceiling finish in the corridor of the ambulatory health care surgical center could be changed to a Class C material if the change were treated as new rehabilitation work categorized as a renovation. Any renovation is subject to the provisions of Section 43.4. Per 43.4.3, new interior finish material must meet the requirements for new construction. Where 21.3.3.2.1 requires either Class A or Class B material in corridors, the presence of the new sprinkler system makes the provision of 10.2.8.1 applicable, which has the effect of permitting the new interior wall and ceiling finish in the surgical center corridor to be Class C material.

**4. Corridor walls and doors.** The existing nonrated corridor walls and doors in the new health care occupancy inpatient sleeping area are permitted to remain in place if they resist the passage of smoke as required by 18.3.6.2 and 18.3.6.3, because the rehabilitation project includes sprinklering the building for compliance with 18.3.5.1.

The existing nonrated corridor walls and doors, and the unprotected openings between use areas and the corridor, in the ambulatory health care surgical center are permitted to remain in place, just as they were prior to the rehabilitation project, as 21.3.6 has no corridor separation requirements.

**43.7.2.4** In historic buildings where a change of occupancy classification occurs within the same hazard classification category or to an occupancy classification in a lesser hazard classification category (i.e., a higher hazard category number), as addressed by Table 43.7.3, the building shall meet the requirements of one of the following:

- (1) 43.7.2.1 or 43.7.2.2, as applicable
- (2) 43.7.2.1 or 43.7.2.2, as applicable, as modified by Section 43.10

**43.7.2.5** In historic buildings where a change of occupancy classification occurs to an occupancy classification in a higher hazard classification category (i.e., a lower hazard category number),

as addressed by Table 43.7.3, the building shall meet the requirements of one of the following:

- (1) 43.7.2.3
- (2) 43.7.2.3, as modified by Section 43.10

**43.7.3\* Hazard Category Classifications.** The relative degree of hazard between different occupancy classifications shall be as set forth in the hazard category classifications of Table 43.7.3.

**Table 43.7.3 Hazard Categories and Classifications**

Hazard Category	Occupancy Classification
1 (highest hazard)	Industrial or storage occupancies with high hazard contents
2	Health care, detention and correctional, residential board and care
3	Assembly, educational, day care, ambulatory health care, residential, mercantile, business, general and special-purpose industrial, ordinary hazard storage
4 (lowest hazard)	Industrial or storage occupancies with low hazard contents

**A.43.7.3** Table 43.7.3 groups all the residential occupancy classifications into the general category of residential. The category of residential includes one- and two-family dwellings, lodging or rooming houses, hotels and dormitories, and apartment buildings. A change from one residential occupancy, as defined in 6.1.8.1 through 6.1.8.1.5, to another residential occupancy is classified as the rehabilitation work category of *change of occupancy* and subject to the requirements of 43.7.2.

Table 43.7.3 provides the hazard category classifications for each occupancy classification addressed in the Code. Hazard category classification is used in the requirements of 43.7.2 on change of occupancy classification and has been applied in the examples in the commentary following A.43.7.2.1(2) and that following 43.7.2.3. Hazard category classification is not used in 43.7.1, as it does not apply to a change of use that does not involve a change of occupancy.

The column at the right of Table 43.7.3 carries the heading “occupancy classification.” The user of Table 43.7.3 locates the occupancy classification before the change of occupancy, looks to the left column of that row and notes the associated hazard category, locates the occupancy classification of the new occupancy, and similarly notes its hazard category. The occupancy classifications in Table 43.7.3 are limited to assembly, educational, day care, health care, ambulatory health care, detention and correctional, residential, residential board and care, mercantile, business, industrial, and storage. The table combines all

**Commentary Table 43.6 Rehabilitation Work Category of Change of Occupancy**

Rehabilitation Work Category	Section	Applicable Occupancy Chapter	Additional (Unplanned) Work Required
Change of Occupancy	43.7.2		
– Within same hazard category OR – To lesser hazard category (higher number)		“Existing buildings” chapter for the new occupancy except for: - Sprinklers (per new) - Alarms (per new) - Hazardous areas (per new)	Sprinklers, alarms, hazardous areas
– To higher hazard category (lower number)		New construction chapter for the new occupancy	All per new

residential occupancy classifications into one (i.e., residential), but, officially, the residential occupancy classifications are one- and two-family dwellings, lodging or rooming houses, hotels and dormitories, and apartment buildings.

Table 43.7.3 does not apply to a change from an industrial occupancy to another subclassification of an industrial occupancy (e.g., from an industrial occupancy with low hazard contents to an industrial occupancy with ordinary hazard contents), because such a change is a change of use and not a change of occupancy. Similarly, Table 43.7.3 does not apply to a change from a storage occupancy to another subclassification of a storage occupancy (e.g., from a storage occupancy with low hazard contents to a storage occupancy with ordinary hazard contents), because such a change is a change of use and not a change of occupancy. The row of the table for hazard category 4 might be used, for example, if an industrial occupancy with low hazard contents is changed to any occupancy other than an industrial occupancy, or if an occupancy other than an industrial occupancy is changed to an industrial occupancy with low hazard contents. Similarly, the row of the table for hazard category 1 might be used, for example, if an industrial occupancy with high hazard contents is changed to any occupancy other than an industrial occupancy, or if an occupancy other than an industrial occupancy is changed to an industrial occupancy with high hazard contents.

Commentary Table 43.6 presents a roadmap for using the Chapter 43 provisions for the rehabilitation work category of change of occupancy.

### 43.8 Additions

The term *addition* is defined in 43.2.2.1.7 as “an increase in the building area, aggregate floor area, building height, or number of stories of a structure.” In other words, an addition affects a structure by creating an increase in at least one of the four categories that follow:

1. Building area
2. Aggregate floor area

3. Height
4. Number of stories

Typically, an addition affects a structure by creating an increase in more than one of the four categories listed in the previous paragraph. For example, Exhibit 43.8 depicts an existing three-story building to which a six-story addition has been constructed. Prior to construction of the addition, the building is considered to be the existing three-story structure. After the addition is built, the original building and the addition are considered to be a single building. The addition affects the building by creating an increase in each of the four categories listed in the previous paragraph as follows:

1. *Increase in building area.* The building area (i.e., the footprint or ground area comprising the space within the perimeter of the exterior building walls) is double that which existed prior to the addition.

**Exhibit 43.8**

*Addition to an existing building.*

2. *Increase in aggregate floor area.* The aggregate floor area is triple that which existed prior to the addition.
3. *Increase in height.* The height of the building is double that which existed prior to the addition.
4. *Increase in number of stories.* The number of stories is double that which existed prior to the addition.

Note that it is possible that an addition would not be visible or obvious to observers stationed outside the perimeter of the building. For example, a multistory building with an open-air court at its center core might undergo a rehabilitation project that extends the floors at each story to cover the space formerly occupied by the court. Such a rehabilitation project is considered an addition, because it has the effect of increasing the building area and the aggregate floor area. Similarly, an intermediate floor or multiple intermediate floors might be added within a high-ceiling space of an existing building, and such a rehabilitation project would constitute an addition that is subject to the requirements of [Section 43.8](#).

### 43.8.1 General Requirements.

**43.8.1.1** Where an addition, as defined in [43.2.2.1.7](#), is made to a building, both of the following criteria shall be met:

- (1) The addition shall comply with other sections of this *Code* applicable to new construction for the occupancy.
- (2) The existing portion of the building shall comply with the requirements of this *Code* applicable to existing buildings for the occupancy.

In earlier sections of this chapter, modification was defined as the step along the repair/renovation/modification/reconstruction continuum at which newly constructed elements, components, and systems are required to comply with the provisions of other sections of the *Code* applicable to new construction (see [43.5.1.3](#)). The requirement for compliance with the provisions for new construction also applies to the rehabilitation work category of reconstruction, via the mandate of [43.6.1.1\(2\)](#), and to any change of occupancy classification where the new occupancy has a higher hazard classification category than the prior occupancy (see [43.7.2.3](#)). [Paragraph 43.8.1.1\(1\)](#) carries the requirement for compliance with the provisions for new construction to the rehabilitation work category of addition.

[Paragraph 43.8.1.1\(2\)](#), applicable to any existing building involved with the rehabilitation work category of addition, serves the same purpose as [4.6.7.3](#) and [43.1.2.1\(1\)](#) for the rehabilitation work categories of repair, renovation, modification, and reconstruction. Per [43.8.1.1\(2\)](#), an existing building to which an addition is being constructed is required to be subject to the requirements of the *Code* applicable to existing buildings for the occupancy, even if the existing building is not undergoing repair, renovation, modification, or reconstruction. This provision is consistent with [1.3.1](#), [4.4.2.1](#), and [4.6.9.1](#). However, where the addition must comply with a provision that requires the entire building to be

outfitted with a feature or system, such feature or system needs to be extended into the existing part of the building. For example, a hotel addition is required to comply with the sprinkler requirement of [28.3.5.1](#). The provision of [28.3.5.1](#) requires the building, not just the addition, to be protected throughout by sprinklers. See also the commentary following [43.8.3](#).

**43.8.1.2** An addition shall not create or extend any non-conformity with regard to fire safety or the means of egress in the existing building for which the addition is constructed.

The rehabilitation work category of addition introduces the potential for creating nonconformities, with other *Code* provisions, in the existing building for which the addition is constructed. The existing building might be wholly compliant with the applicable occupancy chapters for existing buildings before the addition is constructed. The addition might, for example, have the effect of increasing the travel distance for the existing building to an excessive, noncompliant length if the addition abuts the existing building where a door in its exterior wall formerly served as an exit. [Paragraph 43.8.1.2](#) requires the user to address such issues in the existing building to avoid focusing solely on the addition.

**43.8.1.3** Any repair, renovation, alteration, or reconstruction work within an existing building to which an addition is being made shall comply with the requirements of [Sections 43.3](#), [43.4](#), [43.5](#), and [43.6](#).

The work involved with the rehabilitation work category of addition will most often necessitate rehabilitation work within the existing building. For example, where an addition abuts the exterior wall of an existing building at a point where an exit door discharges to the outside, the door might need to be removed, relocated, or otherwise addressed for continued *Code* compliance. Such work will generally fall into the rehabilitation work category of modification or reconstruction. [Paragraph 43.8.1.3](#) requires compliance with the provisions for the applicable work category, as detailed in [Sections 43.3](#), [43.4](#), [43.5](#), or [43.6](#).

**43.8.2 Heights.** No addition shall increase the height of an existing building beyond that permitted under the applicable provisions for new building construction.

[Chapter 43](#) is based on *NFPA 5000, Building Construction and Safety Code*, Chapter 15, Building Rehabilitation, as addressed in the commentary that follows the chapter title. The subject of building height is addressed in *NFPA 5000*, Chapter 7. The subject of height is not directly addressed in this *Code*, so [43.8.2](#) has limited application. One might proffer that [43.8.2](#) serves to help enforce the building construction requirements detailed in the \_\_\_1.6 subsection of the applicable occupancy chapter. For example, a second story is planned to be constructed as an addition to an existing single-story nursing home of Type II(000) construction. [Table 19.1.6.1](#), applicable to building construction types for existing health care occupancies, permits an existing,

**Commentary Table 43.7 Rehabilitation Work Category of Addition**

Rehabilitation Work Category	Section	Applicable Occupancy Chapter		Additional (Unplanned) Work Required
		Existing Building Areas	Floor Area Added	
Addition	43.8	Existing	New	Upgrading existing features where requirement for new applies “building wide”

two-story Type II(000) nursing home to be continued in use if sprinklered. [Table 18.1.6.1](#), applicable to building construction types for new health care occupancies, does not permit a two-story Type II(000) nursing home. The addition can be constructed only if the building construction type is upgraded to at least that provided by Type II(111) construction. The same criteria would need to be met where complying with [43.8.1.1\(1\)](#), which requires that the addition meet the provisions of other sections of the *Code* applicable to new construction for the occupancy.

**43.8.3 Fire Protection Systems.** In other than one- and two-family dwellings, existing compartment areas without an approved separation from the addition shall be protected by an approved automatic sprinkler system where the combined areas would be required to be sprinklered by the provisions applicable to new construction for the occupancy.

The text of [43.8.3](#) clarifies that sprinklering of the existing area is required only if the combined (i.e., unseparated) areas are required to be sprinklered by the provisions applicable to new construction. For example, in applying the provisions of [43.8.3](#) to an existing, low-rise business occupancy building undergoing a rehabilitation project categorized as addition, sprinklers would not be required, because [Chapter 38](#), applicable to new business occupancies, has no sprinkler system mandate for business occupancy buildings that are not high-rise (see [38.3.5](#)).

[Paragraph 43.8.3](#) requires automatic sprinklers under either of the situations that follow in paragraph 1 or paragraph 2.

1. The addition is required by the applicable new occupancy chapter to be sprinklered, and the sprinkler system must be extended into the nonseparated portion of the existing building, so as not to have a fire compartment that is partially sprinklered.

2. The combined area of the nonseparated spaces (i.e., the space in the original building and the space from the addition that is left open to the original building or is otherwise improperly separated from the original building) exceeds an area-based sprinkler threshold in the applicable occupancy chapter. For example, [36.3.5.1\(2\)](#), applicable to new mercantile occupancies, requires automatic sprinklers throughout mercantile occupancies exceeding 12,000 ft<sup>2</sup> (1115 m<sup>2</sup>). The 12,000 ft<sup>2</sup> (1115 m<sup>2</sup>) threshold

should be applied to the combined, nonseparated area if the area of the addition, by itself, is below the sprinkler threshold.

Note that the provision of [43.8.3](#) does not apply to one- and two-family dwellings. Existing one- and two-family dwellings are not required to be sprinklered; new one- and two-family dwellings are required to be sprinklered (see [24.3.5.1](#)). If one- and two-family dwellings were not exempted from the provision of [43.8.3](#), the addition of a garage to an existing nonsprinklered dwelling would require the retroactive sprinklering of the dwelling and the new garage.

**43.8.4 Smoke Alarms.** Where an addition is made to a one- or two-family dwelling or a small residential board and care occupancy, interconnected smoke alarms, powered by the electrical system, meeting the requirements of the other sections of this *Code* shall be installed and maintained in the addition.

[Paragraph 43.8.4](#) does not require an upgrade of the protection offered by the smoke alarms in the existing portion of the building. Compliance with [43.8.1.1\(2\)](#) would require the existing dwelling to meet the existing smoke alarm provisions of [24.3.4](#). Compliance with [43.8.4](#) would also require hardwired, interconnected smoke alarms (i.e., smoke alarms in compliance with the provisions of [9.6.2.10](#) for new smoke alarm installations) in the addition, not in the existing portion of the building.

[Commentary Table 43.7](#) presents a roadmap for using the [Chapter 43](#) provisions for the rehabilitation work category of addition.

## 43.9 Reserved

*NFPA 5000, Building Construction and Safety Code*, Chapter 15, Building Rehabilitation, Section 15.9 addresses damaged or unsafe buildings — a subject germane to building codes. There is no text for [Section 43.9](#) in this *Code*, because the subject of damaged or unsafe buildings is not directly applicable to the scope of the *Code*. The section numbering in [Chapter 43](#) of this *Code* and Chapter 15 of *NFPA 5000* has been made consistent to assist users who work with both documents. Thus, [Section 43.9](#) is shown as having been reserved.

## 43.10 Historic Buildings

The term *historic building* is defined in 3.3.36.8 as “a building or facility deemed to have historical, architectural, or cultural significance by a local, regional, or national jurisdiction.” Historic buildings might be protected by government statute in jurisdictions that also enforce this *Code*. The preceding sections of this chapter have the effect of requiring compliance with provisions of this *Code* that — while increasing the level of life safety — might adversely affect the historic nature of a building. Even minor repairs can cause substantial damage to what preservationists call the historic fabric of a historic building. NFPA 914, *Code for Fire Protection of Historic Structures*,<sup>8</sup> includes definitions of the terms *historic fabric* and *preservation* that are helpful in putting the provisions of Section 43.10 into perspective with those of the remainder of the chapter. The definitions read as follows:

**Historic Fabric.** Original or added building or construction materials, features, and finishes that existed during the period that is deemed to be most architecturally or historically significant, or both.

**Preservation.** The act or process of applying measures necessary to sustain the existing form, integrity, and materials of a historic building or structure.

**43.10.1 General Requirements.** Historic buildings undergoing rehabilitation shall comply with the requirements of one of the following:

- (1) Section 43.10
- (2) Sections 43.3, 43.4, 43.5, 43.6, and 43.7, as they relate, respectively, to repair, renovation, modification, reconstruction, and change of use or occupancy classification
- (3) NFPA 914, *Code for Fire Protection of Historic Structures*

Paragraph 43.10.1 offers three options for *Code* compliance for historic buildings undergoing rehabilitation. The three options are specified in paragraphs 1 through 3, which follow.

1. The historic building is permitted to comply with Section 43.10 (i.e., 43.10.2 through 43.10.5). Section 43.10 requires compliance with the sections of Chapter 43 appropriate to the rehabilitation work category but offers relief in 43.10.4 from specific *Code* provisions that might adversely affect the historic fabric where the detailed evaluation report required by 43.10.2 justifies an exemption. The provisions of 43.10.4 permit exemptions where compensating features are provided, so that life safety is not reduced to an unacceptable level. The compensating features might not provide strict compliance with the applicable occupancy chapter. For example, 43.10.4.4 allows the authority having jurisdiction to permit existing front doors to swing in the opposite direction of egress travel, provided that other exits have

sufficient egress capacity to serve the total occupant load. In an assembly occupancy, the AHJ might base permission to use the exemption on compliance with all of the following:

- a. The written evaluation required by 43.10.2 supports the need to retain the existing direction of door swing.
- b. Trained staff is provided to direct occupants to the other exits to help avoid the situation where large numbers of occupants “rush” the door that swings back into the building.
- c. Normal building operation is such that the front door is not used as the main entrance, because occupants will tend to try to exit via the door they used to enter the building.

2. The historic building is permitted to comply with the sections of Chapter 43 appropriate to the rehabilitation work category without using any of the provisions of 43.10.2 through 43.10.5. In other words, the historic building rehabilitation must be accomplished by the requirements applicable to any building, historic or not.

3. The historic building is permitted to comply with NFPA 914, *Code for Fire Protection of Historic Structures*, which has the effect of sending the user to NFPA 914. The decision to permit compliance with NFPA 914 in lieu of the provisions of this *Code* was made with the knowledge that NFPA 914 requires that fire safety issues be evaluated in accordance with the provisions of the *Life Safety Code*. In other words, compliance with NFPA 914 helps to ensure that adequate life safety is provided in historic buildings.

**43.10.2 Evaluation.** A historic building undergoing modification, reconstruction, or change of occupancy classification in accordance with the requirements of Chapter 43 shall be investigated and evaluated as follows:

- (1) A written report shall be prepared for such a building and filed with the authority having jurisdiction by a registered design professional.
- (2) If the subject matter of the report does not require an evaluation by a registered design professional, the authority having jurisdiction shall be permitted to allow the report to be prepared by a licensed building contractor, electrician, plumber, or mechanical contractor responsible for the work.
- (3) The licensed person preparing the report shall be knowledgeable in historic preservation, or the report shall be coauthored by a preservation professional.
- (4) The report shall identify each required safety feature in compliance with Chapter 43 and where compliance with other chapters of this *Code* would be damaging to the contributing historic features.
- (5) The report shall describe each feature not in compliance with this *Code* and demonstrate how the intent of this *Code* is met in providing an equivalent level of safety.

- (6) The local preservation official shall be permitted to review and comment on the written report or shall be permitted to request review comments on the report from the historic preservation officer.
- (7) Unless it is determined by the authority having jurisdiction that a report is required to protect the health and safety of the public, the submission of a report shall not be required for a building that is being rehabilitated for the personal use of the owner or a member of the owner's immediate family and is not intended for any use or occupancy by the public.

**43.10.3 Repairs.** Repairs to any portion of a historic building shall be permitted to be made with original or like materials and original methods of construction, except as otherwise provided in [Section 43.10](#).

#### **43.10.4 Repair, Renovation, Modification, or Reconstruction.**

**43.10.4.1 General.** Historic buildings undergoing repair, renovation, modification, or reconstruction shall comply with the applicable requirements of [Sections 43.3](#), [43.4](#), [43.5](#), and [43.6](#), except as specifically permitted in [43.10.4](#).

**43.10.4.2 Replacement.** Replacements shall meet the following criteria:

- (1) Replacement of existing or missing features using original or like materials shall be permitted.
- (2) Partial replacement for repairs that match the original in configuration, height, and size shall be permitted.
- (3) Replacements shall not be required to meet the requirements of this *Code* that specify material standards, details of installation and connection, joints, or penetrations; or continuity of any element, component, or system in the building.

**43.10.4.3 Means of Egress.** Existing door openings, window openings intended for emergency egress, and corridor and stairway widths narrower than those required for nonhistoric buildings under this *Code* shall be permitted, provided that one of the following criteria is met:

- (1) In the opinion of the authority having jurisdiction, sufficient width and height exists for a person to pass through the opening or traverse the exit, and the capacity of the egress system is adequate for the occupant load.
- (2) Other operational controls to limit the number of occupants are approved by the authority having jurisdiction.

**43.10.4.4 Door Swing.** Where approved by the authority having jurisdiction, existing front doors shall not be required to swing in the direction of egress travel, provided that other approved exits have sufficient egress capacity to serve the total occupant load.

**43.10.4.5 Transoms.** In fully sprinklered buildings of hotel and dormitory occupancies, apartment occupancies, and residential board and care occupancies, existing transoms in corridors and

other fire resistance-rated walls shall be permitted to remain in use, provided that the transoms are fixed in the closed position.

#### **43.10.4.6 Interior Finishes.**

**43.10.4.6.1** Existing interior wall and ceiling finishes, in other than exits, shall be permitted to remain in place where it is demonstrated that such finishes are the historic finish.

**43.10.4.6.2** Interior wall and ceiling finishes in exits, other than in one- and two-family dwellings, shall meet one of the following criteria:

- (1) The material shall be Class A, Class B, or Class C in accordance with [Section 10.2](#) of this *Code*.
- (2) Existing materials not meeting the minimum Class C flame spread index shall be surfaced with an approved fire-retardant paint or finish.
- (3) Existing materials not meeting the minimum Class C flame spread index shall be permitted to be continued in use, provided that the building is protected throughout by an approved automatic sprinkler system.

#### **43.10.4.7 Stairway Enclosure.**

**43.10.4.7.1** Stairways shall be permitted to be unenclosed in a historic building where such stairways serve only one adjacent floor.

**43.10.4.7.2** In buildings of three or fewer stories in height, exit enclosure construction shall limit the spread of smoke by the use of tight-fitting doors and solid elements; however, such elements shall not be required to have a fire rating.

**43.10.4.8 One-Hour Fire-Rated Assemblies.** Existing walls and ceilings shall be exempt from the minimum 1-hour fire resistance-rated construction requirements of other sections of this *Code* where the existing wall and ceiling are of wood lath and plaster construction in good condition.

#### **43.10.4.9 Stairway Handrails and Guards.**

**43.10.4.9.1** Existing grand stairways shall be exempt from the handrail and guard requirements of other sections of this *Code*.

**43.10.4.9.2** Existing handrails and guards on grand staircases shall be permitted to remain in use, provided that they are not structurally dangerous.

**43.10.4.10 Exit Signs.** The authority having jurisdiction shall be permitted to accept alternative exit sign or directional exit sign location, provided that signs installed in compliance with other sections of this *Code* would have an adverse effect on the historic character and such alternative signs identify the exits and egress path.

#### **43.10.4.11 Sprinkler Systems.**

**43.10.4.11.1** Historic buildings that do not conform to the construction requirements specified in other chapters of this *Code*

for the applicable occupancy or use and that, in the opinion of the authority having jurisdiction, constitute a fire safety hazard shall be protected throughout by an approved automatic sprinkler system.

**43.10.4.11.2** The automatic sprinkler system required by **43.10.4.11.1** shall not be used as a substitute for, or serve as an alternative to, the required number of exits from the facility.

### 43.10.5 Change of Occupancy.

**43.10.5.1 General.** Historic buildings undergoing a change of occupancy shall comply with the applicable provisions of **Section 43.7**, except as otherwise permitted by **43.10.5**.

**43.10.5.2 Means of Egress.** Existing door openings, window openings intended for emergency egress, and corridor and stairway widths narrower than those required for nonhistoric buildings under this *Code* shall be permitted, provided that one of the following criteria is met:

- (1) In the opinion of the authority having jurisdiction, sufficient width and height exists for a person to pass through the opening or traverse the exit, and the capacity of the egress system is adequate for the occupant load.
- (2) Other operational controls to limit the number of occupants are approved by the authority having jurisdiction.

**43.10.5.3 Door Swing.** Where approved by the authority having jurisdiction, existing front doors shall not be required to swing in the direction of egress travel, provided that other approved exits have sufficient capacity to serve the total occupant load.

**43.10.5.4 Transoms.** In corridor walls required to be fire rated by this *Code*, existing transoms shall be permitted to remain in use, provided that the transoms are fixed in the closed position and one of the following criteria is met:

- (1) An automatic sprinkler shall be installed on each side of the transom.
- (2) Fixed wired glass set in a steel frame or other approved glazing shall be installed on one side of the transom.

**43.10.5.5 Interior Finishes.** Existing interior wall and ceiling finishes shall meet one of the following criteria:

- (1) The material shall comply with the requirements for flame spread index of other sections of this *Code* applicable to the occupancy.
- (2) Materials not complying with **43.10.5.5(1)** shall be permitted to be surfaced with an approved fire-retardant paint or finish.
- (3) Materials not complying with **43.10.5.5(1)** shall be permitted to be continued in use, provided that the building is protected throughout by an approved automatic sprinkler system, and the nonconforming materials are substantiated as being historic in character.

**43.10.5.6 One-Hour Fire-Rated Assemblies.** Existing walls and ceilings shall be exempt from the minimum 1-hour fire resistance-rated construction requirements of other sections of this *Code* where the existing wall and ceiling are of wood lath and plaster construction in good condition.

### 43.10.5.7 Stairs and Handrails.

**43.10.5.7.1** Existing stairs and handrails shall comply with the requirements of this *Code*, unless otherwise specified in **43.10.5.7.2**.

**43.10.5.7.2** The authority having jurisdiction shall be permitted to accept alternatives for grand stairways and associated handrails where the alternatives are approved as meeting the intent of this *Code*.

**43.10.5.8 Exit Signs.** The authority having jurisdiction shall be permitted to accept alternative exit sign or directional exit sign location, provided that signs installed in compliance with other sections of this *Code* would have an adverse effect on the historic character and such alternative signs identify the exits and egress path.

**43.10.5.9 Exit Stair Live Load.** Existing historic stairways in buildings changed to hotel and dormitory occupancies and apartment occupancies shall be permitted to be continued in use, provided that the stairway can support a 75 lb/ft<sup>2</sup> (3600 N/m<sup>2</sup>) live load.

# Explanatory Material

# A

The material contained in Annex A of the 2015 edition of the *Life Safety Code* is not a part of the requirements of the *Code* but is included with the *Code* for informational purposes only. For the convenience of readers, in this handbook, the Annex A material is interspersed among the text of **Chapters 1** through **43** and, therefore, is not repeated here.

# Supplemental Evacuation Equipment

**Annex B** provides guidance on the installation, maintenance, and use of supplemental evacuation equipment of the platform rescue systems type and the controlled descent devices type. The terms *supplemental evacuation equipment*, *platform rescue system*, and *controlled descent device* are defined in **B.1.1.4**, **B.1.1.2**, and **B.1.1.1**, respectively. As with the other annexes to the *Code*, **Annex B** provides the *Code* user with information that is not contained in the body of the *Code* (i.e., **Chapters 1** through **43**). **Annex B** differs from Annex A, Explanatory Material, in that its provisions are formatted as mandates, using the word *shall*, that can be enforced by an authority having jurisdiction (AHJ). **Annex B** can become an enforceable document if specifically adopted by a regulatory authority but is otherwise advisory, even though its provisions are formatted as mandates. As indicated in the definition of the term *authority having jurisdiction (AHJ)* in **3.2.2**, the AHJ might be a person outside the governmental bodies that typically adopt the *Code*. A building developer might adopt **Annex B** as a mandatory reference in the construction documents for a new building in which supplemental evacuation equipment is to be installed. An owner of an existing building might reference **Annex B** as part of the specifications for the retrofitting of supplemental evacuation equipment in the building. A design professional might consult **Annex B** for guidance in providing services, even where **Annex B** is not specifically adopted or referenced.

*This annex is not a part of the requirements of this NFPA document but is included for informational purposes only. Information in this annex is intended to be adopted by the jurisdiction at the discretion of the adopting jurisdiction. Additionally, information in this annex is intended to be incorporated on a voluntary basis by building owners and developers who might have a desire to include supplemental evacuation equipment in their projects.*

*Although this annex is written in mandatory language, it is not intended to be enforced or applied unless specifically adopted by the jurisdiction or, if it is being applied on a voluntary basis, by the building owner or developer.*

Note: Traditionally, supplemental evacuation equipment has not been regulated or recognized by the *Code*. Until recently, such equipment was considered to include only items such as chain ladders and rope fire escape ladders for use in single-family homes. The criteria specified in **Annex B** also provides no regulation or recognition for the private installation and use of such equipment by an owner and family, while providing a framework of regulations for the use of controlled descent devices and

platform rescue systems in commercial and residential multistory buildings. The broader term *supplemental evacuation equipment* provides for subsets of equipment to be added as further technologies develop.

The numerous fatalities in the September 11, 2001, attack on the World Trade Center in New York City prompted responses on many levels, including challenges to the fundamental concepts of egress systems for tall buildings. One long-held principle in high-rise building design was that most emergency incidents require only partial evacuation or relocation of building occupants. In the September 11 incident, the exit stair enclosures were penetrated and stairs destroyed or severely compromised on the floors of aircraft impact. These floors were many stories above the reach of even the highest fire department ladders. There were hundreds of people on the floors above those directly impacted by the aircraft who could not evacuate.

While official investigations into the incident were being conducted, inventors and engineers began work on means to evacuate occupants of tall buildings in situations where exit stairs are not available. The need to consider such alternatives was identified in the NIST Final Report on the Collapse of the World Trade Center Towers, which states:

**Recommendation 20:** NIST recommends that the full range of current and next generation evacuation technologies should be evaluated for future use, including protected/hardened elevators, exterior escape devices, and stairwell descent devices, which may allow all occupants an equal opportunity for evacuation and facilitate emergency response access.<sup>1</sup>

The work in developing supplemental evacuation equipment identified a variety of technologies, including group evacuation platform systems, cable-supported descent devices, flexible chutes, personal helicopters, parachutes, and helium balloon vests. Some of the technologies existed and others were adaptations of equipment already being used, while others were entirely novel in concept and design.

In 2003, several interested parties submitted a proposed framework for regulating supplemental evacuation equipment within the *Code* as a new section in **Chapter 7**, Means of Egress. The proposal was considered by the Technical Committee on Means of Egress, which determined that the equipment should not be credited with satisfying any of the requirements for number of means of egress, egress capacity, travel distance, common

path of travel, or dead-end corridors. Additionally, the technical committee identified several principles it considered important. The following principles were identified:

1. Any equipment installed as supplemental evacuation equipment should not adversely affect the use of required egress systems.
2. The equipment should meet the requirements of a suitable product standard.
3. The equipment should be mechanically sound and reliable for use under the expected conditions.
4. The equipment should be simple to use with little or no training required for the user.
5. The equipment should provide a suitable level of protection for the user.
6. The equipment should be reasonably safe for other users and persons on the ground.
7. The equipment should be usable by persons with physical impairments.
8. The equipment should only be used if the required egress systems are not accessible and only as directed by authorized building personnel or emergency responders.

Some of the supplemental evacuation equipment that was conceptualized or underwent initial development cannot meet the principles enumerated in items 1 through 8, primarily because of safety issues or complexity in use of the equipment. For example, even a skilled user of parachutes might lose control of a parachute and plummet to the ground in adverse wind conditions. Two technologies showed potential to evacuate occupants while meeting the prescribed principles — the controlled descent device and the platform rescue system. While leaving open the possibility for other technologies to be recognized for a future edition of the *Code*, the technical committee codified the requirements for the controlled descent device and the platform rescue system for inclusion in **Annex B**, as they were the only equipment that met the needed criteria for manufacture, certification, installation, and safe use.

## B.1 General

### B.1.1 Definitions.

**B.1.1.1 Controlled Descent Device.** A system operating on the exterior of a building or structure that lowers one or two people per descent, each wearing a rescue harness, at a controlled rate from an upper level to the ground or other safe location.

The controlled descent device (CDD) had its origin in equipment that has been in use for several decades by window washers and others who need to access vertical faces of buildings and other structures via a boatswain's chair. In the 1970s, this equipment and concept were adapted for use as an escape device from construction cranes and offshore oil drilling platforms. The design

has since been refined and adapted for multistory building use and is available commercially from several manufacturers.

Most forms of CDD are intended for use by one or, possibly, two persons per descent, as shown in **Exhibit B.1** and **Exhibit B.2**. The CDD equipment typically consists of a cable that can be anchored to the building, a harness or other means for securing the user, and a speed governor, as shown in **Exhibit B.3**. The operation of a CDD is based on gravity acting on the user, while the device limits the rate of descent. A generally constant velocity is achieved once the user steps free of the building, but the speed is limited by the product specification standard [which uses metric units as its primary units; see **B.4(1)** for the reference] to 2.0 m/s (6.7 ft/s), which is equivalent to the rate experienced by a person jumping to the ground from a height of approximately 200 mm (8 in.). Most products allow the user to move laterally while descending by pressing hands or feet against the building face and pushing sideways. Some products are one-use devices, while others can be used repeatedly by various means of multiple cables and harnesses, or by retrieving and redeploying the cable and the harness.

**B.1.1.2 Platform Rescue System.** An enclosed platform, or set of enclosed platforms, moving vertically along guides or other means on the exterior of a building or structure, intended for the evacuation of multiple occupants from an upper level or levels to the ground or other safe location, that has the capability of transporting emergency responders to upper levels of a building.

**Exhibit B.1**

(Photo courtesy of High-Rise Escape Systems, Inc.)

**Exhibit B.3**

Controlled descent equipment consisting of the anchor assembly, cable, protective suit, and speed governor. (Photo courtesy of High-Rise Escape Systems, Inc.)

A platform rescue system bears conceptual similarity to a lifeboat on a ship and to a window washer's platform. A platform rescue system consists of one or more enclosed cabins, each with a rigid platform that can transport multiple building occupants per descent. The rigid platforms with enclosed cabins travel vertically on one or more guideways at the exterior of a building wall. By the nature of its operation, the platform rescue system includes a source of mechanical power for raising, as well as lowering, the platforms. Two forms of platform rescue systems have commercial potential: one system is permanently installed at, and structurally supported from, the roof of the building, such as that shown in [Exhibit B.4](#), and the other is portable, arrives at the building on a truck, and then is supported and controlled from ground level. The roof-supported system depicted in [Exhibit B.4](#) is equipped with five platforms and can be used to evacuate approximately 200 people per trip. [Exhibit B.5](#) depicts occupants as they leave the cabin enclosure and move away from the building. The cabin enclosure is made to collapse and store against the platform to permit the next platform to descend to ground level and discharge its occupants. The process repeats until the topmost platform reaches ground level and discharges its occupants.

**Exhibit B.4**

**Exhibit B.5**

Ground level discharge of evacuees from cabin of roof-supported platform rescue system. (Photo courtesy of Escape Rescue Systems, Ltd.)

Because the platform systems can ascend with a load, as well as descend, they have the capability to transport equipment and emergency responders to upper floors of the building on each return trip.

**B.1.1.3 Supplemental Escape Device or System.** Dedicated equipment that supplements the means of egress or means of escape for exiting a building or structure.

Note: Supplemental escape devices and systems are not a substitute for the required means of egress or means of escape. If properly installed, maintained, and used, controlled descent devices and platform rescue systems might provide an added means of escape for the occupants where the required means of egress or means of escape is not usable or accessible, and where the event that has caused failure of the required system has not also impaired the functionality of the device or system itself.

**B.1.1.4 Supplemental Evacuation Equipment.** Devices or systems that are not a part of the required means of egress or escape, but that might enhance use of the means of egress or escape, or provide an alternate to the means of egress or escape.

**B.1.2 Reserved.**

## B.2 Supplemental Escape Devices or Systems

A supplemental escape device or system, other than that provided or installed for use by the owner and owner's family, and the installation of such device or system, shall comply with Section B.3 or Section B.4, as appropriate, and the following criteria:

Note: The provisions of Section B.2 are not intended to preclude the installation of supplemental escape devices or systems that do not meet these requirements where intended for personal use, such as by an owner and family.

It should be recognized that supplemental escape devices or systems addressed by these requirements are intended to be used only when all other means of egress are unusable and when remaining in place to await the restoration of the means of egress is considered untenable.

Generally, fire departments have the capability of providing external rescue of building occupants within reach of their portable ladders, aerial ladders, and aerial platform devices. Where a fire department responds to a building emergency and has the capability to provide timely assistance with external rescue, that assistance should be used instead of the supplemental escape devices or systems.

The fundamental requirements for the installation, maintenance, and use of supplemental escape devices and systems are found in Section B.2. These requirements apply, regardless of the technology involved, including application to any new technologies developed subsequent to the publication of this Code.

Annex B is not intended to limit or regulate the personal use of escape devices, such as chain ladders in a single-family home, where the equipment is selected, installed, and used by the homeowner and family. See the first paragraph of the note that follows the first paragraph of Section B.2. This exclusion should also extend to an individual apartment owner/occupant, where intended for personal use by the owner/occupant and family. Conversely, where a multistory building developer, owner, or manager proposes installation of multiple devices and systems for use by occupants, Annex B would apply.

Although Annex B is not intended to regulate equipment such as chain ladders, there is a product standard, ASTM F 2175, *Standard Specification for Portable and Permanent Emergency Escape Ladders for Residential Use*,<sup>2</sup> for chain ladders of the type illustrated in Exhibit B.6. At least one manufacturer's product has been evaluated and certified as being compliant with the standard.

- (1) Each supplemental escape device or system shall be of an approved type and shall comply with an approved product safety standard.

The detailed specifications and performance requirements for a particular type of product are best suited for placement in a product standard. The provision of B.2(1) requires that supplemental escape devices and systems comply with an approved product standard. Annex B recognizes two acceptable standards for supplemental escape devices and systems: ASTM E 2484, *Standard Specification for Multi-Story Building External Evacuation Controlled Descent Devices*,<sup>3</sup> and ASTM E 2513, *Standard Specification for Multi-Story Building External Evacuation Platform Rescue Systems*,<sup>4</sup> for controlled descent devices and platform rescue systems, respectively. Other standards might be used for this purpose if acceptable to the AHJ as indicated in the definition of the term *approved* in 3.2.1. For example, a manufacturer might propose using ASME A17.7/CSA B44.7, *Performance-Based Safety Code for Elevators and Escalators*,<sup>5</sup> as the approved product safety standard required by B.2(1). If the use of ASME A17.7/CSA B44.7

Exhibit B.6

Portable escape ladder in use on a single-family dwelling. (Photo courtesy of Bold Industries)

is approved by the AHJ, then ASME A17.7/CSA B44.7 would apply instead of ASTM E 2513.

Based on the current structure and language of **Annex B**, it is likely that future technologies will be incorporated into the annex only after a product standard specific to that technology has been developed and published.

- (2) The installation of escape devices or systems shall be approved. Note: Use of a supplemental escape device or system typically requires that a window or exterior door be opened. The window or door should be closed, except when it is in use for escape. Where the design of the building does not provide exterior doors or operable windows and a window must be broken to use the device or system, consideration should be given to the probable effect of that action, such as showering the emergency response personnel and equipment below with sharp pieces of glass. In such a situation, to obtain approval, it might be appropriate to require tempered safety glass on windows that must be broken to deploy the supplemental escape device and access the system.

**Annex B** grants the AHJ the authority to approve the product, the product standard, the installation, and the evacuation plan, where one is required.

- (3) The supplemental escape device or system shall be installed, inspected, tested, maintained, and used in accordance with the manufacturer's instructions.
- (4) The location of each supplemental escape system access point shall be identified with a readily visible sign complying with the following:
  - (a) The sign shall be in plainly legible letters that read SUPPLEMENTAL ESCAPE DEVICE.
  - (b) The minimum height of the lettering shall be  $\frac{3}{4}$  in. (19 mm), with a stroke width of  $\frac{1}{8}$  in. (3 mm).

Since supplemental devices and systems will only be used on rare occasions, it is important that signage and instructions be provided where the equipment is located and that the signage be readily understandable to the user.

- (5) Each sign required by **B.2(4)** shall comply with the following:
  - (a) The sign shall include the following in plainly legible letters: "Use only when exits are not accessible and building evacuation is imperative, as directed by authorized building personnel or emergency responders."
  - (b) The minimum height of the lettering shall be  $\frac{1}{2}$  in. (13 mm).
- (6) A sign with instructions for use of the escape device or system shall be provided and shall comply with the following:
  - (a) The sign shall be posted at the equipment and the equipment's access location.
  - (b) The minimum height of lettering on the instructions shall be  $\frac{1}{2}$  in. (13 mm).
  - (c) Pictographs demonstrating use of the escape device or system shall be provided. Note: Given the nature of the probable circumstances surrounding its deployment, the proper use of the supplemental escape device or system should be readily apparent to the user or trained operator.

- (7) The signs and instructions specified in [B.2\(4\)](#), (5), and (6) shall be illuminated as follows:
  - (a) The signs shall be continuously illuminated while the building is occupied.
  - (b) The level of illumination provided shall be in accordance with [7.10.6.3](#), [7.10.7.2](#), or an approved equivalent.
- (8) Where emergency lighting is required by [Chapters 11](#) through [43](#), it shall be provided as follows:
  - (a) The illumination shall be in accordance with [7.9.1](#).
  - (b) The level of illumination required by [7.9.2.1](#) shall be provided to illuminate the supplemental escape device or system at its access location and the required signage.
- (9) The supplemental escape device or system and its installation shall accommodate persons with various disabilities and of all ages. Note: It is not the intent of [B.2\(9\)](#) that access ramps, doorways, controls, signage, and other features of the supplemental escape device or system meet all requirements for accessibility for persons with disabilities. The equipment is supplemental in nature and is not recognized as part of the required means of egress. A number of other occupants should be trained to assist persons with disabilities to access the equipment. In selecting the equipment and approving the installation, consideration should be given to how persons with mobility impairments will access the equipment. Even when exit stairs are usable, elevators might not be able to be used. Use of a supplemental escape device or system to evacuate persons with mobility impairments might be desirable. Such circumstances should be considered and incorporated into the facility's evacuation plan, which should also identify the trained operators authorized to deploy the equipment for such use.

Providing access to new buildings for persons with severe mobility impairment (see [3.3.246](#)) triggers a need to provide accessible means of egress in accordance with [7.5.4](#). Ongoing technological development of elevators that are suitable for use during an emergency evacuation supplements the current requirements for accessible means of egress, so as to provide persons with mobility impairment with an egress system that is nearly equivalent to that which enclosed exit stairs provide to persons capable of using the stairs. However, any new elevator technology might not be implemented readily in existing buildings. Addressing the needs of persons with mobility impairment in existing buildings remains a challenge. Where building stairs can accommodate a stair descent device [see the advisory text of [A.7.2.12.2.3](#)], such equipment might be used to evacuate persons with mobility impairment. The external supplemental devices and systems addressed by [Annex B](#) offer an alternative that can enhance the safety of persons who cannot use the stairs, even if stairs are available for evacuation. Where external supplemental devices and systems are to be used for evacuating

persons with mobility impairment while exit stairs are still in service, such use needs to be incorporated into the facility's evacuation plan.

- (10) The installation shall be approved such that use of the supplemental escape device or system shall not cause any harm or injury to the user, operator, or others who might be in the vicinity of the equipment when in use.

Evaluating and approving an installation that is safe for the user, the operator, and others requires experienced judgment. There is no expectation that all risk can be eliminated from an installation of supplemental devices and systems. The evaluation of the risk should be analogous to an evaluation of the use of stairs that provide a significant level of protection to evacuees within the stairwell but that still have the potential for an enclosure door to fail to latch, allowing smoke and heat to enter the stair enclosure, or for evacuees to stumble and fall, causing injury to themselves and others on the stairs.

- (11) Where an evacuation plan is required by [Chapters 11](#) through [43](#), or by other regulation, an approved, written evacuation plan shall be provided as follows:
  - (a) The plan shall be in accordance with [4.8.2](#).
  - (b) The plan shall not rely on the use of supplemental escape devices and systems but shall accommodate the use of such a system by specifying the following:
    - i. Role of the supplemental escape device or system in the overall plan
    - ii. Role and authority of emergency response personnel with respect to the supplemental escape device or system
    - iii. Person or persons authorized to direct the deployment of, and to operate, the escape device or system
    - iv. Special considerations, if any, that affect the usability of the supplemental escape device or system
    - v. Training required for operators and users

[Annex B](#) does not require that a building have an evacuation plan. An evacuation plan is a component of an emergency action plan, as addressed by [Section 4.8](#) [see [4.8.2.1\(3\)](#)]. The provisions of [Section 4.8](#) apply where required by other chapters of the *Code*. Evacuation plans are required by the *Code* provisions for emergency action plans in assembly, educational, day-care, health care, ambulatory health care, detention and correctional, hotel and dormitory, residential board and care, mercantile, and business occupancies. For an example of an occupancy that requires an emergency action plan and the related paper trail that leads to the requirement for an evacuation plan, see [12/13.7.13.1](#) and [4.8.2.1\(3\)](#). The provision of [B.2\(11\)](#) specifies that, in those occupancies where supplemental escape devices or systems are installed, and in which an evacuation plan is required, the required evacuation plan must include criteria related to the use of the supplemental escape devices or systems. Note the criteria

that are to be addressed specifically, as detailed in B.2(11)(b)i. through v.

- (c) Note: An evacuation plan can be a highly effective tool in determining who should be evacuated under various scenarios and how that evacuation will be accomplished. Even where none is required, an evacuation plan is recommended to identify, among other things, those persons who are authorized to deploy supplemental escape devices and systems. The more sophisticated the equipment and the greater the number of potential evacuees, the greater is the need to have a trained and authorized person decide which equipment to deploy and when it should be deployed, based on the circumstances at the time. Such a person would be the incident commander, typically the emergency response officer in charge, whether from a private brigade or public service. Even where a building or facility is not required to have an approved evacuation plan by the *Code*, the supplemental escape device or system operating procedures should be integrated into the building evacuation and emergency procedures to the extent provided.
- (12) User and operator training shall be provided in conjunction with the installation of the supplemental escape device or system, and periodically thereafter.

The text of B.2(12) does not specify a frequency for periodic training. The frequency should be tailored to the individual building and situation. Conducting training in conjunction with periodic evacuation drills will help to refresh the knowledge of potential users of the supplemental escape devices or systems.

- (13) Where an approved evacuation plan is required, training shall be provided in accordance with the approved plan.
- (14) The supplemental escape device or system shall be inspected and tested in accordance with the manufacturer's instructions but not less frequently than annually, and the following also shall apply:
  - (a) Notification of testing shall be provided to building occupants or the authority having jurisdiction, as appropriate.
  - (b) Written records of the inspection and testing shall be maintained by the owner for a minimum of 1 year after the next scheduled inspection and testing. Note: It is important that the supplemental escape device or system does not remain idle for many years in order to help ensure that it will be functional if it does need to be used. The manufacturer's instructions for the particular model of equipment involved should be followed.

Although B.2(14) requires that inspection, testing, and maintenance be performed not less frequently than once per year, the manufacturer's instructions might mandate that such activities

be conducted more frequently for some of the functions, components, or subsystems of the supplemental escape device or system. Any manufacturer's requirement that inspection, testing, and maintenance be conducted more frequently than once per year needs to take precedence over the frequency specified by B.2(14).

The testing of supplemental escape devices or systems provides an opportunity for the AHJ and building personnel to familiarize themselves with the equipment and its operation. Advance notification of testing, where provided to the AHJ and building personnel, can help to ensure a participation level that serves multiple educational needs. The testing activities might be done in conjunction with demonstrations and other training for the occupants who might have to use the equipment under emergency conditions.

- (15) Supplemental escape devices and systems shall be listed, certified, or approved to operate as intended over the prevalent climatic conditions for the location in which they are installed.

ASTM E 2484, *Standard Specification for Multi-Story Building External Evacuation Controlled Descent Devices*, and ASTM E 2513, *Standard Specification for Multi-Story Building External Evacuation Platform Rescue Systems* [see the commentary that follows B.2(1)], specify that the equipment must perform as intended under a range of temperature, wind, rain, snow, and ice conditions. These specifications are typical for climates similar to many of the temperate zones of the world. Where climatic conditions different from those addressed by the standard are likely to exist, the AHJ should request documentation from the manufacturer that the equipment listing is applicable for the expected climatic conditions.

---

## B.3 Platform Rescue Systems

Where platform rescue systems are installed or provided, they shall comply with the following:

- (1) The platform rescue system shall comply with ASTM E 2513, *Standard Specification for Multi-Story Building External Evacuation Platform Rescue Systems*, or an approved, equivalent product safety standard.
- (2) The platform rescue system shall be deployed with trained operators to assist with evacuation of occupants.

Installations of platform rescue systems are more complex technologically and will, by their nature, involve the evacuation of more building occupants. Consequently, emergency responders are needed who have been trained in the use of the equipment, who are available to assist evacuees at the time the equipment is deployed, and who are proficient in maintaining communication with the incident commander.

ASTM E 2513, *Standard Specification for Multi-Story Building External Evacuation Platform Rescue Systems*, requires voice communication between the platform rescue system operator, who typically is the incident commander, and the platform operator and occupants at all times. The required communication can be accomplished either by fixed equipment installed on the platform or by portable equipment carried by the platform operator, such as the two-way radios typically used by emergency responders.

- (3) Where a fixed installation of electrical or other type power is required to operate the platform rescue system, a redundant source of power shall be provided.
- (4) The installation shall be designed such that the vertical distance to be traversed by the platform rescue system shall not exceed the limit specified in the product's listing, certification, or approved installation.
- (5) The platform access from within buildings shall be by ramps or stairs, and the following also shall apply:
  - (a) Portable ramps and stairs shall be permitted.
  - (b) The maximum slope of a ramp shall be as low as practical, but shall not be required to be less than 1 in 8.
  - (c) The maximum riser height of stairs shall be 9 in. (230 mm).
  - (d) The minimum tread depth of stairs shall be 9 in. (230 mm).
- (6) The platform access opening shall be sized in accordance with the following:
  - (a) For installations in new construction, the platform access opening shall be a minimum 32 in. (810 mm) in width and a minimum 48 in. (1220 mm) in height.
  - (b) For installations in existing construction, the platform access opening shall be as large as practical but shall not be required to exceed 32 in. (810 mm) in width and 48 in. (1220 mm) in height.

The dimensions required for openings to access the platform rescue system in new buildings were specified so as to be large enough to accommodate a person using a wheelchair (without that person having to leave the wheelchair) to access the opening with the assistance of another person. In existing construction, building construction elements and existing window openings might make it infeasible to create an opening as large as that required for new construction, but the openings provided should be as close as practical to the size required for installations in new construction. The provision of B.3(6)(b), for existing construction, was written in anticipation that persons who use wheelchairs might have to enter the cabin with the assistance of others but without their wheelchairs, followed by the loading of the wheelchairs. Where such procedure is anticipated, it needs to be documented in the facility's evacuation plan.

- (7) The platform access and egress shall not be by ladders.
- (8) Rooftop operating equipment and systems shall be protected from accumulations of climatic ice or snow and fire suppression ice.

## B.4 Controlled Descent Devices

Where controlled descent devices are installed or provided, they shall comply with the following:

- (1) The controlled descent device shall comply with ASTM E 2484, *Standard Specification for Multi-Story Building External Evacuation Controlled Descent Devices*, or an approved, equivalent product safety standard.
- (2) The installation shall be designed such that the vertical distance to be traversed by the controlled descent device shall not exceed the limit specified in the product's listing, certification, or approved installation.
- (3) Where a fixed installation of electrical or other type power is required to operate the controlled descent device, a redundant source of power shall be provided.
- (4) Rooftop operating equipment and systems shall be protected from accumulations of climatic ice or snow and fire suppression ice.
- (5) Controlled descent device building access openings in new building installations shall be a minimum of 32 in. (810 mm) wide and 42 in. (1065 mm) high.
- (6) Controlled descent device building access openings in existing buildings shall be a minimum of 20 in. (510 mm) wide and 24 in. (610 mm) high and shall provide a clear opening of not less than 5.7 ft<sup>2</sup> (0.53 m<sup>2</sup>).
- (7) The approved occupant load and weight limits shall be posted adjacent to the controlled descent device installation or building access opening in minimum ½ in. (13 mm) letters, with a minimum ⅓ in. (1.6 mm) stroke.
- (8) The occupant load and weight limits shall not be exceeded in use.

The minimum access opening dimensions specified by B.4(6) for existing buildings are the same as specified for windows for rescue in educational occupancies (see 14/15.2.11.1.1) and for secondary means of escape for residential occupancies (see 24.2.2.3.3). The opening size criteria had their advent with the provisions for educational occupancy rescue window openings of sufficient size to permit an emergency responder equipped with self-breathing apparatus to move through the opening. Such openings were chosen because they are large enough to permit the use of the controlled descent device. Larger openings, which further facilitate use of the controlled descent device, are required by B.4(5) for installations in new buildings.

# ***Supplement***

The supplement presents in table format the technical/substantive changes between the 2012 and 2015 editions of the *Code*.

# Supplement

## Technical/Substantive Changes 2012–2015 Editions

Subject / 2015 Edition Text	Notes
<b>Chapter 1 Administration</b>	<b>No changes</b>
<b>Chapter 2 Referenced Publications</b>	
<p><b>2.2* NFPA Publications.</b></p> <p>NFPA 400, <i>Hazardous Materials Code</i>, 2013 edition.</p> <p>NFPA 731, <i>Standard for the Installation of Electronic Premises Security Systems</i>, 2014 edition.</p> <p><del>NFPA 1124, Code for the Manufacture, Transportation, Storage, and Retail Sales of Fireworks and Pyrotechnic Articles, 2006 edition.</del></p>	<p>Reference omitted in error from Chapter 2 in 2012 edition, see <a href="#">36/37.4.5.3(5) – (7)</a></p> <p>New reference, see <a href="#">11.8.8.1.2</a></p> <p>Deleted, as NFPA 1124 was withdrawn</p>
<p><b>2.3.6 ASTM Publications.</b></p> <p>ASTM E 2768, <i>Standard Test Method for Extended Duration Surface Burning Characteristics of Building Materials (30 min Tunnel Test)</i>, 2011.</p>	<p>New reference, see <a href="#">10.2.6.2</a></p>
<b>Chapter 3 Definitions</b>	
<p><b>3.3.21 Area.</b></p> <p><b>3.3.21.2.1* Gross Floor Area.</b> The floor area within the inside perimeter of the outside walls of the building under consideration with no deductions for hallways, stairs, closets, thickness of interior walls, columns, elevator and building services shafts, or other features, <u>but excluding floor openings associated with atriums and communicating spaces.</u> (SAF-MEA)</p> <p><b>3.3.21.2.2 Net Floor Area.</b> The floor area within the inside perimeter of the outside walls, or the outside walls and fire walls of a building, <u>or outside and/or inside walls that bound an occupancy or incidental use area requiring the occupant load to be calculated using net floor area</u> under consideration with deductions for hallways, stairs, closets, thickness of interior walls, columns, or other features. (SAF-MEA)</p>	<p>See new underscored text</p> <p>See new underscored text</p>
<p><b>3.3.31.1* Fire Barrier.</b> A continuous membrane or a membrane with discontinuities created by protected openings with a specified fire protection rating, where such membrane is designed and constructed with a specified fire resistance rating to limit the spread of fire, <del>that also restricts the movement of smoke.</del> (SAF-FIR)</p>	<p>See deleted text</p>
<p><del><b>3.3.49* Consumer Fireworks, 1.4G.</b> (Formerly known as Class C, Common Fireworks.) Any small fireworks device designed primarily to produce visible effects by combustion that complies with the construction, chemical composition, and labeling regulations of the U.S. Consumer Product Safety Commission, as set forth in 16 CFR, Parts 1500 and 1507. Some small devices designed to produce audible effects are included, such as whistling devices, ground devices containing 0.8 gr (50 mg) or less of explosive composition (salute powder), and aerial devices containing 2 gr (130 mg) or less of explosive composition (salute powder) per explosive unit.</del></p>	<p>Deleted, as NFPA 1124 was withdrawn</p>

Subject / 2015 Edition Text	Notes
<b>3.3.56 Deep-Fat Frying.</b> A cooking method that involves fully immersing food in hot oil. (SAF-HEA)	New definition, see <a href="#">18/19.3.2.5.2(7)</a>
<b>3.3.62.1* Emergency Stair Travel Device.</b> Device designed and constructed to facilitate travel over interior floor surfaces, interior and exterior stairs, and exterior accessible pathways. (SAF-MEA)	New definition; formerly <i>stair descent device</i>
<b>3.3.78* Evacuation.</b> The withdrawal of occupants from a building. [72, 2013] (SAF-BSF)	New definition, see <a href="#">Section 4.8</a>
<b>3.3.83* Exit.</b> That portion of a means of egress that is separated from all other spaces of the building or structure by construction, <u>location</u> , or equipment as required to provide a protected way of travel to the exit discharge. (SAF-MEA)	See new underscored text
<b>3.3.109 Fire-Retardant–Treated Wood.</b> A wood product impregnated with chemical by a pressure process or other means during manufacture, <u>treated to exhibit reduced surface-burning characteristics and resist propagation of fire which is tested in accordance with ASTM E 84, Standard Test Method for Surface Burning Characteristics of Building Materials, or ANSI/UL 723, Standard for Test for Surface Burning Characteristics of Burning Materials</u> , has a listed flame spread index of 25 or less, and shows no evidence of significant progressive combustion when the test is continued for an additional 20-minute period; nor does the flame front progress more than 10.5 ft (3.2 m) beyond the centerline of the burners at any time during the test. [703, 2015] (SAF-FIR)	See new underscored and deleted text; definition extracted from NFPA 703
<b>3.3.126* Grade Plane.</b> A reference plane upon which vertical measurements of a building are based representing the average of the finished ground level adjoining the building at all exterior walls. (SAF-FUN)	Requirements removed from definition; requirements moved to new <a href="#">4.6.15</a>
<b>3.3.135.1 Fire Exit Hardware.</b> A type of panic hardware that additionally provides fire protection where used as part of a fire door assembly. (SAF-MEA)	Definition simplified so as to build on definition of <i>panic hardware</i>
<b>3.3.158 Joint.</b> A linear opening in or between adjacent assemblies that is designed to allow independent movement of the building. (SAF-FIR)	New definition, see <a href="#">8.3.6</a>
<b>33.3.223.1* Fire Protection Rating.</b> The designation indicating the duration of the fire test exposure to which an opening protective assembly was exposed. [221, 2015] (SAF-FIR)	Requirements removed from definition so as to extract from NFPA 221
<b>3.3.230 Relocation.</b> The movement of occupants to a safer area within the same building. (SAF-FUN)	New definition, see <a href="#">Section 4.7</a>
<b>3.3.265.1 Aisle Stair.</b> A stair within a seating area of an assembly occupancy that directly serves rows of seats to the side of the stair, <u>including transition stairs that connect to an aisle or a landing</u> . (SAF-AXM)	See new underscored text
<b>Chapter 4 General</b>	
<b>4.4.2.3</b> Where a requirement of this <i>Code</i> conflicts with another requirement of this <i>Code</i> , the following shall apply: (1)* Where a specific requirement contained in <a href="#">Chapters 11 through 43</a> conflicts with a general requirement contained in <a href="#">Chapters 1 through 4</a> and <a href="#">Chapters 6 through 10</a> , the requirement of <a href="#">Chapters 11 through 43</a> shall govern. (2)* Where a requirement contained in <a href="#">Chapters 1 through 4</a> and <a href="#">Chapters 6 through 10</a> conflicts with another requirement contained in <a href="#">Chapters 1 through 4</a> and <a href="#">Chapters 6 through 10</a> , the more specific requirement shall govern.	See new underscored text

Subject / 2015 Edition Text	Notes
(3)* Where a requirement contained in Chapters 11 through 43 conflicts with another requirement contained in Chapters 11 through 43, the more specific requirement shall govern.	
<b>4.6.15 Grade Plane.</b> The grade plan shall be established by calculating the average of the finished ground level adjoining the building at all exterior walls. Where the finished ground level slopes down from the exterior walls, the grade plane shall be established by the lowest points within the area between the building and the lot line or, where the lot line is more than 6 ft (1.8 m) from the building, between the building and a point 6 ft (1.8 m) from the building.	Text moved from definition of <i>grade plane</i> to new 4.6.15
<b>4.8 Emergency Action Plan.</b>	Standardization of terminology. Change made throughout <i>Code</i>
<b>Chapter 5 Performance-Based Option</b>	No changes
<b>Chapter 6 Classification of Occupancy and Hazard of Contents</b>	
<b>6.1.14.4.5*</b> Each separated portion of the building shall comply with the requirements for the occupancy therein.	New provision
<b>6.1.14.4.6</b> Where permitted in Chapters 11 through 43, atrium walls shall be permitted to serve as part of the separation required by 6.1.14.4.1 for creating separated occupancies on a story-by-story basis, provided all of the following are met: (1) The atrium is separated from adjacent areas by walls that are smoke partitions in accordance with Section 8.4. (2) Doors in the smoke partitions required by 6.1.14.4.6(a) are equipped with positive latching hardware. (3) The atrium meets the provisions of 8.6.7 that are applicable to new atriums.	New provision
<b>Chapter 7 Means of Egress</b>	
<b>7.1.3.2 Exits.</b> <b>7.1.3.2.1</b> ... (9)* Openings in exit enclosures shall be limited to door assemblies from normally occupied spaces and corridors and door assemblies for egress from the enclosure, unless one of the following conditions exists: (a) Vestibules that separate normally unoccupied spaces from an exit enclosure shall be permitted, provided the vestibule is separated from adjacent spaces by corridor walls and related opening protectives as required for the occupancy involved but not less than a smoke partition in accordance with Section 8.4. (b) In buildings of Type I or Type II construction, as defined in NFPA 220, <i>Standard on Types of Building Construction</i> , (see 8.2.1.2) fire protection-rated door assemblies to normally unoccupied building service equipment support areas as addressed in Section 7.13 shall be permitted, provided the space is separated from the exit enclosure by fire barriers as required by 7.1.3.2.1(3). ...	New provision  New provision
<b>7.1.6.3.2</b> Vehicle ramps in parking structures, as permitted in 42.8.2.2.6, and not on an accessible means of egress or other accessible element shall be exempt from the provisions of 7.1.6.3.1.	New provision
<b>7.1.6.4* Slip Resistance.</b> Walking surfaces in the means of egress shall be slip resistant under foreseeable conditions.	Two sentences combined so as to delete requirement for uniform slip resistance along general egress path, but see 7.2.2.3.3.3 for stair tread and landing surface traction requirement

Subject / 2015 Edition Text	Notes
<p><b>7.1.7.2.1</b> Where a ramp is used to meet the requirements of <b>7.1.7.2</b>, the presence and location of ramped portions of walkways shall be readily apparent.</p> <p><b>7.1.7.2.2</b> Where a stair is used to meet the requirements of <b>7.1.7.2</b>, the tread depth of such stair shall be not less than 13 in. (330 mm).</p>	See new underscored text
<p><b>7.1.8* Guards.</b> Guards in accordance with <b>7.2.2.4</b> shall be provided at the open sides of means of egress that exceed 30 in. (760 mm) above the floor or the finished ground level below <u>except where guards are specifically exempted by provisions of Chapters 11 through 43.</u></p>	See new underscored text
<p><b>7.2.1.3.7</b> Where doors serve spaces that are not normally occupied, the floor level shall be permitted to be lower than that of the door opening but shall be not more than 8 in. (205 mm) lower.</p>	New provision
<p><b>7.2.1.4.1* Swinging-Type Door Assembly Requirement.</b> (3) Where permitted in <b>Chapters 11</b> through <b>43</b>, horizontal-sliding or vertical-rolling security grilles or door assemblies that are part of the required means of egress shall be permitted, provided that all of the following criteria are met: . . . (b) On or adjacent to the grille or door opening, there shall be a readily visible, durable sign in letters not less than 1 in. (25 mm) high on a contrasting background that reads as follows: <u>THIS DOOR TO REMAIN OPEN WHEN THE BUILDING SPACE IS OCCUPIED.</u> . . .</p>	See new underscored and deleted text
<p><b>7.2.1.4.3* Door Leaf Encroachment.</b> . . . <b>7.2.1.4.3.2</b> When fully open, any door leaf in a means of egress shall not project more than 7 in. (180 mm) into the required width of an aisle, a corridor, a passageway, or a landing, <u>unless the door leaf is equipped with an approved self-closing device and is not required by the provisions of 7.2.1.4.2 to swing in the direction of egress travel.</u></p>	See new underscored text
<p><b>7.2.1.6.1 Delayed-Egress Locking Systems.</b> <b>7.2.1.6.1.1</b> . . . (4)* A readily visible, durable sign in letters not less than 1 in. (25 mm) high and not less than 1/8 in. (3.2 mm) in stroke width on a contrasting background shall be located on the door leaf adjacent to the release device in the direction of egress, and shall read as follows: (a) <u>PUSH UNTIL ALARM SOUNDS, DOOR CAN BE OPENED IN 15 SECONDS, for doors that swing in the direction of egress travel</u> (b) <u>PULL UNTIL ALARM SOUNDS, DOOR CAN BE OPENED IN 15 SECONDS, for doors that swing against the direction of egress travel</u></p>	See new underscored text  New provision
<p><b>7.2.1.7.2</b> <del>Only approved panic hardware shall be used on door assemblies that are not fire-rated door assemblies.</del> Only approved fire exit hardware shall be used on fire-rated door assemblies. New panic hardware and new fire exit hardware shall comply with ANSI/UL 305, <i>Standard for Safety Panic Hardware</i>, and ANSI/BHMAA156.3, <i>Exit Devices</i>.</p>	See deleted text
<p><b>7.2.1.11.1.3*</b> Security access turnstiles that impede travel in the direction of egress utilizing a physical barrier shall be permitted to be considered as a component of the means of egress, where permitted in <b>Chapters 11</b> through <b>43</b>, provided that all the following criteria are met: (1) . . (5) (d)</p>	New provision

Subject / 2015 Edition Text	Notes
<p><b>7.2.1.14 Special-Purpose Horizontally Sliding Accordion or Folding Door Assemblies</b> <del>Horizontal Sliding Door Assemblies</del>. <del>Horizontal sliding door assemblies</del> <u>Special-purpose horizontally sliding accordion or folding door assemblies</u> shall be permitted in means of egress, provided that all of the following criteria are met:</p>	<p>Standardization of term <i>special-purpose horizontally sliding accordion or folding door assemblies</i> made throughout <i>Code</i></p>
<p><b>7.2.1.15 Inspection of Door Openings.</b>  . . .  <b>7.2.1.15.6</b> As a minimum, the following items shall be verified:  (1)  . . .  (12) Where required by <u>7.2.2.5.5.7</u>, door hardware marking is present and intact.  (13) <u>Emergency lighting on access-controlled egress doors and doors equipped with delayed-egress locking systems is present and functioning in accordance with Section 7.9.</u></p>	<p>Provisions for inspection of fire-rated door assemblies moved to <b>Section 8.8</b>. Criteria relative to performance-based inspection frequency expanded.</p> <p>See new underscored text</p>
<p><b>7.2.2.3.3.3*</b> Stair treads and landings within the same stairway shall have consistent surface traction.</p>	<p>New provision</p>
<p><b>7.2.2.4.4 Direction.</b> For standard stairs, at least one handrail shall be installed at a right angle to the leading edge of the stair treads.</p>	<p>New provision</p>
<p><b>7.2.2.5.4* Stairway Identification.</b>  <b>7.2.2.5.4.1</b> New enclosed stairs serving three or more stories and existing enclosed stairs, other than those addressed in <u>7.2.2.5.4.1(P)</u>, serving five or more stories shall comply with <u>7.2.2.5.4.1(A)</u> through <u>7.2.2.5.4.1(M)</u>.  . . .  (P) <u>Previously approved, existing signage shall not be required to comply with 7.2.2.5.4.1(L) through (O).</u></p>	<p>Criteria reorganized relative to placement position on sign</p> <p>Existing signs exempted from various criteria — see new underscored text</p>
<p><b>7.2.2.5.5 Exit Path Markings.</b>  . . .  <b>7.2.2.5.5.7 Door Hardware Marking.</b>  (A) . . .  (B) The marking stripe shall also meet the following requirements:  . . .  (2) Where panic hardware is installed, both of the following criteria shall be met:  (a) The marking stripe shall have a minimum <del>horizontal</del> width of 1 in. (25 mm) and be applied to the entire length of the actuating bar or touch pad.  . . .</p>	<p>See deleted text</p>
<p><b>7.2.4 Horizontal Exits.</b>  . . .  <b>7.2.4.3 Fire Barriers.</b>  . . .  <b>7.2.4.3.2*</b> The separation required by <u>7.2.4.3.1(2)</u> shall not be required to extend below the lowest level providing discharge to the exterior where both of the following are met:  (1) <u>Stories below the lowest level providing discharge to the exterior do not have a horizontal exit.</u>  (2) <u>Stories below the lowest level providing discharge to the exterior are separated from the level above by a minimum of 2-hour fire resistance-rated construction.</u>  . . .</p>	<p>New provision</p>

Subject / 2015 Edition Text	Notes
<p><b>7.2.4.3.4</b> Where fire barriers serving horizontal exits, other than existing horizontal exits, terminate at outside walls, and the outside walls are at an angle of less than 180 degrees for a distance of 10 ft (3050 mm) on each side of the horizontal exit, the outside walls shall be protected <u>by one of the following methods:</u></p> <p>(1) <u>The outside walls shall have a minimum 1-hour fire resistance rating, with opening protectives having a minimum ¾-hour fire protection rating, for a distance of 10 ft (3050 mm) on each side of the horizontal exit.</u></p> <p>(2) <u>One of the outside walls shall have a 2-hour fire resistance rating with opening protectives having a minimum 1½-hour fire protection rating, for a distance of 10 ft (3050 mm) from intersection with the horizontal exit.</u></p>	<p>See new underscored text</p> <p>New provision</p>
<p><b>7.2.5.2 Vehicle Ramps.</b> Vehicle ramps in parking structures, as permitted in <b>42.8.2.2.6</b>, and not an accessible means of egress or other accessible element, shall be exempt from the provisions of <b>7.2.5</b>.</p>	<p>New provision</p>
<p><b>7.2.8.1.1</b> Where permitted in <b>Chapters 11</b> through <b>43</b>, fire escape stairs shall comply with the provisions of <b>7.2.8</b>, unless they are approved existing fire escape stairs.</p>	<p>See new underscored text</p>
<p><del><b>7.2.8.4.2 Slip Resistance.</b> Stair treads and landings of new or replacement fire escape stairs shall have slip-resistant surfaces.</del></p>	<p>Text deleted — see <b>7.1.6.4</b></p>
<p><b>7.2.12.3.5.2</b> Signs required by <b>7.2.12.3.5</b> shall be illuminated as required for <del>exit signs where exit sign illumination is required</del> special signs in accordance with <b>7.10.8.1</b>.</p>	<p>See new underscored and deleted text</p>
<p><b>7.2.13 Elevators in Towers.</b></p>	<p>See new underscored text</p>
<p><b>Table 7.3.1.2</b></p> <p>Concentrated Business Use 50 ft<sup>2</sup>/person / 4.6 m<sup>2</sup>/person  Ambulatory health care <del>400</del>150 ft<sup>2</sup>/person / <del>9.3</del>13.9 m<sup>2</sup>/person</p>	<p>See new underscored and revised text</p>
<p><b>7.3.1.6 Egress Capacity from Balconies and Mezzanines.</b> Where any required egress capacity from a balcony or mezzanine passes through the room below, that required capacity shall be added to the required egress capacity of the room <u>in which it is located</u>.</p>	<p>See new underscored text</p>
<p><b>7.3.4.1.1*</b> The width of exit access <del>that is formed by furniture and movable partitions</del> serving not more than six people and having a length not exceeding 50 ft (15 m) shall meet both of the following criteria:</p> <p>(1) The width shall be not less than 18 in. (455 mm), at and below a height of 38 in. (965 mm), and not less than 28 in. (710 mm) above a height of 38 in. (965 mm).</p> <p>(2) A width of not less than 36 in. (915 mm) for new exit access, and not less than 28 in. (710 mm) for existing exit access, shall be capable of being provided without moving permanent walls.</p>	<p>See deleted text</p>
<p><b>7.5.2.1*</b> Access to an exit shall not be through kitchens, storerooms other than as provided in <b>Chapters 36</b> and <b>37</b>, restrooms, <del>workrooms</del>, closets, bedrooms or similar spaces, or other rooms or spaces subject to locking, unless passage through such rooms or spaces is permitted for the occupancy by <b>Chapter 18, 19, 22, or 23</b>.</p>	<p>See deleted text</p>
<p><b>7.6.2</b> Where outside stairs that are not separated from the building are permitted as required exits, the travel distance shall be measured from the most remote point subject to occupancy to the leading nosing of the stair landing at the floor level under consideration.</p>	<p>New provision</p>

Subject / 2015 Edition Text	Notes
<p><b>7.7.2 Exit Discharge Through Interior Building Areas.</b> Exits shall be permitted to discharge through interior building areas, provided that all of the following are met:</p> <p>...</p> <p>(4) The interior exit discharge shall be protected by one of the following methods:</p> <p>...</p> <p>(b) The interior exit discharge area shall be in a vestibule or foyer that meets all of the following criteria:</p> <p>...</p> <p>ii. The foyer shall be separated from the remainder of the level of discharge by <u>construction providing protection not less than the equivalent of wired glass in steel frames or 45 minutes fire-resistive discharge fire barriers with a minimum 1-hour fire resistance rating, and existing installations of wired glass in steel frames shall be permitted to be continued in use.</u></p> <p>...</p>	See new underscored and deleted text
<p><del>7.7.3.3 Stairs and ramps shall be arranged so as to make clear the direction of egress travel from the exit discharge to a public way.</del></p>	Text deleted
<p><b>7.8.1.2.2*</b> Unless prohibited by <b>Chapters 11</b> through <b>43</b>, automatic <del>motion-sensor-type</del> <u>lighting control devices</u> <del>switches</del> shall be permitted to temporarily turn off the <u>illumination</u> within the means of egress, provided that <del>the switch controllers comply</del> <u>each lighting control device complies</u> with all of the following:</p> <p>(1) <u>In new installations, the switch controller lighting control device is listed.</u></p> <p>(2) <u>The switch controllers are lighting control device is equipped for fail-safe operation and to automatically energize the controlled lights upon loss of normal power and is evaluated for this purpose.</u></p> <p>(3) Illumination timers are provided and are set for a minimum 15-minute duration.</p> <p>(4) <u>The motion sensor lighting control device is activated by any occupant movement in the area served by the lighting units.</u></p> <p>(5) <u>In new installations, the lighting control device is The motion sensor is activated by activation of the building fire alarm system, if provided.</u></p> <p>(6) <u>The lighting control device does not turn off any lights relied upon for activation of photoluminescent exit signs or path markers.</u></p> <p>(7) <u>The lighting control device does not turn off any battery-equipped emergency luminaires, unit equipment, or exit signs.</u></p>	See new underscored and deleted text
<p><b>7.9.2.1.3</b> <del>The A maximum-to-minimum illumination uniformity ratio of 40 to 1 shall not be exceeded shall not exceed a ratio of 40 to 1.</del></p>	See new underscored and deleted text
<p><b>7.14 Occupant Evacuation Elevators for Occupant-Controlled Evacuation Prior to Phase I Emergency Recall Operations.</b></p> <p>...</p> <p><b>7.14.1.3*</b> The occupant evacuation elevators shall be in accordance with the occupant evacuation operation (OEO) requirements of ASME A17.1/CSA B44, <i>Safety Code for Elevators and Escalators</i>, and the building emergency action plan required by <b>7.14.3.1</b>.</p>	See new underscored and deleted text; additional changes made in <b>Section 7.14</b> for consistency with new occupant evacuation operation (OEO) provisions of ASME A17.1/CSA B44
<p><b>Chapter 8 Features of Fire Protection</b></p>	
<p><b>8.2.2.2</b> Fire compartments shall be formed with fire barriers that comply with <del>8.3.1.2</del> <b>Section 8.3</b>.</p>	See new underscored and revised text
<p><b>8.2.2.3</b> Smoke compartments shall be formed with smoke barriers that comply with <b>Section 8.5</b>.</p>	New provision

Subject / 2015 Edition Text	Notes
<p><b>8.2.2.4</b> Where door assemblies are required elsewhere in this <i>Code</i> to be smoke leakage-rated in accordance with <b>8.2.2.4</b>, door assemblies shall comply with all of the following:</p> <p>. . .</p> <p>(3) Door assemblies shall be installed <u>and maintained</u> in accordance with NFPA 105, <i>Standard for Smoke Door Assemblies and Other Opening Protectives</i>.</p> <p>. . .</p>	See new underscored text

<b>Chapter 10 Interior Finish, Contents, and Furnishings</b>	
<b>10.2.1.2</b> <del>Materials applied directly to the surface of walls and ceilings in a total thickness of less than 1/28 in. (0.9 mm) shall not be considered interior finish and shall be exempt from tests simulating actual installation if they meet the requirements of Class A interior wall or ceiling finish when tested in accordance with 10.2.3 using fiber cement board as the substrate material. The provisions of 10.2.1.1 shall not apply to materials having a total thickness of less than 1/28 in. (0.9 mm) that are applied directly to the surface of walls and ceilings where both of the following conditions are met:</del> (1) <del>The wall or ceiling surface is a noncombustible or limited-combustible material.</del> (2) <del>The materials applied meet the requirements of Class A interior wall or ceiling finish when tested in accordance with 10.2.3, using fiber cement board as the substrate material.</del>	See new underscored and deleted text
<b>10.2.1.3</b> If a material having a total thickness of less than 1/28 in. (0.9 mm) is applied to a surface that is not noncombustible or not limited-combustible, the provisions of <b>10.2.1.1</b> shall apply.	New provision
<b>10.2.2.2*</b> <del>Requirements for interior</del> Interior floor finish shall <del>apply</del> <u>comply with 10.2.7</u> under any of the following conditions: (1) Where floor finish requirements are specified elsewhere in the <i>Code</i> (2)* <del>Where carpet or carpetlike material not meeting the requirements of ASTM D-2859, Standard Test Method for Ignition Characteristics of Finished Textile Floor Covering Materials, is used</del> (3) <del>Where the fire performance of the floor finish cannot be demonstrated to be equivalent to floor finishes with a critical radiant flux of at least 0.1 W/cm<sup>2</sup></del> (4) <del>Where the fire performance of the floor finish is unknown</del>	See new underscored and deleted text
<b>10.2.4.3.2</b> Cellular or foamed plastic shall be permitted for trim not in excess of 10 percent of the <u>specific wall or ceiling area to which it is applied</u> , provided that it is not less than 20 lb/ft <sup>3</sup> (320 kg/m <sup>3</sup> ) in density, is limited to 1/2 in. (13 mm) in thickness and 4 in. (100 mm) in width, and complies with the requirements for Class A or Class B interior wall and ceiling finish as described in <b>10.2.3.4</b> ; however, the smoke developed index shall not be limited.	See new underscored text

Subject / 2015 Edition Text	Notes
<p><b>10.2.5 Trim and Incidental Finish.</b></p> <p><b>10.2.5.1 General.</b> Interior wall and ceiling trim and incidental finish, other than wall base in accordance with <a href="#">10.2.5.2</a> and bulletin boards, posters, and paper in accordance with <a href="#">10.2.5.3</a>, not in excess of 10 percent of the <u>specific</u> wall and ceiling areas of any room or space <u>to which it is applied</u> shall be permitted to be Class C materials in occupancies where interior wall and ceiling finish of Class A or Class B is required.</p>	See new underscored text
<p><b>10.2.6.2*</b> <del>In new construction</del> Surfaces of walls, partitions, columns, and ceilings shall be permitted to be finished with factory-applied fire-retardant-coated <del>assemblies</del> products that have been listed and labeled to demonstrate compliance with the requirements of ASTM E 2768, <i>Standard Test Method for Extended Duration Surface Burning Characteristics of Building Materials</i>, on the coated surface <del>with the following:</del> (a) a flame spread index of 25 or less, <del>when tested in accordance with ASTM E 84, <i>Standard Test Method of Surface Burning Characteristics of Building Materials</i>, or ANSI/UL 723, <i>Standard for Test for Surface Burning Characteristics of Building Materials</i>,</del> (b) show no evidence of significant progressive combustion when the test is continued for an additional 20-minute period, and (c) result in a flame front that does not progress more than 10 ft 6 in. (3.2 m) beyond the centerline of the burners at any time during the test.</p>	See new underscored and deleted text
<p><b>10.2.8.2</b> Where an approved automatic sprinkler system is installed in accordance with <a href="#">Section 9.7</a>, throughout the fire compartment or smoke compartment containing the <u>interior floor finish</u>, Class II interior floor finish shall be permitted in any location where Class I interior floor finish is required, and where Class II is required, the provisions of <a href="#">10.2.7.2</a> shall apply.</p>	See new underscored text
<p><b>10.3.1*</b> Where required by the applicable provisions of this <i>Code</i>, draperies, curtains, and other similar loosely hanging furnishings and decorations shall meet the flame propagation performance criteria contained in <u>Test Method 1 or Test Method 2, as appropriate</u>, of NFPA 701, <i>Standard Methods of Fire Tests for Flame Propagation of Textiles and Films</i>.</p>	See new underscored text; other references to NFPA 701 throughout the <i>Code</i> standardized to include Test Method 1 and Test Method 2
<p><b>10.3.2.1* Upholstered Furniture.</b> Newly introduced upholstered furniture, except as otherwise permitted by <a href="#">Chapters 11</a> through <a href="#">43</a>, shall be resistant to a cigarette ignition (i.e., smoldering) in accordance with one of the following:</p> <p>(1) The components of the upholstered furniture shall meet the requirements for Class I when tested in accordance with NFPA 260, <i>Standard Methods of Tests and Classification System for Cigarette Ignition Resistance of Components of Upholstered Furniture</i>, <del>or with ASTM E 1353, <i>Standard Test Methods for Cigarette Ignition Resistance of Components of Upholstered Furniture</i>.</del></p> <p>(2) Mocked-up composites of the upholstered furniture shall have a char length not exceeding 1½ in. (38 mm) when tested in accordance with NFPA 261, <i>Standard Method of Test for Determining Resistance of Mock-Up Upholstered Furniture Material Assemblies to Ignition by Smoldering Cigarettes</i>, <del>or with ASTM E 1352, <i>Standard Test Method for Cigarette Ignition Resistance of Mock-Up Upholstered Furniture Assemblies</i>.</del></p>	See deleted text
<p><b>10.3.9.1</b> Where required by <a href="#">Chapters 11</a> through <a href="#">43</a>, newly introduced containers for rubbish, waste, or linen, with a capacity of 20 gal (75.7 L) or more, shall meet both of the following:</p> <p>(1) Such containers shall be provided with lids.</p>	See deleted text

Subject / 2015 Edition Text	Notes
<p>(2) Such containers and their lids shall be constructed of noncombustible materials or of materials that meet a peak rate of heat release not exceeding 300 kW/m<sup>2</sup> when tested, at an incident heat flux of 50 kW/m<sup>2</sup> in the horizontal orientation, and at a thickness as used in the container but not less than ¼ in. (6.3 mm), in accordance with ASTM E 1354, <i>Test Method for Heat and Visible Smoke Release Rates for Materials and Products Using an Oxygen Consumption Calorimeter</i>, or NFPA 271, <i>Standard Method of Test for Heat and Visible Smoke Release Rates for Materials and Products Using an Oxygen Consumption Calorimeter</i>.</p>	
<p><b>Chapter 11 Special Structures and High-Rise Buildings</b></p>	
<p><b>11.3 Towers.</b>  . . .  <b>11.3.1.3 Use of Accessory Levels.</b>  . . .  <b>11.3.1.3.2</b> Electronic supervision of supervisory signals shall be provided in accordance with 9.7.2.1. Waterflow alarms shall be monitored in accordance with 9.7.2.2.  <b>11.3.2.4* Number of Means of Egress.</b>  . . .  <b>11.3.2.4.3</b> Electronic supervision of sprinkler system supervisory signals shall be provided in accordance with 9.7.2.1 and waterflow alarms shall be monitored in accordance with 9.7.2.2.</p>	<p>New provision</p> <p>New provision</p>
<p><b>11.8 High-Rise Buildings.</b>  . . .  <b>11.8.5 Emergency Lighting and Standby Power.</b>  . . .  <b>11.8.5.2.4</b> The standby power system shall be connected to the following:  (1) . . .  . . .  (8) Stairway video monitoring equipment as required by 11.8.8  . . .  <b>11.8.6* Emergency Command Center.</b>  . . .  <b>11.8.6.2</b> The emergency command center shall contain the following:  (1) . . .  . . .  (12) Stairway video monitoring equipment as required by 11.8.8  . . .  <b>11.8.8 Stairway Video Monitoring.</b>  <b>11.8.8.1* General.</b>  <b>11.8.8.1.1</b> For high-rise buildings having an occupant load of 4,000 or more persons, real-time remote monitoring of exit stair usage shall be provided in accordance with 11.8.8.2 through 11.8.8.4 and shall be displayed at the emergency command center.  <b>11.8.8.1.2</b> Where the monitoring system is integrated with a security system, the security system shall be in accordance with NFPA 731, <i>Standard for the Installation of Electronic Premises Security Systems</i>.  <b>11.8.8.1.3</b> Where the monitoring system includes video cameras also used for video image smoke detection, the portions of the system used for such detection shall be in accordance with NFPA 72, <i>National Fire Alarm and Signaling Code</i>.</p>	<p>New provision</p> <p>New provision</p> <p>New provision</p>

Subject / 2015 Edition Text	Notes
<p><b>11.8.8.2</b> Approved video monitoring equipment shall be provided at the exit stairs immediately adjacent to exit stairway discharge doors to capture discharge from, entry to, and passage through the discharge floor landing.</p> <p><b>11.8.8.3</b> Approved video monitoring equipment shall be provided for exit stairs above the level of exit discharge, at building height intervals not exceeding 5 stories, so that descent and ascent flows on the stairways, at the floor entry landings, can be remotely monitored.</p> <p><b>11.8.8.4</b> Approved video monitoring equipment shall be provided, at locations stipulated by the authority having jurisdiction, for exit stairs below the level of exit discharge where levels are normally occupied by the public.</p>	
<b>Chapter 12 New Assembly Occupancies</b>	
<p><b>12.1.3.2</b> Atrium walls in accordance with <b>6.1.14.4.6</b> shall be permitted to serve as part of the separation required by <b>6.1.14.4.1</b> for creating separated occupancies on a story-by-story basis.</p>	New provision
<p><b>12.2.3.6.4</b> Access to the main entrance/exit shall be as follows:</p> <p>(1) Each level of the assembly occupancy shall have access to the main entrance/exit, and such access shall have the capacity to accommodate two-thirds of the occupant load of such levels in the following assembly occupancies:</p> <p>(a) <del>Bars with live entertainment</del></p> <p>(a) Dance halls</p> <p>(b) Discotheques</p> <p>(c) Nightclubs</p> <p>(d) Assembly occupancies with festival seating</p> <p>(2) . . .</p>	See deleted text
<p><b>12.2.5.5.4</b> The increase in aisle accessway width required by <b>12.2.5.5.2</b> shall not apply to grandstands, bleachers, and folding and telescopic seating, provided that the number of seats between the farthest seat and an aisle does not exceed that shown in <b>Table 12.4.9.2.5</b></p>	New provision
<p><b>12.2.5.6.4.2</b> Aisle stairs shall comply with <b>7.2.2</b> except as otherwise addressed by this chapter.</p>	New provision
<p><b>12.2.5.6.4.3</b> <b>Table 7.2.2.2.1.1(a)</b> and <b>Table 7.2.2.2.1.1(b)</b> shall not apply to aisle stairs.</p>	New provision
<p><b>12.2.5.6.6 Aisle Stair Risers.</b> Aisle stair risers shall meet all of the following criteria:</p> <p>(1) . . .</p> <p>. . .</p> <p>(7) Riser height shall be permitted to be nonuniform where both of the following criteria are met:</p> <p>(a) The nonuniformity shall be only for the purpose of accommodating changes in gradient necessary to maintain sight lines within a seating area, in which case the <u>riser height nonuniformity shall be permitted to exceed 3/16 in. (4.8 mm) in any flight but shall not be greater than 1/2 in. (13 mm) between adjacent risers.</u></p> <p>(b) . . .</p>	See new underscored and deleted text
<p><b>12.2.5.6.8 Aisle Landings.</b> Where the path of travel on a stair, an aisle stair, or aisle ramp continues to another stair of different rise or tread depth, another aisle stair of different rise or tread depth, or another aisle ramp of different slope, there shall be a landing whose depth is equal to or greater than the width of the aisle stair or ramp, unless otherwise permitted by one of the following:</p> <p>(1) No landing shall be required within aisle stairs with nonuniform risers, as permitted by <b>12.2.5.6.6</b>.</p>	New provision

Subject / 2015 Edition Text	Notes
<p>(2) No landing shall be required between aisle ramps of different slopes.</p> <p>(3) No landing shall be required between an aisle ramp and an aisle accessway or between an aisle stair and an aisle accessway.</p> <p>(4) A minimum 30 in. (760 mm) deep landing shall be permitted between an aisle stair and a stair with the same tread depths or between an aisle stair and another aisle stair with the same tread depths.</p> <p>(5) A minimum 30 in. (760 mm) deep landing shall be permitted between an aisle stair and a stair with greater tread depth in the descending direction and between an aisle stair and another aisle stair with greater tread depth in the descending direction.</p> <p>(6) A minimum 30 in. (760 mm) deep landing shall be permitted between an aisle stair and a stair with less tread depth in the descending direction and between an aisle stair and another aisle stair with less tread depth in the descending direction.</p> <p>(7) A minimum 22 in. (560 mm) deep landing shall be permitted between an aisle ramp and a stair and between an aisle ramp and an aisle stair.</p> <p>(8) No landing depth shall be required to exceed 48 in. (1220 mm).</p>	
<p><b>12.2.11.1.6.2*</b> Where a guard is ordinarily required but not provided in accordance with <b>12.2.11.1.6(1)</b> or (2), a written plan shall be developed and maintained to mitigate the fall hazards of unguarded raised floor areas and vertical openings on stages.</p>	New provision
<p><b>12.4.1 Life Safety Evaluation.</b> . . .</p>	Provisions for Life Safety Evaluation extensively rewritten
<p><b>12.4.5 Alcohol-Based Hand-Rub Dispensers.</b> Alcohol-based hand-rub dispensers in accordance with <b>8.7.3.3</b> shall be permitted.</p>	New provision
<p><b>12.4.6.8.2</b> Fire-retardant-treated wood shall be permitted for fly galleries and pinrails of all types of construction.</p>	New provision
<p><b>12.7.6 Crowd Managers.</b></p> <p><b>12.7.6.1</b> Assembly occupancies shall be provided with a minimum of one trained crowd manager or crowd manager supervisor. Where the occupant load exceeds 250, additional trained crowd managers or crowd manager supervisors shall be provided at a ratio of one crowd manager or crowd manager supervisor for every 250 occupants, unless otherwise permitted by one of the following:</p> <p>(1) This requirement shall not apply to assembly occupancies used exclusively for religious worship with an occupant load not exceeding <u>2000</u> <u>500</u>.</p> <p>(2) The ratio of trained crowd managers to occupants shall be permitted to be reduced where, in the opinion of the AHJ, the existence of an approved, supervised automatic sprinkler system and the nature of the event warrant.</p> <p><b>12.7.6.2*</b> The crowd manager and crowd manager supervisor shall receive approved training in crowd management techniques.</p> <p><b>12.7.6.3</b> Duties and responsibilities for the crowd manager and crowd manager supervisor shall be documented within a written emergency plan as required by <b>12.7.13</b>.</p> <p><b>12.7.6.4*</b> The training for the duties and responsibilities of crowd managers shall include the following:</p> <p>(1) Understanding crowd manager roles and responsibilities</p> <p>(2) Understanding safety and security hazards that can endanger public assembly</p> <p>(3) Understanding crowd management techniques</p> <p>(4) Introduction to fire safety and fire safety equipment</p> <p>(5) Understanding methods of evacuation and movement</p> <p>(6) Understanding procedures for reporting emergencies</p> <p>(7) Understanding crowd management emergency response procedures</p>	<p>See new underscored and deleted text</p> <p>New provision</p> <p>New provision</p>

<b>Chapter 17 Existing Day-Care Occupancies</b>	
<p><b>17.1.1.8 Multiple-Level Buildings.</b> For purposes of applying requirements of this chapter that utilize the term <i>level of exit discharge</i>, including determination of stories in height as addressed in <b>4.6.3</b>, the level of exit discharge shall be permitted to be the combination of floor levels as addressed in <b>17.1.1.8.1</b>, <b>17.1.1.8.2</b>, or <b>17.1.1.8.3</b>.</p> <p><b>17.1.1.8.1</b> One floor level located not more than eight stair risers above the level of exit discharge shall be permitted to be considered part of the level of exit discharge.</p> <p><b>17.1.1.8.2</b> One floor level located not more than eight stair risers below the level of exit discharge shall be permitted to be considered part of the level of exit discharge.</p> <p><b>17.1.1.8.3</b> Where one floor level is located above the level of exit discharge, another floor level is located below the level of exit discharge, and not more than a total of eight stair risers separate the upper level from the lower level, the two floor levels shall be permitted to be considered part of the level of exit discharge.</p> <p><b>17.1.1.8.4</b> The provisions of <b>17.1.1.8.1</b>, <b>17.1.1.8.2</b>, and <b>17.1.1.8.3</b> shall not be used in combination with each other.</p>	New provision
<p><b>17.1.2.1 General.</b> Occupancies that include <del>part-day</del> preschools, kindergartens, and other schools whose purpose is primarily educational <u>for children 24 months of age or older</u>, even though the children who attend such schools are of preschool age, shall comply with the provisions of <b>Chapter 5</b>.</p>	See new underscored and deleted text
<p><b>17.1.3.2 Atrium Walls Used in an Occupancy Separation.</b> Atrium walls in accordance with <b>6.1.14.4.6</b> shall be permitted to serve as part of the separation required by <b>6.1.14.4.1</b> for creating separated occupancies on a story-by-story basis in other than high-hazard industrial and high-hazard storage occupancies.</p>	New provision
<p><b>17.1.6 Location and Minimum Construction Requirements.</b></p>	See new underscored text
<p><b>17.6.2.6.2</b> Travel distance shall meet all of the following criteria, unless otherwise permitted by <b>17.6.2.6.3</b>:  (1) <del>The travel distance between any room door intended as an exit access and an exit shall not exceed 100 ft (30 m).</del>  (1) The travel distance between any point in a room and <del>an exit</del> <u>a door leading directly to the outside with access to finished ground level</u> shall not exceed 150 ft (46 m).  (2) The travel distance between any point in a sleeping room and <del>an exit access to that room</del> <u>access to a means of escape from that room</u> shall not exceed 50 ft (15 m).</p>	See new underscored and deleted text
<p><b>17.6.3.3.2.1</b> Interior wall and ceiling finish materials complying with <b>Section 10.2</b> shall be Class A or Class B in <del>exits</del> <u>stairways</u>.</p>	See new underscored and deleted text

Subject / 2015 Edition Text	Notes
<p><b>17.6.4 Alcohol-Based Hand-Rub Dispensers.</b> Alcohol-based hand-rub dispensers shall be protected in accordance with <u>8.7.3.1</u>, unless all of the following requirements are met:</p> <p>(1) Dispensers shall be installed in rooms or spaces separated from corridors, <u>stairways, and exterior doors</u> <del>and exits</del>.</p> <p>. . .</p> <p>(6)</p>	See new underscored and deleted text
<b>Chapter 18 New Health Care Occupancies</b>	
<p><b>18.1.3.2</b> Atrium walls in accordance with <u>6.1.14.4.6</u> shall be permitted to serve as part of the separation required by <u>6.1.14.4.1</u> for creating separated occupancies on a story-by-story basis, provided both of the following are met:</p> <p>(1) The provision is not used for occupancy separations involving industrial and storage occupancies.</p> <p>(2) Smoke partitions serving as atrium walls are not permitted to serve as enclosures for hazardous areas.</p>	New provision
<p><b>18.1.6.5</b> Interior nonbearing walls required to have a <del>minimum 2-hour</del> fire resistance rating <u>of 2 hours or less</u> shall be permitted to be of fire-retardant-treated wood enclosed within noncombustible or limited-combustible materials, provided that such walls are not used as shaft enclosures.</p>	Correction
<p><b>18.2.2.2.7*</b> Doors permitted to be locked in accordance with <u>18.2.2.2.5.1</u> shall be permitted to have murals on the egress doors to disguise the doors, provided all of the following are met:</p> <p>(1) Staff can readily unlock the doors at all times in accordance with <u>18.2.2.2.6</u>.</p> <p>(2)* The door-releasing hardware, where provided, is readily accessible for staff use.</p> <p>(3)* Door leaves, windows, and door hardware, other than door -releasing hardware, are permitted to be covered by the murals.</p> <p>(4) The murals do not impair the operation of the doors.</p> <p>(5) The location and operation of doors disguised with murals are identified in the fire safety plan and are included in staff training.</p>	New provision
<p><b>18.2.3.4*</b> Aisles, corridors, and ramps required for exit access in a hospital or nursing home shall be not less than 8 ft (2440 mm) in clear and unobstructed width, unless otherwise permitted by one of the following:</p> <p>(1)*</p> <p>. . .</p> <p>(7) Nursing home corridors shall be permitted to be not less than 6 ft (1830 mm) wide in smoke compartments housing not more than 30 patients.</p> <p>(8) Cross-corridor door openings in corridors with a required minimum width of <del>8 ft (2440 mm)</del> shall have a clear width of <del>not less than 6 ft 11 in. (2110 mm)</del> <u>6 ft (1830 mm)</u> shall have a clear width of <del>not less than 64 in. (1625 mm)</del> for pairs of doors or a clear width of not less than 41½ in. (1055 mm) for a single door.</p>	New provision See new underscored and deleted text
<p><b>18.2.5.7.2.1 Sleeping Suite Arrangement Supervision.</b></p> <p><del>(A)* Occupants of habitable rooms within sleeping suites shall have exit access to a corridor complying with 18.3.6, or to a horizontal exit, directly from the suite.</del></p> <p><del>(B) Where two or more exit access doors are required from the suite by 18.2.5.5.1, one of the exit access doors shall be permitted to be directly to an exit stair, exit passageway, or exit door to the exterior.</del></p> <p>(A) Sleeping suites shall be provided with constant staff supervision within the suite.</p> <p>(B)* Sleeping suites shall be arranged in accordance with one of the following:</p> <p>. . .</p>	See new underscored and deleted text

Subject / 2015 Edition Text	Notes
<p><b>18.2.5.7.2.2 Sleeping Suite <del>Number of Means of Egress.</del></b>  <b>(A)*</b> <u>Sleeping suites shall have exit access to a corridor complying with 18.3.6 or to a horizontal exit, directly from the suite.</u>  <del><b>(B)*</b> One means of egress from the suite shall be directly to a corridor complying with 18.3.6.</del>  <b>(B)</b> Sleeping suites of more than 1000 ft<sup>2</sup> (93 m<sup>2</sup>) shall have not less than two exit access doors remotely located from each other.  <b>(C)*</b> For suites requiring two exit access doors, one of the exit access doors from the suite shall be permitted to be to one of the following:  (1) <u>An exit stair</u>  (2) <u>An exit passageway</u>  (3) <u>An exit door to the exterior</u>  (4) Another suite, provided that the separation between the suites complies with the corridor requirements of 18.3.6.2 through 18.3.6.5</p>	See new underscored and deleted text
<p><b>18.2.5.7.2.4 Sleeping Suite Travel Distance.</b>  <b>(A)</b> Travel distance between any point in a sleeping suite and an exit access door to another suite, an exit access corridor door, or a horizontal exit door from that suite shall not exceed 100 ft (30 m).  <b>(B)</b> Travel distance between any point in a sleeping suite and an exit shall not exceed 200 ft (61 m).</p>	See new underscored text
<p><b>18.2.5.7.3.1 Patient Care Non-Sleeping Suite Arrangement.</b>  <del><b>(A)</b> Occupants of habitable rooms within non-sleeping suites shall have exit access to a corridor complying with 18.3.6, or to a horizontal exit, directly from the suite.</del>  <del><b>(B)</b> Where two or more exit access doors are required from the suite by 18.2.5.5.2, one of the exit access doors shall be permitted to be directly to an exit stair, exit passageway, or exit door to the exterior.</del></p>	Text deleted
<p><b>18.2.5.7.3.1 Patient Care Non-Sleeping Suite <del>Number of Means of Egress.</del></b>  <b>(A)</b> Patient care non-sleeping suites shall have exit access to a corridor complying with 18.3.6 or to a horizontal exit, directly from the suite.  <b>(B)</b> Patient care non-sleeping suites of more than 2500 ft<sup>2</sup> (230 m<sup>2</sup>) shall have not less than two exit access doors remotely located from each other.  <b>(C)*</b> For suites requiring two exit access doors, <u>one of the exit access doors shall be permitted to be to one of the following:</u>  (1) <u>An exit stair</u>  (2) <u>An exit passageway</u>  (3) <u>An exit door to the exterior</u>  (4) Another suite, provided that the separation between the suites complies with the corridor requirements of 18.3.6.2 through 18.3.6.5.</p>	See new underscored and deleted text
<p><b>18.2.5.7.3.2 Patient Care Non-Sleeping Suite Maximum Size.</b>  <b>(A)</b> Non-sleeping suites shall not exceed <del>10,000 ft<sup>2</sup> (930 m<sup>2</sup>)</del> 12,500 ft<sup>2</sup> (1160 m<sup>2</sup>), unless otherwise provided in 18.2.5.7.3.2(B).  <b>(B)</b> <u>Non-sleeping suites greater than 12,500 ft<sup>2</sup> (1160 m<sup>2</sup>) and not exceeding 15,000 ft<sup>2</sup> (1390 m<sup>2</sup>) shall be permitted where provided with total (complete) coverage automatic smoke detection in accordance with 9.6.2.9 and 18.3.4.</u></p>	See new underscored and deleted text
<p><b>18.2.5.7.3.3 Patient Care Non-Sleeping Suite Travel Distance.</b>  <b>(A)</b> Travel distance within a non-sleeping suite to an exit access <u>door to another suite, an exit access corridor door, or a horizontal exit door</u> from the suite shall not exceed 100 ft (30 m).  <b>(B)</b> Travel distance between any point in a non-sleeping suite and an exit shall not exceed 200 ft (61 m).</p>	See new underscored text

Subject / 2015 Edition Text	Notes
<p><b>Table 18.3.2.1</b></p> <p><b>18.3.2.1 Hazardous Areas.</b></p> <p><b>18.3.2.1.1</b> Any hazardous areas shall be protected in accordance with <b>Section 8.7</b>, and the areas <del>described in Table 18.3.2.1</del> <u>addressed in 18.3.2.1.2 and 18.3.2.1.3</u> shall be protected as indicated.</p> <p><b>18.3.2.1.2</b> The following areas shall be considered hazardous areas and shall be protected by fire barriers having a minimum 1-hour fire resistance rating in accordance with <b>Section 8.3</b>:</p> <p>(1) Boiler and fuel-fired heater rooms</p> <p>(2) Central/bulk laundries larger than 100 ft<sup>2</sup> (9.3 m<sup>2</sup>)</p> <p><del>Laboratories employing flammable or combustible materials in quantities less than those that would be considered a severe hazard</del></p> <p><del>Laboratories that use hazardous materials that would be classified as a severe hazard in accordance with NFPA 99, <i>Standard for Health Care Facilities</i></del></p> <p>(3) Paint shops employing hazardous substances and materials in quantities less than those that would be classified as a severe hazard</p> <p>(4) Physical plant maintenance shops</p> <p>(5) Rooms with soiled linen in volume exceeding 64 gal (242 L)</p> <p>(6) Rooms with collected trash in volume exceeding 64 gal (242 L)</p> <p>(7) Storage rooms larger than 100 ft<sup>2</sup> (9.3 m<sup>2</sup>) and storing combustible material</p> <p><b>18.3.2.1.3</b> <u>The following areas shall be considered hazardous areas and shall be protected by smoke partitions in accordance with Section 8.4:</u></p> <p>(1) Laboratories employing flammable or combustible materials in quantities less than those that would be considered a severe hazard</p> <p>(2) Storage rooms larger than 50 ft<sup>2</sup> (4.6 m<sup>2</sup>) but not exceeding 100 ft<sup>2</sup> (9.3 m<sup>2</sup>) and storing combustible material</p> <p><b>18.3.2.2 Laboratories.</b> Laboratories in which chemicals are handled or stored shall comply with <del>NFPA 99</del> <u>NFPA 45, <i>Standard on Fire Protection for Laboratories Using Chemicals</i></u>.</p> <p><del><b>18.3.2.3 Anesthetizing Locations.</b> Anesthetizing locations shall be protected in accordance with NFPA 99, <i>Health Care Facilities Code</i>.</del></p> <p><b>18.3.2.3 Hyperbaric Chambers.</b> <u>Health care occupancies housing hyperbaric chambers shall comply with 8.7.5.</u></p> <p><b>18.3.2.4 Medical Gas.</b> Areas where medical gas is stored or administered, <u>and the operation, testing, and maintenance of medical gases</u> shall be in accordance with NFPA 99, <i>Health Care Facilities Code</i>.</p>	<p>Table 18.3.2.1 replaced by text</p> <p>See new underscored and deleted text</p> <p>New formatting</p> <p>See new underscored and deleted text</p> <p>Text deleted</p> <p>New provision</p> <p>See new underscored text</p>
<p><b>18.3.2.5.3*</b> Within a smoke compartment, where residential or commercial cooking equipment is used to prepare meals for 30 or fewer persons, one cooking facility shall be permitted to be open to the corridor, provided that all of the following conditions are met:</p> <p>...</p> <p>(11)* Not less than two AC-powered photoelectric smoke alarms <u>with battery backup</u>, interconnected in accordance with <b>9.6.2.10.3</b>, and equipped with a silence feature are located not closer than 20 ft (6.1 m) and not further than 25 ft (7.6 m) from the cooktop or range.</p>	<p>See new underscored text</p>

Subject / 2015 Edition Text	Notes
(12)* The smoke alarms required by <b>18.3.2.5.3(11)</b> are permitted to be located outside the kitchen area where such placement is necessary for compliance with the 20 ft (7.6 m) minimum distance criterion.	New provision
<p>(13)* A single system smoke detector is permitted to be installed in lieu of the smoke alarms required in <b>18.3.2.5.3(11)</b> provided the following criteria are met:</p> <ul style="list-style-type: none"> <li>(a) The detector is located not closer than 20 ft (6.1 m) and not further than 25 ft (7.6 m) from the cooktop or range.</li> <li>(b) The detector is permitted to initiate a local audible alarm signal only.</li> <li>(c) The detector is not required to initiate a buildingwide occupant notification signal.</li> <li>(d) The detector is not required to notify emergency forces.</li> <li>(e) The local audible signal initiated by the detector is permitted to be silenced and reset by a button on the detector or by a switch installed within 10 ft (3.0 m) of the system smoke detector.</li> </ul> <p>(14) System smoke detectors that are required to be installed in corridors or spaces open to the corridor by other sections of this chapter are not used to meet the requirements of <b>18.3.2.5.3(11)</b> and are located not closer than 25 ft (7.6 m) to the cooktop or range.</p>	New provision
<b>18.3.4.2.3</b> The system smoke detector installed in accordance with <b>18.3.2.5.3(13)</b> shall not be required to initiate the fire alarm system.	New provision
<p><b>18.3.4.3.1 Occupant Notification.</b> Occupant notification shall be accomplished automatically in accordance with <b>9.6.3</b>, unless otherwise modified by the following:</p> <p>. . .</p> <p>(3) The provision of <b>18.3.2.5.3(13)(c)</b> shall be permitted to be used.</p>	New provision
<b>18.3.4.3.2.1</b> Emergency forces notification shall be accomplished in accordance with <b>9.6.4</b> , except that the provision of <b>18.3.2.5.3(13)(d)</b> shall be permitted to be used.	New provision
<p><b>18.3.6.3.1*</b> <u>Doors, including doors or panels to nurse servers and pass-through openings, protecting corridor openings shall be constructed to resist the passage of smoke, and the following also shall apply:</u></p> <ul style="list-style-type: none"> <li>(1) Compliance with NFPA 80, <i>Standard for Fire Doors and Other Opening Protectives</i>, shall not be required.</li> <li>(2) <u>For other than doors protecting pass-through openings, a clearance between the bottom of the door and the floor covering not exceeding 1 in. (25 mm) shall be permitted.</u></li> <li>(3) <u>For doors protecting pass-through openings, a clearance between the bottom of the door and the sill not exceeding 1/8 in. (3 mm) shall be permitted.</u></li> <li>(4) Doors to toilet rooms, bathrooms, shower rooms, sink closets, and similar auxiliary spaces that do not contain flammable or combustible material shall not be required to be constructed to resist the passage of smoke.</li> </ul>	See new underscored text
<b>18.3.6.4.1</b> <del>Transfer grilles, regardless of whether they are protected by fusible link-operated dampers,</del> shall not be used in corridor walls or doors, unless otherwise permitted by <b>18.3.6.4.2</b> .	See deleted text
<p><b>18.3.7.2</b> The smoke barrier subdivision requirement of <b>18.3.7.1</b> shall not apply to any of the following occupancies:</p> <ul style="list-style-type: none"> <li>(1) Stories that do not contain a health care occupancy located directly above the health care occupancy</li> <li>(2) Areas <u>on health care floors</u> that do not contain a health care occupancy and that are separated from the health care occupancy by a fire barrier complying with <b>7.2.4.3</b></li> <li>(3) Stories that do not contain a health care occupancy and that are <del>more than one story</del> below the health care occupancy</li> </ul>	See new underscored and deleted text

Subject / 2015 Edition Text	Notes
<p><del>(4) Stories located directly below a health care occupancy where such stories house mechanical equipment only and are separated from the story above by 2-hour fire-resistance-rated construction</del></p> <p>(4) Open-air parking structures protected throughout by an approved, supervised automatic sprinkler system in accordance with <a href="#">Section 9.7</a></p>	
<p><b>18.3.7.9.1</b> The bottom of at least one vision panel in each leaf shall be not more than 43 in. (1090 mm) above the finished floor.</p>	New provision
<p><b>18.4.4.5 Hazardous Area Protection (Nonsprinklered Smoke Compartment Rehabilitation).</b></p> <p><b>18.4.4.5.1</b> Where a new hazardous area is formed in an existing nonsprinklered smoke compartment, the hazardous area itself shall be protected as indicated in <a href="#">Table 18.4.4.5.1</a>. [Table entries:] <del>Laboratories employing flammable or combustible materials in quantities less than those that would be considered a severe hazard</del> <del>Laboratories that use hazardous materials that would be classified as a severe hazard in accordance with NFPA 99</del></p>	See new underscored and deleted text
<p><b>18.7.3.3*</b> Where required by the authority having jurisdiction, a floor plan shall be provided to indicate the location of all required means of egress corridors in smoke compartments having spaces not separated from the corridor by partitions.</p>	New provision
<p><b>Chapter 19 Existing Health Care Occupancies</b></p>	
<p><b>19.1.3.2</b> Atrium walls in accordance with <a href="#">6.1.14.4.6</a> shall be permitted to serve as part of the separation required by <a href="#">6.1.14.4.1</a> for creating separated occupancies on a story-by-story basis, provided both of the following are met:</p> <p>(1) The provision is not used for occupancy separations involving industrial and storage occupancies.</p> <p>(2) Smoke partitions serving as atrium walls are not permitted to serve as enclosures for hazardous areas.</p>	New provision
<p><b>19.1.6.5</b> Interior nonbearing walls required to have a <del>minimum 2-hour</del> fire resistance rating of <u>2 hours or less</u> shall be permitted to be of fire-retardant-treated wood enclosed within noncombustible or limited-combustible materials, provided that such walls are not used as shaft enclosures.</p>	Correction
<p><b>19.2.2.2.7*</b> Doors permitted to be locked in accordance with <a href="#">19.2.2.2.5.1</a> shall be permitted to have murals on the egress doors to disguise the doors, provided all of the following are met:</p> <p>(1) Staff can readily unlock the doors at all times in accordance with <a href="#">19.2.2.2.6</a>.</p> <p>(2)* The door-releasing hardware, where provided, is readily accessible for staff use.</p> <p>(3)* Door leaves, windows, and door hardware, other than door -releasing hardware, are permitted to be covered by the murals.</p> <p>(4) The murals do not impair the operation of the doors.</p> <p>(5) The affected smoke compartments are protected throughout by an approved, supervised automatic sprinkler system in accordance with <a href="#">19.3.5.7</a>.</p> <p>(6) The location and operation of doors disguised with murals are identified in the fire safety plan and are included in staff training.</p>	New provision
<p><b>19.2.5.7.2.1 Sleeping Suite Arrangement Supervision.</b></p> <p><del>(A)* Occupants of habitable rooms within sleeping suites shall have exit access to a corridor complying with 19.3.6, or to a horizontal exit, directly from the suite.</del></p> <p><del>(B) Where two or more exit access doors are required from the suite by 19.2.5.5.1, one of the exit access doors shall be permitted to be directly to an exit stair, exit passageway, or exit door to the exterior.</del></p>	See new underscored and deleted text

Subject / 2015 Edition Text	Notes
<p>(A) Sleeping suites shall be provided with constant staff supervision within the suite.                      (B)* Sleeping suites shall be arranged in accordance with one of the following:                      . . .</p>	
<p><b>19.2.5.7.2.2 Sleeping Suite <del>Number of Means of Egress.</del></b>                      (A)* <u>Sleeping suites shall have exit access to a corridor complying with 19.3.6 or to a horizontal exit, directly from the suite.</u>  <del>(B)* One means of egress from the suite shall be directly to a corridor complying with 18.3.6.</del>                      (B) Sleeping suites of more than 1000 ft<sup>2</sup> (93 m<sup>2</sup>) shall have not less than two exit access doors remotely located from each other.                      (C)* For suites requiring two exit access doors, one of the exit access doors from the suite shall be permitted to be to one of the following:                      (1) <u>An exit stair</u>                      (2) <u>An exit passageway</u>                      (3) <u>An exit door to the exterior</u>                      (4) Another suite, provided that the separation between the suites complies with the corridor requirements of 19.3.6.2 through 19.3.6.5</p>	See new underscored and deleted text

<p><b>32.3.4.2 Alcohol-Based Hand-Rub Dispensers.</b> Alcohol-based hand-rub dispensers in accordance with <u>8.7.3.3</u> shall be permitted.</p>	New provision
<b>Chapter 33 Existing Residential Board and Care Occupancies</b>	
<p><b>33.2.1.4 Multiple-Level Buildings.</b> For purposes of applying requirements of this chapter that utilize the term <i>level of exit discharge</i>, including determination of stories in height as addressed in <u>4.6.3</u>, the level of exit discharge shall be permitted to be the combination of floor levels as addressed in <u>33.2.1.4.1</u>, <u>33.2.1.4.2</u>, or <u>33.2.1.4.3</u>.</p> <p><b>33.2.1.4.1</b> One floor level located not more than three stair risers above the level of exit discharge shall be permitted to be considered part of the level of exit discharge.</p> <p><b>33.2.1.4.2</b> One floor level located not more than three stair risers below the level of exit discharge shall be permitted to be considered part of the level of exit discharge.</p> <p><b>33.2.1.4.3</b> Where one floor level is located above the level of exit discharge, another floor level is located below the level of exit discharge, and not more than a total of three stair risers separate the upper level from the lower level, the two floor levels shall be permitted to be considered part of the level of exit discharge.</p> <p><b>33.2.1.4.4</b> The provisions of <u>33.2.1.4.1</u>, <u>33.2.1.4.2</u>, and <u>33.2.1.4.3</u> shall not be used in combination with each other.</p>	New provision
<p><b>33.2.2.2.1</b> Every sleeping room and living area shall have access to a primary means of escape located to provide a safe path of travel to the outside <u>at street level or the finished ground level</u>.</p>	See new underscored text

Subject / 2015 Edition Text	Notes
<p><b>33.2.2.5.5.3</b> Door-locking arrangements shall be permitted where the clinical needs of residents require specialized security measures or where residents pose a security threat, provided all of the following conditions are met:</p> <p>(1) Staff can readily unlock doors at all times in accordance with <b>33.2.2.5.5.4</b></p> <p>(2) The building is protected by an approved automatic sprinkler system in accordance with <b>33.2.3.5</b></p>	New provision
<p><b>33.2.2.5.5.4</b> Doors located in the means of egress and permitted to be locked in accordance with <b>33.2.2.5.5.3</b> shall comply with all of the following:</p> <p>(1) Provisions shall be made for the rapid removal of occupants by means of one of the following:</p> <p>(a) Remote control of locks from within the locked building</p> <p>(b) Keying of all locks to keys carried by staff at all times</p> <p>(c) Other such reliable means available to staff at all times</p> <p>(2) Only one locking device shall be permitted on each door.</p>	
<p><b>33.2.3.5.7.2</b> Where an automatic sprinkler system is installed, attics not used for living purposes, storage, or fuel-fired equipment shall meet one of the following criteria:</p> <p>...</p> <p>(5) Attics shall be protected by heat alarms arranged to provide occupant notification in accordance with <b>33.2.3.4.2</b>.</p>	New provision
<p><b>33.2.3.6.1</b> Unless otherwise indicated in <b>33.2.3.6.1.1</b> through <b>33.2.3.6.1.4</b>, corridor walls shall meet all of the following requirements:</p> <p>(1) Walls separating sleeping rooms <u>from corridors and areas open to the corridor</u> shall have a minimum ½-hour fire resistance rating. The minimum ½-hour fire resistance rating shall be considered to be achieved if the partitioning is finished on both sides with lath and plaster or materials providing a 15-minute thermal barrier.</p> <p>...</p>	See new underscored text
<p><b>33.2.4 Alcohol-Based Hand-Rub Dispensers.</b> Alcohol-based hand-rub dispensers in accordance with <b>8.7.3.3</b> shall be permitted.</p>	New provision
<p><b>33.3.2.2.2 Doors.</b> Doors in means of egress shall be as follows:</p> <p>...</p> <p>(6) Door-locking arrangements shall be permitted where the clinical needs of residents require specialized security measures or where residents pose a security threat, provided both of the following conditions are met:</p> <p>(a) Staff can readily unlock doors at all times in accordance with <b>33.3.2.2.2(7)</b></p> <p>(b) The building is protected by an approved automatic sprinkler system in accordance with <b>33.3.3.5</b></p> <p>(7) Doors located in the means of egress that are permitted to be locked under other provisions of <b>Chapter 33</b>, other than those meeting the requirement of <b>33.3.2.2.2(4)</b> or <b>33.3.2.2.2(5)</b>, shall have adequate provisions made for the rapid removal of occupants by means such as remote control of locks, keying of all locks to keys carried by staff at all times, or other such reliable means available to staff at all times.</p> <p>(8) Only one such locking device, as described in <b>33.3.2.2.2(7)</b>, shall be permitted on each door.</p>	New provisions
<p><b>33.3.2.5.1</b> Access to all required exits shall be in accordance with <b>Section 7.5</b> <u>unless otherwise modified by this chapter.</u></p>	See new underscored text

Subject / 2015 Edition Text	Notes
<p><b>33.3.2.6.1</b> Travel distance <del>from the door</del> within a room, suite, or living unit to a corridor door shall not exceed 75 ft (23 m) in buildings not protected throughout by an approved automatic sprinkler system in accordance with <b>33.3.3.5</b>.</p> <p><b>33.3.2.6.2</b> Travel distance <del>from the door</del> within a room, suite, or living unit to a corridor door shall not exceed 125 ft (38 m) in buildings protected throughout by an approved automatic sprinkler system in accordance with <b>33.3.3.5</b>.</p>	See deleted text
<p><b>33.3.2.9 Emergency Lighting.</b> Emergency lighting in accordance with <b>Section 7.9</b> shall be provided in all facilities meeting any of the following criteria:</p> <p>(1) Facilities having an impractical evacuation capability</p> <p>(2) Facilities having a prompt or slow evacuation capability with more than 25 sleeping rooms, unless each <u>sleeping</u> room has a direct exit to the outside of the building at the finished ground level.</p>	See new underscored text
<p><b>33.3.3.2.1</b> In other than buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with <b>9.7.1.1(1)</b>, rooms containing high-pressure boilers, refrigerating machinery, transformers, or other service equipment subject to possible explosion shall not be located directly under or adjacent to exits, and such rooms shall be effectively separated from other parts of the building as specified in <b>Section 8.7</b>.</p>	See new underscored text
<p><b>33.3.3.8.2*</b> Where residential cooking equipment is used for food warming or limited cooking, the equipment shall not be required to be protected in accordance with <b>9.2.3</b>, and the presence of the equipment shall not require the area to be protected as a hazardous area.</p> <p><b>33.3.3.8.3*</b> Compliance with <b>9.2.3</b> shall not be required where all of the following conditions are met:</p> <p>(1) Residential or commercial cooking equipment in a single kitchen per smoke compartment is used to prepare meals for 30 or fewer persons.</p> <p>. . .</p> <p>(14) . . .</p> <p><b>33.3.3.8.4*</b> Within a smoke compartment, residential or commercial cooking equipment that is used to prepare meals for 30 or fewer persons shall be permitted, provided that the cooking facility complies with all of the following conditions:</p> <p>(1) . . .</p> <p>(3) . . .</p> <p><b>33.3.3.8.5*</b> Where cooking facilities are protected in accordance with <b>9.2.3</b>, the presence of the cooking equipment shall not cause the room or space housing the equipment to be classified as a hazardous area with respect to the requirements of <b>33.3.3.2</b>, and the room or space shall not be permitted to be open to the corridor.</p>	New provisions
<p><b>33.3.4.2 Alcohol-Based Hand-Rub Dispensers.</b> Alcohol-based hand-rub dispensers in accordance with <b>8.7.3.3</b> shall be permitted.</p>	New provision
<b>Chapter 36 New Mercantile Occupancies</b>	
<p><b>36.1.3.1.3</b> In other than bulk merchandising mercantile occupancies, atrium walls in accordance with <b>6.1.14.4.6</b> shall be permitted to serve as part of the separation required by <b>6.1.14.4.1</b> for creating separated occupancies on a story-by-story basis from nonhazardous spaces in assembly, educational, day care, health care, ambulatory health care, residential, residential board and care occupancies, and business occupancies.</p>	New provision

Subject / 2015 Edition Text	Notes
<p><b>36.3.1 Protection of Vertical Openings.</b> Any vertical opening shall be protected in accordance with <b>Section 8.6</b>, except under any of the following conditions:</p> <p>. . .</p> <p>(5) Unenclosed vertical openings in accordance with <b>8.6.9.7</b> shall be permitted and the number of contiguous stories shall not be limited.</p>	New provision
<p><b>36.3.2.3* Commercial Cooking Equipment Operations.</b> <u>Commercial cooking equipment operations</u> shall be protected in accordance with <b>9.2.3</b>, unless the cooking equipment is one of the following types:</p> <p>(1) Outdoor equipment</p> <p><del>(2) Portable equipment not flue-connected</del></p> <p>(2) Equipment used only for food warming</p>	See new underscored and deleted text
<p><b>36.4.4.2 Special Definitions.</b> The following is a list of special terms used in this chapter:</p> <p>(1) <b>Anchor Building.</b> A building housing any occupancy having low-or ordinary-hazard contents and having direct access to a mall building, but having all required means of egress independent of the mall. <i>(See 3.3.36.2.)</i></p> <p>(2) <b>Food Court.</b> A public seating area located in a mall that serves adjacent food preparation tenant spaces. <i>(See 3.3.50.2.)</i></p> <p>(3) <b>Gross Leasable Area.</b> Fifty percent of major tenant areas, and 100 percent of all other floor areas designated for tenant occupancy and exclusive use, including storage areas. The area of tenant occupancy is measured from the centerlines of joint partitions to the outside of the tenant walls. <i>(See 3.3.21.3.)</i></p> <p>(4) <b>Mall.</b> A roofed or covered common pedestrian area within a mall building that serves as access for two or more tenants and does not exceed three levels that are open to each other. <i>(See 3.3.168.)</i></p>	New provision
<p><del><b>36.4.4.3.7</b> Every mall shall be provided with unobstructed exit access parallel to, and adjacent to, the mall tenant fronts and extending to each mall exit.</del></p>	Text deleted

<p><b>42.9.3 Inspection of Door Openings.</b> Door openings shall be inspected in accordance with <b>7.2.1.15</b>.</p>	New provision
<p><b>Chapter 43 Building Rehabilitation</b></p>	No changes

## IMPORTANT NOTICES AND DISCLAIMERS CONCERNING NFPA® STANDARDS

### NOTICE AND DISCLAIMER OF LIABILITY CONCERNING THE USE OF NFPA STANDARDS

NFPA® codes, standards, recommended practices, and guides (“NFPA Standards”), of which the document contained herein is one, are developed through a consensus standards development process approved by the American National Standards Institute. This process brings together volunteers representing varied viewpoints and interests to achieve consensus on fire and other safety issues. While the NFPA administers the process and establishes rules to promote fairness in the development of consensus, it does not independently test, evaluate, or verify the accuracy of any information or the soundness of any judgments contained in NFPA Standards.

The NFPA disclaims liability for any personal injury, property or other damages of any nature whatsoever, whether special, indirect, consequential or compensatory, directly or indirectly resulting from the publication, use of, or reliance on NFPA Standards. The NFPA also makes no guaranty or warranty as to the accuracy or completeness of any information published herein.

In issuing and making NFPA Standards available, the NFPA is not undertaking to render professional or other services for or on behalf of any person or entity. Nor is the NFPA undertaking to perform any duty owed by any person or entity to someone else. Anyone using this document should rely on his or her own independent judgment or, as appropriate, seek the advice of a competent professional in determining the exercise of reasonable care in any given circumstances.

The NFPA has no power, nor does it undertake, to police or enforce compliance with the contents of NFPA Standards. Nor does the NFPA list, certify, test, or inspect products, designs, or installations for compliance with this document. Any certification or other statement of compliance with the requirements of this document shall not be attributable to the NFPA and is solely the responsibility of the certifier or maker of the statement.

### ADDITIONAL NOTICES AND DISCLAIMERS

#### Updating of NFPA Standards

Users of NFPA codes, standards, recommended practices, and guides (“NFPA Standards”) should be aware that these documents may be superseded at any time by the issuance of new editions or may be amended from time to time through the issuance of Tentative Interim Amendments or corrected by Errata. An official NFPA Standard at any point in time consists of the current edition of the document together with any Tentative Interim Amendments and any Errata then in effect. In order to determine whether a given document is the current edition and whether it has been amended through the issuance of Tentative Interim Amendments or corrected through the issuance of Errata, consult appropriate NFPA publications such as the National Fire Codes® Subscription Service, visit the NFPA website at [www.nfpa.org](http://www.nfpa.org), or contact the NFPA at the address listed below.

#### Interpretations of NFPA Standards

A statement, written or oral, that is not processed in accordance with Section 6 of the Regulations Governing the Development of NFPA Standards shall not be considered the official position of NFPA or any of its Committees and shall not be considered to be, nor be relied upon as, a Formal Interpretation.

#### Patents

The NFPA does not take any position with respect to the validity of any patent rights referenced in, related to, or asserted in connection

with an NFPA Standard. The users of NFPA Standards bear the sole responsibility for determining the validity of any such patent rights, as well as the risk of infringement of such rights, and the NFPA disclaims liability for the infringement of any patent resulting from the use of or reliance on NFPA Standards.

NFPA adheres to the policy of the American National Standards Institute (ANSI) regarding the inclusion of patents in American National Standards (“the ANSI Patent Policy”), and hereby gives the following notice pursuant to that policy:

**NOTICE:** The user’s attention is called to the possibility that compliance with an NFPA Standard may require use of an invention covered by patent rights. NFPA takes no position as to the validity of any such patent rights or as to whether such patent rights constitute or include essential patent claims under the ANSI Patent Policy. If, in connection with the ANSI Patent Policy, a patent holder has filed a statement of willingness to grant licenses under these rights on reasonable and nondiscriminatory terms and conditions to applicants desiring to obtain such a license, copies of such filed statements can be obtained, on request, from NFPA. For further information, contact the NFPA at the address listed below.

#### Law and Regulations

Users of NFPA Standards should consult applicable federal, state, and local laws and regulations. NFPA does not, by the publication of its codes, standards, recommended practices, and guides, intend to urge action that is not in compliance with applicable laws, and these documents may not be construed as doing so.

#### Copyrights

NFPA Standards are copyrighted. They are made available for a wide variety of both public and private uses. These include both use, by reference, in laws and regulations, and use in private self-regulation, standardization, and the promotion of safe practices and methods. By making these documents available for use and adoption by public authorities and private users, the NFPA does not waive any rights in copyright to these documents.

Use of NFPA Standards for regulatory purposes should be accomplished through adoption by reference. The term “adoption by reference” means the citing of title, edition, and publishing information only. Any deletions, additions, and changes desired by the adopting authority should be noted separately in the adopting instrument. In order to assist NFPA in following the uses made of its documents, adopting authorities are requested to notify the NFPA (Attention: Secretary, Standards Council) in writing of such use. For technical assistance and questions concerning adoption of NFPA Standards, contact NFPA at the address below.

#### For Further Information

All questions or other communications relating to NFPA Standards and all requests for information on NFPA procedures governing its codes and standards development process, including information on the procedures for requesting Formal Interpretations, for proposing Tentative Interim Amendments, and for proposing revisions to NFPA standards during regular revision cycles, should be sent to NFPA headquarters, addressed to the attention of the Secretary, Standards Council, NFPA, 1 Batterymarch Park, P.O. Box 9101, Quincy, MA 02269-9101; email: [stds\\_admin@nfpa.org](mailto:stds_admin@nfpa.org)

For more information about NFPA, visit the NFPA website at [www.nfpa.org](http://www.nfpa.org).
